aceous; leaves deltoid, toothed, silvery underneath." The whole plant is covered with a skin that peels off, and is of a grey hoary colour; stem two feet high, branched; leaves except the lowest alternate, and filvered with little plates; lower ones deltoid; upper deltoid-lanceolate, below entire at the edge, above variously jagged; hermaphrodite flowers in sessile clusters at the top of the stalks, females axillary and twin. It grows on our and other European sea-coasts, flowering in July and August. Annual. 9. *A. hastata*, broad-leaved wild orache, vulg. Fat-hen. Martyn's Mill. Dict. "Stem herbaceous; valves of the calyx in the female flowers large, deltoid, sinuated." Dr. Smith says, "all our botanists had taken the *A. patula*, or common orache, for the *A. hastata* of Linnaeus, till his herbarium discovered it to be his *patula*. The real *hastata* proves a very different plant, having the valves of the female calyx, when in fruit, very large, membranous, reticulated, with veins, and bordered with long setaceous teeth." The above two species however bear so close a resemblance to each other according to Haller, that he doubts if they really be distinct species. A common weed in cultivated grounds, gardens, and dunghills, flowering from June till August. 10. *A. patula*, spreading halberd-leaved orache. Eng. Bot. 13. t. 136. *A. hastata*. Hudf. 443. With. 274. Curt. Lond. 2. 66. "Stem herbaceous, spreading; leaves triangular-lanceolate, somewhat halberd-shaped; calyx of the fruit more or less tuberculated at the sides." Smith. Eng. Bot. It grows everywhere, on dunghills, waste or cultivated land; root annual, fibrous; stem with long, spreading, numerous branches; leaves alternate, on stalks mealy beneath; the lower ones hastate, deeply and irregularly toothed; the upper narrow, lanceolate, mostly entire; clusters of flowers terminal, and axillary, long, interrupted, a little leafy; valves of the female calyx, which alone seems to ripen its seed, triangular, acute, toothed about the lateral angles, and fluted in the middle with tubercles. By the sea-side the whole plant is procumbent, more fleshy, reddish, and all the leaves somewhat entire. Smith. l. c. 11. *A. littoralis*, grass-leaved sea orache. Hudf. 444. With. 275. Eng. Bot. 10. t. 702. "Stem herbaceous, erect; leaves all linear, entire, or toothed; calyx of the female flowers mucicated, sinuated." Stem erect, angular, with leafy branches; leaves alternate, on footstalks, flat, linear, having their margins entire, or more commonly set with small scattered teeth, mealy underneath; spikes terminal, dense, obtuse; valves of the female flowers become much enlarged, ovate, deeply and irregularly sinuated, and furnished with large pointed tubercles. Found on the eastern and southern coasts of this kingdom, in a muddy soil, flowering in August and September. 12. *A. pedunculata*, pedunculated sea-orache. Hudf. 444. With. 1146. Eng. Bot. 4. 232. "Stem herbaceous, with divaricating branches; leaves lanceolate, obtuse, undivided; fruit of the female flowers peduncled." The pedunculated fruit, even, without the zigzag, angular stem, sufficiently distinguishes this species from all its congeners. The stem is six or eight inches high, with remarkably glaucous leaves. It grows on the salt marshes near Yarmouth, and was found by Dr. Smith on the muddy shore of the river Ouse, just below Lynn. Annual. 13. *A. marina*, serrated sea-orache. Lightf. 637. "Stem herbaceous, erect; leaves linear ferrate." Mr. Hudson's *A. serrata* is certainly a variety of *A. littoralis*, and we are disposed to consider this as the same plant. 14. *A. albicans*, white orache. "Stem shrubby, erect; leaves hastate, entire, acute; spikes terminating." A native of the Cape; discovered by Masson, and introduced by him into the Kew garden in 1774.

Propagation and Culture. 1, 2, 3. may be increased by cuttings planted in any of the summer months, on a shady border; where, if they be daily watered, they will be in a state to transplant the Michaelmas following. N^o 7. must be sown for use in the spring, or at Michaelmas, soon after the seeds are ripe, which is better. These plants require no other care, but to hoe them when they are about an inch high; to cut them down where they are too thick, leaving them about four inches asunder, and to clear them from weeds. When the plants are about four inches high, it will be proper to hoe them a second time, and if this be well performed in dry weather, the ground will remain clean until the plant is fit for use. Where it is sown on a rich soil, and the plants are allowed a proper distance, the leaves will be very large and in that the excellence of the herb consists. Unless it be eaten when young, the stalks become tough and good for nothing. The seeds will ripen in August, when the plants may be cut or pulled up and laid on a cloth to dry; after which the seeds may be beaten out and put in bags to dry. Most of the other sorts, so far from being cultivated in gardens, are to be rooted out from them as rank weeds. Martyn's Miller's Dict.

ATRIplex. See ATRAPHAXIS, AXIRIS, BLITUM, CHENOPodium, and GALENIA.

ATRIPLICIS, in *Entomology*, a species of SCARABÆUS (*Melolontha*). This insect is oblong, villose, pale; future and apex of the wing-cases black; shield of the head reflected. A native of Barbary, and feeds on the atriplex halimifolia; in size and appearance resembles *S. ruficornis*.

ATRIPLICIS, a species of CURCULIO that is found on the shores of Norway. It is long and black; thorax shining; wing-cases striated and obtuse. Gmelin.

ATRIPLICIS, a species of PHALÆNA (*Noctua*). The first wings are clouded with brown, with a yellow bifid mark in the middle. Fn. Sv. Fabr. &c. The larva is naked, reddish, dotted with white, and marked along the back with a brown line. Pupa, naked and brown.

ATRIPLICIS, a species of APHIS that infests the atriplex hortensis. The body is glossy black, plaited at the sides; shanks pale; tail obtuse. Fabr. &c.

ATRIROSTRIS, a species of CURCULIO. It is cinereous, with the snout arched and black. Inhabits Leipzick. Paykull.

ATRIUM, in *Ancient Architecture*, one of the interior divisions of the ancient Roman houses. Aulus Gellius tells us, that even in his time many learned persons confounded together the terms atrium and vestibulum. Cecilius Gallus teaches us, that the vestibulum was not a part of the interior of the house, but only a large recess at the principal entrance, perhaps analogous to the modern loggias of the Italians. Cicero, in a letter to Atticus, seems to express the same thing, when he says, that in passing through the sacred street, when he was pursued by assassins, he took refuge in the vestibulum of Tatius. "Secessi in vestibulum Cui Tatii Domitionis." From the time of Aulus Gellius, the same uncertainty of the exact meaning of these words continued, and they became almost synonymous. It must be still more difficult at the present time, to assign to the atrium its true situation and use.

Martial places the colossus of Nero in the atrium, and Suetonius in the vestibulum; from whence it results that one of them must have employed one of these terms improperly. Vitruvius even sometimes employs the word atrium for cavædium. Virgil by this verse, "apparet domus nitus et atria longa patebant," gives us to understand, that the atrium was an interior part of buildings; and it appears certain,

certain, that this was a particular place in private houses, palaces, and temples.

From the description which Vitruvius gives us of it, it appears to have been an oblong room, having its breadth divided into three parts by two rows of columns. He gives rules for placing these columns according to the general proportion of the atrium.

The atrium was situated after the cavædium which was what we commonly call the court, and immediately before the tablinum. It was in the atrium that the Romans placed the statues of their ancestors, and it was also sometimes used as an eating room, though they had also other places designed for the purposes of the table. This is proved by Virgil, who in describing the place where they made their repast, says,

“Crateras magnos statuunt et vina coronant,
Fit strepitus tectis vocemque per ampla volutant.
Atria dependent lychni laquearibus aureis.”

It follows from this, that we must consider the atrium as one of the interior parts of the house, in which it differed from the vestibulum, and that it was covered, which distinguishes it still more from the cavædium or the impluvium.

Some temples had also an atrium: of this number was the temple of Vesta, and that of Liberty. It was in the latter (says Titus Livius) that they deposited the hostages of the Tarentines. It appears that it was a covered semi-circular court, if we may judge from the ancient marble plan of Rome, which is preserved in the capitol, on which we still read these words “atrium libertatis.”

If we may believe the historians, the use and form of the atrium were borrowed from the Etruscans, and this appellation comes from the city of Atria, or Adria, which gives name to the Adriatic or Adriatic sea, and where this sort of porticoes was much used.

Festus says “atrium proprie est genus edificii dictum atrium, quia id genus edificii primum atria in Etruria fit institutum.” Varro de ling. Lat. l. 4. “atrium appellatum ab atriaticis Tuscis: illinc enim exemplum sumptum.

ATRIUM, in *Ecclesiastical Antiquity*, denotes an open place or court, before a church, making part of what was called the narthex, or ante-temple.

The atrium, in the ancient churches, was a large area, or square plat of ground, surrounded with a portico or cloyster, situate between the porch or vestibule of the church, and the body of the church.

Some have mistakenly confounded the atrium with the porch or vestibule, from which it was distinguished; others with the narthex, of which it was only a part.

The atrium was the mansion of those who were not suffered to enter farther into the church. More particularly, it was the place where the first class of penitents stood, to beg the prayers of the faithful, as they went into the church.

ATRIUM is also used, in the *Canon Law*, for the cemetery, or church-yard.

In this sense we find a law, prohibiting buildings to be raised in *atrio ecclesie*, except for the clergy; such the glossary explains thus: id est in *cameterio*, which includes the space of forty paces round a large church, or thirty round a little church or chapel.

ATROPA, in *Botany*, (from Atropos, the third fate, who was supposed to cut the thread of life.) *deadly nightshade*, Lin. g. 240. Schreb. 335. Juss. 125. Gaertn. t. 131. Class, *pentandria monogynia*. Nat. Ord. *Lupulaceae*. Juss. Gen. Char. *Cal.* perianth one-leaved, five-parted, gibbous; divisions acute, permanent. *Cor.* one-

petalled, bell-shaped; tube very short; border ventricose, ovate, longer than the calyx; mouth small, five-cleft, spreading; divisions subequal. *Stam.* Filaments five, subulate from the base of the corolla, and of the same length with it, converging at the base, above diverging outwards, bowed; anthers thickish, rising. *Pyl.* germ semiovate; style filiform, the length of the filaments, inclined. *Stigma* headed, rising transversely, oblong. *Per.* berry globular, sitting on a large calyx, two-celled. *Receptacle* fleshy, convex on both sides, reniform. *Seeds*, very many, reniform.

Ess. Gen. Char. *Cor.* bell-shaped. *Stam.* distant. *Berry* globular, two-celled.

Species, 1. *A. Mandragora*, mandrake, Woody. Med. Bot. t. 225. “Stemless, scapes one-flowered.” Root perennial, large, tapering, three or four feet long, externally brown, internally whitish. From the crown of the root arises a circle of leaves, which are large, ovate, sinuated; veined, they sit close to the root, and are of a deep green colour, and fetid smell; among these arise three or four short slender scapes, each supporting a single flower of an herbaceous white colour; fruit a globular soft berry of a yellowish colour, and about the size of a nutmeg. A native of the south of Europe. It was cultivated here, according to Turner, in 1562. The superstitious and absurd stories related of the mandrake would not now for a moment impose on the most credulous and ignorant. The supposed resemblance of some of the roots to the human form, the danger of taking them out of the ground, as well as their surprising effects, seem to have been the invention of charrlatanical knavery and imposture. Boerhaave used the leaves as a cataplasm with success in cases of indurated tumours, and Hoffberg experienced the like effects from the roots in glandular swellings; the latter also found that three grains of the root given internally had a considerable narcotic effect in mitigating arthritic pains. See Woody. l. e. 2. *A. belladonna*, deadly nightshade, Hudf. 93. With. 252. Smith. Brit. 255. Curt. Lond. 5. t. 16. Woody. Med. Bot. t. 1. Eng. Bot. 592. “Stem herbaceous; leaves ovate, entire.” Root perennial, thick, fleshy, creeping; stalks herbaceous, annual, erect, firm, three feet high, round, branched, leafy, subpubescent; leaves lateral, two together, of an unequal size, petioled, ovate, acute, entire, smoothish, and of a dull green colour; peduncles lateral, subaxillary, solitary, one-flowered, nodding; flowers of a dirty violet colour; calyx rather pubescent, viscid; anthers large, white; berry depressed, furrowed; when ripe of a shining black colour, and abounding with a purple juice. It grows in waste-ground and gloomy lanes, &c. This plant has been long known as a very strong poison of the narcotic kind; the berries, which are said to be less powerfully so than the leaves, have produced many instances of their fatal effects, particularly upon children, who are readily tempted to eat this fruit by its alluring appearance and sweet taste. Whether these berries eaten in different states of maturity renders them more or less deleterious, has not been ascertained; but we are told that in some instances, one berry, or even half of one, has produced a fatal effect: while Haller informs us, that he has seen a fellow-student of his eat more than three or four without suffering any inconvenience from them. The symptoms produced by this poison are vertigo, delirium, great thirst, painful deglutition, and retching, followed by suror, stridor dentium, and convulsions; the eye-lids are drawn down, the uvula dilated and immovable, the face becomes red and tumid, and spasms affect the mouth and jaw; the sensibility and irritability of the body suffer such great diminution, that large and repeated doses of the strongest emetics produce no sensible effect;

effect; the pulse is small, hard, quick; and subsultus tendinum, risus sardonius, and coma, close the fatal scene. Vinegar liberally drank has been found most efficacious in obviating the effects of this poison. On opening the bodies of those poisoned by this plant, inflammation and erosions of the stomach and intestines have been discovered. A similar effect was produced in the stomach of a horse, at the Veterinary College, from a large dose of opium, viz. three ounces. The leaves of the belladonna were first used externally to discuss scirrhus and cancerous tumours, and as an application to ill-conditioned ulcers, and their good effects in this way at length induced physicians to employ them internally for the same disorders, and we find a considerable number of well-authenticated facts, which prove them to have been of important service. Dr. Cullen says, "I have had a cancer of the lip entirely cured by belladonna; a scirrhus in a woman's breast entirely dissolved by the use of it; a sore a little below the eye, which had put on a cancerous appearance, was much mended by the internal use of this plant; but the patient having learned somewhat of the poisonous nature of the medicine, refused to continue the use of it, upon which the sore again spread, and was painful; but upon a return to the use of belladonna, it was again mended to a considerable degree; when the same fears again returning, the use of it was again laid aside, and with the same consequence." The root is much less powerful than the leaves. See Woodv. l. c. and Murray App. Med. 3 *A. physalidis*, Peruvian deadly nightshade. "Stem herbaceous; leaves sinuate-angular; calyxes closed, acute-angular." Root annual, fibrous; stem spreading, two feet high; leaves alternate, smooth, oblong, running down the footstalk; peduncles subaxillary, solitary, naked, one-flowered; calyx ovate, deeply five-parted; leaflets sagittate-ovate; corolla bell-shaped, slightly five-lobed, blue, with a white eye, having five blue spots; berry about the size of a cherry, with five sharp angles, and inclosed in a ventricose bladder. A native of Peru. Cultivated by Miller. 4. *A. solanacea*. "Stem shrubby; peduncles solitary; corollas bell-shaped; leaves subovate." Six feet high, somewhat branched and angular; leaves alternate, usually many from the buds, petioled, entire, naked; peduncles axillary, one-flowered, filiform, the length of the leaves; flowers pendulous. A native of the cape of Good Hope. 5. *A. arborescens*, tree atropa, belladonna frutescens, &c. Plum. 46. f. 1. "Stem shrubby; peduncles crowded; corollas revolute; leaves oblong." A small tree or shrub. Leaves alternate, in tufts towards the ends of the branches, lanceolate-ovate, acute, entire, nerved, of a dark colour; flowers peduncled, heaped, white, fragrant, nodding; peduncles numerous, one-flowered, whitish; corolla somewhat bell-shaped, narrow at the bottom, swelling at top; filaments twice as long as the corolla. This species is often tetrandrous. A native of South America and Jamaica. 6. *A. frutescens*, shrubby atropa. "Stem shrubby; peduncles crowded; leaves cordate ovate, obtuse." Six or eight feet high; leaves alternate, roundish; flowers come out between the leaves on short peduncles, and resemble those of belladonna, but much smaller, and of a dirty yellow colour. A native of Spain. Cultivated by Miller in 1739. 7. *A. herbacea*, herbaceous atropa, Mill. Dict. n. 3. "Stem herbaceous; leaves ovate, nerved, with waved edges." Root perennial; stems channelled, about two feet high, dividing into two or three branches; leaves four inches long and three broad, having several transverse prominent ribs on the under side; flowers white, bell-shaped. The seeds were sent to Mr. Miller from Campeachy. 8. *A. procumbens*, wheel-flowered atropa, Cavan. Hist. n. 80. t. 72. "Stem

procumbent, herbaceous; leaves twin, unequal, ovate, smooth; flowers in umbels." Root annual; stem grooved, much branched, three feet high; leaves sharp-ovate, running down the petiole, smooth, entire, one-nerved, glaucous beneath; common peduncle, solitary, scarcely an inch in length; rays of the umbel from two to five; corolla herbaceous, yellow, wheel-shaped, which sufficiently distinguishes it from all its congeners. A native of Mexico.

Propagation and Culture. 1. Mandrake is propagated by seeds, as soon as they are ripe, when they are to be sown upon a bed of light earth, and occasionally refreshed with water. In August they must be taken up very carefully and transplanted into the places where they are to remain, observing that the soil be light and deep, for the roots run far down, and will grow to a large size in a few years if not interrupted by gravel or chalk, or rotted in winter by wet soil. The plant should also have a warm situation. The root will remain found above fifty years, and continue to be as vigorous as a young plant. Deadly nightshade may be propagated both by its roots and by its seeds; it requires a shady situation. If the seeds of the third species be permitted to scatter, the plants will come up the following spring, and may then be transplanted into the borders of the pleasure garden, where they will grow to a large size. Species 4th, &c. may be propagated by seeds, which should be sown in a hot-bed in the spring; and when fit to be removed, they should be each put into a separate small pot filled with loamy earth, and shaded until they take root. The 4th and 6th may be placed with other hardy exotic plants in a sheltered situation, and in October they must be removed into the green-house. The 5th, 7th, and 8th, must be kept in the bark-house. The 7th may be increased by parting the roots. See Martyn's Miller's Dict.

ATROPATENE, or ATROPASIA, in *Ancient Geography*, a country of Asia, occupying the north-west part of Media, and lying between mount Taurus and the Caspian sea. It is said to have taken its name from one Atropatus, who, being governor of this province in the time of Darius, the last Persian monarch, opposed Alexander the Great, and upon the destruction of the Persian monarchy, seized this part of Media, and transmitted it to his posterity, who held it as sovereigns to the time of Strabo. (Geog. lib. xi. p. 523.) It was a cold, barren, and inhospitable country, and on that account allotted by Salmazer for the residence of many captive Israelites, after the conquest of their kingdom. Its inhabitants, according to Polybius (l. v. p. 402.), were good soldiers; and we learn from Strabo, that its kings could bring into the field 40,000 foot and 20,000 horse. The metropolis of Atropatene was Gaza.

ATROPHY (*ἀτροφία* from *α*, privative, and *τροφία*, nutritio), in *Medicine*, a defect of nourishment, and consequent emaciation. It differs from phthisis, by being unaccompanied with cough, and purulent expectoration; and from tabes, by the absence of hectic fever. This distinction, however, of systematic writers, between tabes and atrophy is not altogether so satisfactory as could be wished; since atrophy in its advanced stage is often attended with a symptomatic fever resembling the hectic. In the fourth volume of his First Lines of the Practice of Physic, Dr. Cullen has candidly acknowledged that he was not satisfied with his arrangement of the several species of atrophias and tabes. He even expresses a doubt, whether the distinction attempted in Nosology, between the two diseases, will properly apply; being of opinion that there are certain affections of the same nature, which sometimes appear with, and sometimes without fever.

fever. If, however, in compliance with system, the distinction is to be made, we would restrict the term *tabes* to emaciations proceeding either from glandular and visceral obstruction, or from parulency and ulceration. If this be done, the third species of *tabes* in Cullen's Nomenclature will rank under atrophy; of which we shall then have six species placed in the following order; viz. *Atrophia inimatorum*; *A. famelicorum*; *A. debiliūm*; *A. cacochymica*; *A. venenata*; *A. à compressione ductūs thoracici*. The causes which induce the first-mentioned species, are long-continued and profuse evacuations; such as an immoderate flow of saliva, profuse perspirations, diabetes, fluor albas, femoral emisions, abuse of venery, continuing to suckle too often or too long in the case of nurses, &c. &c.; chronic diarrhoea and rejection of the food soon after being swallowed, are among other causes enumerated by practical writers: of these two, the first brings on that emaciation which is commonly known under the name of marasmus; the latter (viz. vomiting), when it arises from a feirrholy of one of the orifices of the stomach, or other organic disease of that viscus, we would rather refer to the causes which produce *tabes*. When the vomiting depends upon mere irritability, without injured organisation, it will then give rise to atrophy. The most frequent form under which the *atrophia famelicorum* appears, is, that which is described by medical writers under the name of *tabes dorsalis*. It is occasioned by a loss and forced secretion of the femoral fluid, and happens to those who are too much addicted to venery, to those who inflame their imaginations with lascivious ideas, and especially to youths who indulge themselves in the obscene and baneful practice of onanism. This disease was well known to the ancients, and is described in the collection of writings attributed to Hippocrates. (πρωτοβιβλιον, lib. ii.) With the frequent emissions of semen there is a pain in the back and loins, costiveness, head-ach, giddiness, and dimness of sight; oppression of the breath, hurry of the spirits, restless nights, lassitude, paleness of the countenance, wasting of the flesh, pains of the joints, tremors, and in some instances palsy, with a failing of the memory and dejection of mind. In setting about the cure we must first remove the exciting causes, by forbidding venereal intercourse, and restraining manual pollution (manulupratio.) The soft downy bed must be exchanged for a hard one, and early rising enjoined. The patient must abstain from strong wines, especially white wines, hot liquors, and seasoned food, and take to a plain, mild, nutritious diet, of which milk and its preparations should constitute the chief part. Sage, tapioca, animal jellies, and eggs, will also be proper. The common cold-bath or sea-bathing should be employed, with daily exercise on horse-back; and besides the free use of cow's milk, asses milk should be taken at least once a day. The proper medicines will be the Peruvian bark, the lichen islandicus, the infusion of the red rose, the infusion of catechu, and chalybeates; or if the last-named metallic preparations prove too stimulant, the zincum vitriolatum. In some of these cases, mild opiates, or the cicuta, may also be given with advantage. Costiveness should be prevented by occasional doses of the electuarium fennæ, or oleum ricini, or magnesia and rhubarb. (See Tissot on Onanism.) The same means will be equally suited to most of the other varieties of *atrophia inimatorum*. When it is occasioned by profuse perspirations, the sulphuric acid should be given with the other tonics; and when the urinary evacuation is excessive, the same remedies as in diabetes; which see. When this disorder occurs in nurses giving too much suck, the strongest vegetable substances (the Peruvian bark excepted) and metallic salts above mentioned will not be proper; a more

liberal use of fermented liquor and animal food should be allowed, and the infant should be weaned. When it proceeds from a diarrhoea, opiates may be given more freely, joined with terebinthaceous powders, and small doses of ipecacuanha. When it is occasioned by the food being rejected from the stomach shortly after it is swallowed, the peculiar constitution of that organ, on which the vomiting depends, must be ascertained and remedied accordingly. In such case, glysters of milk and animal jellies should be administered once or twice every day, until the disposition to inverted action is removed.

A. famelicorum. This occurs in infants at the breast, not being supplied with a sufficiency of milk. It is known by the daily emaciation of the infant, constant cries, and wakefulness, its eagerness to suck, and its tranquility and disposition to sleep after being put to the breast. It happens when the mother's or nurse's milk is either deficient in quantity, or poor and watery in its quality. It may be remedied in part by putting the mother upon a generous diet, and supplying the infant with nourishment by the syringe; but the most effectual method is to resort to a nurse capable of affording a healthier and more abundant stream of milk.

A. debiliūm. To this species belong the nervous atrophy, and the emaciation which accompanies old age. It depends upon a debility of the organs of digestion and nutrition. In the first instance, it is sometimes the consequence of close application to business or study, and excessive anxiety, grief, a longing after one's native country or a beloved object, with other depressing passions. In these cases, a removal from the scene of study or business, and from the source of anxiety, regular exercise and proper recreations, will form the basis of the cure. At the same time, bitters, chalybeates, and opiates, should not be omitted. (Morton de Atrophia, seu Phthisi nervosa.) When the disorder is the consequence of old age, much relief cannot be expected. In that case, little more can be done than to render the diet as nutritious as possible.

A. cacochymica. When the emaciation in this species is connected with a febrile acrimony, the remedies proper for correcting the same must be employed; such as subacid fruits, fresh malt liquor, &c. all salted meats being strictly avoided. When it is connected with a syphilitic acrimony, the cure should be attempted by mercurials, opiates, and the guaiacum and sarsaparilla decoctions, with the warm bath. When it occurs in a rickety constitution, the same treatment as in *rachitis* will be proper. (See Rickets.) If this species (the *A. cacochymica*) is accompanied with febrile or syphilitic fœces, it should be referred to *tabes*.

A. venenata. This happens when the concoctive powers are impaired or destroyed by vegetable or mineral poisons. Among the vegetable poisons which prove the cause of atrophy, may be mentioned the abuse of green tea in women, and the chewing of tobacco in men. In like manner the opium-eaters in the Levant and other parts of the east are affected with atrophy. Another poison extracted from vegetable substances undergoing fermentation, which produces the same effect, is alcohol, or brandy, rum, &c. Among the mineral poisons which have been observed to cause this disease, may be mentioned lead and arsenic. The remedies in this species of atrophy must be varied according to the kind of poison by which it was induced. (See Poisons.) In the Nomenclological System of Dr. Cullen, this species of emaciation is ranked under *tabes*; but as it is not accompanied either with glandular obstruction, or with parulency or ulceration, we have conceived it to belong to the present genus, and have accordingly introduced it here.

The last species we have to notice is the *A. à compressione ductus thoracici*. This takes place when the thoracic duct is so compressed by a tumor or other mechanical cause, that the transmission of the chyle through it is either partially or wholly intercepted. In the latter case it is irremediable. Fortunately this species of atrophy is of very rare occurrence. See Morton's *Phthiologia*; and Hoffman de *Atrophia*, Suppl. II. 1. Cullen's *Practice of Physic*, vol. iv.

ATROPICA, in *Entomology*, a species of **MANTIS** described by Pallas. It is a native of the island of Java; on the thorax are four spines; wing-cases short and mucronate at the base.

ATROPOS, a species of **SPHINX**, with yellow posterior wings fasciated with brown, and yellow abdomen with black rings. Varieties of this species differing in size, colour, and some peculiarities of the marks on the anterior wings, are found in Egypt, India, the cape of Good Hope, America, and Europe. It is the largest of the European insects of the lepidopterous tribe, and is certainly a beautiful creature. In England this kind is rare, and is called the death's head hawk-moth, from certain characteristic and very singular marks on the thorax, by which the figure of a human skull is strongly depicted. These insects for this reason have generally been regarded as an ominous presage of some approaching calamity by the peasantry in most countries where they have appeared by chance; and Linnæus has himself named it after one of the three fates of the heathen mythology. The larva feeds on the jasmine, potatoe, and elder; is solitary, yellow, with oblique, blue, green, and black lateral stripes, and a reflected tail; pupa reddish. Vide *Donov. Brit. Inf.* 9. t. 289. Linnæus in *Amœnit. Acad.* names this insect *caput mortuum*; and Geoffroy in *Hill. des Insectes*, *le sphinx à tête de mort*.

ATROPOS, is also a species of **MUSCA**, about half an inch in length, that inhabits Aultria. It is rather downy; thorax whitish with three black spots; abdomen black, with interrupted yellow bands, and margin of the segments of the same colour. Schrank *Beylr.*

ATROPOS, in *Mythology*, one of the **Parcæ** or **Fates**, whose office it was to cut the thread of life.

ATROPOS, in *Zoology*, a species of **COLUBER**, described by Linnæus in *Mus. Ad. Fr. & Gmel. Syst. Nat.* as having 131 abdominal plates, and 22 subcaudal scales. It is a native of America, and deemed an extremely poisonous serpent; the colour hoary grey, with a quadruple series of brown ocellated spots, each with a white iris or margin. The head is heart-shaped, gibbous, with four and sometimes more black spots; and the scales are lanceolate. Gmel. It is *cobra atropos* of Laur. *Amph.*

Dr. Shaw observes that this species is of a thick and short form, scarcely exceeding fifteen or sixteen inches in length; the head is large and viperine, marked with four or five large dusky spots, and covered with small scales; the remainder of the animal of a pale brown, marked all along the upper part by four rows of very large, alternate, round, black spots bordered with white; the abdomen ash-colour, and tail very short, measuring about a ninth part of its whole length; the scales on all the upper parts are of a slightly sharpened form, and carinated. *Gen. Zool.* v. 3. p. 2. 40+

ATRO-VIOLESCENS, in *Entomology*, a species of **CHRYSOMELA**, once taken in the month of September, in the county of Norfolk. It is ovate, violaceous-black; wing-cases striated; legs pitchy-black. *Marsh. Ent. Brit.*

ATROVIRENS, in *Zoology*, a species of **COLUBER**, described by the count de Cèpede under the title of "*la coluvre verte et jaune*;" and by Dr. Shaw, under that of

coluber atrovirens, *C. atrovirens*, *flavo maculatus*, *abdomine flavo*, *lateribus nigro punctato*. Black-green snake, speckled with yellow; the abdomen yellow, with a row of black specks down each side. French snake.

"This seems," says Dr. Shaw, "to be the species figured by Aldrovandus, under the name of *anguis Æsculapii niger*, and which appears to have been so little attended to by modern naturalists, as to have been generally confounded with the ringed snake (*C. natrix*), till it was again brought to notice by Monf. Daubenton, and afterwards by the count de Cèpede, who has accurately described it, and who informs us that it is very frequent in some of the provinces of France, being found in woods and moist shady places; in its general size and appearance it resembles the ringed snake or *natrix*, but differs in colour, being of an extremely dark or blackish green, so as to appear black on a cursory view, the sides being marked by numerous rays of yellow specks of different forms, some oblong and some square, and which form somewhat more decided or distinctly marked stripes towards the head; the eyes and edges of the mouth are bordered with yellow scales; the abdomen is also yellow, each scutum being marked on each side by a black speck. This snake is an animal of a perfectly harmless nature, and like the ringed snake, is capable of being tamed to a considerable degree."—"On the approach of winter, it retires, like the latter, into subterraneous retreats, and passes that season in a state of torpidity, from which it recovers in the spring, when it casts its skin, and appears in its highest beauty."

ATROX, in *Zoology*, a kind of **COLUBER**, which according to Linnæus is specifically characterized by having 169 abdominal plates, and 69 subcaudal scales. *Amœn. Acad.* This creature is a native of Asia, and is about a foot and a half in length; the colour hoary; scales carinated; beneath marked with dark brown, transverse, alternate spots; head depressed, compressed, angulated, and covered with minute scales. Gmelin makes "*dipsas indica*" of Laur. *Amph.* a variety of this species. Dr. Shaw describes it in his *Gen. Zool.* as being the "grey brown snake, with transverse linear whitish stripes, and dusky abdomen, with white transverse variegations; and names it the *fierce snake*. This author also notices one error of Linnæus respecting this species that deserves particular remark. "In the *Museum Adolphi Friderici*, p. 33," says he, "this species is, by a mistake, inscribed *angulatus*, while the figure on plate 22 of that work, represents the body marked by several distant, narrow, transverse whitish bands reaching to the abdomen, which is spotted with small, round, white specks; the dusky transverse spots appearing only beneath the tail; the general colour of the abdomen, however, in this snake is rather deep brown or blackish, beautifully variegated or marbled by numerous narrow transverse bands, accompanied here and there with small spots; the tail is remarkably short and slender. In the *Système Nature* a mistaken reference appears to be made to a figure in *Seba* representing a very different species. The *C. atrox* is a poisonous snake, and is a native of the island of Ceylon."

ATSCHARES, in *Geography*, a tribe of the **MANDSHURES**, who inhabited the banks of the middle Amoor, in Siberia, before it was taken possession of by the Russians. They then subsisted in a state of independence; but they were afterwards removed, by order of the Chinese government, from the Amoor farther towards China.

ATTACAMA, in *Geography*, one of the fourteen jurisdictions belonging to the archbishopric of Plata, in the audience of Charcas, in South America. It is the western boundary of the audience, extending to the South sea; and

and the principal town, called also *Anaxoma*, is no less than 120 leagues from Plata. Its jurisdiction is of a considerable extent, and a great part of it very fruitful; but intermixed with some deserts, particularly towards the south, where it divides the kingdoms of Peru and Chili. On the coast in this province there is annually a very large fishery of Tolo, a fish common in the South sea, with which a very great trade is carried on with the inland provinces, this being the chief food in Lent and other days of abstinence. There is a great desert of the same name, and a chain of mountains, which separate Peru, on the north, from the province of

Example.

ATTACHIAMENTA BONORUM, in *Law*, a distress taken upon goods or chattels, where a man is sued for personal estate or debt, by the legal attachiators or bailiffs, as security to answer an action.

ATTACHIAMENTA DE SPINIS ET BOSCO, is a privilege granted to the officers of a forest to take to their own use thorns, brush, and wind-falls, within their own precincts.

ATTACHING, or **ATTACHMENT**, denotes the apprehending a person or thing, either by a precept or writ. The word is formed of the French *attacher*, to fasten, or tie; and that from the corrupt Latin *attachiare*, of *attexere*, to weave to; or rather, as others think, from the Celtic *tach*, a nail; and *tachta*, to nail; or the Saxon *tecan*, to take.

Lambard makes this difference between an arrest and an attachment; that an arrest proceeds out of an inferior court by precept only, and an attachment out of a higher court, either by precept or writ; and that a precept to arrest hath these formal words, *duci facias*, &c. and a writ of attachment these, "*precipimus tibi quod attachies talen, & haldas eum coram nobis.*"

By this it appears, that he who arrefts carries the party arrested to another higher person, to be disposed of forth-

Quito. The cold in these mountains is sometimes so extremely severe, that those who pass it are occasionally frozen to death. S. lat. 22°. W. long. 80° 35'.

ATTACANA, in *Ancient Geography*, a town of Asia, in greater Armenia. Ptolemy.

ATTACCO, in *Musick*, is a kind of short subject or point, not restricted to all the laws of regular fugue. Sometimes it is a section of the principal theme itself, treated rather as an imitation than a subject of regular fugue, and may be answered in any interval, at pleasure.

with: whereas he that attaches keeps the party attached, and presents him in court at the day assigned in the attachment.

There is this farther difference, that an arrest lies only upon the body of a man; and an attachment sometimes on his goods too; for a man may be attached by an hundred sheep.

Moreover, attachment is a process from a court of record, awarded by the justices at their discretion, on a bare suggestion, or on their own knowledge; and is properly grantable in cases of contempts, against which all courts of record, but more especially those of Westminster-hall, and above all the court of B. R. may proceed in a summary manner.

The contempts that are thus punished, are either *direct*, which openly insult or resist the powers of the courts, or the persons of the judges who preside there; or else a *constructive*, which, without such gross insolence or direct opposition, plainly tend to create an universal disregard of their authority. The principal instances of either sort that have been usually punishable by attachments, are of the following kinds: 1. Those committed by inferior judges and magistrates by acting unjustly, oppressively, or irregularly, in administering those portions of justice which are con-

trusted to their distribution; or by disobeying the king's writs issuing out of the superior courts, by proceeding in a cause after it is put a stop to or removed by writ of prohibition, certiorari, error, superseadeas, or the like. 2. Those committed by sheriffs, bailiffs, gaolers, and other officers of the court, by abusing the process of the law, or deceiving the parties, by any acts of oppression, extortion, collusive behaviour, or culpable neglect of duty. 3. Those committed by attorneys and solicitors, who are also officers of the respective courts, by gross instances of fraud and corruption, injustice to their clients, or other dishonest practices. 4. Those committed by jurymen in collateral matters relating to the discharge of their office; such as making default when summoned, refusing to be sworn, or to give any verdict, eating or drinking without the leave of the court, and especially at the cost of either party; and other irregularities of a similar kind; but not in the mere exercise of their judicial capacities, as by giving a false or erroneous verdict. 5. Those committed by witnesses; by making default when summoned, refusing to be sworn or examined, or prevaricating in their evidence when sworn. 6. Those committed by parties to any suit or proceeding before the court; as by disobedience to any rule or order made in the progress of a cause; by non-payment of costs awarded by the court upon a motion; or by non-observance of awards duly made by arbitrators and umpires, after having entered into a rule for submitting to such determination. 7. Those committed by any other person under the degree of a peer; and even by peers themselves, when enormous and accompanied with violence, such as forcible rescous, and the like; or when they import a disobedience to the king's great prerogative writs of prohibition, habeas corpus, and the rest.

Some of these contempts may arise in the face of the court; as by rude and contumelious behaviour; by obstinacy, perverseness, and prevarication; by breaking the peace, or any wilful disturbance whatever: others, in the absence of the party; as by disobeying, or treating with disrespect, the king's writ, or the rules or process of the court; by perverting such writ to the purposes of private malice, extortion, or injustice; by speaking or writing contemptuously of the court, or judges acting in their judicial capacity; by printing false accounts (or even true ones, without proper permission) of causes then depending in judgment; and by any thing, in short, that demonstrates a gross want of that regard and respect, which, when once courts are deprived of, degrade and destroy their authority among the people. The process of attachment for these and similar contempts must necessarily be as ancient as the laws themselves; for laws, without a competent authority to secure their administration from disobedience and contempt, would be vain and nugatory. This has accordingly been exercised as early as the annals of our law extend.

If the contempt be committed in the face of the court, the offender may be instantly apprehended and imprisoned, at the discretion of the judges, without any further proof or examination. But in matters at a distance, and of which the court cannot have so perfect a knowledge, unless by the confession of the party, or the testimony of others, if the judges upon affidavit see sufficient ground to suspect that a contempt has been committed, they either make a rule on the suspected party to shew cause why an attachment should not issue against him; or in very flagrant instances of contempt, the attachment issues in the first instance; as it also does, if no sufficient cause be shewn to discharge, and therefore the court confirms and makes absolute the original rule. This process of attachment is merely intended to

bring the party into court; and, when there, he must either stand committed, or put in bail, in order to answer upon oath to such interrogatories as shall be administered to him, for the better information of the court with respect to the circumstances of the contempt. These interrogatories are in the nature of a charge or accusation, and must by the course of the court be exhibited within the first four days; and if any of the interrogatories is improper, the defendant may refuse to answer it, and move the court to have it struck out. If the party can clear himself upon oath, he is discharged; but, if perjured, may be prosecuted for the perjury. If he confesses the contempt, the court will proceed to correct him by fine or imprisonment, or both, and sometimes by a corporal or infamous punishment. If the contempt be of such a nature, that, when the fact is once acknowledged, the court can receive no farther information by interrogatories than it is already possessed of (as in the case of a rescous), the defendant may be admitted to make such simple acknowledgement, and receive his judgment, without answering to any interrogatories; but if he wilfully and obstinately refuses to answer, or answers in an evasive manner, he is then clearly guilty of a high and repeated contempt, to be punished at the discretion of the court. Blackstone's Com. vol. iv.

The terrors of attachment in case of disobedience on the part of unwilling witnesses, as well as the compulsory process for obtaining their attendance, are of excellent use in the thorough investigation of truth: and upon the same principle, in the Athenian courts, the witnesses who were summoned to attend the trial, had their choice of three things, either to swear to the truth of the fact in question, to deny or abjure it, or else to pay a fine of a thousand drachmas.

ATTACHMENT, Writ of, called also *Pone*, is a writ issuing out of the court of Common Pleas, and grounded on the non-appearance of the defendant at the return of the original writ; which commands the sheriff to attach him, by taking gage, that is, certain of his goods, which he shall forfeit, if he doth not appear; or by making him find safe pledges or sureties who shall be amerced in case of his non-appearance. This is the first and immediate process, without any previous summons, upon actions of trespasss *vi et armis*, or for other injuries, which though not forcible, are yet trespasses against the peace, as deceit and conspiracy: where the evidence of the wrong requires a more speedy remedy, and therefore the original writ commands the defendant to be at once attached, without any precedent warning. See *PROCESS*.

ATTACHMENT out of Chancery, is a writ in the nature of a *captus*, directed to the sheriff, and commanding him to attach, or take up the defendant, and bring him into court. It is had of course, upon an affidavit made that the defendant was served with a *subpoena*, and appears not; or it issueth upon not performing some order or decree.

After the return of this attachment by the sheriff, *quod non est inventus in balliva sua*; another attachment, with proclamations, issues: which, besides the ordinary form of attachment, directs the sheriff that he cause proclamations to be made, throughout the county, to summon the defendant, upon his allegiance personally to appear and answer: and if this be also returned with *non est inventus*, and he still stands out in contempt, a commission of rebellion is awarded against him. See *COMMISSION of Rebellion*.

ATTACHMENT, Foreign, is an attachment of goods or money found within a liberty or city, to satisfy some creditor within such city or liberty.

Under the custom of London, if a plaint be exhibited in the mayor's or the sheriff's court (the proceeding in the former being the most advantageous) against *A*, and the process be returned

returned *nil*, and thereupon the plaintiff suggests that another person within London is indebted to *A*, the debtor shall be warned (whence he is called the *garnishee*), and if he does not deny himself to be indebted to *A*, the debt shall be attached in his hands. The custom of foreign attachment is said to prevail in Exeter and other places. But a foreign attachment cannot be had when a suit is depending in any of the courts at Westminster. Cro. Eliz. 691. And nothing is attachable, but for a certain and due debt: though by the custom of London, money may be attached before due, as a debt, but not levied before due. Sid. 327. 1. Nelf. Abr. 282. 283.

Foreign attachments in London, upon plaint of debt, are made after this manner: *A* oweth *B* 100l. and *C* is indebted to *A* 100l.; *B* enters an action against *A* of 100l. and by virtue of that action a feizant attacheth 100l. in the hands of *C*, as the money of *A*, to the use of *B*, which is returned upon that action. Upon this the plaintiff is immediately to see an attorney before the next court, or the defendant may then put in bail to the attachment, and nonsuit the plaintiff. Four court days must pass before the plaintiff can cause *C*, the garnishee, in whose hands the money was attached, to shew cause why *B* should not condemn the 100l. attached in the hands of *C* as the money of *A* the defendant in the action (though not in the attachment) to the use of *B* the plaintiff; and the garnishee *C* may appear in court by his attorney, wage his law, and plead that he hath no money in his hands of the defendant's, or other special matter; but the plaintiff may hinder his waging of law, by producing two sufficient citizens to swear that the garnishee had either money or goods, in his hands, of *A* at the time of the attachment, of which affidavit is to be made before the lord mayor, and being filed, may be pleaded by way of *esloppel*: then the plaintiff must put in bail, that if the defendant come within a year and a day into court, and he can discharge himself of the money condemned in court, and that he owed nothing to the plaintiff at the time in the plaint mentioned, the said money shall be forthcoming, &c. If the garnishee fail to appear by his attorney, being warned by the officer to come into court to shew cause as aforesaid, he is taken by default for want of appearing, and judgment given against him for the goods, and money attached in his hands, and he is without remedy either at common law or in equity; for if taken in execution, he must pay the money condemned, though he hath not one penny, or go into prison; but the garnishee appearing to shew cause why the money or goods attached in his hands ought not to be condemned to the use of the plaintiff, having seen an attorney, may plead as aforesaid, that he hath no money nor goods in his hands, of the party's against whom the attachment is made; and it will then be tried by a jury, and judgment awarded, &c. but after trial, bail may be put in, whereby the attachment shall be dissolved, but the garnishee, &c. and his security will then be liable to what debt the plaintiff shall make out to be due, upon the action: and an attachment is never thoroughly perfected, till there is a bail, and satisfaction upon record. Privilege London.

But the original defendant must be summoned, and have notice: otherwise judgment against the garnishee will be erroneous; and the money paid or levied in execution; or it will not discharge the debt from the garnishee to the defendant (though it was allowed that the custom of the city court is to give no notice). 3 Will. 297. 2 Black. Rep. 834. See 1 Ld. Raym. 727. Where a foreign attachment is pleaded to an action, the custom is to set forth that he who levied the plaint shall have execution of the debt

owing by himself, and by whom he was attached, if the plaintiff in the original action shall not disprove it within a year and a day; now if the plaintiff in the action below doth not set forth such conditional judgment given by the court, it is wrong, because he doth not bring his case within the custom. Vide 2 Lutw. 985.

A sum of money was to be paid at Michaelmas, and it was attached before that day: adjudged, that a foreign attachment cannot reach a debt before it is due; therefore, though the judgment on the attachment was after Michaelmas, yet the money being attached before it was due, it is for that reason void. Cro. Eliz. 174. For further matter, see Com. Dig. tit. Attachment.

Money due to an executor or administrator, as such, cannot be attached. It would give a simple contract creditor priority over judgments. Fisher v. Lane and others, 3 Will. 297. Nor trust money in the hands of the garnishee. Doug. 383.

Debtor and creditor being both citizens of London, the debtor delivered several goods to the Exeter carrier then in London, to carry and deliver them at Exeter, and the creditor attached them in the hands of the carrier for the debt due to him from his debtor: adjudged, that the action should be discharged, because the carrier is privileged in his person and goods, and not only in the goods which are his own, but in those of other men, of which he is in possession, for he is answerable for them. 1 Leon. 189. See Jacob's Law Dict. by Tomlins, art. Attachment.

ATTACHMENT of the Forest, or Woodmote, is one of the four courts held in the forest. (See COURTS of Forest, &c.) The court of attachments seems so called, because the verderors of the forest have therein no other authority, but to receive the attachments of offenders against vert and venison taken by the foresters, to enrol them, and to certify them under their seals, to the court of justice-seat, or swainmote; for this court can only inquire of, but not convict offenders.

This attachment is by three means; by goods and chattels; by body, pledges, and manprize; or by body only. Offenders may be attached by their bodies, if taken with the mainour (or *mainoeuvre*, a *manu*), that is, in the very act of killing venison, or stealing wood, or preparing so to do, or by fresh and immediate pursuit after the act is done; otherwise, they must be attached by their goods. This court is held once in every forty days throughout the year; whence it is also denominated *forty days court*.

ATTACHMENT of Privilege is, by virtue of a man's privilege, to call another to that court whereto he himself belongs, and in respect whereof he is privileged to answer some action: or, it is a power to apprehend a man in a place privileged. Corporation courts have sometimes power by charter to issue attachments, and some courts-baron grant attachments of debt. Kitch. 79.

ATTACK, an attempt upon any person or thing; or the act of beginning a combat or dispute.

ATTACK, in the Military Art, signifies an engagement having for its object the forcing of an entrenched post, or dislodging an adverse army from its lines, or in a situation calculated to impede the progress of an invading army.

War is naturally an offensive operation. In the earliest ages we find it carried on by a series of engagements uniformly on the principle of attack, and unconnected with any of those skilful manœuvres which the ready genius of mankind has since carried into execution for their mutual destruction. The ultimate object of a battle consisted in plundering, in case of success, a small tract of the enemy's country, and

in burning a few miserable villages. Superiority of numbers generally insured the advantage. The vanquished were exterminated. The victors withdrew with their hard earned booty, diminished in numbers, and exhausted by fatigue.

The Greeks, who first brought the military art to some degree of perfection, were fully sensible of the advantages to be derived from the attack. Even at the famous plain of Marathon (vid. MARATHON), where, by the most moderate accounts, the Persian army exceeded them ten times in number, they had the temerity to forsake a well-chosen position, and (Herodotus, l. vi. c. 112.) advance running to the onset; a degree of rashness, which, though in the instance before us crowned with the most glorious success, can never find an excuse in the eyes of military judgment. At the final engagement of Thermopylæ, the despair of Leonidas drove him to pursue a similar conduct. (Herod. l. vii. c. 223.) The particular circumstances of his situation, and the celebrity of his death, extenuate in part his conduct.

Among the Greeks, the Lacedæmonians alone advanced to battle in silence, and at a steady pace, regulated by the sound of musical instruments. (Thucyd. l. v. c. 70.) On the contrary, the other Grecian nations rushed forward with the utmost eagerness and velocity, clashing their spears upon their bucklers, and, at the moment of the onset, raising a loud shout, to astonish and terrify their enemies. This mode of attack was generally irresistible, where only opposed by an undisciplined and tumultuous assemblage of Asiatics. Witness the battle of Cynaxa (vid. CYNAXA), where a phalanx of 13,000 Greeks dispersed in an instant the almost innumerable forces of Artaxerxes Mnemon; and, if it had not been for the fatal temerity of Cyrus the younger, would infallibly have placed the crown of Persia on his head. (Xenophon, Anab. l. i. c. 8.)

In engagements with every nation, the vigorous onset of the Greeks was attended with splendid victory. Even in the declining ages of their monarchy, when the arbitrary sway of Macedonian tyranny had extinguished within their bosoms that spirit of liberty which glowed so fervently at Marathon and Platæa, their formidable phalanx was regarded with apprehension by Roman intrepidity; and in the famous and decisive battle of Pydna (vid. PYDNA), the firmness and talents of a Paulus Æmilius deprived of victory, till a happy and well-timed exertion of his superior military abilities decided the doubtful contest. (Plut. in Æm. Paal.)

The Romans, those great masters in the art of war, were not ignorant of the advantages of acting offensively, nor how to improve them. The impetus of their legion, a heavy and well-organized body of infantry, exceeded in effect that of the Macedonian phalanx; and no weight of armour, no exertion of courage, no resolution, however daring, could preserve the front of that army unbroken, which once experienced the terrible discharge of the Roman pilum.

In every age the system of attack has been preferred by experienced generals (with some few exceptions, justified always by coincident circumstances), to that of protracting a war by tedious and indecisive manœuvres, and it has generally been attended with success. Hannibal, Sylla, Alexander, Cæsar, the greatest captains of antiquity, never suffered a favourable opportunity of engaging to escape them. Their attacks were general, violent, frequently unexpected, and rarely unattended with the most ample success.

Of later days, we may reckon among the commanders, who, in their eagerness to engage an enemy, have sometimes overleaped the bounds prescribed to genius by modern tactics, a Condé, a Gustavus, an Eugene, a Charles the Twelfth, and a Frederic the Great, whose rapid manœuvres frequently

baffled the most acute observation of their antagonists, and the impetuosity of whose attacks seldom gave time for effectual opposition.

It is scarcely necessary to insist upon the manifest advantages an attacking army possesses over that which acts upon the defensive. With numbers generally superior, a confidence in their own strength, and spirits which defy opposition, they rarely encounter an enemy able, or resolute enough to repulse them.

In the course of the late war, Europe has beheld with surprize the system of attack, which before only affected a tract of country comparatively trifling, carried to an extent and a perfection truly astonishing. In 1794, armies acting offensively, though in bodies widely distant, pierced, as if animated by the same soul, in all directions, from the frontiers of France to the left bank of the Rhine, and the centre of the Batavian territories. Two years after, at the same moment when Moreau was penetrating by the circle of Suabia, and along the Danube to the Austrian borders, the army of the Sambre and Meuse advanced through Franconia, and Buonaparte fought his way through Italy to gain the summit of the Noric Alps. According to the new principle, success in a general engagement, however complete, in no wise contributed to terminate the campaign. A battle gained only opened the road to new attacks. A town taken merely furnished materials for fresh sieges. The armies rivalled each other in overcoming, with incredible expedition, obstacles which formerly would have been deemed insurmountable; and as long as any vestige of an adverse power remained to face them in the field, all success was regarded as incomplete.

In the fluctuating campaign of 1799, the same system was carried to a still greater extent. The rocks and mountains of Switzerland furnished fresh subjects for plans of a nature still more difficult, intricate, and complicated. The line of attack and defence was lengthened in an unexampled manner, and from the Zuyder Zee to the Adriatic formed but one vast field of battle, on which French, Austrians, Russians, Helvetians, Dutch, English, and Italians, alternately destroyed each other; and strove, with infinite vicissitude of fortune, but finally with nearly equivalent success, to gain a dear-bought advantage.

ATTACK, in *Besieging*, signifies the operations carried on by the besiegers, with mines, saps, trenches, batteries, &c. against an enemy's fortrefs. The rules of war naturally prescribe the weakest side of the place as the point of attack. Nevertheless, prince Eugene thought proper to infringe upon them in the instance of the siege of Lille, where, to favour the movements of the covering army, he directed his approaches against the strongest part of the fortifications.

Two, or even three attacks, are formed in sieges where dispatch is necessary. In such cases, their communications should be easy, carefully constructed, and industriously maintained.

ATTACK, *Falſe*, is an attack but faintly prosecuted, though sufficiently serious to induce the enemy to divide his forces, and more especially to weaken, if possible, that part of his position, or works, which is the object of the true assault.

ATTACOTTI, in *Ancient History*, a savage people of Great Britain, mentioned by Ammianus Marcellinus (l. 27. c. 8.) and St. Jerom (tom. ii. p. 75.), as well as in the *Notitia Imperii*, whose situation is not precisely ascertained by antiquaries. Some have supposed that they inhabited Wales, and alledge, that their name was derived from the British words "at a coit, or coed," signifying amongst woods. But it is probable, that they were seated somewhere further north

north than any part of Wales; for Ammianus Marcellinus represents them as allies and confederates of the Scots and Picts, and therefore they were probably their neighbours. These enemies, and afterwards the soldiers, of Valentinian, are accused, by an eye-witness, of delighting in the taste of human flesh. When they hunted the woods for prey, it is said by Jerom (*ubi supra*), that they attacked the shepherd, rather than his flock; and that they curiously selected the most delicate and brawny parts both of males and females, (*pasterum nates et feminarum papillas*), which they prepared for their horrid repasts.

ATTAGEN, ATTAGAS, in *Ornithology*, names given by Brill and Buff. to the red or moor-game, or red grouse, in Gmelin's arrangement the fourth variety of *tetrao lagopus*. Linn. & Gmel. Brill also calls *tetrao umbellus* of Gmelin *attagen Pennsylvanicus*.

ATTAINDER, in *Law*, is that stain or infamy which is incurred by a man who has committed felony, treason, or other crime, and who is capitally convicted for the same.

This, by the common law, is the immediate inseparable consequence of the sentence of death that is pronounced. The law, in this case, sets a note of infamy upon the criminal, puts him out of its protection, and takes no farther care of him than barely to see him executed. He is then called attain, *atinctus*, stained or blackened. He is no longer of any credit or reputation; he cannot be a witness in any court; neither is he capable of performing the functions of another man: for, by an anticipation of his punishment, he is already dead in law. This is after "judgment;" for there is a great difference between a man "convicted," and "attainted;" though they are frequently, through inaccuracy, confounded together. After conviction only, a man is liable to none of these disabilities; for, in the contemplation of law, there is still a possibility of his innocence. Something may be offered in arrest of judgment; the indictment may be erroneous, which will render his guilt uncertain, and thereupon the present conviction may be quashed; he may obtain a pardon, or be allowed the benefit of clergy; both which suppose some latent sparks of merit, which plead in extenuation of his fault. But when judgment is once pronounced, both law and fact conspire to prove him completely guilty; and there is not the remotest possibility left of any thing to be said in his favour. Upon judgment, therefore, of death, and not before, the "attainder" of a criminal commences; or upon such circumstances as are equivalent to judgment of death; as judgment of outlawry on a capital crime, pronounced for absconding or fleeing from justice, which tacitly confesses the guilt. And, therefore, upon judgment of outlawry, or of death, for treason or felony, a man shall be said to be "attainted."

A man is "attainted by *appearance* or by *process*." "Attainder" on *appearance* is by confession, or verdict, &c.: by *confession*, when the prisoner, upon his indictment, being asked whether guilty or not guilty, owns himself guilty, without putting himself upon his country; and formerly confession was allowed before the coroner in sanctuary, upon which the offender was to abjure the realm, and this was called "attainder" by *abjuration*. "Attainder" by *verdict*, is when the prisoner at the bar pleads not guilty, and is found guilty by the verdict of the jury of life or death. "Attainder" by *process*, otherwise called "attainder" by *default* or by *outlawry*, is when a party flies, and is not found, until he hath been five times publicly called or proclaimed in the county, and, at last, upon his default, is pronounced or returned outlawed. *Staudf. Pl. Co.* 44. 122. 182. Persons may also be attainted by act of parlia-

ment. Accordingly acts of attainder have been passed in several reigns, on the discovery of plots and rebellions, from the reign of king Charles II., when an act was made for the attainder of several persons guilty of the murder of king Charles I., to this time. Among these, the most remarkable is that for attainting sir John Fenwick for conspiring against king William; this act having been made for attainting and convicting him of high treason on the oath of one witness, just after a law had been enacted, "that no person should be tried or attainted of high treason, where corruption of blood is incurred, but by the oath of two lawful witnesses, unless the party confess, stand mute, &c." *Stat. 1 and 8 W. III. c. 3.* However, sir John Fenwick was indicted of treason, on the oaths of two witnesses, though only one appeared against him on his trial; and it was alleged, that sir John had tampered with and prevailed on one of the witnesses to withdraw.

The consequences of "attainder" are forfeiture, and corruption of blood; which latter cannot be regularly taken out but by act of parliament. See these articles.

"Attainders" may be reversed or falsified by writ of error, or by plea; in the former case it must be by the king's leave, &c.; and in the latter it may be by denying the treason, pleading a pardon by act of parliament, &c. *3 Inst.* 232.

By a king's taking the crown upon him, all attainders of his person are "ipso facto" purged, without any reversal. *1 Inst.* 26. *Fineh. L.* 82. *Wood.* 17. This was the declaration of parliament, made in favour of Henry VII.

ATTAINDER, Bill of, is a bill brought into parliament for attainting, condemning, and executing a person for high treason. See **ATTAINDER**.

ATTAINMENT, ATTINGA, in *Law*, a writ which lieth to inquire, whether a jury of twelve men gave a false verdict; that so the judgment following thereupon may be reversed; and this must be brought in the life-time of him for whom the verdict was given, and of two at least of the jurors who gave it. This lay, at the common law, only upon writs of assise; and seems to have been coeval with that institution by king Henry II. at the instance of his chief justice Glanvil; being probably meant as a check upon the vast power then reposed in the recognitors of assise, of finding a verdict according to their own personal knowledge, without the examination of witnesses. And even here it extended no farther than to such instances, where the issue was joined upon the very point of assise (the heirship, disseisin, &c.), and not on any collateral matter, as villenage, bailardy, or any other disputed fact. (See *ASSISE in juratam*, &c.) It seems that no attainlay against the inquest or jury that determined such collateral issue; nor did such a process obtain after the trial by inquest or jury, in the old Norman or feudal actions prosecuted by a writ of entry: nor did any attainlay lie in trespass, debt, or other action personal, by the old common law; because those were always determined by common inquest or juries. At length the statute of *Westm. 1.* (*3 Edw. I. c. 28.*) allowed an attainlay to be sued upon inquests, as well as assises, which were taken upon any plea of land or of freehold. But this was at the king's discretion, and so it is understood by the author of *Fleta*, a writer cotemporary with the statute; though sir Edward Coke (*2 Inst.* 130. 237.) seems to hold a different opinion. Other subsequent statutes (*1 Edw. III. st. 1. c. 6.* *5 Edw. III. c. 7.* *28 Edw. III. c. 8.*) introduced the same remedy in all pleas of trespass; and the statute *34 Edw. III. c. 7.* extended it to all pleas whatsoever, personal as well as real; excepting only the writ of right, in such cases where the main or issue is joined on the mere right, and not on any collateral question.

question. For though the attaint seems to have been generally allowed in the reign of Henry II., at the first introduction of the grand assise (which at that time might consist of only twelve recognitors, in case they were all unanimous), yet subsequent authorities have holden, that no attaint lies on a false verdict given upon the mere right, either at common law or by statute; because that is determined by the grand assise, appealed to by the party himself, and now consisting of sixteen jurors. Bract. 290. Flet. 5. 22. 7. Britt. 243. b. 12 Hen. VI. 6. Bro. Abr. *Attaint*, 42. 1 Roll. Abr. 280.

The jury who are to try this false verdict must be twenty-four, and are called the grand jury; for the law wills not that the oath of the jury of twelve men should be attained or set aside by an equal number, nor by less indeed than double the former. Bract. l. 4. tr. 5. c. 4. § 1. Flet. l. 5. c. 22. § 7. If the matter in dispute be of forty pounds value in personals, or of forty shillings a year in lands and tenements, then by stat 15 Hen. VI. c. 5. each grand juror must have freehold to the annual value of twenty pounds. And he that brings the attaint can give no other evidence to the grand jury than what was originally given to the petit. But those against whom it is brought are allowed, in affirmance of the first verdict, to produce new matter; because the petit jury may have formed their verdict upon evidence of their own knowledge, which never appeared in court. If the grand jury found the verdict a false one, the judgment by the common law was, that the jurors should lose their "liberam legem," and become for ever infamous; should forfeit their goods and the profits of their lands; should themselves be imprisoned, and their wives and children thrown out of doors; should have their houses rased, their trees extirpated, and their meadows ploughed; and that the plaintiff should be restored to all that he lost by reason of the unjust verdict. But as the severity of the punishment had its usual effect in preventing the law from being executed, therefore by the statute 11 Hen. VII. c. 24. revived by 25 Hen. VIII. c. 3. and made perpetual by 13 Eliz. c. 25. an attaint is allowed to be brought after the death of the party, and a more moderate punishment was inflicted upon attained jurors; viz. perpetual infamy; and if the cause of action were above forty pounds value, a forfeiture of twenty pounds a-piece by the jurors; or if under 40l. then five pounds a-piece; to be divided between the king and the party injured. So that a man may now bring an attaint either upon the statute or at common law, at his election (3 Inst. 164); and in both of them may reverse the former judgment. But the practice of setting aside verdicts upon motion, and granting new trials, has so superseded the use of both sorts of attaints, that few instances of attaints occur in our books later than the sixteenth century. Cro. Eliz. 309. Cro. Jac. 90. By the old Gothic constitution, indeed, no certificate of a judge was allowed, in matters of evidence, to countervail the oath of the jury; but their verdict, however erroneous, was absolutely final and conclusive. Yet there was a proceeding, from whence our attaint may be derived. If upon a lawful trial before a superior tribunal, the jury were found to have given a false verdict, they were fined, and rendered infamous for the future. Stiernhook de jure Goth. l. i. c. 4. Blackstone's Comm. vol. iii. p. 402. &c.

ATTAINED, ATTAINTUS, or ATTINCTUS, in *Law*. See ATTAINDER.

ATTAK, in *Geography*, the largest of the islands commonly denominated the Aleutsky or Aleutian islands. It seems to have a larger extent of surface than Behring's island, and has an oblong form, lying more west and east. In these islands no volcanic traces have been discovered, and

here are no land animals but ice-foxes and rock-foxes, more frequently black than white. The sea-otters come hither but singly; whereas sea-lions, sea-bears, manatis, and some other sea-animals frequent these shores in herds. See ALEUTIAN ISLANDS.

ATTALIA, in *Ancient Geography*, a town of Asia, in Pamphylia, on the coast of the sea, which there formed a gulf of the same name, now called the gulf of Satalia. Strabo (l. xiv. p. 459.) says, that it was built by Attalus Philadelphus, king of Pergamus, who founded a colony there, and that it was the chief residence of the prefect. St. Paul proceeded from Perga to this town. Acts xiv. 25. —ALFA, a town of Asia, in Lydia.

ATTALICÆ VESTES, in *Antiquity*, garments made of a kind of cloth of gold.

They took the denomination from Attalus, surnamed Philometer, a wealthy king of Pergamus, who was the first, according to Pliny, who procured gold to be woven into cloth. Hist. Nat. lib. iii. cap. 48.

ATTALIS, in *Ancient Geography*, the name of a tribe of Attica.

ATTALUS, in *Biography*, the name of several kings of Pergamus.—Attalus I. succeeded his cousin Eumenes I. in the year 241 B. C. Having expelled the Gauls who had settled in his country, he assumed the title of king, and extended his conquests of the Asiatic provinces as far as mount Taurus. But in the distress to which he was afterwards reduced by the united forces of his grandfather Achæus and Selencus, he availed himself of the succour afforded him by the Gauls settled in Thrace, and recovered his dominions of which he had been dispossessed. He then pursued his conquests in Ionia, till his career was stopped by the refusal of the Gauls to advance any farther. Upon this he returned to the Hellepont, and allowed his allies to settle there in a very fertile and extensive region. For the security of the territories he had acquired, he formed an alliance with the Romans, whom he vigorously assisted in their two wars against Philip of Macedonia. In conjunction with the Athenians he invaded Macedonia, and recalled Philip from his enterprise against Athens; and on this account the Athenians gave his name to one of their tribes. At Thebes in Bœotia, whilst he was haranguing the people, and urging them to take arms against Philip, he was seized with an apoplexy; and being conveyed to Pergamus, he soon after died, in the 72d year of his age, and 43d of his reign. He is represented as a generous and amiable prince, a liberal encourager of literature, and also a writer. Of his veneration for Homer the following singular instance is mentioned by Suidas and Valerius Maximus; viz. his causing the grammarian Daphnidus to be thrown from a rock, for speaking disrespectfully of this celebrated bard.—Attalus II. was the second son of Attalus I. and called *Philadelphus*, from his fidelity and affection to his brother Eumenes, who was king of Pergamus before him. Upon a false rumour of the death of Eumenes, he hastily assumed the regal ensigns, and married his brother's wife; but on his brother's safe return, he manifested every token of satisfaction and allegiance, and bore an halbert as one of his guards. Eumenes kindly embraced him, and in a whisper cautioned him "not again to be in such haste to marry his wife, till he was sure of his death." Attalus was actively attached to the Romans in their war against Perseus, and made successive visits to Rome for the purpose of exculpating his brother from the charge of indifference to their interest. At his death, Eumenes bequeathed both his kingdom and his wife to Attalus; and appointed him guardian of his infant son, which trust he faithfully executed. Attalus

talus commenced his reign in the year 159 B. C. and after a reign of 21 years, distinguished principally by his success in restoring Ariarathes VI. to the throne of Cappadocia, and by his contest with Prusias king of Bithynia, which terminated after alternate defeats and success in the dethronement and assassination of this prince, he died in his 82d year. He was a patron of literature, acknowledged as the founder of two cities in Asia; viz. Attalis and Philadelphia, and esteemed much by the Romans, by whom he was considered as one of their most faithful allies.—Attalus III. was the son of Eumenes II. and succeeded his uncle in the year 138 B. C. His disposition was cruel and suspicious, and led him to sacrifice most of his own family, and several persons of distinction in his court, with their wives and children. From his real or affected love for his mother Stratonica, he was denominated *Philometer*. After filling his capital and kingdom with deplorable distress, he retired into solitude, and sequestered from all social intercourse, devoted himself to the culture of a garden, in which he planted a variety of poisonous herbs; and these he occasionally sent in packets, mixed with pulse, to those who were the objects of his gloomy suspicions. This conduct indicates insanity; but it has been ascribed by Varro and Columella to a fondness for horticulture, and the study of medicinal simples; and Attalus has been numbered among those who wrote on these subjects. By the heat and toil which he experienced in the chemical employment of casting a statue of his mother, he was thrown into a fever, which terminated his life and reign in the year 133 B. C. The Roman people were by his testament left the heirs of his goods, which they interpreted to mean his dominions and subjects. Their claim to this rich inheritance was contested, but at length established. The wealth of Attalus seems to have been a proverbial expression, and is frequently alluded to by the Roman poets. Gen. Biog. See PERGAMUS.

ATTALUS, a Christian martyr, was a native of Pergamus in Phrygia, and fell a sacrifice to persecution at Lyons, in the 17th year of the emperor Marcus Antoninus, and the 177th year of our Lord. In an epistle of the churches of Vienna and Lyons, addressed to the churches of Asia and Phrygia, containing a relation of the sufferings of their martyrs, Attalus is denominated “the pillar and support of the churches there,” and a zealous champion for the truth. He was led round the amphitheatre with a board carried before him, on which was inscribed, “This is Attalus the Christian;” whilst the people were incessant in expressing their great indignation against him. For the gratification of the people he was delivered to the wild beasts, and after having been run through with a sword, he was set in an iron chair and burned to death. The conduct of Attalus, as well as that of his fellow-sufferers, manifested a fortitude that was invincible. Eusebius, l.v. Præp. c. 1. Lardner’s works, vol. vii. p. 425, &c.

ATTALYDA, in *Ancient Geography*, a town of Asia, in Lydia.

ATTAMINATUS, in *Entomology*, a species of SCARABÆUS, with the thorax black and glabrous; head tuberculated; wing-cases testaceous, with five black spots on each. Marsham’s Ent. Brit. Panzer names this little insect *S. inquinatus*, Ent. Germ.

ATTAR of *Roses*. See OTTAR.

ATTARSOAK, in *Zoology*, a name assigned by Cranz (Grœnl. p. 163.) to the species of PHOCA, groenlandica, or harp seal of Pennant. See GROENLANDICA.

ATTELABOIDES, in *Entomology*, a species of CARABÆUS that inhabits Coromandel, and is about the size of

the European species leucoplthalmos. It is apterous and black, with a narrow thorax; the posterior part of the head attenuated; wing-cases furrowed and truncated. Fabricius.

ATTELABOIDES, a species of CIRCULIO that inhabits Brazil. The shells are rough, varied with brown and grey; legs variegated; and thighs clavate. It is thus specifically defined by Fabricius; “rostrum clystrisque unatuberculatis,” beak and wing-cases with a single tubercle.

ATTELABOIDES, a species of RHINOCATER that inhabits the pine. It is downy; antennæ and legs testaceous. A native of Sweden. Gmel. &c.

ATTELABOIDES, a species of FORTECA of a black colour; two spines on the thorax; legs ferruginous; posterior part of the head attenuated. Fabricius. Inhabits Brazil.

ATTELABOIDES, a species of CIMEX (*Reluctus* Sect.), found in New Holland. It is testaceous, varied with black; anterior part of the thorax testaceous, with two black teeth. Fabricius. The snout is pale, with a black dorsal line; a black band in the middle of the thorax; anterior margin of the wing-cases black; wings black; body testaceous beneath; thighs annulated with black.

ATTELABUS, a genus of COLLOPTEROUS insects in the Linnæan system, that is distinguished by having the head inclined and pointed behind; antennæ moniliform, and thickest near the end. Linn. &c.

Of this genus, Gmelin enumerates thirty-four species, including the Fabrician cleri, and spondylides described in Spec. Inf.—Fabricius in his Ent. Syst. describes thirty-seven species of the attelabi exclusively; his character of the genus is, feelers filiform; jaws bifid; lip horny, concealing the feelers; antennæ moniliform, and situated on the beak.

This genus Linnæus observes is very obscure, the insects arranged under it differing much from one another in their external appearance. But this obscurity a later writer remarks, “proceeds rather from Linnæus’s not having known a sufficient number of insects proper to be arranged under it; and his playing with those, the species included in the CLERUS genus by Geoffroy, in which the generic characters he assigns for his attelabi are not found, than to any defect in the characters themselves.” Scopoli distinguishes the attelabi by the following character; hinder part of the head gradually diminishing in size; eyes prominent; thorax somewhat broader than the diameter of the head, and of a cylindrical form. Among these are included some of the Linnæan chrysonela, whose bodies are oblong and narrower than the thorax. The clerus of Geoffroy and Schæffer is partly taken from the Linnæan attelabi, and partly from the dermetes of that author; the characters they assign it are, antennæ club-formed, and placed on the head; the knob composed of three joints; no proboscis; thorax almost cylindrical, and without margin; soles of the feet spongy.

The body of the insects in the genus attelabus is commonly of an ovate form; the head projecting, ovate, and narrow behind, where it unites with the thorax; the eyes are globose and situated in front; the antennæ short and approximate, moniliform, and composed of eleven joints, of which that at the base is large, and the three at the extremity form an oval of a somewhat lengthened shape; thorax and scutellum are both rotundated; wing-cases as long as the abdomen, and rather convex; legs short and the feet of four joints. The insects of this genus approach very nearly to les brachiceres, les brentes, les rhinomacres, les macrocéphales, and les bruches of modern French naturalists, but are sufficiently distinguished by their antennæ.

The

The larva of the attelabi, according to some writers, are furnished with six feet; are very fat, of a whitish colour, and have an annulated body. The head is protected by a hard scaly covering, and the mouth furnished with two very strong jaws, with which it does great mischief. It attacks the leaves, the flowers, the fruits, and even the stalks and roots of different plants; but most of the species penetrate into the plant, and subsist entirely on the parenchymous or spongy parts within. Preparatory to the transformation to the pupa state, some species spin a silky web, and others form a little ball of a very solid kind, in which they remain during the second state. The perfect insects inhabit the same plants as the larva, but are deemed less injurious to them.

Gmelin, as before observed, describes thirty four species of this genus: these are coryli, avellanæ, bicolor, denigratus, erythropterus, bipustulatus, gemmatus, indicus, curculio-noides, furinamentis, pennsylvanicus, melanros, angulatus, ruficollis, pubescens, betule, mutillarius, dubius, iclineumoni-us, formicarius, sphageus, sexguttatus, quadrimaculatus, uninfasciatus, octopunctatus, tricolor, bifasciatus, spylus, ammius, apiarius, cyaneus, crabroniformis, ceramboides, buprestoides; which see respectively.

Obs. A few of the figures in the third entomological plate of this work having been inadvertently misplaced, the insect inscribed g. 15. *attelabus* will be found to belong to another genus, and that marked g. 13. *bruchus* being one of the Linnæan *attelabi*, may serve to illustrate this genus, till another figure can be given.

ATTELEBUSSA, in *Ancient Geography*, an island in the Mediterranean sea, on the coast of Lycia. Ptolemy calls it Atelebusa, and places it on the coast of Pamphylia. Pliny.

ATTELLANÆ. See ATELLANÆ.

ATTENA, in *Ancient Geography*, a town of Ethiopia, below Egypt. Pliny.

ATTENBY, in *Geography*, a town of Sweden, in the island of Oeland.

ATTENDANT, or ATTENDENT, in a general sense. See ASSISTANT, RETINUE, and SATELLITES.

ATTENDANT, *Attendens*, in *Lazæ*, signifies one that owes duty, or service to another, or depends in some manner upon him.

Where the wife is endowed of lands by guardian, she shall be attendant on the guardian, and on the heir at his full age.

ATTENDORN, in *Geography*, a town of Germany, in the archbishopric of Cologne, and duchy of Westphalia, seated on the river Bigge, and seven leagues south of Arensburg.

ATTENHOVE, a town of Brabant, one league north-east of Landen.

ATTENTION, ATTENTIO, compounded of *ad, to*, and *tendo, I stretch*, a due application of the ear, or the mind, to any thing said or done, in order to acquire a knowledge of it.

Attention of mind, is not properly an act of the understanding, but rather of the will, by which it calls the understanding from the consideration of other objects, and directs it to the thing in hand. Nevertheless, our attention is not always voluntary: an interesting object seizes, and fixes it beyond all power of control.

It is by the attention that is given to any object of sense or intellect, that we form a distinct notion of it, or discover its nature, its attributes, or its relations: and so great indeed is the effect of attention, that, without it, it is impossible to acquire or retain a distinct notion of any object of thought.

To this purpose it is said, that sir Isaac Newton, when he was complimented upon the force of genius which had made such improvements in mathematics and natural philosophy, made this reply, no less judicious than modest; "that, if he had made any improvements in those sciences, it was owing more to patient attention, than to any other talent." As it is very helpful to memory, if not essential to it, that the perception of the idea which we wish to remember should remain in the mind for a certain space of time, and should be contemplated by itself exclusively of every thing else, we can be at no loss to account for the assistance which the memory derives from attention, which consists partly, if not entirely, in the effort of the mind, to detain the idea or the perception, and to exclude the other objects that solicit its notice. Hence it happens that in solitude, or the stillness of the night, when the attention is undiverted and undistracted by surrounding objects, the impression made by any one object is stronger and deeper: and the memory becomes more retentive. When one faculty of the mind is intensely engaged about any object, the other faculties are laid, as it were, fast asleep; hence a man sees not what is before his eyes, when his mind is occupied about other things. In the tumult of a battle, a man may be shot through the body without knowing any thing of the matter, till he discovers it by the loss of blood or of strength. The most acute sensation of pain may be deadened if the attention be vigorously directed to another object. The anecdote relating to the attention of Archimedes at the siege of Syracuse is well known. (See ARCHIMEDES.) When there is no particular object that draws away our attention, there is a desultoriness of thought in man, and in some more than in others, which makes it very difficult to give that fixed attention to important objects which reason requires. A habit of attention may be acquired by practice; and the study of the mathematical sciences has a peculiar aptitude to direct and fix it. Attention is one of those operations of the mind, which, according to Dr. Reid's distribution (*Essays*, p. 78.), belong to the class of those that are voluntary.

Attention, in respect of hearing, is the stretching or straining of the *membrana tympani*, so as to make it more susceptible of sounds, and better prepared to catch even a feeble agitation of the air. Or it is the adjusting the tension of that membrane to the degree of loudness or lowness of the sound to which we are attentive.

"Sounds," says the celebrated Bacon in his *Natural History*, "are meliorated by the intension of the sense, where the common sense is collected most to the particular sense of hearing, and the sight suspended. Therefore sounds are sweeter, as well as greater, in the night than in the day; and I suppose they are sweeter to blind men than to others; and it is manifest, that between sleeping and waking, when all the senses are blind and suspended; music is far sweeter than when one is fully waken."

ATTENUANTS, in *Medicine*. This term is applied to those medicines which are supposed to possess the power of restoring the concentered parts of a fluid to the same state of fluidity which they possessed before concretion. It is nearly synonymous with *resolvent*. A very reasonable doubt has been entertained, whether there is properly any such attenuating power residing in any medicine, independent either of mere dilution, or else of the stimulant property. The idea, however, of the operation of attenuants is the following:—many of the older physicians, and after them the Boerhaavians, supposed obstruction in the circulating system to be produced by the red blood, or a thinner impervious humour joined with it, stagnating in their proper vessels, or wedged into other vessels of a smaller diameter than

than the sanguiferous by an *error loci*. This, they supposed, would produce a greater motion and heat, owing to the resistance of the vessels, which would incline the humours very much to a state of putrefaction. Of these concretions some are soluble by water alone, such as the saline, saponaceous, and mucous; but others require the dissolving power of certain medicines; and hence in the former case, *diluents* alone are sufficient to remove the obstruction, but in the latter, recourse must be had to the *attenuants*. Concretions supposed to be produced by an inflammatory spirititude of the blood, and oily, sebaceous, and calculeous concretions, were considered as yielding to the internal use of various salts, such as sal gem, sal ammoniac, and fixed alkali, also soaps, decoctions of the acrid and alkalescent vegetables, and bile (which is a kind of natural soap), all of which were considered as highly attenuating; and the reader will here perceive how closely the experiments of the laboratory were applied to the living animal. Another species of attenuating or resolving remedies was the whole class of mercurial medicines, which are known to produce the most violent flow of saliva and thin fetid humours from the body, the consequence (as was imagined) of the power possessed by this mineral to resolve and break down acid matter impacted in the glands and minuter vessels.

The term attenuant is not now much employed in its original sense; the alleged cause of obstructions being entirely disputed, as well as the supposed solvent power of these medicines upon the concentered humours, whilst remaining in the vessels of the body.

ATTENUATA, in *Entomology*, a species of **LEPTURA** that inhabits Europe, and is both described and figured by several authors. The wing-cases are attenuated and fulvous, with four black bands; legs testaceous.

ATTENUATA, a species of **BUPRESTIS** that inhabits Rio Janeiro. The wing-cases taper towards the end, terminate in two teeth, and are striated; body brassy-green; beneath coppery. Fabricius.

ATTENUATA, a species of **VESPA** with a ferruginous abdomen, and black petiole, with yellow band. This kind inhabits America. Fabricius, &c. *Obs.* The antennæ are ferruginous, tipped with black; head black, with the lip yellow.

ATTENUATION, compounded of *ad*, and *tenuis*, *thin*, the act of *attenuating*; that is, of making any fluid thinner and less consistent than it was before.

Attenuation is defined more generally by Chauvin, the dividing or separating of the minute parts of any body, which before, by their mutual *nexus* or implication, formed a more continuous mass.—Accordingly, among alchemists, we sometimes find the word used for pulverization, or the act of reducing a body into an impalpable powder, by grinding, pounding, or the like.

ATTENUATUS, in *Entomology*, a species of **CARABUS**. (*Cyebus attenuatus* Fabr. Append.) This insect is apterous, black, wing-cases rather coppery, with three rows of raised dots; thorax narrow; head very narrow. Panz.

ATTENUATUS, in *Natural History*, a species of **ECHINORHYNCHUS**, described by Müll. Zool. Dan. It is globiferous, with an equal smooth yellow body; and neck filiform. Sometimes found in the intestines of the flounder. This is *zenia longicollis* of Pallas.

ATTENUATUS, *pedunculus*, in *Botany*, denotes a foot-stalk that grows smaller towards the flower.

ATTENY, in *Geography*, a town of India, in the kingdom of Deccan, beautifully situate in a forest of palm-trees, not far from the sea, about twenty-two leagues north of Vissapour.

ATTERBURY, *FRANCIS*, in *Biography*, a person of eminence in the political and literary world, who died in 1662, at Milton Keynes, near Newport-Pagnall, in Berkshire, where his father, Dr. Lewis Atterbury, was rector. Having passed through a course of grammar schooling at Westminster school, he was elected in 1640 a scholar of Christ-church college in Oxford. Here he acquired reputation as a classical scholar, and exhibited specimens of his political talents in a Latin version for Mr. Dryden's "Abdolon and Achitophel;" an epigram on "Alady-fay," addressed to Miss Osborn, who afterwards was his wife; and a translation of "Two Odes of Horace;" viz. Od. 9. l. iii. and Od. 3. l. iv. These are published in his "Epistolary Correspondence." He took his degree of bachelor of arts in 1654, and that of master in 1657; and at this period he first appeared as a controversial writer, by vindicating the reformation, in a piece intitled, "An Answer to some considerations on the spirit of Martin Luther, and the origins of the Reformation." Whilst he continued at college, he is thought to have taken a part in the famous dispute between Mr. Be they and the hon. Mr. Charles Boyle (afterwards earl of Orrery), concerning the genuineness of "Phalaris's Epistles," although his name did not appear on the occasion. The time of his taking orders is not precisely ascertained; but it may be inferred from circumstances that it was either at the close of the year 1655, or in the beginning of 1657. He seems to have been tired of a college life, and thinking himself formed, as he expresses himself, for "another scene, and another sort of conversation," he determined, whenever any favourable opportunity occurred, to leave Oxford. Disappointed in his application for the rectory of Milton, which was the place of his birth, he came to London in 1653, and was appointed one of the chaplains in ordinary to king William and queen Mary, preacher at Bridewell, and lecturer at St. Bride's. His conversations for the pulpit were distinguished by boldness of sentiment and warmth of language; and accordingly they soon commanded attention. One of them, "On the power of charity to cover sin," excited the notice and animadversions of Hoadly; and another, intitled "The sinner incapable of true wisdom," was more acrimoniously censured. In the year 1655 he commenced a controversy with Archbishop Wake, concerning "the rights, powers, and privileges of convocations," which lasted four years, and in the prosecution of which he appeared as an able and ardent advocate for high ecclesiastical authority, and the independence of the church on the state. The learning, ingenuity, and zeal manifested on this occasion, procured for him the thanks of the lower house of convocation, and the degree of doctor in divinity from the university of Oxford. At the commencement of the year 1659, he was installed archdeacon of Totness; and in the progress of it he was engaged with some other learned divines, in revising an intended edition of the Greek testament, with Greek scholia, collected chiefly from the fathers, by Mr. Archdeacon Gregory. The accession of queen Anne, in 1702, was to him a favourable event; and it was soon followed by his appointment as one of her majesty's chaplains in ordinary; and in 1704, he was advanced to the deanery of Carlisle. In 1706, he preached a funeral sermon on 1 Cor. xv. 19, which occasioned a dispute with Hoadly "concerning the advantages of virtue with regard to the present life." In the following year he was appointed one of the canons residentiary of the cathedral at Exeter; and in 1709, his distinguished talents in the pulpit introduced him into the honourable office of preacher at the Rolls chapel. In this year he was engaged in a controversy with Hoadly concerning "Passive obedience;" and in the follow-

ing year he assisted Sacheverell in his famous trial, who recompensed him by a legacy of 500*l.*, and in performing the office of prolocutor to the lower house of convocation. In 1711 he was appointed by the convocation one of the committee for comparing Mr. Whilton's doctrines with those of the church of England; and he was principally concerned in drawing up "A representation of the present state of religion," which, though too exceptionable in its principles, and too virulent in its spirit to be presented to the queen, was nevertheless printed and privately dispersed. In 1712, Dr. Atterbury was made dean of Christ-church; and in 1713 he attained, by the recommendation of the earl of Oxford, the height of his promotion, that of the bishopric of Rochester, and deanery of Westminster. It is said, that he aspired to the primacy; but the death of the queen, in 1714, disconcerted all his projects, and disappointed all his hopes of higher advancement. The accession of George I. was an event which he had reason to deplore. The personal dislike of the king, of which he had mortifying evidence, was retaliated on his part by disaffection to the established government. In the first year of this reign, during the rebellion in Scotland, he, and one other bishop at his instigation, refused to sign the "Declaration" of the bishops; and his name occurs in the most violent protests against the measures of government. Not content with a constitutional opposition, he engaged in a correspondence with the pretender's party, in order to bring about a revolution in favour of the abdicated family; and in August 1722, he was apprehended on this account, and committed to the Tower. Whilst he was under examination, previous to his commitment, he is said to have adopted our Saviour's answer to the Jewish council; "If I tell you, you will not believe me; and if I also ask you, you will not answer me, nor let me go." In the month of March of the following year, a bill was brought into the house of commons for "inflicting certain pains and penalties on Francis bishop of Rochester;" and having passed the commons, it was sent up to the lords for their concurrence. In this house it was strongly opposed, and the bishop, in his defence, made an able and eloquent speech, closing, after a solemn protestation of his innocence, and an appeal to the searcher of hearts, with this memorable declaration: "If your lordships shall proceed to pass this bill against me, I shall dispose myself quietly, and tacitly submit to what you do; God's will be done; *naked came I out of my mother's womb, and naked shall I return*; and whether he gives or takes away, *blessed be the name of the Lord!*" At length, however, after a long and very warm debate, the bill passed into a law, and the bishop was condemned to the deprivation of all his offices and benefices, and to perpetual exile. The justice of this sentence, though much litigated at and immediately after the time when it was passed, has been since generally allowed. Of his attachment to the pretender, the following striking instance is related by the author of the *Memoirs of lord Chesterfield*, from Dr. Birch's MS. papers. "Lord Harcourt, leaving the old ministry, provoked Atterbury's abusive tongue. He, in return, declared, that, on the queen's death, the bishop came to him and to lord Bolingbroke, and said, nothing remained but immediately to proclaim king James. He further offered, if they would give him a guard, to put on his lawn sleeves, and lead the procession." Of his disaffection to the existing government, many convincing evidences occur; and particularly his conduct towards Mr. Gibbin, a worthy clergyman, and curate of Gravesend, whom he suspended for allowing the use of his church to the chaplain of the Dutch troops, who were called over in 1715 to suppress the rebellion. Atterbury,

in consequence of his sentence, left the country in June, 1723, accompanied by his daughter, Mrs. Morrice, to whom he was affectionately attached, and landed at Calais. From thence he went to Brussels; but being obliged to leave that place, he removed to Paris, where he resided till his death, softening the rigours of exile by study, and conversation and correspondence with learned men. It appears however, by some letters published at Edinburgh in 1768, of unquestionable authenticity, that he was actively engaged, in 1725, in fomenting discontents in the highlands of Scotland, with a view of encouraging another rebellion. In 1729 he lost his daughter, and this afflictive event, which he bore with resignation, is nevertheless thought to have hastened his own dissolution, which happened at Paris, in February 1731. His remains were brought over to England, and privately interred in Westminster-abbey. We cannot forbear inserting, in this place, Mr. Pope's fine epitaph on the bishop, written in the form of a dialogue between his daughter, supposed to be expiring in his arms, immediately after her arrival in France to see him, and himself, and preserved in *Pope's Works*, vol. iv. p. 58. Svo. 1776. As to the justice of the compliment, which it pays to his political sentiments, the reader must judge.

Dialogue.

She. "Yes, we have lived,—one pang, and then we part!
May heaven, dear father! now have all thy heart.
Yet, ah! how much we loved, remember still,
Till you are dust like me.—"

He. "Dear shade! I will:
Then mix this dust with thine—O spotless ghost!
O more than fortune, friends, or country lost!
Is there on earth, one care, one wish beside!
Yes, *SAVE MY COUNTRY, HEAV'N*, he said, and died."

Bishop Atterbury had four children, two sons and two daughters. His son Osborn alone survived him.

Some time before his death the bishop published a vindication of himself, bishop Smalridge, and Dr. Aldrich, from a charge brought against them by Mr. Oldmixon, of having altered and interpolated the copy of lord Clarendon's "History of the Rebellion." His sermons are extant in four volumes Svo.: those contained in the two first were published by himself, and dedicated to his great patron, sir Jonathan Trelawny, bishop of Winchester: those in the two last were published after his death by Dr. Thomas Moore, his lordship's chaplain. His epitolar correspondence with Mr. Pope is extant in the collection of that poet's "Letters." Mr. Nichols has lately published in three volumes, Svo. "The Epitolar Correspondence, Visitation, Charges, Speeches, and Miscellanies, of the right reverend Francis Atterbury, D.D. lord bishop of Rochester." with historical notes; the greater part of these volumes is entirely new. From the *General Dictionary* (vol. ii. 445.) we learn, that Dr. Atterbury is said to have translated "Virgil's Georgics" in English, and to have written an "Harmonia Evangelica." In an elegant dissertation on the fictitious person of Japys, or Japis in the *Æneid*, he attempted to prove that Virgil meant by this person to allude to Antonius Musa, an eminent physician and polite scholar at Rome, in the reign of Augustus; but the attempt does no honour to his critical erudition, and has been deemed futile by judicious commentators. His translations of two odes of Horace, are reputed by a competent judge to have received more than their due share of applause.

As to this prelate's character, however the moral and political part of it may have been differently appreciated by
opposite

opposite parties, it is universally agreed, that he was a man of great learning and uncommon abilities, a fine writer, and a most excellent preacher. With respect to Atterbury's public and political character, it "was marked with that turbulent ambition and contentious violence which animated the Becketts and Lauds of former times, and which was ill disguised by the affected mildness and moderation of his epistolary writings." "The turbulent and imperious temper of this haughty prelate," says Dr. Wharton (*Essay on the Writings and Genius of Pope*, vol. ii. p. 432, 433.), "was long felt and remembered in the college over which he presided. It was with difficulty queen Anne was persuaded to make him a bishop; which she did at last on the repeated importunities of lord Harcourt. After her decease, Atterbury occasionally urged his friends to proclaim the Pretender; and on their refusal, upbraided them for their timidity, with many oaths; for he was accustomed to swear on any strong provocation." From an anecdote related by lord Chesterfield to Dr. Maty, and recorded in "Maty's Memoirs" of that nobleman (p. 279.), it has been inferred, that Dr. Atterbury had been long known, among his friends, to be a sceptic, or an unbeliever, with regard to revelation. The anecdote is as follows. "I went to Mr. Pope one morning at Twickenham, and found a large folio bible with gilt clasps lying before him upon his table; and, as I knew his way of thinking upon that book, I asked him jocosely, if he was going to write an answer to it? It is a present, said he, or rather a legacy, from my old friend the bishop of Rochester. I went to take my leave of him yesterday in the Tower, where I saw this bible upon his table. After the first compliments, the bishop said to me, my friend Pope, considering your infirmities, and my age and exile, it is not likely that we should ever meet again, and therefore I give you this legacy to remember me by it.—Does your lordship abide by it yourself?—I do.—If you do, my lord, it is but lat-ly. May I beg to know, what new light or arguments have prevailed with you now, to entertain an opinion so contrary to that which you entertained of that book all the former part of your life?—The bishop replied, we have not time to talk of these things; but take home the book; I will abide by it; and I recommend to you to do so too, and so God bless you!" This single story, however, not only uncorroborated, but contradicted by other facts, is not sufficient to warrant the charge of scepticism against this prelate. Whatever were his faults, he does not appear to have disbelieved or even doubted the truth of Christianity. His actions and writings exhibit the fiery zealot and bigot rather than the infidel; though it must be acknowledged, that these characters may be united in the same person. His sermons on the miraculous propagation of the gospel, and on a standing revelation's being the best means of conviction, besides other discourses, furnish important and pleasing evidences of his attachment to the Christian religion. It ought also to be considered, that he generally treats unbelievers with contempt, as an ignorant, superficial, and conceited set of men; which he would scarcely have done if he had been of the same sentiments. For though a man may conceal, or deny, or even persecute the opinions which he himself holds, it is not very likely that he should appear to despise the retainers of them. Besides, there is an ardour of affectionate esteem in Mr. Pope's two last letters to Dr. Atterbury (*Pope's Works*, vol. v. p. 351—355.), written to him when he was in the tower, which that eminent poet, who valued himself upon his moral character, could not well have expressed to the bishop, if he had known that he had acted the base and hypocritical part of publicly professing and defending that religion which he privately

disavowed. Not to add, that he actually derived much of his consolation in adversity from his religious principles. His correspondence with Dr. Wall and bishop Potter, preserved in Nichols's publication, fully proves his belief in, and his zeal for the honour of the Christian revelation; and the testimony, derived from his private correspondence and from the uniform tenour of his life and writing, ought surely, with impartial and candid judgment, to outweigh the evidence deduced from a single story, however well authenticated. In his letters to Mr. Pope, and to his other correspondents, bishop Atterbury appears in a very pleasing light, both as a writer and a man. In ease and elegance, these letters are superior to those of Mr. Pope, and he is more studied. If we were to form our judgment of him, as a man, from these letters, we should incline to think that it was his sole wish to spend his life in a learned and elegant social intercourse with a few private friends; and yet numerous facts sufficiently shew, that nothing could be more distant from his real disposition and character, and that he was actuated in early life and in the progress of his years, by a restless and turbulent ambition. His panegyrist, bishop Smalridge, in the speech which he made, upon presenting him to the upper house of convocation, as Professor, represents him as "Vir in ulla literarum genere habes, in plerisque artibus et studiis diu et feliciter exercitatus, in maxime perfectis literarum disciplinis perfectissimus; i. e. "one, who is well acquainted with all parts of literature, long and successfully exercised in most arts and studies, and most accomplished in those sciences which admit of the greatest perfection." Although it is allowed, that he was sometimes too severe upon his adversary, and dealt rather too much in satire and invective, yet this is imputed by his panegyrist more to the natural fervour of his wit, than to any bitterness of temper, or prepossession of malice. As a composer of sermons and a preacher, he excelled his cotemporaries, and in this respect few English authors have attained to so high a rank. Of his character, as a preacher, the following encomium is bestowed upon him by the author of the "Tatler" (N^o 66); who, having observed that the English clergy too much neglect the art of speaking, makes a particular exception with regard to this prelate. "Atterbury," says he, "has so particular a regard to his congregation, that he commits to his memory what he has to say to them; and has so soft and graceful a behaviour, that it must attract your attention. His person, it is to be confessed, is no small recommendation, but he is to be highly commended for not losing that advantage, and adding to the propriety of speech (which might pass the criticism of Longinus), an action which would have been approved by Demosthenes. He has a peculiar force in his way, and has many of his audience, who could not be intelligent hearers of his discourse, were there not explanation as well as grace in his action. This art of his is used with the most exact and honest skill. He never attempts your passions, till he has convinced your reason. All the objections, which you can form, are laid open and dispersed, before he uses the least vehemence in his sermon; but when he thinks he has your head, he very soon wins your heart, and never pretends to shew the faintness of holiness, till he has convinced you of the truth of it." Dr. Blair (*Lectures on Rhetoric*, &c. vol. ii. p. 127—155.), says of this prelate, that he is deservedly accounted one of our most eloquent writers of sermons. "At the same time," he adds, "he is more distinguished for elegance and purity of expression, than for profoundness of thought: his style, though sometimes careless, is, upon the whole, neat and chaste; and more beautiful than that of most writers of sermons."

sermons. In his sentiments, he is not only rational, but pious and devotional, which is a great excellency. Dr. Warton (ubi supra, p. 435.), thinks, that Atterbury was, on the whole, rather a man of ability, than a genius; and that he writes more with elegance and correctness, than with any force of thinking or reasoning. Biog. Brit. Gen. Dict.

ATTERBURY, Lewis, the elder brother of the bishop, was born at Caldecot, in the parish of Newport-pagnel in 1656, and after finishing his grammatical education under Dr. Busby at Westminster school, removed to Christ church college, Oxford, in 1674. In 1695, he was elected preacher to the chapel at Highgate, in the neighbourhood of London; and in 1707, he was presented by the queen to the rectory of Shepperton, in Middlesex. In 1719, he was collated to the rectory of Hornsey, in Middlesex, in which parish the chapel of Highgate is situated. Upon application to his brother for the archdeaconry of Rochester, he was refused; probably more from a mean opinion of his talents, than from delicacy. However, he sustained the character of an useful parish priest, annexing the profession of physic, which he studied for the benefit of his poor parishioners, to the clerical character; and he acquired the reputation of a plain, solid, useful preacher. At the age of seventy he had a stroke of the palsy, and died at Bath in the year 1731. He published several sermons, which formed two volumes, and other pieces; and since his death, two volumes of his sermons have been published, in consequence of his testamentary directions, by Mr. E. Yardley, archdeacon of Cardigan. Dr. Atterbury was intimately acquainted with archbishop Tillotson, formed his style of preaching on his model, and published a defence of him against the attack of an Irish priest. Biog. Brit.

ATTERKLAA, in *Geography*, a town of Germany, in the arch-duchy of Austria, six miles north-west of Entzertorff.

ATTERMINING, in our *Old Writers*, is used for a time or term granted for payment of a debt, according to Blount.

ATTERN, in *Geography*, a town of Hindoستان, in the country of Agra, thirty-eight miles S. S. E. of Agra, and thirty-nine north-east of Gwalior.

ATTESTATION, compounded of *ad, to*, and *testis, witness*, the giving testimony or evidence of the truth of any thing; especially in writing.

ATTESTATION of Deeds, in *Law*. See **DEED**.

ATTESTATION of Devices. See **DEVISE**.

ATTHIS, in *Ornithology*, a species of **GRACULA**, called by Haffelquilt *corvus Ægyptius*; and by Latham, the *Ægyptian grackle*. The colour of this bird is greenish; belly ferruginous; legs sanguineous. Gmelin. It inhabits Egypt, as the synonymous names imply; and is believed to live on centipedes, scorpions, and other insects, the remains of such having been found in the stomach.

It is about the size of a lark; bill dull black, reddish at the base; eye bluish; head rather flattened at the top; upper parts of the plumage deep green, spotted with blue-green on the crown, hind part of the neck, and the shoulders; neck and back of the same deep green, but not spotted. On each side of the neck and back is a longitudinal broad line, the fore-part of which is ferruginous, the rest of a whitish lucid blue; throat whitish; tail nearly even at the end, and of a deep blue colour; claws blackish. Lath. Gen. Syn.

Among the ancients, the name of attlis was given to some bird at present not very accurately known. By Aldrovandus, and other naturalists, the same name has been also

assigned to birds altogether different from the present species.

ATTIA, in *Geography*, a town of Persia, ten leagues south of Kin.

ATTIC, something relating to Attica, or the city of Athens. In matters of *Philology*, we use, Attic salt, *sales Attici*, meaning a delicate, poignant kind of wit and humour, peculiar to the Athenian writers. Attic witness, was a witness incapable of corruption; so an Attic muse was an excellent one, &c.

ATTIC Dialect, in *Grammar*, one of the four Grecian dialects, which was used in Athens and the adjoining country. Those who have chiefly distinguished themselves in this dialect, are Thueydides, Aristophanes, Plato, Isocrates, Xenophon, and Demosthenes. Its general properties are, that it affects contractions of syllables in the same word, and also the joining of words; it often changes σ into ξ , ρ , and τ , as $\xi\upsilon\sigma\iota\sigma$ for $\sigma\upsilon\sigma\iota\sigma$, *prudent*, $\delta\alpha\zeta\epsilon\omega$ for $\delta\alpha\zeta\epsilon\omega$, *to confide*, and $\pi\epsilon\acute{\alpha}\lambda\theta\omega$ for $\pi\epsilon\alpha\sigma\sigma\omega$, *to do*; it casts away ι from $\alpha\iota$ and $\epsilon\iota$, as $\kappa\lambda\alpha\omega$ for $\kappa\lambda\alpha\iota\omega$, *to sweep*, and $\pi\lambda\epsilon\omega$ for $\pi\lambda\epsilon\iota\omega$, *more*; it changes σ into ν , as $\nu\epsilon\omega\varsigma$ for $\nu\epsilon\sigma\varsigma$, *a temple*; it joins $\delta\iota$ to the end of words, giving it a circumflex accent, as $\delta\iota\upsilon\delta\iota$ for $\delta\iota$, $\tau\iota$, *what*; and it annexes ι to the end of adverbs, as $\nu\upsilon\iota$, $\nu\upsilon\iota\iota$. Besides, the Attics have several phrases peculiar to themselves. Port Royal Greek Grammar, vol. ii. p. 332, &c.

ATTIC, or *Attic Story*, in *Architecture*, a low story erected over an order of architecture, to finish the upper part of a building. It is so called because supposed to have been first used in Attica; but whether it was originally employed to conceal the roof, or from some reasons of convenience in the internal distribution, does not clearly appear; what has been mentioned respecting it by ancient authors being very obscure. There is no instance of an Attic among the existing antiquities of Athens. In Italy it is met with in the triumphal arches, and in the forum of Nerva.

It has been much employed by the moderns, and particularly by the Italian architects. But the rules which they give for its proportions are various, some making it in height equal to one half, and others to one third of the principal order. It is usually decorated with pilasters, and frequently with basso-relievos, in the spaces between; or there are windows in these spaces. The pilasters are sometimes plain, and sometimes have a sunk pannel, or other ornaments. They have no diminution, nor have they any peculiar base or capital, the mouldings at the top and bottom of the Attic continuing round the pilasters. In the arch of Constantine at Rome there are statues placed over the columns of the principal order, immediately before the pilasters of the Attic; and this has frequently been imitated in modern buildings.

ATTIC Story is also frequently applied to the upper story of a house, constructed in the roof, when there is no order of architecture employed in its decoration.

ATTIC Order. This term has been by some authors used to denote the pilasters that are employed to decorate an Attic story. Pliny, after enumerating the other orders, says, "Præter hæc sunt quæ vocantur Atticæ columnæ quaternis angulis pari laterum intervallo." But how these square columns were formed is very uncertain, since we have no remains of columns which are known to have been of the kind here described; and Vitruvius makes no mention of them. The Attic of the forum of Nerva corresponds most with Pliny's description, there being projections that come forward from the attic over the detached columns, faced with square pilasters, whose sides are nearly equal in width to their fronts. It seems improper, however, to call this an order of architecture, as it has no peculiar parts essentially

rially constituting an order, such as capital, base, entablature, &c.

ATTIC or *Attic* *Base*. Vitruvius, lib. iii. cap. 3. speaking of the bases of columns, says, "This done, the bases are fixed in their places, and are so proportioned that including their plinth, they have in height half the thickness of the column; and in projection, which the Greeks call *εξήρσις*, they should have one quarter of the thickness of the column; so that their breadth and length will be once and a half the thickness of the column. Their height, if they are to be in the Attic mode, is so divided, that the upper part is one third of the thickness of the column, and the remainder is left for the plinth. The plinth being excluded, the remaining part is divided into four parts, and the upper torus has one of them; the remaining three parts are equally halved, and one half makes the lower torus, and the other the scotia, which the Greeks call *τροχίλος*, with its squares."

This kind of base is frequently found in the ancient examples of the Ionic and Corinthian orders, both Greek and Roman, but the proportion of its parts varies in almost every different example. We sometimes also meet with astragals between the toruses and fillets, and all its mouldings are, in Roman architecture, frequently covered with ornaments. This base is extremely beautiful, and has been much employed by modern architects, who have, though very improperly, applied it also to the Doric order, or rather to the order which has long been called Doric by the moderns. See *Doric Order*.

For an example of the Attic base we refer the reader to *Plate XVI.* of *Architecture*.

ATTIC or *Attic* *Door*. Vitruvius, lib. iv. cap. 6. says, in speaking of doors, that "they are of three kinds, Doric, Ionic, and Attic." And he afterwards proceeds to describe the manner of forming the Attic door, concluding with this remarkable passage, "These rules, which are practised in the composition of Doric, Ionic, and Corinthian temples, I have explained as well as I have been able, according to the approved methods;" intimating thereby, that he has applied the term Attic only as relating to the Corinthian order.

ATTIC Year. See *YEAR*.

ATTICA, in *Ancient Geography*, one of the eight districts into which Achaia was divided, anciently called *Αἴε*, *Αἴα*, and *Αθῆναι*. Plin. l. iv. c. 7. Pausan. in Attic. c. 11. Mela, l. ii. c. 3. This country is a kind of peninsula of a triangular form, bounded on the north by Bœotia and the gulf of Euripus, on the west by Megaris, on the south by the Saronic gulf, and on the east by part of the Ægean sea; and extending from north-west to south-east about eighty miles with decreasing breadth, but at an average about fifty miles, so that its area is considerably less than that of Yorkshire. This little country, every where intersected with rocks and mountains, is by nature extremely barren. The sterility of the soil requiring assiduous industry to produce the common necessaries of life, rendered the territory much less inviting to plundering or conquering invaders than the fruitful lands in other parts of Greece. Hence Thucydides observes, in his Introduction to his History, that a much greater portion of its inhabitants was aboriginal than those of neighbouring divisions. The physical deficiencies of Attica tended to invigorate the intellectual and moral energies of the people; and a political establishment happily adapted to the circumstances and characters of the citizens, cherished and improved the genius and spirit from which it sprung. A region less extensive and naturally productive than North Wales, was transcendent in the arts of war and

of peace, and repelled the attacks of the most potent monarch. Inspired by freedom, the Attic body made the gigantic despot of the East tremble on his throne, and left monuments of military achievement springing from liberty and patriotism, and guided by wisdom, which have only been surpassed by the tranquil and pacific efforts of genius in the various departments of the arts, literature, and philosophy.

Though in the early periods of their history they were little subject to foreign invasions that sought to dispossess them of their habitations, their maritime exposure opened the way to engagements of sea-faring adventurers who sought establishments, not by exterminating and enslaving the natives, but by conciliating them through an interchange of benefit. The first navigators recorded in history to have visited the Autochthones, or aboriginal possessors of Attica, came from the mother country of civilization and science. Cæcrops, an Egyptian (B. C. 1556), led a colony of his countrymen into Greece. (See Strabo, lib. ix.) The colony of Cæcrops derived its origin from the city of Sais, in Egypt. The adventurers who composed it had quitted the banks of the Nile, to withdraw themselves from the tyranny of an inexorable conqueror; and after a tedious voyage, reached the shores of Attica, at all times inhabited by a people whom the fierce nations of Greece had declined to bring under the yoke. Their sterile fields offered no plunder, nor could their weakness inspire any dread. Habituated to the enjoyments of peace, free without knowing the value of independence, rude rather than barbarous, they must have united themselves without difficulty to strangers introduced by misfortune. In a short time, the Egyptians and the inhabitants of Attica formed but one people; the former, however, assumed over the latter that ascendancy which sooner or later invariably attends superiority of knowledge; and Cæcrops, placed at the head of the united people, conceived the noble design of bestowing happiness on his adopted country.

The ancient possessors of these lands yearly saw a regular succession of the wild fruits of the oak, and relied on nature for a reproduction which secured their annual subsistence. Cæcrops first engaged the wandering hunters or shepherds of Attica to unite in villages of husbandmen. Corn, oil, and wine, and oil, rewarded their useful labours; and these productions, being acquired by common toil, were regarded, with the ground itself, as a common property. The idea of an exclusive and permanent right to all the uses of a piece of land, whether belonging to communities or to individuals, is one of the most interesting steps in the progress of society. In Attica, this invaluable right was immediately followed by such institutions as tended to secure its enjoyment, and to check the injustice of man, who is seldom willing to acquire by slow labour what he can ravish by sudden violence. The salutary influence of religion was employed on this important occasion. With agricultural property religious rites were introduced, and Cæcrops instituted sacrifices to the attributes of wisdom and of power under the names and sensible representations of Minerva and Jupiter. He is also by some historians said to have taught his subjects the art of navigation; to have instituted the areopagus, and to the institution of civil rights to have added the punishment of crimes. Aware of the advantages which might be derived from union of effort, Cæcrops proposed to facilitate it by contiguity of residence; he induced his subjects to collect and secure themselves within a wall, and laid the foundation of Athens. He placed this new city on a hill in the midst of a large plain, and built the citadel on the rock in which the hill terminated: this

prince reigned fifty years. For an abstract of the history of this country, and other particulars relating to it, see *ATHE-NIANS*, and *ATHENS*.

The chief city of Attica, next to Athens, was *ELEU-SIS*. Rhamnus was famous for the temple of Amphiarus and the statue of Nemesis. The principal river was *ASO-PUS*; as to the Ilissus, Eridannus, and Cephissus, they were rather brooks than rivers; but Attica, having a number of havens, was less in want of rivers. The riches of this kingdom, according to Thucydides (l. ii.), occasioned by its frugality and commerce, are said to have amounted to 1200 Attic talents a year; hence it was enabled to maintain a powerful army and navy, and thus to extend its possessions. The coin of Attica was commonly stamped with the figure of an ox, and this circumstance gave occasion to the phrase frequent among the Greeks, of a thing being worth 10 or 100 oxen; and hence also arose the common proverb "*bovem habet in lingua*," when a man was thought bribed to speak contrary to his own sentiments. But the wealth, strength, and populousness of Attica, were principally displayed in the number of tribes, amounting to thirteen, into which it was divided, and the great number of cities and towns belonging to each tribe.

ATTICUS, *HERODES TIBERIUS CLAUDIUS*, in *Biog-raphy*, was descended of a noble family, which traced their pedigree as high as Cimon and Miltiades, and born at Marathon in the territory of Athens. His father, Julius Atticus, was reduced to a low condition by the proscription of his father; but by the accidental discovery of a treasure in his house, he was unexpectedly raised to the possession of affluence. Dreading the event of this discovery, he communicated it to the emperor Nerva, who empowered him to use it at his pleasure; and on a second representation, that it was too large for a private person, the emperor renewed his licence, adding that if it was too large for use, he might abuse it, if he pleased, for it was his own. Atticus having increased his wealth by marriage, lived at Athens with very singular magnificence, giving to the people frequent largesses, and offering to the gods very splendid sacrifices. Whilst he had the command of the free cities in Asia, in the time of Adrian, he perceived that the city of Troas wanted water, and he obtained of this emperor a grant of three millions of drachmas, in order to defray the expence of procuring the necessary supply; but the charge of executing his project for this purpose amounted to seven millions of drachmas instead of three, and the additional expence he defrayed out of his own fortune. The great wealth of Atticus enabled him to make very liberal provision for the education of his son, Herodes; and accordingly he employed Scopelian, one of the most eminent orators of the age, as his instructor, and rewarded him liberally for his services. Herodes possessed distinguished talents, which he cultivated with diligence; and his attention was principally directed to the study of rhetoric. In this science, as it was then practised, he made great proficiency; and such was the ardour of his pursuit, and his ambition of gaining applause, that when he was deputed at an early age to address a speech to the emperor Adrian, who was then in Pannonia, the young orator is said to have failed in the attempt, and to have been almost urged by shame and despair to throw himself into the Danube. This misfortune, however, served only as an incitement to future diligence. Having finished his attendance in the schools of rhetoric, Herodes returned to his own country, and delivered public lectures, which were popular and much frequented by the sophists, philosophers, and rhetoricians of the age, who were munificently rewarded for their attendance and applause.

The liberality of Herodes was, however, sometimes imposed upon and abused. Aulus Gellius, who was himself a disciple of Herodes, mentions, one instance to this purpose. A man with a cloak, long hair, and a beard down to his waist, presented himself to the orator, and supplicated alms. Being interrogated who he was, the pretended philosopher indignantly replied, that he was a philosopher, and expressed surprize at the question. "I see," replied Herodes, "the cloak and the beard, but I do not see the philosopher." One of the company interposed, and observed, that this person was an impudent beggar, who spent his time in the tavern, and insulted those who refused to relieve him. "Well then," said Herodes, "let us give as men, though not as to a man;" *tanquam homines non tanquam homini*.

The fame of Herodes having extended through Greece, and even to Rome, he was appointed by the emperor Titus Antoninus the preceptor of eloquence to his two sons Marcus Aurelius and Lucius Verus; and being there introduced into the way of promotion, he was created consul in the year 143. About this time he was appointed prefect of the free cities of Asia, and president at the Panhellonia and Panathenian games, at which he was crowned. On this occasion he erected the stadium, 600 feet in length, and formed of white marble, a most sumptuous work, of which some remains are still visible. He also constructed a magnificent theatre at Athens, called Regillum, in honour of his wife Regilla; he also repaired and beautified the odeum of Pericles; and decorated many other places in Greece and Asia with useful and ornamental works. He likewise consecrated rich offerings in the temples at Athens, Delphos, Olympia, Pisa, and in other places. To this liberal and even profuse expenditure of his wealth it is owing, that his name has not sunk into oblivion; as the productions of his eloquence, some of which existed in the time of Philostratus and Suidas, have been all lost. Notwithstanding these displays of his public spirit, and the benefits he bestowed on his country, his influence excited jealousy; and two brothers, named Quintili, who commanded in Greece, seized occasion for transmitting complaints against him to the emperor Aurelius. Herodes presented himself before the emperor, but instead of employing his eloquence for the purpose of conciliation, he rudely reproached him with a pre-determination to ruin him. An officer, who stood by, exclaimed, that this insolence merited death. "A man of my age," said Herodes, "does not fear death." The mild emperor contented himself with punishing the freedmen of Herodes; who himself retired to Attica; and attempting by a letter to Aurelius to regain his kindness, the emperor returned a friendly answer. Herodes was again mortified by a charge of having been accessory to the death of his wife, preferred against him before the senate by his brother, who had been consul; but he was acquitted. In token of his sorrow for her loss, he erected to her memory a statue, bearing an inscription, still subsisting. The close of his life was spent at Marathon, where he died at the age of 76; and his countrymen honoured him with a public funeral at Athens. *Crevier's Hist. Emp. vol. vii. p. 250, &c. Mem. de l'Acad. des Inscrip. vol. xxx. Gen. Biog.*

ATTICUS, *Titus Pomponius*, a Roman knight, lived in the latter period of the Roman republic, and acquired great celebrity from the splendor of his private character. He inherited from his father, and from his uncle Q. Cæcilius, who adopted him, great wealth; and availed himself of his liberal education to such a degree, that he was exhibited as a pattern to his school-fellows, among whom were the younger Marcus and Cicero. When he attained maturity, the republic was disturbed by the factions of Cinna and

and Sylla; but endowed with a peculiar suavity of manners, which made him uniformly averse from civil contentions, he retired to Athens with a great part of his property, and there devoted himself to study, and particularly to Grecian literature, in which he excelled his contemporaries of his own country. At Athens he became popular by his conciliatory disposition and conduct, by the liberal distribution of his money, and by his charity to the poor and distressed. The Athenians wished to confer on him the honour of a citizen, which he declined; and though during his abode with them, he would not suffer them to erect statues to him, they testified their respect in this way immediately on his departure, an event which occasioned a general mourning through the city. The surname of *Atticus*, which he acquired from his attachment to this city, and his familiarity with its language and manners, became his usual appellation during his life, and continued to distinguish him in after ages. At a distance from the scene of political contention, he interested himself in the welfare of his friends; and at the risk of displeasing the triumphant party, he served a friend in distress, for he assisted young Marius, when declared a public enemy, by supplying him with money to escape from his enemies. He even occasionally made journeys to Rome to support his friends in contested elections, and embraced every opportunity that occurred of serving those who needed his assistance. To Cicero he was particularly attached, partly from affinity, as his sister Pomponia was married to Quintus Cicero, but chiefly from similarity of disposition; and he supplied him with money in the time of his exile; and also intimate with Hortensius, the rhetorical rival of Cicero, he exerted himself in preserving a good understanding between them. When Rome was in a tranquil state, it was the place in which Atticus chose to reside; but he never engaged in public business. He availed himself of none of the opportunities that occurred of increasing his fortune; whilst he was honoured with a nomination to public offices, he disregarded the emoluments accruing from them. He never engaged in a law-suit, nor was ever concerned in an accusation as the principal or second. He never bid for estates at public auctions, or in any way partook of the spoils of the unfortunate. When the war broke out between Cæsar and Pompey, Atticus was sixty years old; and his age was a plea of which he availed himself for not taking part with either; and by his subsequent conduct he offended neither the one nor the other. After the death of Cæsar, whose favour he had conciliated, he successfully opposed the establishment of a private treasure for the use of the party which had taken him off, though he was upon very intimate terms with Brutus. Nevertheless, when Brutus and Cassius were obliged to leave Italy, he supplied Brutus with a large sum of money. He afterwards exerted himself to the utmost of his power in favour of Antony and his family. Upon the return of Antony from his retreat, and when every friend of the republican party was exposed to great danger, Atticus withdrew into a place of refuge; and though Antony was urged to destroy him, he remembered his obligations to his benefactor, assured him by a letter written with his own hand of his safety, and appointed a guard for his protection. In this season of distress, Atticus succoured the fallen party, and supplied the necessities of those who, under proscription, had fled to Epirus, out of his own estates; and he shewed no less respect to Servilia the mother of Brutus, after the death of this patriot, than he had done during his prosperity. His family afterwards became allied to the imperial family by the marriage of his daughter with M. Agrippa, the friend

and favourite of Octavian, who formed with Atticus an intimate acquaintance, and communicated to him all his movements and designs. While Antony lived, an intimate correspondence was carried on between him and Atticus. Thus from the first to the last, he maintained the character of "the general friend of all parties, in all fortunes." The conduct by which this character was acquired and maintained has not escaped censure; and Atticus has been charged with a neutrality and indifference, with regard to public concerns, which was dishonourable and criminal. To his Epicurean principles, which he imbibed at Athens under Phædon and Zeno the Sidonian, some have ascribed the peculiarities of his temper, and the resolution by which he seems to have been actuated, that amidst the fluctuation and vicissitudes of political events he would maintain a composed and tranquil mind. But others have attributed his determining character to natural disposition and early habits, more than to any speculative principles. In domestic life, as well as in the more extended circle of social intercourse, he possessed a degree of self-command, which, all circumstances considered, appears to have been very extraordinary and singular. The temper of his uncle Cælius was intolerably perverse, and yet Atticus honoured it in such a manner that he retained his favour to the last, and inherited the greatest part of his very large fortune. With his mother, who died at the age of 50, when he was 67 years old, and with his sister, who was nearly of the same age with himself, he lived with a harmony so uninterrupted, that he never had occasion to be reconciled to the former, nor ever had any quarrel with the latter. By his own patrimony and his uncle's bequest, he was master of a large fortune, which he expended with liberality. His mode of living corresponded to his affluence, and to his taste and habits, as a man of literature and philosophy. His domestics were select, but not numerous; several of them had been born and brought up in his own family; and many of them were in one way or other readers or copyists, employed to the purposes of literature. His table was elegant, but not costly. Reading was always an accompaniment of the supper; and he had no guests to whom such an entertainment was not acceptable. In his enjoyments he was moderate; in his studies, which formed a great part of his occupation, he was particularly attached to inquiries relative to the antiquities of his country; its laws, treaties, customs, and the genealogies of its illustrious families. On these subjects he wrote several treatises, which were held in high estimation. His poetical talents were employed in concise descriptions of the characters and actions of illustrious men, which were placed under their statues. He wrote in Greek a history of the consulate of his friend Cicero. Of the writings of Atticus, none remain; but we have a large number of the letters of Cicero, addressed to him, and written from the year of his consulship almost to the time of his death. These letters are confidential, and contain a variety of curious particulars; both political and literary. Atticus having attained to the age of 77, with little interruption of health, was seized with a disorder of the intestines, which terminated in a painful and incurable ulcer. Apprized of the danger of his case, he communicated to his son-in-law Agrippa, and other friends, his resolution of putting a period to a life that was no longer valuable to himself and others. Unmoved by their remonstrances, he determined to abstain from food, and though his fever left him and his pain abated, after an abstinence of two days, he persisted in his purpose, and on the fifth day, death closed the scene, in the year of Rome 721, B. C. 33. Corn. Nepos in Vit. Attici. Gen. Dict. Gen. Biog.

ATTICIUS, a Platonic philosopher, lived under the emperor M. Aurelius, and took pains in ascertaining the precise difference between the doctrines of Plato and those of Aristotle. Eusebius has preserved several fragments of his works, in which he argues against Aristotle, concerning the ultimate end of man, providence, the origin of things, the immortality of the soul, and other topics. Plotinus, of the Eclectic school, held the writings of Atticus in high estimation, and recommended them as very useful for obtaining an accurate knowledge of the Platonic system. Atticus pronounced it impossible for those who had imbibed the Peripatetic notions, to deviate their minds to a capacity of understanding and relishing the sublime conceptions of Plato. Euseb. Chron. sub. Aurel. A. 179. Prep. l. xv. c. 4, &c. Fab. Bib. Græc. v. ii. p. 54.

ATTICIUS, a patriarch of Constantinople in the fifth century, was a native of Sebastia in Armenia, and having received his education among the Macedonian monks, became first presbyter, and afterwards, viz. in 406, patriarch of the church of Constantinople. But having seized this see while John Chrysostom was living, he was excommunicated by pope Innocent I. and the western bishops. However, on the death of Chrysostom he was again restored, on condition of replacing his name in the diptychs, or list of the archbishops of Constantinople, whose names were recited at the altar, as having died in the communion of the church. Atticus is extolled for his learning, prudence, and piety; for the gentleness of his temper and manners; for his zeal against the Nestorians; and for his charity to the poor, without discrimination of religious party and profession. He died in the year 427. Whilst he was presbyter, he committed his sermons to memory; but when he became a bishop he preached extempore. Of his writings there are extant "A Letter to Cyril of Alexandria," on the restoration of the name of Chrysostom in the diptychs (apud Nicephor. Hist. Eccl. l. xiv. c. 26.); "A Letter to Calliopius, presbyter of the church at Nice," accompanying 300 crowns sent to the poor of that city (Soerat. l. vii. c. 25.); and another (in Nicephor. ubi supra) addressed to the deacons of the church of Alexandria, concerning the means of restoring peace to the church. He also wrote a book "On Faith and Virginitv," dedicated to the daughters of Arcadius, and cited by Cyril in his book to the empresses. Soerat. H. E. l. vii. c. 2. Sozom. H. E. l. viii. c. 27. Cave, H. L. vol. i. p. 384.

ATTIDIUM, now **ATTIGIO**, in *Ancient Geography*, a city of Umbria, situated between Sentinum, Camerinum, and Matilica, near the sources of the river Ælis. Pliny calls the inhabitants Attidates. Several ancient inscriptions have been found in the vicinity of Attigio.

ATTIGNY, in *Geography*, a town of France, and seat of a tribunal, in the department of Ardennes; two leagues north-west of Vouziers, and six south of Mezieres.

ATTILA, in *Biography and History*, king of the Huns, and by the modern Hungarians denominated "The Scourge of God," was the son of Mundzuk, and deduced his descent from the ancient Huns, who had formerly contended with the monarchs of China. Indeed the modern Hungarians have traced his genealogy upwards, in the thirty-fifth degree, to Ham, the son of Noah. At the death of Rugilas, A. D. 433, his two nephews, Attila and Bleda, succeeded to the throne of their ancestors. Having concluded an humiliating peace with the emperor Theodosius II., they extended their arms towards the north with so much success, as to reduce all the nations between the Danube and the Tuxine under their dominion. Under pretence of an offence given them by the Romans, they made an irruption into the

eastern empire, took several towns on the south of the Danube by storm, defeated several imperial armies, and laid waste the whole adjacent country with fire and sword. Theodosius, thinking himself insecure at Constantinople, retired into Asia, and was glad to purchase an inglorious peace. At this time the two nephews of Rugilas shared the government of the Huns; but Attila, whose ambition admitted of no partnership in power, caused Bleda to resign both his sceptre and his life, and acquired the sole sovereignty of the nation and its dependent territories. The extent of his empire affords the only evidence of the number and importance of his victories. If a line of separation were drawn between the civilized and the savage climates of the globe; between the inhabitants of cities, who cultivated the earth, and the hunters and shepherds who dwelt in tents; Attila might aspire to the title of supreme and sole monarch of the Barbarians. He alone, among the conquerors of ancient and modern times, united the two mighty kingdoms of Germany and Scythia, in their most ample latitude; Thuringia, extending to the Danube, was in the number of his provinces; he interposed with the authority of a powerful neighbour, in the domestic affairs of the Franks; and one of his lieutenants chastised, and almost exterminated, the Burgundians of the Rhine. He subdued the islands of the ocean, the kingdoms of Scandinavia, encompassed and divided by the waters of the Baltic; towards the east his dominion extended over the Scythian deserts to the banks of the Volga; and he sent ambassadors to negotiate an equal alliance with the empire of China. He also reckoned among his subjects the numerous and warlike tribes of the Gepidæ and Ostrogoths. "The crowd of vulgar kings, the leaders of so many martial tribes, who served under the standard of Attila, were ranged in the submissive order of guards and domestics, round the person of their master. They watched his nod; they trembled at his frown; and, at the first signal of his will, they executed, without murmur or hesitation, his stern and absolute commands. In time of peace, the dependent princes, with their national troops, attended the royal camp in regular succession; but when Attila collected his military force, he was able to bring into the field an army of five, or, according to another account, of 700,000 Barbarians." The portrait of Attila, says Jornandes, a Gothic historian, exhibits the genuine deformity of a modern Calmuck; with a large head, a swarthy complexion, small deep-seated eyes, a flat nose, a few hairs in the place of a beard, broad shoulders, and a short square body, of nervous strength, though of a disproportioned form. His haughty step and demeanour expressed conscious superiority; and by fiercely rolling his eyes, he seemed to enjoy the terror which he inspired. Nevertheless, this savage hero was not inaccessible to pity; his suppliant enemies might confide in the assurance of pardon and peace; and Attila was regarded by his subjects as a just and indulgent master. His delight was war, and he indulged his passion for it to the destruction of myriads. Apprized of the influence of superstition over ignorant and savage minds, he availed himself of it, as a collateral and useful instrument for the accomplishment of his purposes. Accordingly he pretended to have discovered, by means of a shepherd, the famous sword of the Scythian Mars; and being in possession of this, he asserted his divine and indefeasible claim to the dominion of the earth. As the favourite of Mars, whom he propitiated by bloody rites and sacrifices, Attila soon acquired a sacred character, which rendered his conquests more easy and more permanent; and the Barbarian princes confessed, in the language of devotion or of flattery, that they could not presume to gaze with

with a steady eye, on the divine majesty of the king of the Huns. In his garb and mode of living, the king of the Huns affected no peculiar distinction, but rigidly adhered to the simplicity of his Scythian ancestors. His dress, his arms, and the furniture of his house, were plain, without ornament, and of a single colour. The royal table was served in wooden cups and platters; fish was his only food; and the conqueror of the north never tasted the luxury of bread. His palace, though it surpassed all other houses in his dominions, was built entirely of wood; and it contained, within a palliated inclosure, a variety of separate buildings, appropriated to his numerous wives. When the Roman ambassadors were introduced into the privy apartment of Carca, the principal queen, she received their visit, reclining on a couch; her domestics formed a circle round her; and her domestics, seated on the ground, were employed in working the variegated embroidery which adorned the dress of the Barbaric warriors. The other wives of Attila politely admitted them to their presence and table, nor was there any appearance among them of the rigid and illiberal confinement imposed by Asiatic jealousy. When these ambassadors had audience of Attila himself, he was surrounded by a formidable guard; and when they were invited to the royal feast, they had reason to praise his politeness and hospitality. On this occasion the company were diverted by a variety of buffooneries, which produced loud and licentious peals of laughter; but Attila himself maintained an inflexible gravity, and never relaxed his features except on the reception of his favourite son, Irnac, who, by the assurance of his prophets, was to be the future support of his family and empire. Thus did this powerful monarch live familiarly among his people, and pride himself in trampling upon the pomp and parade of kings and emperors.

After the last peace with Theodosius, Attila sent various embassies, with complaints and threats, to Constantinople; and, to the dishonour of the imperial court, a base design was formed, with the privity and sanction of the emperor, of murdering Attila, under the disguise of a solemn embassy. The conspiracy was discovered, and the king of the Huns, with a singular moderation, contented himself with exacting a large ransom for the immediate agent in the business, and with severely reprimanding Theodosius. The treaty with the eastern emperor was renewed, at the expence of fresh payments. On the accession of Marcian, in 450, Attila's demand of tribute was refused; upon which he sent a threatening message to the emperors of the east and west, which was delivered by his eavys in these terms: "Attila, my lord, and thy lord, commands thee to provide a palace for his immediate reception." He proposed, however, to direct his arms, in the first instance, against Valentinian III. a weak and unworthy prince. The pretext of this hostility was founded on the following circumstance. Honoria, the sister of Valentinian, having dishonoured herself by an intrigue with her chamberlain, was banished to the court of Constantinople. Here she found means to send an offer of her person to Attila, with a ring, and an urgent request that he would march and claim her for his spouse. These overtures were at first received with coolness on the part of Attila, but afterwards conceiving that he might derive advantage from them, he made a formal demand of Honoria, with an equal share of the imperial patrimony, before he proceeded on his intended irruption into Gaul. His demand was refused, and Honoria was married to an obscure person in Italy, and there confined to perpetual imprisonment. Attila, professing to be satisfied with respect to Honoria, entered Gaul, under a pretence of making war upon Theo-

doas, king of the Visigoths, in the province. While the Visigoths assembled, in 451, an immense army of northern Barbarians, and without opposition, crossed the Rhine. In his progress through Gaul, he defeated the counts of Orleans and burnt several cities, and at length laid siege to Orleans. Here he was overtaken by the emperor Theodosius, and of the empire, under the name of Flavius Aetius, who persuaded him to retire. After the bloody battle of Chalons, he marched without molestation to the confines of Thuringia, where he passed the Rhine, and continued his progress to Pannonia. At the commencement of the following year, Attila, having recruited his forces, passed the Alps, entered Italy, and invaded Aemilia, which he utterly destroyed. He then ravaged Lombardy, sacked and reduced to ashes many of their towns; and thus, by means of the fright which he spread from the terror of his name, was instrumental in laying the foundation of the Venetian republic. Valentinian, incapable of resistance, fled from Ravenna to Rome, and sent a deputation to Attila, at the head of which was Leo, bishop of Rome, for the purpose of communicating his wrath, and proposing terms of accommodation. Attila consented to leave Italy, on the payment of a very large sum, as the dowry of the princess Honoria, and an annual tribute. But this was only a temporary truce; as he threatened to return the next year, if Honoria and her dowry were not punctually transmitted to him. Attila, however, did not long survive his return to his own country. Having added to the number of his wives a beautiful young virgin whose name was Ildico, he celebrated his marriage with great pomp and festivity at his wooden palace beyond the Danube; and, oppressed with wine and sleep, he retired at a late hour to the nuptial bed. In the night a blood-veined burst, and as he lay in a supine posture, he was suffocated by a torrent of blood. His attendants found the trembling bride sitting by the side of the bed, hiding her face with a veil, and lamenting the death of the king, as well as her own danger. His body was deposited in the middle of the plain, under a stolen pavilion; and "the chosen squadrons of the Huns, wheeling round in measured evolutions, chanted a funeral song to the memory of a hero glorious in his life, invincible in his death, the father of his people, the scourge of his enemies, and the terror of the world. According to their national custom, the Barbarians cut off a part of their hair, gashed their faces with unseemly wounds, and bewailed their valiant leader as he deserved, not with the tears of women, but with the blood of warriors. The remains of Attila were inclosed within three coffins, of gold, of silver, and of iron, and privately buried in the night; the spoils of nations were thrown into the grave; the captives who had opened the ground were inhumanly massacred; and the same flames, who had indulged such excessive grief, feasted with his late and intemperate marriage at the recent sepulture of their king." The death of Attila is commonly dated in the year 453; by some in 452. With him the empire of the Huns terminated; for after his death, his numerous sons either destroyed one another by their mutual contentions, or were disposed by their old enemies, who seized on the rack of kings. *Anc. Un. Hist. vol. xvii. p. 144—152. Gibber's Hist. vol. vi. p. 40—157.*

ATTILIA, *ATTILIA*, in *shipbuilding*, denotes the rigging or furniture of a ship. *Fleta. l. i. c. 25.*

ATTILUS, in *Medicine*, a term synonymous with *adale*, *adale*, and *adale* *Attur*; and applied by Pury and Rondelcius to the variety of the Linnæan *asper* *flario*, or common surgeon.

ATTINGA AMERICANA, in *Conchology*, a name by which

which Briff. calls the pinnated grouse of the Arctic Zoology, and *tetrax cupido* of Gmelin.

ATTIRE, in *Botany*, is used by some to denote the third part or division of the flower of a plant; the other two being the *emballement* and the *foliation*.

The attire is of two kinds, *semiform* and *florid*.—The semiform attire consists of two parts; chives or stamina, and summits or apices, one upon each flamen.

The florid attire is usually called the thrums, as in the flowers of marygold, tansy, &c. Those thrums are called suits, which consist of two, but most times of three pieces. And the outer part of the suit is the floret, whose body is divided at the top like a cowslip flower, into five parts, or distinct leaves.

ATTIRE, in *Heraldry*, signifies a single horn of a stag.

ATTIRE, in *Hunting*, denotes the head or horns of a deer. The attire of a stag, if perfect, consists of bur, pearls, beam, gutters, antler, sur-antler, royal, sur-royal, and croches:—of a buck, of the bur, beam, brow-antler, advancer, palm, and spellers.

ATTIRED, in *Heraldry*, a term used in speaking of the horns of a stag, hart, or buck.

ATTIRES, are both the horns of a stag, hart, or buck.

ATTITUDE, in *Painting* and *Sculpture*, the posture or gesture of a figure or statue; or such a disposition of their parts, as seems to express the action and the sentiments of the person represented. See *MECHANICAL MOTION of the Human Figure*, and *Composition*, and *Contrast*, under the article *SCULPTURE*.

ATTIUM, in *Ancient Geography*, a promontory on the western coast of the island of Corsica; now called *Punta di Acciolo*.

ATTLEBOROUGH, in *Geography*, a township of America, in Bristol county, Massachusetts, eighty-two miles south from Boston, and nine north from Providence.

ATTLEBURGH, a town of England, in Norfolk, distant N. N. E. from London ninety-four miles.

ATTMELLA. See *ACMELLA*.

ATTNANG, in *Geography*, a town of Germany, in the archduchy of Austria, one mile W. S. W. of Schwannlact.

ATTOCK, a city and fortrefs of Hindostan, on the eastern bank of the Indus, built by Achar, in 1581, to command the pass that leads from Cabul to Lahore. This pass is so confined, either by the nature of the banks, or of the channel of the river, or both, that the passage from the landing place leads through the very fortrefs itself. The ancient Taxila, where Alexander crossed the Indus, stood on or near to the site of Attock. N. lat. 33° 6'. E. long. 71° 15'. That part of the river Indus, called also Nilab and Sinde, that separates the province of Lahore from Pailhawur, is denominated the Attock, probably from the city founded on its banks. At Attock, the river Cabul, after receiving the rivers of Sewad, Bijore, &c. joins the Indus, and very considerably increases it. For though the Indus is sometimes fordable above Attock, and Mr. Forster actually forded it at twenty miles above this place, July 10th, 1783; we never hear of its having been forded below that point. "From Attock downwards to Moultan, or to the conflux of the Panjab waters, this river (says Major Rennell) has obtained the name of Attock;" but spoken of generally, it is called Sinde.

ATTOLLENS, compounded of the Latin *ad, to*, and *sollo, I lift*, in *Anatomy*, a name common to several muscles, whose office or action is to raise the parts they belong to. The attollent muscles are otherwise called *levators* and *elevators*.

ATTOLLENS *Musculus Aurem*, is a thin broad muscle connected at its upper part to the tendon of the fronto-occipitalis, and at the lower to the pinna of the ear opposite to the antihelix. Its use is to draw the external ear upwards, and to render it tense. This muscle is called *superior auris* by Winslow.

ATTOMBISSEUR, in *Ornithology*, a term by which the French falconers distinguish those falcons which will attack the heron in its flight; such a bird they call *un bon attombisseur*.

ATTORE, in *Geography*, a town of Hindostan, in the Myrore country, fifty-four miles north of Trichinopoly, and twenty-nine N. N. W. of Rajanagur.

ATTORNARE, in the original sense, signified to turn over money and goods, that is, to assign and appropriate them to certain persons, or use. This is properly called *attornare rem*. *Attornare personam* denotes to depute a representative, or proxy, to appear and act for another.

ATTORNATO *faciendo vel recipiendo*, in the *Common Law*, a writ to command a sheriff, or steward, of a county-court, or hundred-court, to receive and admit an attorney to appear for the person that oweth suit of court. F. N. B. 156. Every person that owes suit to the county-court, court-baron, &c. may make an attorney to do his suit. Stat. 20 H. III. c. 10.

ATTORNEY, ATTORNATUS, in *Law*, a person appointed by another to do something in his stead, particularly to solicit and carry on a law-suit.

The word is compounded of the Latin *ad, to*, and the French *tourner, to turn*, q. d. *to turn a business over to another*. The ancient Latin name, according to Braeton, is *responsalis*.

An attorney is either public, in the courts of records, the king's bench, common pleas, &c. and made by warrant from his client; or private, upon occasion for any particular business, who is commonly made by letter of attorney.

Attorneys, in *Common Law*, are much the same with procurators, proctors, or syndics, in the *Civil* and *Canon Law*.

Attorneys are properly those who sue out writs or process, or commence, carry on, and defend actions, or other proceedings, in the names of other persons, in any of the courts of common law.—They are distinguished from *solicitors*, who do the like business in courts of equity; as the chancery, equity-court in the exchequer, chamber-court of the duchy, or the like.

Formerly every suitor was obliged to appear in person to prosecute or defend his suit, according to the old Gothic constitution, unless by special licence under the king's letters patent. F. N. B. 25. This is still the law in criminal cases. Nor can an ideot appear to this day by attorney, but in person; because he is supposed not to have sufficient discretion for appointing a proper substitute; and upon his being brought before the court in so defenceless a condition, the judges are bound to take care of his interests, and they shall admit the best plea in his behalf that any one present can suggest. But as in the Roman law "*cum olim in usu fuisset, alterius nomine agi non posse, sed, quia hoc non minimam incommoditatem habebat, ceperunt homines per procuratores litigare*" (Inst. 4. tit. 10.); so with us, upon the same principle of convenience, it is now permitted, in general, by divers ancient statutes, of which the first is stat. Westm. 2. c. 10. (13 Ed. I. A. D. 1285.) that attorneys may be made, as if they had letters patent, to prosecute or defend any action in the absence of the parties to the suit. These attorneys are now formed into a regular corps; they are admitted to the execution of their office by the superior courts

of Westminster-hall; and are in all points officers of the respective courts in which they are admitted; and as they have many privileges on account of their attendance there, so they are peculiarly subject to the censure and animadversion of the judges. No man can practise as an attorney in any of those courts, but such as is admitted and sworn an attorney of that particular court; an attorney of the king's bench cannot practise in the court of common pleas; nor *vice versa*. To practise in the court of chancery, it is also necessary to be admitted a solicitor therein; and by the stat. 22 Geo. II. c. 46. no person shall act as an attorney at the court of quarter sessions, but such as has been regularly admitted in some superior court of record. With respect to the several courts, there are attorneys at large, and attorneys special, belonging to this or that court only. An attorney may be a solicitor in other courts by a special retainer; one may be an attorney on record, and another do the business; and there are also attorneys who manage the business out of the courts. So early as the statute 4 Hen. IV. c. 18. it was enacted that attorneys should be examined by the judges, and none admitted but such as were virtuous, learned, and sworn to do their duty. And many subsequent statutes have laid them under farther regulations. By 3 Jac. I. c. 7. attorneys, &c. shall not be allowed any fees laid out for counsel, or otherwise, unless they have tickets thereof signed by them that receive such fees, and they shall give in true bills to their clients of all the charges of suits under their hands, before the clients shall be charged with the payment thereof. If they delay their client's suit for gain, or demand more than their due fees or disbursements, the client shall recover costs and treble damages; and they shall for ever after be disabled to be attorneys. None shall be admitted attorneys in courts of record, but such as have been brought up in the said courts, or are well skilled, and honest; and no attorney shall suffer any other to follow a suit in his name, on pain of forfeiting 20 l. to be divided between the king and the party aggrieved. By 12 Geo. I. c. 29. if any person who hath been convicted of forgery, perjury, subornation of perjury, or common barratry, shall practise as an attorney or solicitor in any suit or action in any court, the judge where such action shall be brought hath power to transport the offender for seven years, by such ways and under such penalties as felons. The act 2 Geo. II. c. 23. ordains, that all attorneys shall be sworn, admitted, and enrolled, before they sue out writs in the courts at Westminster; and they are required to have served a clerkship of five years, and to be examined, sworn, and admitted in open court; and attorneys shall not have more than two clerks at one time, except the prothonotaries in the common pleas, and the secondary in the king's bench, and the several prothonotaries in the counties palatine and great sessions in Wales, each of whom may have three. Attorneys, upon being sworn and admitted, shall pay a stamp-duty, by several acts, of 16 l. When the attorney's bills are taxed, he is to pay the costs of taxation, if the bill be reduced a sixth part. A penalty of 50 l. and disability to practise, are the consequences of acting contrary to this statute. By stat. 6 Geo. II. c. 27. attorneys of the courts at Westminster may practise in inferior courts. By 12 Geo. II. c. 13. attorneys, &c. that act in any county-court, without admission according to the statute 2 Geo. II. c. 23. shall forfeit 20 l.; and no attorney, who is a prisoner, shall sue out any writ, or prosecute suits; if he doth, the proceedings, &c. shall be void, and such attorney, &c. shall be struck off the roll. By 22 Geo. II. c. 46. persons bound clerks to attorneys or solicitors are to cause affidavits to be made and filed of the execution of the articles, names,

and places of abode of attorney or solicitor, and clerk; and none to be admitted till the affidavits be produced and read in court. Clerks are actually to serve during their whole time, and make affidavits thereof. Persons admitted sworn clerks in chancery, or serving a clerkship to such, may be admitted solicitors. By 23 Geo. II. c. 26. any person duly admitted a solicitor, may be admitted an attorney, without any fee for the oath, or any stamp; and by stat. 2 Geo. II. c. 23. § 20. attorneys may be admitted solicitors. By 25 Geo. III. c. 80. every admitted attorney, solicitor, notary, proctor, agent, or procurator, shall annually take out a stamped certificate, with a five pound stamp within the Bill of mortality, and three pound elsewhere, from the courts in which they practise, on penalty of 50 l. and incapacity of practising. By 34 Geo. III. c. 14. every person who shall become bound to serve as a clerk in order to his admission as a solicitor or attorney in any of the courts at Westminster, shall be charged an additional stamp-duty of 100 l. And in any of the courts of great session in Wales, or in the counties of Chester, Lancashire, or Durham, or in any court of record in England holding pleas, where the debt or damage shall amount to 40 s. and not in any of the said courts at Westminster, a stamp duty of 50 l. And by the several stamp acts, if the consideration money given with such clerk or apprentice be under 10 l. a stamp duty of 10 s. If above 10 l. but not over by 37 G. III. c. 3. 10 s. more. The indenture shall be enrolled, and affidavit shall be made within six weeks. Persons who have paid the duty of 100 l. in any of the courts at Westminster, may be admitted in any of the other courts without payment of any further duty. New contracts with other masters are subject to no further duty. The privileges belonging to attorneys are as follow: an attorney, in respect of his attendance at the court, cannot be pressed for a soldier; but he is not privileged from serving in the militia, or finding a substitute: an attorney shall not be made constable, nor be elected into any other office against his will; as to the office of overseer of the poor, or churchwarden, or any office within a borough. Attorneys have the privilege to sue and be sued only in the courts at Westminster, where they practise; they are not obliged to put in special bail, when defendants; but when they are plaintiffs, they may insist upon special bail in all bailable cases. 1 Vent. 259. Wood's Inst. 450. But an attorney of one court may, in that court, hold an attorney of another court to bail. Payment to the attorney is payment to the principal. Dougl. 623. 1 Black. R. 8. An attorney has a lien in the money recovered by his client, for his bill of costs; if the money come to his hands, he may retain to the amount of his bill. He may stop it *in transitu*, if he can lay hold of it; if he apply to the court, they will prevent it being paid over until his demand is satisfied. If the attorney give notice to the defendant not to pay till his bill be discharged, a payment by the defendant after such notice would be in his own wrong, and like paying a debt which has been assigned after notice. Dougl. 288.

Attorneys are liable to be punished in a summary way, either by attachment, or having their names struck out of the roll, for ill practice, attended with fraud and corruption, and committed against the obvious rules of justice and common honesty; but the court will not easily be prevailed upon to proceed in this manner, if it appears, that the matter complained of was rather owing to neglect or accident than design, or if the party injured has other remedy by act of parliament, or action at law. 12 Mod. 251. 318. 320. 583. 657. 4 Mod. 367. If an attorney, defendant in an action, does not appear in due time, the plaintiff may sign a "*non-procurer*," which enables him to strike the defendant

off the roll, and then he may be sued as a common person (2 Hen. 4V. c. 8.), and cannot be proceeded against by bill. On making satisfaction to the plaintiff, an attorney for a judgment may be reformed. Impey's Instructor Clerical, C. P. 521.

Attorneys are sometimes struck off the roll on their own application, for the purpose of being called to the bar, &c.; and in this case, they must be disbarred by their law, before they are re-admitted attorneys. Dougl. 144. An attorney convicted of felony is struck off the roll. Cowp. 820. Attorneys are also liable to be punished for late and unfair dealings towards their clients in the way of business, as for protracting suits by little trifles and devices, and putting the parties to unnecessary expence, in order to raise their bills; or demanding fees for business that was never done; or for refusing to deliver up their clients' writings, with which they had been intrusted in the way of business, or money which has been recovered and received by them to their clients' use, and for other such like gross and palpable abuse. 2 Hawk. P. C. 143. 8 Mod. 386. 12 Mod. 516.

Attorney of the Duchy Court of Lancaster, attornatus curi. decanus Lancastrie, is the second officer in that court; being there, for his skill in law, placed as assessor to the chancellor of the court, and chosen for some special trust reposed in him, to deal between the king and his tenants. Cowel.

Attorney-General, is a great officer under the king, made by letters patent. It is his province to exhibit informations, and prosecute for the crown, in matters criminal; and to file bills in the Exchequer, for any thing concerning the king in inheritance or profits; and others may bring bills against the king's attorney. His proper place in court, upon any special matters of a criminal nature, in which his attendance is acquired, is under the judges, on the left hand of the clerk of the crown; but this is only upon solemn and extraordinary occasions; for usually he does not sit there, but within the bar in the face of the court.

Attorney, Letter of. See LETTER.

Attorney, Warrant of. See WARRANT.

ATTOURNMENT, or **ATTORNMENT**, a transferring of duty and service to another lord; or an acknowledgment which a tenant makes of homage and service to a new lord.

By the nature of the feudal connection, it was not thought reasonable nor allowed, that a feudatory should transfer his lord's gift to another, and substitute a new tenant to do the service in his own stead, without the consent of the lord; and, as the feudal obligation was considered as reciprocal, the lord also could not alienate his feignory without the consent of his tenant, which consent of his was called an "*attornment*." This doctrine of attornment was afterwards extended to all leases for life or years. For if one bought an estate with any lease for life or years standing out thereon, and the lessee or tenant refused to attorn to the purchaser, and to become his tenant, the grant or contract was in most cases void, or at least incomplete (Lit. §. 551.): which was an additional clog upon alienations. But after the statute "*quia emptores terrarum*" (18 Ed. I. il. 1.), was passed, by which subinfeudation was prohibited, it became necessary that when the reversion or remainder-man after an estate for years, for life or in tail, granted his reversion or remainder, the particular tenant should attorn to the grantee. The necessity of attornment was, in some measure, avoided by the statute of uses (27 Hen. VIII. c. 10.), as by that statute, the possession was immediately executed to the use; and by the statute of "*Wills*" (34 & 35 Hen. VIII. c. 5.), by which the legal estate is immediately vested in the devisee.

Attornments, however, still continued to be necessary in many cases; but both their necessity and efficacy are now almost wholly taken away: for by Stat. 4 & 5 Ann. c. 16. it is enacted, that all grants and conveyances of manors, lands, rents, and reversions, &c. by fine or otherwise, shall be good, without the attornment of the tenants; but notice must be given of the grant to the tenant, before which he shall not be prejudiced by the payment of any rent to the grantor, or for breach of the condition for non-payment. And by Stat. 11 Geo. II. c. 19. attornments of lands, &c. made by tenants to strangers claiming title to the estate of their landlords shall be null and void, and their landlord's possession not affected thereby; though this shall not extend to vacate any attornment made pursuant to a judgment at law, or with consent of the landlord; or to a mortgage on a forfeited mortgage. Till these statutes were passed, the doctrine of attornment was one of the most copious and abundant parts of the law. But these acts having made attornment both unnecessary and inoperative, the learning upon it may be deemed almost entirely useless. 1 Inst. 309. Jacob's Law Dict. by Tomlyns, tit. *Attornment*.

ATTOWAI, in *Geography*. See **AREOI**.

ATTRACTION, in *Natural Philosophy*, a general term used to denote the power or principle, by which all bodies mutually tend towards each other, without regarding the cause or kind of action that may be the means of producing this effect.

The existence of a principle of this kind is so clearly manifested by many of the most common phenomena of nature, which fall under our daily inspection, that it must have been known in very early times; but the information we have hitherto obtained of the progress made by the ancients in physical investigations, is too vague and obscure to afford any proof of their ever having applied the action or influence of this power to the purposes of science. The philosopher Anaxagoras, who flourished about 500 years before the Christian era, is reported, by Diogenes Laertius, to have attributed to the celestial bodies a tendency towards the earth, which he considered as the centre of their motions; and the doctrines of Democritus and Epicurus are founded upon the same principle, as appears from their elegant interpreter Lucretius, who thence derives the consequence of the universe being without bounds. But though some bold and original characters had embraced these opinions, it is no less certain, from the testimonies of other writers, that they were far from being generally received in the ancient world.

The first, among the moderns, who appears to have had just notions of this doctrine, was Nicholas Copernicus, the celebrated restorer of the old Pythagorean system of the universe; who in his work "*De Revolut. Orb. Caelest.*" (lib. i. c. 9.), expresses himself thus: "I consider gravity as nothing more than a certain natural appetite (*appetentia*) that the Creator has impressed upon all the parts of matter, in order to their uniting and coalescing into a globular form, for their better preservation; and it is probable that the same power is also inherent in the sun, moon, and planets, that those bodies may constantly retain that round figure in which we behold them." He also considered the sun as the chief governing power of all the rest, as may be inferred from some of the last words of Tycho Brahe, who perceiving the approach of death, called for the celebrated Kepler (then a young man, and his assistant in his observatory at Prague), and after charging him with completing the Astronomical Tables which he had left unfinished, thus addressed him: "My friend, although what I ascribe to a voluntary, and as it were, an obsequious motion of the planets round

the sun, you attribute to an attractive energy of that body, yet I must entreat, that, in the publication of my observations, you would explain all the celestial motions by my hypothesis, rather than by that of Copernicus, which I know you would otherwise incline to follow." (Life of Tycho Brahe.)

Kepler, however, in his own works, constantly maintains the doctrine of attraction, and even carries it farther than Copernicus had ever done. Thus, he calls gravity the reciprocal and mutual affection between similar bodies, in order to their union." He also remarks, with Copernicus, against the Peripatetics, that "the heavenly bodies do not tend to the centre of the universe, but to the centre of those larger round bodies, of which they make a part: so that if the earth were not spherical, things would not fall from all points towards its centre. If a stone, for instance, were to be placed at a distance from another stone, in any part of the universe, without the sphere of action of a third body, like two magnets, they would come together in some intermediate point; each advancing, in space, in the inverse proportion of their quantities of matter. Hence, if the sun and the earth were not kept asunder by some power, in their respective orbits, they would move towards each other; the moon passing over fifty-three parts of the way while the earth passed over one, supposing their densities equal." (Astron. Nov. in Introduct.)

From the same principle, Kepler also accounted for the general motion of the tides; viz. by the attraction of the moon, and expressly calls it *vis attractiva lunaris*; adding, that if the earth did not exert an attraction over its own waters, they would rise and rush to the moon. We also find him suspecting that certain irregularities in the motion of the moon are owing to the combination of the earth and sun upon this body. (Ibid.)

These and other reflections concerning the universality of attraction, he accompanies with an ingenious dissipation of a law of nature, from conjecture only, but which was afterwards verified by experiment. The schools had taught that some bodies were by their nature heavy, and so fell to the ground; and that others were naturally light, and for that reason ascended. But Kepler pronounced, that no bodies whatever are absolutely light, but only relatively so; and consequently that all matter is subjected to the law of gravitation. So far the genius of Kepler was fortunate, in tracing out the great principle which prevents the planets from flying off from the sun; but his sagacity failed him, when he endeavoured to shew by what means they were kept from falling into that immense body, and what power perpetuated their motion in their orbits: a general investigation of the laws of motion was yet wanting; the discovery of which, as well as many other things, being reserved, as he himself prophesies at the end of his work, "for the succeeding age, when the Author of nature would be pleased to reveal these mysteries."

The first person in this country, who embraced the doctrine of attraction, was Dr. Gilbert, a native of Colchester, and a physician at London, is a work published in the year 1600, intitled, "De Magnete Magneticisque Corporibus;" which contains a number of curious things; but he did not properly distinguish between attraction and magnetism. The next after him was lord Bacon, who, though not a convert to the Copernican system, yet acknowledged an attractive power in matter (Nov. Organ. lib. ii. achor. 56. 47. & 48.); and in the dawn of philosophy, in which he lived, he constantly recommends an inquiry into the physical causes and reasons of things; observing, "that he who shall deny attend to the appetences and general attraction of matter, which

is in the earth and heaven, are exceedingly powerful, and indeed pervade the universe, will receive from what he sees passing on the earth, clear information concerning the nature of the celestial bodies; and, contrariwise, from notions which he shall find over on the heavens, will learn many particulars relating to the things below, which not he could find from us." (De Dignitate & Augmentis Scient. lib. iii. cap.)

In France, this was first taught and followed, methinks, by great excellence, by the illustrious father of physics. The latter, by his principles, made it the fundamental principle of his system of philosophy from new, which he published in 1639, and is thus intitled, "Analyse de la Mécanique." In this work, he demonstrated the parts of matter or weight, the universe being actuated, by the quantity of having a tendency to move to each other, and shewing, that this is the reason why they move to the middle of the solid figure, not by virtue of a centre, but by their mutual attraction; and to that end may be placed in an epigram with another. Galileo, in Italy, had likewise considered this subject, but with far less profundity and extension than we find it in these contemporary Bacon and Kepler.

But to one, before Newton, had entertained such just and clear notions of the doctrine of universal gravitation, or had applied so near to the making of the great application of it to the laws of nature, as the celebrated Dr. Hooke. The philosophical experiments he had made, were, one bean, b, and another c, in air; but Hooke, in his work, called "An Attempt to prove the Motion of the Earth," 1674, 4to. pp. 173. 174. has comprehended it in nearly the whole of his plan. He there shews, that the hypothesis of a whirlwind, or the system of the world, is, in many respects different from all other systems which depend upon the three following principles: 1. That the celestial bodies move not by an attraction or gravitation towards their proper centres, but that they mutually attract each other within their sphere of activity. 2. That all bodies which have a simple and direct motion, continue to move in a right line, if no force, which operates without ceasing, does not constrain them to describe a circle, an ellipse, or some other more complicated curve. 3. That attraction is so much the more powerful, as the attracting bodies are nearer to each other.

He also made several experiments with a view to strengthen the preceding conjectures. For this purpose, he suspended a bullet to the end of a long string, and after it had been made to oscillate, he impressed upon it a small lateral motion; and remarked, that the bullet described an ellipse, or a curve of that form, round the vertical line. He then attached to the string of the first bullet, another, which carried a smaller one; and after having given to the latter a circular motion round the vertical line, he put the other in motion, as in the former experiment; when it was found, that neither one or the other described an ellipse, but moved round a point at a mean distance between them, which appeared to be their centre of gravity. (Life of Dr. Hooke, prefixed to his posthumous work.)

This was certainly very ingenious; but Hooke did not consider that the centre of force slides to each of the foci of the ellipse, and not in its centre; and though the observation was suggested to him, and he was even excited by the promise of a very considerable reward, to determine the law of attraction, which would occasion a body to describe an ellipse round another quiescent body, placed in one of its foci, he was unable to accomplish the undertaking. The problem, which belongs to the higher geometry, was too difficult for that time; this admirable discovery, which does the highest honour to the human mind, being reserved for

the genius of Newton; and though Hooke claimed a share of the glory of this discovery, it was without the smallest foundation; as his conjectures were far short of the proofs which were required in the sublime demonstrations by which the former established this law of the universe.

Such was the progress of the system of universal gravitation, when this extraordinary man first appeared; who, according to Pemberton (View of Sir Isaac Newton's Philosophy, 1725, 4to.), first began, about the year 1666, to suspect the existence of this principle, and to attempt to apply it to the celestial motions. Having retired into the country to avoid the plague, which about this time prevailed in London and its vicinity, his meditations turned upon the nature of gravity; and one of his first reflections appears to have been, that this power, which, by its continual action, occasions the fall of bodies towards the surface of the earth, to whatever height they are taken, might possibly extend much farther than was commonly imagined; as for instance, to the distance of the moon, or still higher. And if so, he began to consider, that it might be this force which retained the moon in her orbit, by counterbalancing the centrifugal force which arises from her revolution round the earth. It also occurred to him, at the same time, that though this power appears to suffer no diminution at any heights to which we can ascend, these being comparatively extremely small, yet it was highly probable, that, at very great distances from the earth, it might be considerably weakened.

In following therefore this conjecture, he was farther led to conceive, that if the attraction of the earth was the cause of retaining the moon in her orbit, the planets, in like manner, must be retained in their orbits by the attractive force of the sun; and as the squares of the times of the revolutions of the planets had been found by Kepler to be proportional to the cubes of their mean distances from the sun, it followed that the diminution of their centrifugal forces, and of course that of gravity, would be reciprocally as the squares of their distances from that body. Hence, from the experiments which had been already made on the descent of heavy bodies at small elevations, he determined the height from which the moon, if left freely to herself, would descend towards the earth in a short interval of time: this is well known to be the versed sine of the arc that she describes in that time; and which, by means of the lunar parallax, may be determined in parts of the earth's radius; so that to compare the diminution of gravity with the observations, nothing more was necessary than to know the magnitude of this line.

But Newton having at that time only an incorrect measure of the terrestrial meridian, obtained a result considerably different from that which he expected; whence, imagining that some unknown forces might be connected with the gravity of the moon, he abandoned his first ideas. Some years afterwards, however, his attention was again called to the subject by a letter of Dr. Hooke; and as Picard, about this time, had measured a degree of the earth in France with great exactness, he employed this measure in his calculations instead of the one he had before made use of, and found, by that means, that the moon is retained in her orbit by the sole power of gravity, supposed to be reciprocally proportional to the squares of the distances.

According to this law, he also found that the line described by bodies in their descent is an ellipse, of which the centre of the earth occupies one of the foci; and considering, afterwards, that the orbits of the planets are, in like manner, ellipses, having the centre of the sun in one of their foci, he had the satisfaction to perceive, that the solution which he had undertaken, only from curiosity, was applicable

to some of the most sublime objects of nature. These discoveries gave birth to his celebrated work entitled, "Philosophiæ Naturalis Principia Mathematica," which appeared in 1767; and is justly considered as one of the greatest monuments that has ever been erected by human genius to the honour of science.

In generalising these researches, this profound geometer afterwards shewed, that a projectile may describe any conic section whatever, by virtue of a force directed towards its focus, and acting in proportion to the reciprocal squares of the distances. He also developed the various properties of motion in these kinds of curves, and determined the necessary conditions, so that the section should be a circle, an ellipse, a parabola, or an hyperbola, which depend only upon the velocity and primitive position of the body; assigning, in each case, the conic section which the body would describe. He also applied these researches to the motion of the satellites and comets, shewing that the former move round their primaries, and the latter round the sun, according to the same law; and he pointed out the means of determining, by observation, the elements of these ellipses.

In considering that the satellites move round the planets in nearly the same manner as if these planets were quiescent, Newton perceived that they must all equally gravitate towards the sun. The equality of action and re-action, did not allow him to doubt that the sun gravitates towards the planets, as well as these towards their satellites; and that the earth is attracted by all the bodies that are attracted towards her. He afterwards extended, by analogy, this property to all the parts of which bodies are composed, and established it as a principle, that every molecule of matter attracts every other body in proportion to its mass, and reciprocally as the square of the distance from the body attracted.

Having arrived at this principle, Newton soon saw that all the great phenomena of the system of the world might be easily derived from it. In considering the force of gravity at the surface of the celestial bodies as the *resultante* of the attractions of all their molecules, he arrived at these remarkable conclusions: that the attractive force of a body, or spherical stratum, on a point placed without it, is the same as if the whole of its mass was united in the centre; and that a point placed within the body, or more generally in any stratum terminated by two similar elliptical surfaces, similarly situated, is equally attracted on all parts. He also proved that the rotation of the earth upon its axis must occasion a flattening of it about its poles, which was afterwards verified by an actual measurement; and he determined the law of the variation of the degrees, in different latitudes, upon the supposition that the matter of the earth was homogeneous. He likewise saw, that the actions of the sun and moon upon the terrestrial spheroid, must produce a movement of rotation of its axis, as well as occasion a retrocession of the equinoxes, and the various oscillations of the waters of the ocean which are called the tides. In short, he also assured himself, that the inequalities of the motion of the moon arise from the combined actions of the sun and earth upon this satellite.

But, with the exception of what concerns the elliptical motions of the planets and comets, and the attractions of spherical bodies, these discoveries were not wholly completed by Newton. His theory of the figures of the planets is limited by the supposition of their homogeneity; and his solution of the problem of the precession of the equinoxes, although extremely ingenious, and nearly agreeing with the results obtained from observations, is defective in several respects; as among the great number of perturbations of the celestial motions, several small ones, and particularly that

that which arises from the ejection of the moon, escaped his researches. He has perfectly established the principle which he had discovered; but left the complete development of its consequences and advantages to the geometers that should succeed him.

The profound analysis, of which this great man was also the inventor, had not, at this time, been sufficiently perfected, to enable him to give complete solutions to all the difficult problems which arise in considering the theory of the system of the world; so that he was sometimes obliged to give only imperfect sketches or approximations, and leave them to be verified by a more rigorous calculation. But, notwithstanding these inevitable defects, the importance and generality of his discoveries, and the great number of his original and profound views, which have given rise to the most brilliant mathematical theories of the present age, will always assure to this performance the pre-eminence above every other similar production of the human mind.

Having thus given a concise history of the discovery of this extensive principle, and its application to the laws of motion, it is proper to observe, that though Newton makes use of the word attraction in common with the school philosophers, yet he very studiously distinguished between the ideas. The ancient attraction was supposed to be a kind of quality, inherent in certain bodies themselves, and arising from their particular or specific forms; but the Newtonian attraction is a more indefinite principle, denoting no particular kind or manner of action, nor the physical causes of such action, but only tendency in the general, a *conatus accedendi*, to whatever cause, physical or metaphysical, such effects be owing, whether to a power inherent in the bodies themselves, or to the impulse of an external agent.

He accordingly shews in his *Philosoph. Nat. Prin. Math.* that he uses the words attraction, impulse, and propension to the centre, indifferently; and cautions the reader not to imagine, that by attraction he expresses the modus of the action, or the efficient cause thereof, as if there were any proper powers in the centres, which in reality are only mathematical points; or as if centres could attract. *Lib. i. p. 5.* In like manner he considers centripetal powers as attractions, though physically speaking, it were more just to call them impulses. *Ib. p. 148.* He also adds, that what he calls attraction may possibly be effected by impulse, though not a common or corporeal impulse, but after some other manner unknown to us. *Optics, p. 322.*

Attraction indeed, if considered as a quality arising from the specific forms of bodies, ought, together with sympathy, antipathy, and the whole tribe of occult qualities, to be exploded. But when we have set these aside, there will remain innumerable phenomena of nature, and particularly the gravity or weight of bodies, or their tendency to a centre, which argue a principle of action seemingly distinct from impulse, or where at least there is no sensible impulsion concerned. It is also well known, that this action differs, in some respects, from all impulsion we know of, the latter being always found to act in proportion to the surface of bodies; whereas gravity acts according to their solid contents; and consequently must arise from some cause that penetrates or pervades their whole substances. This unknown principle, which can be considered so only with respect to its cause (for its phenomena and effects are most obvious), with all the species and modifications of it, is what we call attraction, which is a general name under which all mutual tendencies, where no physical impulse appears, and which cannot therefore be accounted for from any known laws of nature, may be ranged; and here arise

several particular kind of attractions, as gravity, magnetism, electricity, &c. which are so many different laws; and only agreeing in this, that we do not see any physical causes of them; but that as to our senses, they may really arise from some power or efficacy in such bodies, by which they are enabled to act, even upon distant bodies, though our reason absolutely disallows of any such action.

Attraction may be divided with respect to the law it observes, into two kinds: 1. That which extends to sensible distances; such are the attractions of gravity found in all bodies; and the attraction of magnetism and electricity found in some particular bodies; the former laws and phenomena of which see under their respective titles.

Among these, the attraction of gravity, which is also called the centripetal force, is one of the greatest and most universal principles in nature; we see and feel it operate on bodies near the earth, and find by observation, that the same power also obtains in the moon, and in both the primary and secondary planets, as well as in the comets; and that this is the power by which they are all retained in their orbits, &c.: and hence, as gravity is found in all the bodies which come under our observation, it is easily inferred, by one of the settled rules of philosophizing, that it obtains in all others; and as it is found to be as the quantity of matter in each body, it must be in every particle thereof; and hence, every particle in nature is proved to attract every other particle, &c. See the demonstration of this laid down at large under the articles *CENTRIFUGAL, CENTRIPETAL, COMET, MOON, NEWTONIAN Philosophy, PLANET, SATELLITE, SUN, &c.*

From this attraction arises all the motion, and consequently all the mutation, in the universe; by this, heavy bodies descend and light ones ascend, projectiles are directed, vapours and exhalations arise, and rains, &c. fall. Also from the same cause rivers glide, the air presses, the ocean swells, &c. In effect, the motions arising from this principle, make the subject of that extensive branch of mathematics called *Mechanics* or *Statics*, with the parts or appendages thereof *Hydrostatics, Pneumatics*. See *MATHEMATICS, PHILOSOPHY, &c.*

2. That which extends only to small distances.—Such is found to obtain in the minute particles whereof all bodies are composed, which attract each other at or extremely near the point of contact, with a force much superior to that of gravity; but which at any distance from it decreases much faster than the power of gravity. This power is known by the name of the *Attraction of Cohesion*, as being that by which the atoms or insensible particles of bodies are united with larger and more sensible figures. See *COHESION*.

The latter kind of attraction owns Newton for its discoverer, as the former does for its improver. The laws of motion, percussion, &c. in sensible bodies under various circumstances, as falling, projected, &c. ascertained by the later philosophers, do not reach to those more remote intestine motions of the component particles of the same bodies, on which the changes of their texture, colour, properties, &c. depend; so that our philosophy, if it were founded wholly on the principle of gravitation, and carried no farther than that would lead us, would necessarily be very deficient.

But beside the common laws of sensible masses, the minute parts which they are composed of are found subject to some others which have been only of late taken notice of, and are yet very imperfectly known. Newton, to whose happy penetration we owe the hint, contents himself with establishing that there are such motions in the *minima nature*, and that they flow from certain powers or forces

not reducible to any of those in the great world. — By virtue of these powers he shews, — that the small particles act on each other even at a distance, and that many of the phenomena of nature are the result of this action. Sensible bodies, as we have already observed, act on each other several ways; and as we thus perceive the tenor and course of nature, it appears highly probable that there may be other powers of the like kind, nature being always uniform and consistent with herself.—Those just mentioned, reaching to sensible distances, have been generally observed; but there may be others, which reach to such small distances as have hitherto escaped observation; and this, it is probable, may be the case with electricity, even without being excited by friction.

He then proceeds to confirm the reality of these suppositions from a great number of phenomena and experiments, which plainly argue such powers and actions between the particles of bodies, e. g. of salts and water, oil of vitriol and water, aqua fortis and iron, spirit of vitriol and salt-petre, and many other chemical substances. He also shews that these powers are unequally strong between different bodies; e. g. stronger between the particles of salt of tartar and those of aqua fortis, than those of silver; and between aqua fortis and lapis calaminaris, than iron; between iron and copper, than silver, or mercury, &c. So spirit of vitriol acts on water, but more on iron or copper, &c. The other experiments which countenance the existence of such principles of attraction in the particles of matter are innumerable, many of which may be found enumerated under the articles AFFINITY, ACID, MATTER, MENSTRUUM, SALT, &c.

These actions, by virtue of which the particles of the bodies above mentioned tend towards each other, are called by the general indefinite name attraction, which is equally applicable to all actions by which distant bodies tend towards each other, whether by impulse, or by any other more latent power; and hence we can account for an infinity of phenomena which would be otherwise inexplicable from the principle of gravity; such as cohesion, dissolution, coagulation, crystallization, the ascent of fluids in capillary tubes, animal secretion, fluidity, fixity, fermentation, &c.; which see under their proper names.

“Thus” (adds our incomparable author) “will nature be found conformable to herself, and very simple, performing all the great motions of the heavenly bodies by the attraction of gravity which intercedes those bodies, and almost all the small ones of their parts, by some other attractive power diffused through their particles. Without such principles, there never would have been any motion in the world; and without the continuance thereof, motion would soon perish, there being otherwise a great decrease or diminution thereof which is only supplied by these active principles.” *Optics*, p. 373.

For these reasons it is certainly unjust to declare against a principle which furnishes so beautiful a view, for no other reason but because we cannot conceive how one body should act on another at a distance. It is certain that philosophy allows of no action but what is by immediate contact or impulsion (for how can a body exert any active power where it does not exist? to suppose this of any thing, even of the Supreme Being himself, would perhaps imply a contradiction); yet we see effects without seeing any such impulse; and where there are effects, we can easily infer there are causes, whether we see them or not. We may consider such effects, therefore, without entering into the consideration of the causes, as indeed it seems the business of a philosopher to do; for to exclude a number of pheno-

mena which we see, would be to leave a great chasm in the history of nature: and to argue about those which we do not see, would be to build castles in the air. Hence it follows, that the phenomena of attraction are matter of physical consideration, and as such entitled to a share in the system of physics: but that the causes of them will only become so when they become sensible, i. e. when they appear to be the effect of some other higher causes (for a cause is no otherwise true than as itself is an effect, so that the first cause null, from the nature of things, be invisible); we are, therefore, at liberty to suppose the causes of attraction what we please, without any injury to the effects. The illustrious Newton himself seems, indeed, a little irresolute as to the causes, inclining sometimes to attribute gravity to the action of an immaterial cause, *Optics*, p. 343, &c.; and sometimes to that of a material one, *Ibid.* p. 325.

In his philosophy, the research into causes is the last thing, and never comes under consideration till the laws and phenomena of the effects be settled; it being to these phenomena that the cause is to be accommodated. The cause even of any of the grossest and most sensible actions is not adequately known; how impulse or percussion itself, for instance, produces its effect, that is, how motion is communicated by one body to another, confounds the deepest philosophers; yet is impulse received not only into philosophy, but into mathematics; and accordingly the laws and phenomena of its effects make the greatest part of common mechanics.

The other species of attraction, therefore, in which no impulse is remarkable, when their phenomena are sufficiently ascertained, have the same title to be promoted from physical to mathematical consideration; and this without any previous inquiry into their causes, which our conceptions may not be proportioned to; let them be occult, as all causes strictly speaking are, so that their effects, which alone immediately concern us, be but apparent. See CAUSE.

Our illustrious countryman, therefore, far from adulterating philosophy with any thing foreign or metaphysical, as many have reproached him with doing, has the glory of having thrown every thing of this kind out of his system, and of having opened a new source of the most sublime mechanics yet known; it is hence, therefore, that we must expect to learn the manner of the changes, productions, generations, corruptions, &c. of natural things; with all that scene of wonders which is opened to us by the operations of chemistry.

The cause of attraction was long accounted for, by supposing that there existed a certain unknown substance which impelled all bodies towards each other; an hypothesis to which philosophers had recourse, from an opinion which had constantly been admitted as a first principle, “that no body can act where it is not;” as if it were more difficult to conceive why a change is produced in a body by another which is placed at a greater distance, than why it is produced by one which is situate at a small distance; it being not only as impossible to explain the phenomena of attraction by impulsion as it is to conceive how bodies should be urged towards each other by the action of an external substance, as how they should be urged towards each other by a power inherent in themselves. The fact is, that we can neither comprehend the one nor the other; nor can any reason be assigned why the Creator might not as easily bestow upon matter the power of acting upon matter at a distance, as the power of being acted upon and changed by matter in actual contact.

But we have no reason besides for supposing that bodies are ever in any case actually in contact. For all bodies are diminished in bulk by cold, that is to say, their particles
are

are brought nearer each other, which would be impossible, unless they had been at some distance before the application of the cold. Almost all bodies are diminished in bulk by pressure, and consequently their particles are brought nearer each other; and the diminution of bulk is always proportioned to the pressure. Newton has also shewn that it requires a force of many pounds to bring two glasses within the 800th part of an inch of each other; that a much greater force is necessary to diminish that distance, and that no pressure whatever is capable of diminishing it beyond a certain point. Consequently there is a force which impedes the actual contact of bodies, which increases inversely as some power or function of the distance, and which no power whatever is capable of overcoming. Boscovich has likewise demonstrated that a body in motion communicates part of its motion to another body before it actually reaches it. Hence we may conclude, that, as far as we know, there is no such thing as actual contact in nature; and that bodies of course always act upon each other at a distance. Even impulsion, therefore, or pressure, is an instance of bodies acting on each other without being in contact, and consequently this is no better an explanation of attraction than the supposition that it is an inherent power. We must therefore be satisfied with considering attraction as an unknown power, by which all bodies are drawn towards each other, and which acts constantly and uniformly in all times and places, so as always to diminish the distance between them, unless when they are prevented from approaching each other by some force equally powerful. But why it diminishes as the distance increases, it is impossible to say; although the fact is certain, and is almost incompatible with the supposition of impulsion being the cause of attraction. The truth is, that we must not be too precipitate in drawing conclusions, but must wait, with patience, till future discoveries shall enable us to advance farther; satisfying ourselves, in the mean time, in arranging the laws of nature which have been ascertained, without attempting to develop the causes upon which they depend.

ATTRACTION, in *Chemistry*. See AFFINITY.

ATTRACTION, *Centre of*. See CENTRE.

ATTRACTION of *Mountains*. According to the Newtonian theory of attraction, this principle pervades the minutest particles of matter, and the combined action of all the parts of the earth forms the attraction of the whole. For the same reason, therefore, that a heavy body tends downwards in a perpendicular to the earth's surface, considered as smooth and even, it must be attracted towards the centre of a neighbouring mountain, by a force proportional to the quantity of matter contained in it; and the effect of this attraction, or the accelerative force produced by it, must depend on the nearness or distance of the mountain from the gravitating body, because this force increases as the squares of the distances decrease. Upon these principles it is obvious, that the plumb-line of a quadrant, or of any other astronomical instrument, must be deflected from its proper situation, by a small quantity, towards the mountain, and the apparent altitudes and zenith distances of the stars, taken with the instrument, be altered accordingly: e. g. if the zenith distance of a star on the meridian were observed at two stations under the same meridian, one on the south side of a mountain, the other on the north; and the plumb-line of the instrument were attracted out of its vertical position by the mountain, the star must appear too much to the north, by the observation at the southern station, and too much to the south by that at the northern station; and consequently the difference of the latitudes of the two stations, resulting from these observations, would be greater

Vol. III.

than it really is. If then the true difference of their latitudes be determined by measuring the distance between the two stations on the ground, the excess of the difference, found by the observations of the star above that found by this measurement, must have been produced by the attraction of the mountain; and the half of it will be the effect of such attraction on the plumb-line at each observation, provided that the mountain attracts equally on both sides.

The first hint for determining the quantity of this attraction was suggested by Newton in his *Treatise of the System of the World*; and the first experiment for this purpose was conducted by M. Bouguer, and M. de la Condamine, in the year 1738. Whilst they were employed in measuring three degrees of the meridian, near Quito in Peru, they endeavoured to ascertain the effect of the attraction of Chimborazo, a mountain in that neighbourhood, which, by a rough computation, they supposed to be equal to about the 2000th part of the attraction of the whole earth. By observing the altitudes of fixed stars at two stations, one on the south side of the mountain, and the other on the north, they found the quantity of $7\frac{1}{2}''$ in favour of the attraction of the mountain by a mean of their observations; whereas the plumb-line, according to the theory, should have declined from the true vertical line $1'43''$. However, though the general result is favourable to the Newtonian doctrine, the experiment was performed under so many disadvantages, as not to afford the satisfaction which was to be wished; and M. Bouguer terminates his account of their observations, with expressing his hopes, that the experiment might be repeated under more favourable circumstances either in France or in England. Bouguer, *Figure de la Terre*.

Nothing was afterwards done, till Mr. (now Dr.) Maskelyne, the present astronomer royal, made a proposal to the Royal Society for this purpose in the year 1772; and in 1774, he was deputed to make the trial, accompanied with proper assistants, and furnished with the most accurate instruments. He made choice of the mountain Schellalen, in Scotland, for the scene of his operations; the direction of which is nearly from east to west, its mean height above the surrounding valley about 2000 feet, and its highest part above the level of the sea 3550 feet. Two stations for observations were selected, one on the north, and the other on the south side of the mountain. Every circumstance that could contribute to the accuracy of the experiment was regarded; and from the observations of ten stars near the zenith, Mr. Maskelyne found the apparent difference of the altitudes of the two stations to be $54.6''$; and from a measurement by triangles, formed from two bases on opposite sides of the mountain, he found the distance of their tops to be 4364 feet, which, in the latitude of Schellalen, viz. $56^{\circ}40'$, answers to an arch of the meridian of $4^{\circ}40'$, which is less by $11.6''$ than that found by the sector. Half, therefore, or $5.8''$ is the mean effect of the attraction of the mountain. From this experiment, conducted with great assiduity and accuracy, and tending to the establishment of the Newtonian theory, Mr. Maskelyne infers, that the mountain Schellallen exerts a sensible attraction; and, therefore, that every mountain, and every particle of the earth, is endued with the same property, in proportion to its quantity of matter. The law of the variation of this force, in the inverse ratio of the squares of the distances, is likewise confirmed by it; for if the force of the attraction of the hill had been only to that of the earth as the matter in the hill to that of the earth, and had not been greatly increased by the near approach to its centre, the attraction must have been wholly insensible. He infers also, that the mean density of the earth is at least double of that at the

surface; and consequently, that the density of the internal parts of the earth is much greater than that of those near the surface; also that the whole quantity of matter in the earth will be at least twice as great as if it were composed of matter of the same density with that at the surface; and therefore that the hypothesis of those naturalists, who suppose the earth to be only a great hollow shell of matter, is groundless. And finally, that the sensible deflections in the plumb-lines of astronomical instruments, by the density of the superficial parts of the earth, must cause apparent inequalities in the measurement of degrees in the meridian. He candidly acknowledges, however, that a single experiment is not sufficient to ascertain a matter of such importance, and recommends other experiments of a similar kind to be repeated in various places, and attended with different circumstances; since Schellien may differ in its internal constitution from other mountains, as there is no appearance of its ever having been a volcano, which is the case of many others. Phil. Transf. vol. lxx. part 2. N^o 48 and 49.

ATTREBATH, in *Ancient Geography*. See ATREBATH.

ATTRIBUTE, from *attribuo*, in a general sense, that which agrees to some person or thing; or a quality which determines something to be after a certain manner. Among logicians, it denotes the predicate of any subject, or whatever may be affirmed or denied concerning it. But more strictly speaking, an attribute is the same with an essential mode, or it is that which belongs to the nature or essence of the subjects in which it is. Thus, understanding is an attribute of mind; figure, an attribute of body, &c.

Of the several attributes belonging to any substance, that which presents itself first, and which the mind conceives as the foundation of all the rest, is called its *essential* attribute. Thus, extension is by some, and solidity by others, made the essential attribute of body or matter. The other attributes are called *accidental* ones; e. gr. roundness in wood, or learning in a man. Mr. Locke endeavours to prove, that thinking, which the Cartesians make the essential attribute of the mind, is only an accidental one.

Mr. Harris (Hermes, p. 29.) considering all things whatever that exist either as the energies or affections of some other thing, or as not being the energies or affections of something else, refers the former to the denomination of attributes, and the latter to that of substances. Thus, to think is the attribute of a man; to be white, of a swan; to fly, of an eagle, &c. If they exist not after this manner, then they are called substances.

Spinoza makes the soul and the body to be of the same substance, with this only difference, that the soul is to be conceived under the attribute of thought, and the body under that of extension.

ATTRIBUTES, in *Theology*, denote the several qualities and perfections which we conceive in God, and which constitute his proper essence; as justice, goodness, wisdom, &c. The perfections of God are called his attributes, because he cannot be without them. Theological writers have distributed the attributes of the deity into natural, such as knowledge and power; and moral, such as justice and benevolence. Of these writers some have maintained that all the natural attributes are comprehended under power and knowledge; and that benevolence comprehends all those that are denominated moral. Others, alleging that God always does that which is right and fit, have considered all his moral attributes, viz. justice, truth, faithfulness, mercy, patience, &c. as merely different modifications of rectitude. Others, again, have represented wisdom as the spring of all the divine actions. Accordingly, they have stated the moral

attributes of God to be only different ways of considering his will, as invariably determined by his wisdom to that which is best in all possible circumstances. The attributes discriminated by this denomination are goodness, justice, truth, and faithfulness. Goodness is the will of God, determined by his wisdom, to the communication of being and happiness, because it is fit, and as far as it is fit; justice is the will of God, determined by his wisdom, to maintain right and order, and for this purpose to do all that is necessary for convincing his reasonable creatures of the regard he hath for the preservation of his own rights, and of theirs; truth, or sincerity, is the will of God determined by his wisdom to avoid using all signs in his intercourses with his intelligent creatures, from which they may not only take occasion, without necessity, to deceive themselves, but would have just ground to charge him with being their deceiver, having a meaning to himself quite different from that which the words or other signs he made use of naturally suggested, and were intended to suggest; faithfulness is the will of God, determined by his wisdom to make good all his promises and engagements; and the holiness of God seems to stand for all these perfections in conjunction, the Deity being separated by them from all society and friendship with false gods. According to this statement it is alleged, that we have clear, distinct, and proper, though not adequate, ideas of the moral attributes of the divine nature; whereas some have maintained, that our notions of justice and goodness do not at all agree to these attributes as they pertain to the Deity, in whom they signify something, of which we have only a confused or rather no apprehension, and very different from what they do when ascribed to men. To this purpose, lord Bolingbroke (Works, vol. iv. and v.) founds his system on this extravagant paradox, as it has been justly called, that we have no adequate ideas of God's moral attributes, his goodness and justice, as we have of his natural, his wisdom and power; and accordingly he denies justice and goodness to be the same in kind in God as in man; and he pretends, that the ideas of God's moral attributes cannot be acquired by any reasoning at all, either *a priori* or *a posteriori*, and hence concludes, that if a man has such ideas, they were not found but invented by him. See his objections stated and answered by the late bishop Warburton, in his "View of Lord Bolingbroke's Philosophy," Letter I. See Hartley's Obs. on Man, p. 316. Bays on Divine Benevolence. Wollaston's Rel. of Nat. p. 116—119. Grove's Wisdom the first Spring of Action in the Deity, in his Works, vol. iv. p. 1—46, &c. Balguy's Divine Rectitude, p. 3—8.

The heathen mythologists divide the deity into as many distinct beings as he has attributes: thus the power of God was called *Jupiter*; the wrath of God, *Juno*; the absolute will of God, *Fate*, or *Destiny*, to which even his power is subject.

ATTRIBUTES, in *Painting and Sculpture*, are symbols added to figures and statues, to denote their particular office and character. Thus the club is an attribute of Hercules; the palm is an attribute of victory; the peacock, of Juno; the eagle, of Jupiter; the trident, of Neptune; the balance, of justice; the olive, of peace, &c. See PAINTING.

ATTRIBUTIVES, in *Grammar*, are words which are significant of attributes; and thus include adjectives, verbs, and participles, which are attributes of substances, and adverbs, which denote the attributes only of attributes. Mr. Harris, who has introduced this distribution of words, denominates the former attributives of the first order, and the latter attributives of the second order. Harris's Hermes.

ATTRITION, formed of *atterere*, to wear, triture or friction,

friction, expresses such a motion of bodies against one another, as strikes off some superficial particles, whereby they gradually become less and less. The grinding and polishing of bodies is performed by attrition. The effects of attrition in exciting heat, light, electricity, &c. see under **ELECTRICITY, FIRE, HEAT, and LIGHT.**

ATTRITION, among *Divines*, denotes a sorrow or regret for having offended God; arising from a sense of the odiousness of sin, and the apprehensions of punishment; i. e. of the loss of heaven, and the pains of hell.

Attrition is esteemed the lowest degree of repentance, being a step short of contrition, which supposes the love of God an ingredient or motive of our sorrow and repentance. Attrition, in the church of Rome, was considered as a sufficient disposition for a man in the sacrament of penance to receive absolution, and be justified before God, by removing his guilt, and the obligation to punishment. Hence Dr. Jer. Taylor mentions this notion as one of those which accidentally taught or led to an ill life. *Liberty of Prophecy*, p. 252.

ATTROW, in *Botany*, a name given by the people of Guinea to a plant which they use in cafes of scaldings, boiling the leaves in water, and using the decoction by way of a fomentation.

It is a species of **KALI**, and is called by Petiver *Kali Guineense foliis polygoni, floribus verticillis in modum dispositi*, from its leaves resembling the common knot-grass, and its flowers growing in bundles round the stalks. *Phil. Trans.* N^o 232.

ATTRUMAPHOC, a name given by the people of Guinea to a shrub which they use in medicine; they boil it in water, and give the decoction in the venereal disease. The juice of it, when fresh pressed out, is also used, snuffed up the nostrils, to promote sneezing, and cure several disorders of the head and eyes. *Phil. Trans.* N^o 232.

It is a species of **COLUTEA**, called by Petiver, *COLUTEA lanuginosa floribus, parvis siliquis pilosis deorsum tendentibus*; and Dr. Herman calls it an *asbragalus*.

ATTUARI, in *Ancient Geography*, a people of Germany, called by Strabo *Chattuarii*, and placed by him in the neighbourhood of Cattes. By Tacitus they are denominated *Chasuari*. Julian marched against these people, and after an expedition of three months, defeated them.

ATTUIE, in *Geography*, a town of Arabia, 76 miles W. S. W. of Saada.

ATTUND, or **OSTUND**, a country of Sweden, being one of the three parts of Upland, between Stockholm, Upland, and the Baltic sea; famous for its mines.

ATTURNATO *faciendo vel recipiendo*, in *Law*. See **ATTORNATO**, &c.

ATTUSA, in *Ancient Geography*, a town of Asia Minor, on the confines of Bithynia and Mysia. Pliny.

ATUACA, or **ATUATUCA**, a town of Belgic Gaul, mentioned by Cæsar as belonging to the Eburones, and called by Antonin (*Itin.*) *Alvoea Tungrorum*. This city, under the appellation of Tongres, was ruined by Attila in 451, and its episcopal see was transferred to Maastricht; and from thence, in 881, to Liege.

ATUED, or **ATUET**, in *Geography*, a town of Sweden, in East Gothland, having in its vicinity some good mines; six leagues south-east of Lindkoping.

ATUN-JAUXA. See **JAUXA**.

ATUN-CANAR, or **GREAT CANAR**, a village of South America, in the jurisdiction of Cuença, and province of Quito, famous for its fertility and the treasures supposed to be buried in the earth. One of the Incas is said to have built in this place several magnificent temples, splendid pa-

laces, and forts of stone, like those of Cuzco, and to have plated the inside of the walls with gold. Some remains of its ancient magnificence are still visible. *Journal of the Voyage to South America*, by Adams, vol. i. p. 275.

ATURAE, or **ATURENSIS CIVITAS**, in *Ancient Geography*, a town of Gaul, in the district of Novempopulania, seated on the river Atures; now **AISE** on the Adour.

ATURES, in *Geography*, a famous cataract of the river Oronoko, in South America.

ATURI, a town of European Turkey, in Besarabia, twenty-two miles south of Bender.

ATURIA, or **ATYRIA**, in *Ancient Geography*, a name given by Strabo to **ATYRIA**.

ATSMANDORF, in *Geography*, a town of Germany, in the circle of the Lower Rhine, four miles south-east of Eilart.

ATWOOD'S KEY, a small island surrounded by rocks, twelve miles north-east from Crook Island, and fifty east from Yuma, or Long Island, one of the Bahamas. N. lat. 23^o 28'. W. long. 73^o.

ATYADÆ, in *Ancient Geography*, the first wife of king Midas who reigned in Lydia, so called from Atys, the son of Crotus, and grandson of Manes, who was said to be the son of Jupiter and Tellus. The Atyadæ were succeeded by the Heraclidæ, or descendants of Hercules. See **LYDIA**.

ATYMSUS, in *Entomology*, a species of **PAPILIO** (*Pach. Riv. Linn.*) that inhabits China and Siam. The wings are tawny, fulvous; with the anterior ones black at the apex. Fabricius. *Danovan's Inf. China*, &c. *Obs.* This is *Hesperia Atymsus* of Fab.

ATYPOS, from α negative, and $\tau\epsilon\tau\alpha$ form, or *tenor, erratic*, or *irregular*, a word used by the old writers in medicine, for such diseases as did not observe any regularity in their periods.

Others have also used the same word in a very different sense, namely, for deformities and irregularities in the limbs; and others, for persons who, from some defects in the organs of speech, cannot articulate certain particular sounds.

ATYS, in *Ancient Geography*, a river of Sicily, now called the Corbo.

ATYS, in *Zoology*, a species of **SIMIA**, in Audebert's *Histoire des Singes*. (Fam. 4. sec. 2. fig. 8.) It belongs to the family of *Guenons*, and measures one foot five inches from the muzzle to the tail. The whole body is of a dirty whitish colour; the feet, hands, face, and ears are of a flesh colour; the muzzle is long; tail moderate; ears nearly square. This is represented as a mischievous and choleric animal; and capable of biting with great violence. It is conjectured to be the great white East Indian Ape figured by Albert Seba in his *Theaurus Rer. Natur.* t. 1. pl. 48. fig. 3. by some modern French naturalists; and also the *Cercopithecus senex* of Erxleben. *Syst. Reg. Anim.* p. 24.

ATZEL, **ORIOLOS NOBILIS**, in *Ornithology*, the name given in Merrem Beyr. to the bird called by Latham the long-billed Grackle; *Gracula longirostris* of Pallas and Gmelin. Merrem also calls it *Oriolus erythrocephalus* of Gmelin, *Goldkoeffige gellschulderichte Atzel*.

AU, in *Geography*, a town of Germany, in the archduchy of Austria, six miles north of Gemunden.—Also, a town in Lower Bavaria, twelve miles north-west of Moßburg.

AVA, a kingdom of Asia, in the peninsula of India beyond the Ganges; for an account of which see **BERMAN Empire**.

AVA, or *Aungmya*, the capital city of the kingdom of the same name, or of the whole of the Birman empire, situate

in N. lat. $22^{\circ} 5'$. E. long. $97^{\circ} 54'$. It is divided into an upper and lower city, both of which are fortified: the lower is the most extensive, and is supposed to be about four miles in circumference; it is protected by a wall thirty feet high, with a broad and deep fossé. The communication between the fort and the country is over a mound of earth, crossing a ditch that supports a causeway; the upper or smaller fort, which may be called the citadel, and does not exceed a mile in circuit, was much stronger and more compact than the lower; but neither the upper nor the lower had a ditch on the side of the river. This ancient capital has been suffered to sink into ruins, since the recent foundation of Ummerapoora. "The walls" says colonel Symes, "are now mouldering into decay; ivy clings to the sides; and bushes, suffered to grow at the bottom, undermine the foundation, and have already caused large chafms in the different faces of the fort. The materials of the houses, consisting chiefly of wood, had, on the first order for removing, been transported to the new city of Ummerapoora; but the ground, unless where it is covered with bushes, or rank grass, still retains traces of former buildings and streets. The lines of the royal palace of the Lotoo, or grand council hall, the apartments of the women, and the spot on which the piasath, or imperial spire, had stood, were pointed out to us by our guide. Clumps of bamboos, a few plantain trees, and tall thorns, occupy the greater part of the area of this lately flourishing capital. We observed two dwelling-houses of brick and mortar, the roofs of which had fallen in; these, our guide said, had belonged to Colars, or foreigners: on entering one, we found it inhabited only by bats, which flew in our faces, whilst our sense of smelling was offended by their filth, and by the noisome mildew that hung upon the walls. Numerous temples, on which the Birman never lay sacrilegious hands, were dilapidated by time. It is impossible to draw a more striking picture of desolation and ruin." To the gloomy and deserted walls of Ava, a fine contrast is exhibited by the new city of Ummerapoora.

AVA, *River of*, now called *Irrawaddy*, is the chief river of the Birman empire; according to major Rennell (*Memoir*, p. 298.), it is the Nou-Kian, little, if at all, inferior to the Ganges, and it runs to the south through that angle of Yunan which approaches nearest to Bengal. It is said to be navigable from the city of Ava to Yunan; it passes by Moguang to Bamoo, and thence to Ummerapoora and Chagain, and thence to Prome towards the sea, into which it discharges itself by many mouths, after a comparative course of near 1200 British miles. The two extreme branches of the Ava river are the Perfaim and Syrian rivers, which major Rennell (*Mem.* p. 39.) has been able to trace to the place where they separate from the main river, at about 150 geographical miles from the sea. The bearings of these two branches intersect each other at an angle of about sixty degrees. The mouths of the Ava river form an assemblage of low islands like those of the Ganges. M. D'Anville erroneously supposed the Sanpoo, Thibet river, or Burrampooter, to be the same with that which is called, in the lowest part of its course, the river of Ava; and the Nou-Kian he supposes to be the same with the river of Pegu. This river of Pegu, according to Buchanan (see Symes's *Embassy*, vol. ii. p. 414.), which is supposed to come from China, rises among hills about 100 miles from the sea, which form the boundary between the Birman and Pegu kingdoms. The river coming from Thibet, supposed to be that of Arracan, is in reality the Keenduem, or the great western branch of the Ava river. That which is supposed to be the western branch of the Irrawaddy, is in fact the

eastern one, which passes by Ava, and runs to the north, keeping west from the province of Yunan, and leaving between it and that part of China a country subject to the Birman. He adds, that between the Pegu and Martaban rivers there is a lake from which two rivers proceed; the one runs north to Old Ava, where it joins the Myoungnya, a little river of Ava, which comes from mountains on the frontiers of China; the other river runs south from the lake to the sea, and is called Sitang. The country bordering on the Ava river, from the sea to Lumsay, is flat, and the soil rich, and resembles the lower parts of the courses of the Ganges, Indus, and other capital rivers, formed out of the mud deposited by the inundations of the river. This low tract is called PEGU. Rennell's *Mem.* p. 297. Symes's *Embassy to Ava*, vol. ii. p. 413.

AVA, *Cape*, a point of land in the island of Japan, in the eastern ocean, lying in N. lat. $34^{\circ} 45'$, and E. long. $140^{\circ} 55'$.

AVA AVA, in *Botany*, a plant so called by the inhabitants of Otaheite, in the South Sea, from the leaves of which they express an intoxicating juice. It is drunk very freely by the chiefs and other considerable persons, who vie with each other in drinking the greatest number of draughts, each draught being about a pint: but it is carefully kept from their women. Hawkefworth's *Voyages*, vol. ii. p. 200.

AVADLÆ, in *Ancient Geography*, a people of Asia, placed by Ptolemy in Bactriana.

AVADOUTAS, a sect of Indian bramins, distinguished by their austerity and abstinence, and depending on accidental beneficence for their necessary supplies.

AVAIL *of Marriage*, in *Scots Law*, denotes that casualty in ward-holding, by which the superior was entitled to a certain sum from his vassal, upon his attaining the age of puberty, as the value or avail of his tocher.

AVAILLE, in *Geography*, a town of France, in the department of the Vienne, and chief place of a canton in the district of Civray; five leagues east of Civray, and six and a half S. S. W. of Montmorillon.

AVAL, the largest of the islands in the gulf of Persia, known to the Europeans by the name of Bahrein. In this island were once 360 towns and villages; but at present it contains, besides Bahrein the capital, only sixty wretched villages; the others having been ruined by a long series of wars. This island produces great abundance of dates; but its chief dependence is upon the pearl-fishery, as the best pearls are supplied by it. The duties upon the two articles of dates and pearls affords its sovereign a lack of rupees, out of which he is obliged to maintain a garrison in the city.

AVALANCHES, a name given in Swisserland and Savoy to those prodigious masses of snow, which are precipitated, with a noise like thunder, and in large torrents, from the mountains, and which destroy every thing in their course, and have sometimes overwhelmed even whole villages. In 1719, an avalanche from a neighbouring glacier overspread the greater part of the houses and baths at Leuk, and destroyed a considerable number of inhabitants. The best preservative against their effects being the forests, with which the Alps abound, there is scarcely a village situated at the foot of a mountain, that is not sheltered by trees; which the inhabitants preserve with uncommon reverence. Thus, what constitutes one of the principal beauties of the country, affords also security to the people.

Our readers may be gratified by the description which Thomson has given of the avalanches, in his "Seasons:"

"Among

“ Among these hilly regions, where embrac'd
In peaceful vales, the happy Grifons dwell;
Oft, rushing sudden from the loaded cliffs,
Mountains of snow their gath'ring terrors roll
From steep to steep, loud thund'ring down they come,
A wintry waste in dire commotion all;
And herds and flocks, and travellers and swains,
And sometimes whole brigades of marching troops,
Or hamlets sleeping in the dead of night,
Are deep beneath the smothering ruin hurl'd.”

AVALAS, a town of Servia, twelve miles south of Belgrade.

AVALITES *Struvus*, in *Ancient Geography*, a gulf on the right of the Erythrean sea. In this gulf was a sea-port, called *Avalis*, on the coast of Ethiopia: and the people of Ethiopia who lived near this gulf were called *Avalites*, and *Abalites*. Ptolemy.

AVALLON, in *Geography*, a town of France, in the department of the Yonne, and principal place of a district, seated on the river Cousin. This is a town of considerable trade in grain, wine, and cattle, with a cloth manufactory; twenty-three miles S. S. W. from Auxerre, and fifty south of Troyes. N. lat. 47° 29'. E. long. 3° 5'.

AVALON, a peninsula of the island of Newfoundland, not far from the south-east part of it, with Placentia bay on the south, and Trinity bay on the north.

AVANCAY, a jurisdiction in the diocese of Cusco, in South America, lying north-east from the city of Cusco, and extending above thirty leagues. The climate is variable, but in general hot, and many parts of it are cultivated with canes, which yield a very rich sugar. The more temperate parts abound in wheat, maize, and fruits, which are sent to the city of Cusco. In this province is the valley of Xaquijaguna, or Xajaguana, where Gonzalo Pizarro was defeated and taken prisoner by Pedro de la Gasca.

AVANCHE. See *AVEXCHE*.

AVANIA, in the *Turkish Legislature*, a fine for crimes, and on deaths, paid to the governor of the place. In the places where several nations live together under a Turkish governor, he takes this profitable method of punishing all crimes among the Christians or Jews, unless it be the murder of a Turk. Pococke's *Eg.* vol. ii. part ii. p. 30.

AVANT, a French preposition, signifying *before*, or any priority either in respect of time or place; sometimes used in composition in our language, but more usually contracted, and wrote *vant*, or *vant*, or even *van*.

AVANT Fosse, &c. See *VAN Fosse*.

AVANT Guard, &c. See *VAN GUARD*, &c.

AVANTICI, in *Ancient Geography*, a people reckoned among the inhabitants of the Alps, and, according to Pliny, comprehended by Galba within the province called *Narbonensis*. Some have represented them as the inhabitants of *Avantium* or *Aventium*, the capital of *Helvetia*; but as *Gallia Narbonensis* never extended so far, *Hardouin* rejects this opinion. *Menard* (*Mem. de Liter.* t. xxix. p. 248.) fixes them in a place, now called *Avançon*, between *Gap* and *Embrun*.

AVANTURINE, in *Natural History*, a yellowish stone full of sparkles, resembling gold, very common in France. An artificial imitation of it is made by mixing sparkles of copper with glass, whilst it is in fusion, which is used by enamellers, and to sprinkle as sand upon writing. Various stones have been known by this appellation. See *QUARTZ*, and *FELSPAR*.

AVAOU, in *Ichthyology*, the name given by the natives of *Otaheite* to a species of *Gobius* figured by *Broussonet* in his decade of fishes. See *GOBIUS OCELLARIS*.

AVARA, or *AVERA*, in *Ancient Geography*, a river of Gaul, which passes by the town of *AVARICUM*.

AVARAY, in *Geography*, a town of France, in the department of the *Loir and Cher*, and chief place of a canton in the district of *Mer*, 12 miles N. E. of *Blois*.

AUARCAVLLICA. See *GUANANGA*.

AVARES, or *AVARI*, a tribe of *Sarmatian* origin, denoting *far distant*, and formerly applied to a class of the inhabitants of the southern parts of *Russia*, from their dwelling farther to the east than any of the *Sarmatian* stocks.

In the dissertation of *M. Peyssonnel* on the origin of the *Scythian* language, we are informed that the slaves, who possessed *Macedonia*, *Greece*, and *Epirus*, were also called *avares* or *avari*; and that they were unknown to the inhabitants of *Constantinople* till the end of the reign of *Justinian*. At this time, says *Gibbon*, A. D. 558. their ambassadors addressed the *Roman* emperor who admitted them to an audience, as the representatives of the strongest and most populous of nations, the invincible, the irresistible *Avars*. Their friendship was purchased by the timid emperor, and *Valentin*, one of the emperor's guards, was sent under the character of an ambassador to their camp at the foot of *mount Caucasus*. He persuaded them to invade the enemies of *Rome*. These fugitives, who had fled before the *Turkish* arms, passed the *Tanais* and *Borythiènes*, and boldly advanced into the heart of *Poland* and *Germany*, violating the law of nations and abusing the rights of victory. Before ten years had elapsed, their camps were seated on the *Danube* and the *Elbe*, many *Bulgarian* and *Scythian* names were obliterated from the earth, and the remnants of their tribes are found, as tributaries and vassals, under the standard of the *Avars*. The *Chagan*, by which appellation their king was distinguished, still affected to cultivate the friendship of the emperor; and *Justinian* entertained some thoughts of fixing them in *Pannonia*, to balance the prevailing power of the *Lombards*. But the virtue or treachery of an *Avar* betrayed the secret enmity and ambitious designs of their countrymen; and they loudly complained of the timid, though jealous policy of detaining their ambassadors, and denying the arms which they had been allowed to purchase in the capital of the empire. An embassy that was received about this time from the conquerors of the *Avars*, might possibly have produced an apparent change in the disposition of the emperors. The *Turkish* ambassadors having pursued the footsteps of the vanquished to the *Jais*, the *Volga*, *mount Caucasus*, the *Euxine*, and *Constantinople*, at length appeared before the successor of *Constantine*, to request that he would not espouse the cause of rebels and fugitives. In consequence of this embassy, the emperor renounced, or seemed to renounce, the fugitive *Avars*, and accepted the alliance of the *Turks*. In the year 566, *Justin II.* gave audience to the ambassadors of the *Avars*, and the scene was decorated to impress the barbarians with astonishment, veneration, and terror. After the first emotions of surprise, the chief of the embassy extolled the greatness of the *Chagan*, by whose clemency the kingdoms of the south were permitted to exist, whose victorious subjects had traversed the frozen rivers of *Scythia*, and who now covered the banks of the *Danube* with innumerable tents. It was also alleged, that the late emperor had cultivated, with annual and costly gifts, the friendship of a grateful monarch, and that the enemies of *Rome* had respected the allies of the *Avars*. The same prudeness, it was intimated, would instruct the nephew of *Justinian* to imitate the liberality of his uncle, and to purchase the blessings of peace from an invincible people, who delighted and excelled in the exercise of war. To this address the emperor replied in the

same strain of haughty defiance; and he derived his confidence from the God of the Christians, the ancient glory of Rome, and the recent triumphs of Justinian. The Chagan was awed by the report of his ambassadors; and instead of exercising his threats against the eastern empire, he marched into the poor and savage countries of Germany, which were subject to the dominion of the Franks; but after two doubtful battles, he consented to retire. The spirit of the Avars being chilled by repeated disappointments, their power would have dissolved away in the Sarmatian desert, if the alliance of Alboin, king of the Lombards, had not given a new object to their arms, and a lasting settlement to their wearied fortunes. (See ALBOIN, and LOMBARDS.) By the departure of the Lombards, and the ruin of the Gepidæ, between the years 570 and 600, the balance of power was destroyed on the Danube; and the Avars, at this time, spread their permanent dominion from the foot of the Alps to the sea-coast of the Euxine. The reign of Baian is the brightest æra of their monarchy; and the Chagan, who occupied the rustic palace of Attila, appears to have imitated his character and policy. The pride of Justin II., of Tiberius, and of Maurice, was humbled by a proud barbarian, more prompt to inflict, than exposed to suffer, the injuries of war; and as often as Asia was threatened by the Persian arms, Europe was oppressed by the dangerous inroads, or costly friendship, of the Avars. As the successor of the Lombards, the Chagan asserted his claim to the important city of Sirmium, the ancient bulwark of the Illyrian provinces. The plains of the Lower Hungary were covered with the Avar horse, and a fleet of large boats were built in the Hercynian wood, for the purpose of descending the Danube, and transporting into the Save, the materials of a bridge. But as the strong garrison of Singidunum, which commanded the conflux of the two rivers, might have stopped their passage and baffled his designs, he dispelled their apprehensions by a solemn oath that his views were not hostile to the empire. Sirmium, however, was invested by the perfidious Baian, and its defence was prolonged above three years; but at length distressed by famine, a merciful capitulation allowed the escape of the naked and hungry inhabitants. Singidunum, at the distance of fifty miles, experienced a more cruel fate; its buildings were razed, and the vanquished people condemned to servitude and exile. From Belgrade to the walls of Constantinople a line extended of 600 miles, which was marked with flames and blood. The horses of the Avars were alternately bathed in the Euxine and the Adriatic; and the Roman pontiff, alarmed at the approach of a more savage enemy, was reduced to cherish the Lombards as the protectors of Italy. The despair of a captive, whom his country refused to ransom, disclosed to the Avars the invention and practice of military engines, but in the first attempts they were rudely framed and awkwardly managed; and the resistance of Diocletianopolis and Beræa, of Philipopolis and Adrianople, soon exhausted the skill and patience of the besiegers. Although the warfare of Baian was that of a Tartar, his mind was susceptible of sentiments that were generous and humane; and accordingly, he spared Anichialus, by whose salutary waters the health of the best beloved of his wives was restored; and the Romans confess, that their starving army was fed and dismissed by the liberality of a foe. His empire extended over Hungary, Poland, and Prussia, from the mouth of the Danube to that of the Oder; and his new subjects were divided and transplanted by the jealous policy of the conqueror. The eastern regions of Germany, which had been left vacant by the emigration of the Vandals, were replenished with Slavonian conquests; the same tribes are discovered in the neighbour-

hood of the Adriatic and the Baltic, and with the name of Baian himself, the Illyrian cities of Neys and Lissa are again found in the heart of Silesia. In the disposition both of his troops and provinces, the Chagan exposed the vassals, whose lives he disregarded, to the first assault, and the swords of the enemy were blunted before they encountered the native valour of the Avars. The emperor Maurice, after having, for ten years, supported the insolence of the Chagan, declared his purpose of marching against the barbarians. Deaf to the advice and intreaty of the senate, the patriarch, and the empress Constantina, who dissuaded him from personally encountering the fatigues and perils of a Scythian campaign, he boldly advanced seven miles from the capital; but Anichialus was the limit of his progress both by sea and land. In five successive battles, 17,200 barbarians were made prisoners; near 60,000, with four sons of the Chagan, were slain; the Roman general, Priscus, surprised a peaceful district of the Gepidæ, protected by the Avars; and his last trophies were erected on the banks of the Danube and the Teyfs. Baian, however, again prepared, with dauntless spirit and recruited forces, to avenge his defeat under the walls of Constantinople. In the reign of Heraclius, A. D. 610—622. Syria, Egypt, and the provinces of Asia, were subdued by the Persian arms under Chosroes; while Europe, from the confines of Iltria to the long wall of Thrace, was oppressed by the Avars, unsatiated with the blood and rapine of the Italian war. They had coolly massacred their male captives in the field of Pannonia; the women and children were reduced to servitude, and the noblest virgins were abandoned to the promiscuous lust of the barbarians.

When Heraclius was preparing to abandon his capital, and to transfer his person and government to the more secure residence of Carthage, the Chagan was encamped in the plains of Thrace; and dissembling his perfidious designs, solicited an interview, for the purpose of reconciliation, with the emperor, near the town of Heraclæa. On a sudden, the Hippodrome was encompassed by the Scythian cavalry; the tremendous sound of the Chagan's whip gave the signal of assault; and Heraclius was saved by the fleetness of his horse. So rapid was the pursuit, that the Avars almost entered the golden gate of Constantinople with the flying crowds; but the plunder of the suburbs rewarded their treason, and they transported beyond the Danube 270,000 captives. The Persian king having ratified a treaty of alliance and partition with the Chagan, A. D. 626; 30,000 Barbarians, the vanguard of the Avars, forced the long wall of Constantinople, and drove into the city a promiscuous crowd of peasants, citizens and soldiers. In the mean while the magistrates of the capital repeatedly strove to purchase the retreat of the Chagan, but their deputies were rejected and insulted; and he suffered the patricians to stand before his throne, while the Persian envoys, richly dressed, were seated by his side. For ten successive days, the capital was assaulted by the Avars, who had made some progress in the science of attack. At length however, by the vigorous resistance of the inhabitants, the Avars were repulsed; a fleet of Slavonian canoes was also destroyed in the harbour; the vassals of the Chagan threatened to desert; his provisions were exhausted, and after burning his engines, he gave the signal of a slow and formidable retreat. To the hostile league of Chosroes with the Avars, the Roman emperor opposed the honourable and useful alliance of the Turks; and the Persians were then reduced to the necessity of retreating with precipitation. Gibbon's Hist. vol. vii. viii.

From the annals of France, cited by Bolandus, we learn, that Thudun, a leader of the Avars, sent ambassadors to
Charles

Charlemagne, in 795, with proposals for surrendering himself and his people to that prince, and for embracing Christianity under his auspices.

At this day there exists an Avarian nation in Dighestan, in the district of Derbent and Kubet, who, though by their cohabitation for several centuries with various nations, they have adopted their language and the Mahometan religion, have nevertheless retained some Sarmatian words, that prove their ancient origin. They marched, says Mr. Tooke (Hist. Russ. vol. i. p. 9.), in the fourth century to Pannonia, dispossessed the slaves, and established themselves with those that remained. On the arrival of the Mahares and Komanes, they collectively assumed the name Mahares, and by this name they are still distinguished.

AVARICUM, called also BITURIGES, now *Bourges*, the capital of the Biturige-Cubi, and afterwards of Aquitania Prima, was one of the most considerable cities of Gaul at the time of the Roman conquest. About the forty-seventh Olympiad, or 592 years before the Christian æra, it was the capital of Gaul, or of that part of it which was subject to the Celtes. The Romans erected an amphitheatre in this place, which was not demolished before the year 800; and also a capitol.

AVARILLO, *Cape*, lies N. E. from Padaran bay, and nearly in the fourth-east extremity of Cambodia. N. lat. 11° 35'. E. long. 109° 21'. See *COMORIN Bay*.

AVAROMOTEMO, in *B. Beng.* the name of a siliquose tree, which grows in the Brasils. The bark is externally of a cineritious, and internally of a deep red colour; and is the only part of the plant used by the skilful for medicinal purposes: though the same astringent qualities are by some applied to the leaves: for the bark, which is of a bitter taste, whether reduced to a powder, or boiled and used by way of fomentation, happily cures inveterate and obstinate ulcers, and, as it is said, has been found to cure cancers themselves, by means of its remarkably cleansing and drying nature.

Beside these purposes, it is also made use of on account of its effectually astringent quality, for baths designed to strengthen and invigorate the muscular parts of the body, when weakened, or too much relaxed. Ray says it is much used by courtezans for contracting the *puccuda*.

AVARUM, in *Ancient Geography*, a promontory of Hispania Taragonensis. Ptolemy.

AVAS. See *ATHAMANIA*.

AVAS, in *Geography*, a mountain of Hungary, in the district of Marmarufs.

AVAST, a term frequently used on board a ship, signifying, to stop, hold, or stay. The word is formed of the Italian *vasta*, or *basta*, it is enough, it suffices.

AVASTOMATES, in *Ancient Geography*, a people of Africa, in Mauritania. Amm. Marc.

AVATSCHA or AWATSKA, called also *St. Peter and St. Paul*, in *Geography*, a sea-port of Kamtschatka, lying in N. lat. 52° 51'. and E. long. 158° 48'. The bay of Avatscha lies in the bight of another formed by cape Gavareca to the south, and Cheeponkoi Nofs to the north: the latter bearing from the former N. E. by N. and distant from it thirty-two leagues. From cape Gavareca to the entrance of Avatscha bay the coast bears to the north, extends about eleven leagues, consists of a chain of ragged cliffs and rocks, and presents in many parts an appearance of bays or inlets, which on a nearer approach are found to be low grounds connecting the head-lands. From the entrance of Avatscha bay, Cheeponkoi-nofs bears E. N. E., at the distance of seventeen leagues. The shore on this side is flat and low, with hills behind that rise gradually to a considerable height. When

navigators approach the bay from the southward, the difference of the land on both sides of cape Gavareca, lat. 52° 21', will direct them in their course; when they approach it from the northward, Cheeponkoi-nofs becomes very conspicuous, as it is a high projected headland, united to the continent by a large extent of level ground lower than the Nofs, and it presents the same appearance both from the north and south. The situation of Avatscha may be also known, in clear weather, by the two high mountains to the south of it; of which that nearest to the bay is in the form of a sugar-loaf, and the other far and so high. These very conspicuous mountains also appear on the north side of the bay; that is, the west being the highest; the next, which is a volcano, may be known by its smoke; and the third, which is the most northerly, is a cluster of mountains, with several flat tops. Above the cape, the entrance of Avatscha bay to the north is pointed out by a light-house on a perpendicular headland, to the eastward of which are many sunken rocks, stretching two or three miles into the bay; four miles to the south of the entrance lies a small round island, principally composed of high pointed rocks. The entrance into the bay is at first about three miles wide, and in the narrowest part 1½; the length in a north-west direction is four miles. Within the mouth is a noble basin about twenty-five miles in circumference; in which are the harbours of Rak-wera to the east, Tarishka to the west, and St. Peter and St. Paul to the north. Such is the account of Avatscha given in the continuation of Cook's voyages. The bay of Avatscha, according to the relation of La Perouse, who visited it in 1787, is certainly the finest, most commodious, and safest that can possibly be met with in any part of the world. Its mouth is narrow, and ships would be compelled to pass under the guns of the fort, which might be erected there. It has excellent holding ground, as the bottom is of mud. Two vast harbours, one on the east, and the other on the western coast, would contain all the ships of England and France. The rivers of Avatscha and Paratounka empty themselves into this bay; but they are impeded by sand banks, and can only be entered at high water. The village of St. Peter and St. Paul is situated on a tongue of land, which, like an artificial bank, forms behind the village a little harbour, inclosed like a circle, which might accomodate three or four dismantled ships during the winter: its entrance is less than twenty-five toises wide. On the side of this basin M. Kasseff, the governor, proposed to mark out the plan of a town destined to be the capital of Kamtschatka, and perhaps the grand centre of commerce with China, Japan, the Philippines, and America. A large lake of salt water lies to the north of the site of this projected city, and at the distance of only 300 toises are many small brooks, the junction of which would facilitate the conveyance of all the commodities necessary for a large establishment. M. Kasseff gave orders for announcing, that an union of several districts with that of St. Peter and St. Paul would soon take place, and that he intended immediately to build a church. The ice in the bay of Avatscha never extends within 3 or 200 toises from the bank; and during the winter it often happens, that the land winds disperse that which obstructs the passage into the rivers of Paratounka and Avatscha, when the navigation again becomes practicable. This bay is said to bear a great resemblance to that of Back, but it affords better anchorage by the mud of its bottom; its mouth is narrower, and of course more easily defended. The two shoals at the entrance of this bay, which are separated by a large channel for the passage of ships, may be easily avoided, by leaving two detached rocks on the east shore open with

the light-house point, and by keeping, on the contrary, shut in with the west shore, a large rock on the larboard-hand, and which is only separated from the shore by a channel less than a cable's length wide. The tides in this bay are very regular; and the greatest rise of high water, which happens at half past three on the days of new and full moon, is four feet. From M. Dagelet's observations, the governor's house at St. Peter and St. Paul, is situated in N. lat. $53^{\circ} 1'$. and E. long. from Paris, $156^{\circ} 30'$. La Perouse's Voyage, vol. ii. ch. 22. p. 117, &c. Eng. Transl.

AVATHA, in *Ancient Geography*, a town of Arabia Petraea. Ptolemy.—Also a town of Phœnicia. Notit. Imp.

AVATICI, a people of Europe, in Gallia Narbonensis, whose capital according to Pliny was *Maritima*; or as Steph. Byz. has it, *Majramela*.

AVAUNCHERS, among *Hunters*, the second branches of a hart's horn.

AUAXA, or AUAZA, in *Ancient Geography*, a town of Asia, in Pontus. Not. Imp.

AUB, in *Geography*, a town of Germany, in the circle of Franconia, and bishopric of Wurzburg, on the river Gollach, seventeen miles south of Wurzburg, and twenty-eight north-west of Anspach.

AUBADE, Fr. in *Music*, a concert given at day-break in hot climates, in the open air; generally by a lover under the window of his mistress. The Italians term this harmonical morning salutation, *matinata*; a noon song of the same kind, *giornata*; evening song or concert, *serenata*; a midnight concert, *notturno*.

AUBAGNE, in *Geography*, a town of France, in the department of the mouths of the Rhone, and chief place of a canton in the district of Aix; three leagues east of Marseilles and five S. S. E. of Aix. N. lat. $43^{\circ} 17'$. E. long. $5^{\circ} 52'$.

AUBAINE, in the *French Customs*, a right vested in the king, of being heir to a foreigner, who died within his dominions.

The word is formed of *aubain*, a *foreigner*; which Menage derives farther from the Latin, *alibi natus*; Cujas, from *advena*, which is the name foreigners bear in the capitularies of Charlemagne; Du-Cange, from *Albanus*, a Scot, or Irishman; because these were anciently much given to travelling and living abroad.

The king of France, by the right of aubaine, claimed the inheritance of all foreigners in his dominions; exclusive of all other lords, and even of any testament the deceased could make. An ambassador, though not naturalized, is not subject to the right of aubaine. The Swifs, Savoyards, Scots, and Portuguese, are also exempted from the aubaine, as being reputed natives and regnicoles.

M. de Lauriere (*Glossaire du Droit François*, art. Aubaine, p. 92.) produces several ancient deeds which prove, that in different provinces of France, strangers became the slaves of the lord on whose lands they settled. Beaumanoir says (*Coust. de Beauv.* ch. 45. p. 254.), that there are several places in France, in which if a stranger fixes his residence for a year and a day, he becomes the slave of the lord of the manor. As a practice so contrary to humanity could not subsist, the superior lords found it necessary to rest satisfied with levying certain annual taxes from aliens, or imposing upon them some extraordinary duties or services. But when any stranger died, he could not convey his effects by a will; and all his real as well as personal estate fell to the king, or to the lord of the barony, to the exclusion of his natural heirs. This practice of confiscating the estates of strangers upon their death, was very ancient. It is mentioned, though very obscurely, in a law

of Charlemagne, A. D. 813. Not only persons who were born in a foreign country were subject to the droit d'aubaine, but in some countries such as removed from one diocese to another, or from the lands of one baron to another. "It is scarcely possible," says Dr. Robertson (*Hist. Ch. V.* vol. i. p. 397.), "to conceive any law more unfavourable to the intercourse between nations. Something similar to it may be found in the ancient laws of every kingdom in Europe. With respect to Italy, see Murat. Ant. vol. ii. p. 14." It is no small disgrace to the French jurisprudence, that this barbarous, inhospitable custom, should have so long remained in a nation so highly civilized.

AUBAIS, in *Geography*, a town of France, in the department of the Gard, one league S. E. of Sommieres, and three and a half S. W. of Nismes.

AUBE, a river of France, which rises near Auberive, in the department of the Upper Marne, passes by Fert sur Aube, Bar sur Arbe, Dienville, Arcis, &c. and joins the Seine seven miles below Mery. Aube gives name to a department which it waters. This department is one of the four into which the province of Champagne is distributed. It is bounded on the north by the departments of Upper Marne, Marne and Seine, and Marne; on the east by that of the Upper Marne; on the south by those of Coté d'Or and the Yonne; and on the west by this last, and that of the Seine and Marne. The superficies is about 1,196,370 square acres, or 610,608 bectares; its population consists of 228,814 persons; and it is divided into five communal districts.

AUBENAS, a town of France, in the department of the Ardeche, and chief place of a canton, in the district of Coiron, three and a half leagues S. W. of Privas. N. lat. $44^{\circ} 32'$. E. long. $4^{\circ} 32'$.

AUBENTON, a town of France, in the department of the Aisne, and chief place of a canton, in the district of Vervins, nine leagues N. E. of Laon, and three and three quarters east of Vervins.

AUBERG, a town of Germany, in the archduchy of Austria, on the north side of the Danube, opposite to Lintz.

AUBERIVE, a town of France, in the department of the Marne, and chief place of a canton, in the district of Rheims, on the Suippe, 15 miles north of Chalons.—Also, a town of France, in the department of the Upper Marne, and chief place of a canton in the district of Langres, 12 miles south-west of Langres.—Also, a town of France, in the department of the Isere, and chief place of a canton in the district of Vienne, five miles south of Vienne.

AUBERT, PETER, in *Biography*, a French lawyer, was born at Lyons in 1642, and at an early age discovered marks of genius, and a fondness for books. He was distinguished by reputation and success in his profession, and employed in several offices in his native city. His library, which was large and valuable, he left for public use to the city of Lyons. He published, besides a small romance which he wrote at seventeen, intitled "Retour de l'Isle Amour," a collection of "Factums" of various advocates, in 2 vols. 4to., printed at Lyons in 1710; and a much improved edition of "Richelet's Dictionary," published in 1728, in 3 vols. fol. *Nouv. Diet. Hist.*

AUBERTIN, EDMUND, a learned French divine of the reformed church, was born at Chalons on the Marne, in 1595, chosen minister of the church of Chartres, in 1618; and removed to the church of Paris, in 1631. His famous work, intitled "L'Eucharistie de l'Ancienne Eglise," and printed in folio in 1633, was highly esteemed by the reformers, but gave great offence to the catholics. In this

work

work he discusses the subject of the ancient church, on the grounds of reason and scripture, and examines the faith of the church for the six first centuries, in order to shew, that, through the whole of this period, the doctrines of transubstantiation and of the real person were unknown. The historical part of this performance was answered by Arnaud, and other Port Royal divines, in a work intitled "La Perpetuité de la Foi." Aubertin became the object of clerical odium; a process was instituted against him for styling himself pastor of the reformed church of Paris, and he was suspended two or three years for some expressions which he used in the pulpit. Intolerant bigotry pursued him to his last moments. On his death-bed, and when he was just expiring, Ollerus, the curate of St. Sulpice, with a bailiff and an armed mob, consisting of forty persons, intruded on his retirement; under a pretence, that he wished to make an abjuration before a priest, which he was prevented from doing, and that they would give him an opportunity of disburdening his conscience. The leader of this gang obtained admittance by feigning himself to be a physician. The honest Aubertin, roused by this intrusion and assault, distinctly declared his perseverance in the faith of the reformed church. When the curate and bailiff withdrew, the mob were with difficulty persuaded to depart without plundering the house. In these happier days this extreme of bigotry, which would not allow a man of distinguished probity and worth to die in peace, and which at a season, when

"Claudicat ingenium, delirat linguaque mensque,"

Lucret. l. iii. v. 454.

"When reason halts, and thought and speech are wild," endeavoured to extort from him a declaration, which his sound reason had disclaimed, will be universally reprobated and condemned. This good man died at Paris in the year 1652, at the age of 57 years. A Latin translation of his work by himself, was published at Deventer in 1654, folio. Gen. Diet.

AUBERY, or AUERY, JOHN, was physician to the Duc de Montpensier. He was educated under the famous Du Laurens; published in 1604, "Les Bains de Bourbon-Lancy;" and in 1608, "De restituenda et vindicanda Medicinæ Dignitate;" both at Paris; but the work which gained him most reputation, and which is still in request, is his "Antidote de l'Amour;" 12mo., first printed in 1599, and since at Delft, 1663.

AUBERY, ANTHONY, a French historian, was born in 1617, and after having been educated at Paris for the law, retired into the tranquillity of private life, and devoted himself to historical researches. In 1642, his "General History of the Cardinals" was published in 5 vols. 4to.; in 1649, appeared his historical treatise "On the Pre-eminence of the Kings of France above the Kings of Spain and the Emperors;" in 1654, the "History of the Cardinal de Joyeuse, and Collection of Letters written by that Cardinal to Henry III.;" and in 1660, his "History of Cardinal Richelieu, containing the principal events in the reign of Louis XIII." in folio, which was accompanied by two other volumes of titles, letters, dispatches, instructions, and memoirs, serving as documents and vouchers to the general history. When Bertier the printer waited upon the queen regent, requesting her authority for the publication of the work, which contained severe strictures on many persons in high life, it is said that the queen replied, "Finish your work without fear; and put vice to the blush, that virtue alone may dare to shew her face in France." Aubery, notwithstanding the freedom with which he wrote, has been charged with drawing, in this work, too flattering a picture of Cardinal Richelieu, and it has been said that

this was done, from lucrative motives, for gratifying the vanity of the dukes d'Anguillon, the cardinal's niece. A book, written by Aubery in 1667, on the just pretensions of the king of France to the empire, and dedicated to Louis XIV. alarmed the princes of the empire, and excited complaints against the author, who was committed to the Bastille, in order to silence and conciliate them, but he was soon released. This work was followed by a treatise "On the dignity of Cardinal," and another of little value, "On the Regale, or the right of the Revenues of vacant Bishoprics." His last work, published in 4 vols. 12mo. in 1751, was "The History of Cardinal Mazarin." The facts collected in this publication from the registers of parliament, now no longer to be found, constitute its chief excellence; for neither the style nor method of it have much to recommend them, and the author had not sufficient independence of mind or situation to write with impartiality. While he was preparing for the press other historical collections, his life, which had been spent in a course of literary labour and industry, was terminated by an accident in 1695, at the age of 78. Journal des Sçavans, t. xxiii. p. 185. Nouv. Dict. Hist.

AUBERY, LOUIS DE MAURIER, a French historian of the 17th century, accompanied his father, who went, whilst he was young, as ambassador to Holland, and visited Germany, Poland, and Italy. On his return to Paris, he obtained the favour of the queen regent; but having no public employment, he retired, after the death of Richelieu, to his family mansion, and spent his time in literary avocations. He died in 1687, and his works were "Memoirs for the history of Holland," published in two vols. 12mo. in 1682; and "Memoirs of Hamburg, Lubeck, Holstein, Denmark, Sweden, and Poland," published after his death, and both printed together at Amsterdam in 1736. The former work contains interesting facts, though it gave offence to the Dutch. Nouv. Dict. Hist.

AUBETERRE, in *Geography*, a town of France, in the department of the Charente, and chief place of a canton in the district of Barbezieux, six leagues south-east of Barbezieux, and $7\frac{1}{2}$ south of Angoulesme. N. lat. $45^{\circ} 15'$. E. long. $0^{\circ} 10'$.

AUBETTE, a river of France, which runs into the Seine, near Rouen.

AUBEVILLIERS, a town of France, in the department of the Somme, and chief place of a canton in the district of Montdidier, thirteen miles S. S. E. of Amiens.

AUBEVILLIERS (*Les*), a town of France, one league N. N. E. of Paris.

AUBIERES, a town of France, in the department of Puy de Dome, and chief place of a canton in the district of Clermont-Serand, one league south-east of Clermont.

AUBIERES (*Les*), a town of France, in the department of the Two Seves, and chief place of a canton in the district of Chatillon sur Sevre, $2\frac{1}{2}$ leagues E. N. E. of Chatillon.

AUBIGNE, THEODORE-AGRIPPA D', in *Biography*, was born at St. Maury, near Pons, in Saintonge, in 1550; but, although he was betimes a proficient in literature, the circumstances of his family, on the death of his father, obliged him to recur to the profession of arms. In the service of Henry IV. of France, then king of Navarre, he so far recommended himself to the royal favour, as to obtain several considerable poils, both of honour and profit. Such was his known and approved fidelity, that his royal master received his remonstrances on such parts of his private and public conduct as deserved animadversion, without offence. "The word of D'Aubigné disconcerted (said Henry on one occasion, is worth as much as the gratitude of another man!"

and when he was reproached for his friendship for La Tremouille, whom Henry had disgraced and banished, he excused himself by saying, "Sire, he is unfortunate enough to have lost the favour of his master—could I withdraw from him my friendship when he has most need of it?" D'Aubigné, however, found at length that extreme frankness becomes not only unacceptable but offensive to the best of princes. He therefore quitted the court and the kingdom, and retired to Geneva, where he died much honoured and regretted, in 1630, at the age of 80 years. By his wife, Safauna de Lezai, he had several children, one of whom was the father of the famous madame de Maintenon. The principal of his works is "An Universal History from 1550 to 1601, with an abridged account of the death of Henry IV." in 3 vols. folio, printed in 1616, 1618, and 1620. The style is exceptionable, being partly vulgar and partly affected and turgid, but the sentiments are free, and the representations of the transactions and characters of the times in general are impartial. On the appearance of the first volume, in which the character of Henry III. is represented in an odious and contemptible light, the parliament of Paris condemned it to the flames. The detail of the military operations is the part of the work that has been most esteemed for its accuracy. The "Confession of Sancy," and the "Baron de Fœnesté," are two satirical poems; the first of which is commended for its vein of ingenious and delicate raillery; but the second, though not less acrimonious, is of a grosser kind. Besides miscellaneous pieces, tragedies, poems, &c. D'Aubigné also wrote "Memoirs of his own life," which were not published till 1731. They abound with curious and free anecdotes, and exhibit a lively picture of the man. Of these we have an English translation. Gen. Dict. Nouv. Dict. Histor.

AUBIGNY, in *Geography*, a town of France, in the department of the straits of Calais, and chief place of a canton in the district of St. Pol, eight miles W. N. W. of St. Pol.—Also, a town of France, and chief place of a district in the department of the Cher, six leagues north-west of Sancerre, and $7\frac{1}{2}$ north of Bourges. In 1442, Charles VII. granted the estate of Aubigny to John Stuart, constable of England and his heirs male, as a recompence for services rendered to him in France, with remainder to the crown on failure of male issue. This reversionary clause took effect in the 16th century, by the death of Charles Stuart without issue. Lewis XIV. made a new grant in favour of Charles II. king of England, the descendant of John Stuart, and made the estate a duchy annexing a peerage to it in favour of Charles Lenox, duke of Richmond, (natural son of Charles II. by Louisa de Querouaille, the dutchess of Portsmouth), from whom it descended to the present duke. The right of peerage to this estate was guaranteed by the treaty of Utrecht, confirmed to the present duke, and registered in the parliament of Paris, in 1777. N. lat. $47^{\circ} 29'$. E. long. $2^{\circ} 20'$.

AUBIN, in French *Hobbin*, in the *Blange*, is derived from the Italian word *Ullino*, signifying a little horse. Accordingly the light-armed troops were termed in unclassical Latin *Hoblearii*; in contradistinction to the cataphracts, or heavy-armed troops. Berenger. See HOBBY.

AUBIN'S, *Str.*, *Bay*, in *Geography*, lies on the island of Jersey, in the English channel; and at the bottom of it is a town of the same name with a good harbour, defended by a fort near the south-west extremity; three miles west from St. Helier's. N. lat. $49^{\circ} 7'$. W. long. $2^{\circ} 15'$.

AUBIS, *Str.*, is also a town of Switzerland, in the principality of Neuchatel.

AUBLETHIA, in *Botany* (named after M. F. Aublet, author of the History of Plants in Guiana). Schreb. 889. Apeiba, Aubl. 213. Swartz. Prod. Sz. Sloanea, Læfl. 311.

Class, *polyandria monogynia*. Gen. Char. *Cal.* perianth five-leaved, rigid, spreading, coloured within, pubescent without, deciduous, five-parted; parts linear-lanceolate, acute, with thick margins, which before flowering are contiguous. *Cor.* petals five, roundish-oblong, smaller than the calyx, with very short claws. *Stam.* filaments very many, very short; anthers ovate-oblong, outwardly gibbous, gaping on the inner side, foliaceous at the tip, acute, the exterior ones sterile, lanceolate, ending in a foliaceous point, shorter than the corolla. *Pist.* germ roundish, depressed; style long, striated, gradually thickening, slightly incurved; stigma spreading, perforated, ten-toothed. *Pov.* capsule large, orbiculate, depressed, coriaceous, echinate, ten-celled, gaping at the base. *Seeds*, very many, small, roundish, somewhat compressed; receptacle of the seeds, fleshy.

Ess. Gen. Char. *Cal.* five-leaved. *Cor.* five-petalled. *Cosf.* many-celled, echinate, with many seeds in each cell.

Species, 1. *A. Tibourbou*, apeiba tibourbou. Aubl. l. c. Swartz. l. c. "Leaves acutely serrate, hirsute." A tree of a middling size, having a trunk seven or eight feet high, and a foot in diameter, with irregular, chooped, soft bark, which is fibrous, and fit for making ropes. Wood white and light; branches spreading in all directions, and bent down; twigs villose; leaves alternate, ovate-oblong, cordate at the base, green above, on short petioles; stipules in pairs, acute; flowers in racemes, opposite to the leaves. A pair of opposite bractes is placed at the origin of each twig, and four at the peduncle. The raceme, peduncles, and under side of the leaves, are covered with russet-coloured hairs. A native of Brasil, Guiana, the islands of Cayenne and Tobago. Apeiba is the Brazilian name, and Tibourbou the Caribbean. 2. *A. Petoumo* apeiba petoumo. Aubl. l. c. Swartz. l. c. "Leaves elliptic, acute, serrulate, hoary beneath." This tree often rises forty feet high, with a brown, thick, filamentose bark, fit for cordage. Wood whitish, soft; branches spreading, arising from the top of the trunk; leaves alternate, nine inches long, and four broad, entire, smooth, ending in a point, petiolated; flowers yellow, in racemes opposite to the leaves, on long peduncles surrounded by four large scales at the base. A native of Guiana, in the vast forests of Sinemari. It is called petoumo by the Caribbees. 3. *A. aspera*. Aubl. and Swartz. l. c. "Leaves quite entire, pubescent beneath; fruit compressed." A tree from thirty to forty feet high, with bark and wood like those of the preceding. Leaves alternate, ovate, smooth, pointed, rounded at the base, five inches long, on a short footstalk, at the base of which are two stipules, which soon fall off; flowers at the extremities of the branches, in racemes which have at the base two bractes, and at the divisions three or four scales, from which spring three yellow flowers. A native of Guiana and Cayenne. It is also called petoumo by the Caribbees. 4. *A. levii*. Aubl. l. c. t. 214. (apeiba glabra) "Leaves quite entire, smooth on both sides; fruit rough, depressed." A tree of middling size, with a trunk from ten to twelve feet high; its wood is very light; leaves ovate, acuminate, on short footstalks; stipules in pairs, short, deciduous; flowers in racemes, greenish. A native of Guiana, flowering in May. The inhabitants call it Ivouyira, and use pieces of the wood rounded and pointed to procure fire: hence the Croles call it bois de mèche.

AUBONDAGE, in *Geography*, a town of France, in the department of the Meurte, and chief place of a canton in the district of Chateau-Salins, six miles N. N. E. of Chateau-Salins.

AUBONNE, the name of a government and of a town in the canton of Berne, in Switzerland, which was formerly a lordship, belonging to the marquis du Quéne, purchased by him of the famous traveller, Tavernier, and afterwards sold to

to Bernè; eleven miles W.S.W. of Laufanne. The town is situated near a river of the same name, on an eminence, with a gentle declivity, at the foot of which the river runs with an impetuous torrent. The form of the town is that of an amphitheatre, and in its upper part is a handsome castle, from the top of which may be seen not only the town and its adjacent fields, but the whole lake of Geneva, and the land that furrounds it. In the castle of Aubonne, as well as at Thonen in Savoy, which is opposite to it on the other side of the lake, is a tower covered with tin, which makes a glittering appearance when the sun shines upon it. In the balliage of Aubonne are several villages, most of which lie at the foot of mount Jura; and in one part of this mountain is a deep cave, which forms a natural ice-house; and from the bottom of it ascends the noise of a subterraneous river, supposed to be the river Aubonne, because it first appears, with several sources, about 100 paces from the foot of this mountain.

AUBREY, in Latin ALLERICUS, JOHN, in *Biography*, an eminent English antiquary, was born at Easton Piercy in Wiltshire, in 1625 or 1626; and after preparatory education at Malmesbury, entered in 1642 as a gentleman commoner of Trinity college at Oxford. Whilst he was at the university, he assisted in compiling materials for the "Monasticon Anglicanum." In 1646, he was admitted a student in the Middle Temple; but the death of his father, and the derangement of his affairs, devolved upon him much business and many perplexing law-suits, which prevented him from prosecuting his legal studies. However he did not abandon his favourite pursuit, but maintained a regular correspondence with the lovers of antiquities, and furnished Antony Wood with many valuable materials for his great work. He also preserved an intimacy with several of those philosophical friends, who formed the Royal Society, of which he became a member in 1662. His domestic circumstances were peculiarly distressing; for he married unfuitably, and by the total loss of his patrimony he was reduced to absolute indigence. But he had the wisdom and fortitude to adapt his mind to his circumstances; and accordingly he says of himself, "From 1670, I have, I thank God, enjoyed a happy delitescency." "This obscurity, which he calls happy, consisted in following the bent of his genius, while he owed his subsistence to the kindness of his friends; and in labouring to inform the world, in which he knew not how to live." The principal of those who contributed to his support was lady Long of Draycot in Wiltshire, in whose house he had an apartment till his death, which happened about the year 1700, as he was on a journey to Oxford. Aubrey was a good classical scholar, a tolerable naturalist, and a most laborious antiquarian; but he was credulous, and addicted to superstition. His works were numerous, but most of them were left behind him in MS. These are 1. "The life of Thomas Hobbes of Malmesbury," never published, but having supplied materials for Dr. Blackbourn's account of this philosopher. 2. "Miscellanies upon the following subjects; viz. Day-fatality, Local-fatality, Omens, Dreams, Apparitions, Voices, &c. &c. Corpse-candles in Wales, Magic, &c. Second-sighted persons, &c." This work, the title of which sufficiently indicates the trifling taste and credulous disposition of the author, was printed in 1696, and Aubrey left corrections and additions for a second edition, which was not printed till the year 1721. 3. "A Perambulation of the county of Surrey, begun 1673, ended 1692;" printed in 1719, in 5 vols. 8vo., and often referred to by topographical writers. 4. "The Natural History of the north division of Wiltshire," never published. 5. "Monumenta Britannica, or a discourse concerning Stonehenge,

and Rollrich Stones in Oxfordshire." MS. On the subject, Aubrey's judgment was held in high esteem by Mr. Toland; and it was his opinion that it surpassed the Druidical, and anterior to the Roman invasion of Britain. 6. "Architectonica Særa, a dissertation concerning the manner of our church-building in England." MS. 7. "The idea of universal education," and several letters on natural philosophy, and other curious topics, published in "Ralph's Letters," by Derham, and other collections. Among the MSS. at Oxford, there is one which is an account of English writers, especially poets, with many of whom the author was well acquainted. This MS. "was lent to Wood, while he was drawing up his 'Athenæ' for Wood greatly castrated the MS. while it was in his possession. Wood's account of Milton, the first that ever appeared in print, and which has since furnished the substance of all the materials now extant of Milton's life, was literally taken from this MS." See Warton's Life of Dr. Barrow, p. 151—153. Biog. Brit.

AUBURG, in *Geography*, a town of Germany, in the circle of Westphalia, and county of Diepholz, six miles east of Diepholz.

AUBURN, or AUBOURN, is a small town in Wiltshire, 76 miles west from London. It is seated on a branch of the river Kennet, and has a small market on Tuesdays. Its inhabitants are principally employed in the manufacture of fullians, a considerable quantity of which is annually sent to the metropolis. The soil of Auburn and its vicinity is chiefly gravel, with a substratum of chalk. About one mile from the town is a very extensive rabbit warren, whence many hundred couple of rabbits are sent to London during the proper season. Auburn suffered materially in its trade and buildings by a furious fire that occurred here on the twelfth of September 1760, when seventy-two houses, and other property, to the estimated amount of 200,000*l.*, were consumed. By means of a public subscription, the distressed inhabitants obtained some remuneration for their losses; but the town has never recovered the serious injury it then sustained.

AUBUSSON, a town of France, and chief place of a district in the department of the Creuse, fourteen leagues west of Clermont. Its manufacture of tapestry renders the town populous. N. lat. 45° 58'. E. long. 2° 15'.

AUCA, a town of Asia, in the kingdom of Candahar, forty-five leagues north-east of Zareng.

AUCAGUERELLE, a town of Africa, in the country of Adel. N. lat. 9° 10'. E. long. 44° 25'.

AUCAS, the name of a warlike and independent tribe in South America, occupying the same parts of Paraguay with the AMBOXTANS, and resembling them in their disposition and manners.

AUCH, a city of France, and capital of the department of Gers. Before the revolution it was the capital of Armagnac, and the see of an archbishop, who had the title of primate of Aquitaine; and it was the metropolis of Gascony. It is seated near the Gers, on the declivity of a hill. Some of the streets are straight, well paved, and full of neat buildings. The cathedral is a large and beautiful building, adorned with painted windows, whose colourings are bright and superior to most of the kind. The number of inhabitants has been estimated at 6000. The country round Auch consists of high limestone hills, with narrow vallies, in which are many vines, and in the vineyards are also fig-trees. N. lat. 43° 40'. E. long. 0° 40'.

AUCHIA, in *Ancient Geography*, a river, upon which was seated the town of Galtis.

AUCHASES, in *Geography*, the name of a tribe of mount Caucasus, called also Abases, or Abasges, who dwell

on the southern side of the Kuban, and on the eastern coasts of the Euxine. The proper Auchasia or Abasa is under the Ottoman supremacy, having a prince, who resides at Anelopia. The western races of the Auchasians acknowledge the paramount sovereignty of the Khan of the Crimea; and these are they who at present belong to the Russian Kuban. They mostly live about the river Laba. See *ABASSA*.

AUCHATAE, in *Ancient Geography*, a people of Asia, in Scythia.

AUCHENIA, in *Entomology*, the name of a genus of coleopterous insects, adopted after professor Thunberg, by Mr. Marshall, in his late and very excellent work intitled *Entomologia Britannica*. It comprehends a tribe of insects before arranged with the Linnæan *chrysomelæ*, and among them several which Linnæus had himself assigned to that genus; such as *merdigera*, 12-punctata, *asparagi*, *cyanella*, *melanops*, *flavipes*, *hirta*, 4-maculata, and *tenella*; to which Mr. Marshall adds the *subspinosa* and *rustipes* (*criocerides*) of Fabricius; and a new species which he names *flavicollis*. The character of the *auchenia* genus is, antennæ filiform; head advanced; thorax cylindrical, and narrower than the wing-cases; and the body oblong. T. 1. p. 213.

AUCHISÆ, in *Ancient Geography*, a people of Africa, in the Cyrenaic territory.

AUCKLAND, or *BISHOP AUCKLAND*, in *Geography*, is a neat market and corporate town situated about ten miles south-west from Durham, and 246 N. by W. from London. This place obtained the latter name at the time of bishop Bee, who is said to have built a magnificent castellated edifice here during his prelacy, which continued from 1283 to 1310. But this building has been wholly destroyed, and succeeding bishops have erected and enlarged another noble mansion where the present diocesan occasionally resides. Mr. Pennant describes the palace and grounds as peculiarly beautiful and grand. "Nothing," he observes, "can equal the approach to the former through the latter, which is varied with verdant slopes, rising hills, woods, and deep precipices impending over the Wear." The ground on which the town and castle are placed is of an angular form, and the streets are extended on the sides of the angle, having the castle at one of the terminating points. The eminence is washed on the north side by the river Wear, and on the south-east by the river Gaifeles; the banks are formed into hanging gardens, and the whole aspect is extremely beautiful. The town is built on high ground, which rises nearly one hundred and forty feet from the level of the plain below, and the steepness of the roads that approach the town renders them very disagreeable and difficult for the passage of carriages. A free grammar school was founded here by Anne Swyfte, under letters patent from James I. in the second year of his reign. It has been further endowed in 1783, and is held in an apartment under a small and neat chapel which was then rebuilt by a subscription of the inhabitants, and dedicated to St. Ann. As the parish church is at St. Andrew Auckland, a village about one mile distant from the town, this was a necessary improvement. Here are a weekly market on Thursday, and three annual fairs. The market place is a large open space in the middle of the town, and on its western side has lately been erected and established a large manufactory for printing all kinds of cottons, calicoes, muslins, &c. On the north-west is a substantial old bridge, built by bishop Skirlaw about 1403, over the river Wear; and in the vicinity of the town are four or five respectable and handsome gentlemen's seats. Leland's *Itin.* vol. i. and Hutchins's *History of the County of Durham*, vol. iii.

AUCTA, in *Entomology*, a species of *CHRYSOMELA*, with an azure shining thorax; wing-cases blue, dotted,

with a red margin. Fabricius. A native of Europe. In size and appearance it resembles *CHRYSOMELA marginata*.

AUCTA, a species of *VESPA*, of a black colour, with the anterior margin yellow; two yellow dots and a transverse line on the scutell; and six yellow bands, the first with a dot on each side, upon the abdomen. This kind inhabits Germany. Gmel. &c.

AUCTION, in *Commerce*, denotes a kind of public sale, much in use for estates, houses, household goods, and other commodities, subject to certain conditions, in which the highest bidder is the buyer. These sales are subject to legal regulations. By 19 G. III. c. 56. an auctioneer is required to take out a licence, setting forth his true name and place of abode; and for the said licence, if it be within the limits of the chief office of excise in London, he shall immediately pay the sum of 20s. and elsewhere 5s. over and besides any other duties or payments for trading in or vending any gold or silver plate, or otherwise; and acting without such a licence incurs, within the bills, a forfeiture of 100l. and elsewhere 50l. The said licence must be renewed annually; and bond must be given at the time of taking it out with two sureties in the sum of 200l. within the bills, and elsewhere in 50l.; that he will deliver in a just account, and make payment of the duties. These duties are as follow: viz. for every 20s. of the purchase money arising by virtue of any sale by auction of any interest in possession or reversion, in any freehold, copyhold, or leasehold lands, tenements, houses, or hereditaments, and of any annuities, or money charged thereon; and of any utensils in husbandry and farming stock, ships and vessels; and of any reversionary interest in the public funds; and of any plate or jewels, shall be paid by the auctioneer or agent 6d. viz. 3½ d. by 27 G. III. c. 13. and 2½ d. more by 37 G. III. c. 14. And for every 20s. of the purchase money arising or payable by virtue of any sale by auction, of furniture, fixtures, pictures, books, horses, and carriages, and all other goods and chattels whatever, 10d. viz. 7d. by 27 G. III. c. 13. and 3d. more by 37 G. III. c. 14. Piece goods are exempted from duty by 29 G. III. c. 63.; and also all goods imported from Yucatan, and sundry commodities imported from Africa in British ships, or from any British settlement abroad by 32 G. III. c. 41. There are also further exemptions specified in the statutes 17 G. III. c. 50. § 11, 12, 13. and 19 G. III. c. 56. § 13, 14, 15. The auctioneer is required to give previous notice to the office of excise of the day of sale, and deliver a written or printed catalogue specifying the several articles to be sold, attested and signed by himself or his known clerk, under a penalty of 20l. 19 G. III. c. 56. § 9. He shall also within 28 days, within the limits of the chief excise office in London, and elsewhere within six weeks, deliver in an account in writing of the total amount of the money bid at each sale, and of the several articles or lots there sold, and the price of each; and at the same time make payment of the duties: the truth of the account to be attested upon oath. And by 38 G. III. c. 54. every auctioneer, neglecting to make payment within the limited time, shall forfeit double the duty.

AUCTION, or *Auctio*, was originally a kind of sale among the ancient Romans, performed by the public crier "*sub hasta*," that is under a spear stuck up on that occasion, and by some magistrate, who made good the sale by delivery of the goods. This custom of setting up a spear at an auction seems to have been derived from this circumstance, that at first only those things which were taken in war were sold in that manner. Hence *hasta* is put for a public sale, and "*sub hastam venire*" denotes to be publicly sold. This was termed *auctio*, q. d. *increase*; because, according to Sigonius, the goods

goods were sold to him, "*qui plurimum rem auget,*" who would bid most for them. The day, and sometimes the hour, and the terms of the auction, were advertised, either by a common crier, or in writing; and there were courts in the forum, called "*atria auctonaria,*" where auctions were made; and to these Juvenal is supposed to allude. (Sat. vii. 7.) A money-broker, "*argentarius,*" was also present, who marked down what was bidden, and to whom the purchasers either paid down the price, or gave security for it. The seller was called "*auctor,*" and the right of property conveyed to the purchaser was called "*auctoritas.*"

AUCTION by *Verb of Candle.* See CANDLE.

AUCTORATI, in *Roman Antiquity*, an appellation given to such as entered the list as gladiators, and who received wages; or who hired themselves for money to perform in the games or spectacles. The auctorati degraded themselves by the act, and became servile and infamous.

AUCTORATI *Milites* also denoted soldiers bound by oath, and the receipt of wages, to serve in war. In this sense auctorati stand opposed to exauctorati, who were disbanded. The stipend they received for their service was denominated *auctoramentum*.

AUCTORITAS SENATUS, in *Roman Antiquity*. See SENATUS *Auctoritas*.

AUCTUS, in *Botany*, an epithet applied to the calyx, when it has the addition of another smaller calyx; or when it is augmented by a series of distinct leaves shorter than its own, that surround its base.

AUCTUS, in *Entomology*, a species of CIMEX (*Lygus* Fabr.), the thorax of which is slightly spinous, black, with two fulvous spots; a yellow band on the upper wings; franks of the posterior legs membranaceous and yellow. Inhabits Cayenne.

AUCUBA, in *Botany*, a large Japanese tree. Thunb. Jap. 4. Nov. Gen. 61. Schreb. 1414. Juss. 382. Class, *monocelia tetrandria*. Gen. Char. * Male flowers. *Cal.* perianth one-leafed, truncate, obscurely four-toothed, villose, very short, permanent. *Cor.* four-petalled; petals ovate, acute, spreading; underneath concave, hairy; above convex, deciduous. *Stam.* filaments four, inserted into the receptacle among the petals, thick, erect; very short; anthers ovate, twin, with four furrows. *Recept.* plano-convex, smooth, with a square hole impressed upon the middle. Female flowers on the same tree. *Cal.* and *Cor.* as in the male. *Pist.* germ inferior; style thick, short; stigma simple, capitate. *Per.* nut ovate, one-celled.

Ess. Gen. Char. *Mile. Calyx* four-toothed. *Cor.* four-petalled; berry one-seeded.

Species, 1. *A. japonica*. Thunb. Jap. 64. t. 12, 13. Kämpf. Am. fasc. 5. 775. Ic. select. t. 6. A large tree. Branches and subdivisions dichotomous, smooth, divaricate, erect, angular; leaves aggregate at the tops of the branches, petiolate, opposite, oblong, sharp, remotely ferrate, smooth, nerved; flowers terminal, paniced; peduncles and pedicels villose; bractes lanceolate. It varies with brown green unspotted leaves, and bright green leaves, variegated with white. It is distinguished from the serpicula by the receptacle of the male being smooth, not torulose, but perforated in the middle. A native of Japan. Introduced by Mr. John Graëfer in 1783.

AUDARISTENSES, in *Ancient Geography*, a people of Macedonia, in Pelagonia. Pliny.

AUDATTHA, a town of Arabia Deserta. Ptolemy.

AUDE, in *Geography*, a river of France, which rises in the Pyrenées, passes by Quilan, Alet, Limoux, Carcassonne, &c. and discharges itself into the Mediterranean, about ten miles east of Narbonne. It gives name to a department

through which it flows. This department is one of the seven formed by Languedoc, Comminge, &c. It is bounded on the north by the departments of Herault, Tarn, and Upper Garonne; on the east, by the Mediterranean; on the south, by the departments of the Eastern Pyrenées and Arriege; and on the west, by those of Arriege and Upper Garonne. Its superficies is about 1,275,593 square acres, or 650,996 hectares; its population consists of 219,101 persons; and it is divided into four communal districts.

AUDELA, in *Ancient Geography*, a town of Asia, in Mesopotamia.

AUDENA, a river of Italy, in Liguria.

AUDIA, a town of Arabia Petraea. Ptolemy.

AUDIANISM, in *Ecclesiastical Hist.*, the system or sentiments of Audius, and his followers; particularly as to the belief of the human figure of the deity. See ANTHROPOMORPHITES, and AUDIUS.

AUDIENCE, in a general sense. See HEARING.

The word is formed from *audire*, to hear.

AUDIENCE is also used for the ceremonies practised in courts, at the admission of ambassadors and public ministers to a hearing. In England, audience is given to ambassadors in the presence chamber; to envoys and residents, in a gallery, closet, or any place where the king happens to be. At their admission, the way in all courts is to make three bows after which they cover and sit down, the king first covering and sitting down, and giving them the sign to put on their hats. When the king cares not to have them be covered and sit, he continues uncovered himself, and standing all the while, which is taken as a slight and an affront. After the first audience, it does not look well to be too haughty in demanding another. At Constantinople, ministers usually have audience of the prime vizir; in his absence the calimacan admits them to audience.

AUDIENCE is also a name of courts of justice or tribunals established by the Spaniards in America, and formed upon the model of the court of chancery in Spain. Of these there are eleven, which dispense justice to as many districts, into which the Spanish dominions in America are divided. They are established at the following places; viz. St. Domingo in the island of Hispaniola, Mexico in New Spain, Lima in Peru, Panama in Terra Firma, Santiago in Guatemala, Guadalaxara in New Galicia, Santa Fé in the new kingdom of Granada, La Plata in the country of Los Charcas, St. Francisco de Quito, St. Jago de Chili, and Buenos Ayres. To each of these are subjected several large provinces; and some so far removed from the cities where the courts are fixed, that they can derive little benefit from their jurisdiction. The Spanish writers commonly reckon twelve courts of audience, including that of Manila in the Philippine islands. The number of judges is various, according to the extent and importance of their jurisdiction. Both civil and criminal causes come under their cognizance; and for each peculiar judges are set apart. The Spanish viceroys have often attempted to intrude themselves into the seat of justice; and, therefore, in order to check this interference, which must have annihilated justice and security in the Spanish colonies, the viceroys have been prohibited by repeated laws, from interfering in the judicial proceedings of the courts of audience, or from delivering an opinion, or giving a voice with respect to any point litigated before them. These courts of audience are subject to restraint and limitation. They may advise, they may remonstrate; but in the event of a direct collision between their opinion and the will of the viceroy, what he determines must be executed, and nothing remains for them but to lay the matter before the king and the council of the Indes.

Indies. But to be entitled to remonstrate and to inform against a person, before whom all others must be silent and tamely submit to his decrees, is a privilege which adds dignity to the courts of audience. Besides, upon the death of a viceroy, without any provision of a successor by the king, the supreme power is vested in the court of audience resident in the capital of the viceroyalty; and the senior judge, assisted by his brethren, exercises all the functions of the viceroy, while the office continues vacant. In matters which come under the cognizance of the audiences, in the course of their ordinary jurisdiction as courts of justice, their sentences are final in every litigation concerning property of less value than 6000 pesos; but when the subject in dispute exceeds that sum, their decisions are subject to review, and may be carried by appeal before the royal council of the Indies. Robertson's Hist. Amer. vol. iii. p. 286, &c.

AUDIENCE is also the name of one of the ecclesiastical courts in England, which is held wherever the archbishop calls a cause to his own hearing.

The two archbishops have their courts of audience: that of the archbishop of Canterbury is under the direction of the dean of the arches, who is official of the audience, and keeps his court in the hall of Doctors Commons.

The court of audience is chiefly concerned in differences arising upon elections, consecrations, institutions, marriages, &c.

AUDIENCES, *Chamber of*. See CHAMBER.

AUDIENDO & terminando, a writ, or rather commission, directed to certain persons, when an insurrection or great misdemeanour is committed in any place, for the appeasing and punishment thereof.

AUDIENTS, or AUDITORES, in *Ecclesiastical History*, an order of catechumens; consisting of those who were newly instructed in the mysteries of the Christian religion, and not yet admitted to baptism.

AUDIERNE, in *Geography*, a town of France, in the department of Finisterre, and chief place of a canton in the district of Ponterioix, five and a half leagues west of Quimper.

AUDIFRET, JOHN-BAPTIST, in *Biography*, a French geographer, was a native of Draguignan, in Provence, or of Marseilles, and flourished at the end of the seventeenth, or beginning of the eighteenth centuries. He was appointed by Louis XIV. in 1698, envoy extraordinary to the courts of Mantua, Parma, and Modena. He died at Nancy, in 1733, at the age of seventy-six years. His much esteemed work, intitled, "Geographie Ancienne, Moderne, et Historique," was printed in three volumes, 4to., at Paris, in 1689 and 1691, and in 12mo., at Paris in 1694. This work, which unites geography and history, comprehends only Europe, and, being left unfinished, it wants Spain, Italy, and part of Turkey in Europe. Nouv. Dict. Hist.

AUDIGUIER, VITAL DE, a French noble, was born at Naive, near Villefranche de Rouergue, about the year 1565, and united literature with the profession of arms. Of his writings, the principal are, "A Treatise on the true and ancient Usage of Duels," printed in 8vo. at Paris, in 1617, shewing the injustice of common duels, and recommending a revival of the ancient practice of public combats on great occasions, under royal authority; "Poems," in two volumes, 8vo., printed in Paris, in 1614; and two romances under the titles of "The Loves of Lyfander and Calista," printed at Lyons, in 1622; and "The Loves of Aristander and Cleonice," at Paris, in 1625. His style is clear and sprightly; and his romances were much read. He

is said to have been assassinated about the year 1630. Nouv. Dict. Hist.

AUDIT, a regular hearing and examining of an account, by officers appointed for that purpose. See AUDITOR.

AUDITA *Querela*, in *Law*, is a writ by which a defendant, against whom judgment is recovered, and who is, therefore, in danger of execution, or perhaps actually in execution (or on a statute-merchant, statute-staple, or recognizance), may be relieved upon good matter of discharge, which has happened since the judgment; as if the plaintiff hath given him a general release; or if the defendant hath paid the debt to the plaintiff, without procuring satisfaction to be entered upon the record. In these and the like cases, wherein the defendant hath good matter to plead, but hath had no opportunity of pleading it (either at the beginning of the suit, or *puis darrein continuance*, which must always be before judgment), an *audita querela* lies, in the nature of a bill in equity, to be relieved against the oppression of a plaintiff. It is a writ directed to the court, stating, that the complaint of the defendant hath been heard, *audita querela defendantis*, and then setting out the matter of the complaint, it at length enjoins the court to call the parties before them, and having heard their allegations and proofs, to cause justice to be done between them. Finch. L. 488. F. N. B. 102. It also lies for bail, when judgment is obtained against them by *seire facias*, to answer the debt of their principal, and it happens afterwards that the original judgment against their principal is reversed; for here the bail, after judgment had against them, have an opportunity to *plead* this special matter, and therefore they shall have redress by *audita querela* (1 Roll. Abr. 308.); which is a writ of a most remedial nature, and seems to have been invented, lest in any case there should be an oppressive defect of justice, where a party, who hath a good defence, is too late to make it in the ordinary forms of law. But the indulgence now shewn by the courts in granting a summary relief upon motion, in cases of such evident oppression (Lord Raym. 439.), has almost rendered useless the writ of *audita querela*, and driven it quite out of practice. Blackst. Com. vol. iii. p. 406.

AUDITIONALIS *Scholasticus*, in *Middle Age Writers*, is used for an advocate who pleads causes for his clients in audiences. Du-Cange.

AUDITOR, a hearer, one who listens or attends to any thing.

AUDITOR is also used for several officers, appointed to audit or hear accounts, pleadings, &c.

Anciently the word auditor was also used for a judge, and even for an inquisitor, appointed by judges to examine and find out the truth of some matter in contest. Notaries are also frequently called auditors.

AUDITOR, in our *Law*, is an officer of the king, or some other person, or corporation, who yearly, by examining the accounts of under-officers that are accountable, makes up a general book, with the difference between the receipts and charges, and their allowances or allocations.

Receivers-general of fee-farm rents, &c. are also termed *auditors*, and hold their audits for adjusting the accounts of the said rents, at certain times and places appointed. There are also *auditors* assigned by the court to audit and settle accounts, in actions of account, and other cases, who are proper judges of the cause, and pleas are made before them, &c. 1 Brownl. 24. See ACCOUNT, and ASSUMPSIT.

AUDITORS of the Revenue, or of the Exchequer, are officers who take the accounts of those who collect the revenues, taxes, &c. raised by parliament; as also of the sheriffs, escheators,

cheators, collectors, tenants, and customers; and set them down, and perfect them.

AUDITORS of the Press, or Impress, are officers in the exchequer, who formerly had the charge of auditing the great accounts of the kings customs, naval and military expences, and of all monies impressed to any man for the king's service: but they are now superseded by the commissioners for auditing the public accounts. See *Public Accounts*.

AUDITOR of the Receipts is an officer of the exchequer who files the tellers' bills, and makes an entry of them, and gives the lord-treasurer a certificate of the money received the week before. He makes debentures to every teller, before they receive any money, and takes their accounts. He also keeps the black book of receipts, and the treasurer's key of the treasury (where the ancient leagues of the realm, and many records of the king's bench, and common pleas, are repositd); and sees every teller's money locked up in the new treasury. 4 Inst. 107. All the exchequer bills, orders, debentures, patents, and other instruments which pass the office of the exchequer, are signed by him.

There are also auditors of the first fruits; of the principality of Wales; of the duchy of Cornwall, &c. See *First Fruits, &c.*

AUDITOR of the Rota, the apostolic chamber, the chatelet, &c. See *ROTA, CHAMBER, &c.*

AUDITORS, in Church History. See *AUDIENTS*.

The auditors formed one branch of the Manichean sect, which was divided into elect and auditors; corresponding, according to some writers, to clergy and laity; and, according to others, to the faithful and catechumens among the catholics. By the Manichean rule, a different course of life was prescribed to the elect from that of the auditors. The latter might eat flesh, drink wine, bathe, marry, traffic, possess estates, bear magistracy, and the like; all which things were forbidden to the elect. The auditors were obliged to maintain the elect, and knelt down to ask their blessing. Beaufobre observes, that the elect were ecclesiastics, and in general such as made profession of observing certain counsels, called evangelic; such as the clergy and monks; and they were called the *perfect* by Theodoret. The auditors were the laity, and so denominated, because they heard in the church, whilst others taught and instructed. Lardner's Works, vol. iii. p. 424. &c.

AUDITORS, Conventual, Collegiate, &c. were officers formerly appointed among the religious, to examine and pass the accounts of the house.

AUDITORIUS MEATUS, or AUDITORY Passage, in Anatomy. There are two passages distinguished by this title; an external one, by which the air has access to the tympanum; and an internal one, by which the seventh pair of nerves pass from the brain into the petrous part of the temporal bone. See the *Description of the EAR*.

AUDITORY, in an adjective sense, something belonging to the sense of HEARING.

AUDITORY, AUDIENCE, is also a collective name, denoting an assembly of persons, hearing or attending to a person who speaks in public.

AUDITORY is also used for the seat or bench where a magistrate or judge hears causes.

At Rome, the several magistrates had auditories, or seats of justice, according to their dignity.—Those of the superior officers were called *tribunals*; those of the inferior, *subsellia*.

The pedanei had their benches or auditories in the portico of the imperial palace. Those of the Hebrews, at the gates of cities. The judges appointed by the ancient lords distributed justice under an elm, which was usually

planted before the manor-house, and served them for an auditory.

AUDITORY, Auditorium, in the *Ancient Churches,* was that part of the church where the audientes stood to hear, and be instructed: and it was that part now called *navis ecclesie*. See *NAVE*. In the primitive times, the church was so strict in keeping the people together in that place, that the person who went from thence in sermon-time was ordered by the council of Carthage to be excommunicated.

AUDITORY Passage, or Canal, Diseases of the, in Surgery, are described under the articles *EAR,* and *DEAFNESS*.

AUDITORY Nerves, the seventh pair. See *NERVES, Description of the*.

AUDIUS, in Biography, the founder of a Christian sect, was a native of Mesopotamia, and flourished about the year 350. In his own country he was much esteemed on account of the holiness of his life, and zeal for the faith; but he exposed himself to ill-treatment by his freedom in admonishing the bishops and presbyters, and particularly in reproving the rich clergy, who pursued a luxurious course of life. At length, he separated from the church, formed an assembly of those who were attached to him, and became their bishop. The clergy, offended by his rebukes, and jealous of his popularity, accused him to the emperor, either Constantine or one of his successors, who banished him into Scythia; and here he converted many Goths to the Christian faith. His followers, who were called Audians, adopted some peculiar tenets and customs. They celebrated Easter, or the paschal feast, with the Jews, on the fourteenth day of the moon, alleging that this was the ancient custom, confirmed by the apostolical constitutions, and that the council of Nice had innovated in compliance to Constantine; and they are also said to have used the apocryphal books in their assemblies. They have been likewise charged with some errors in point of doctrine, and particularly with attributing to the deity a human form; whence they have been classed with the Anthropomorphites. Moheim E. H. vol. i. p. 630. Lardner's Works, vol. iv. p. 304.

AUDON, in Ancient Geography, a promontory of Africa, in Mauritania Cæsariensis. Ptolemy.

AUDRAN, in Biography, the name of a celebrated family of artists, who acquired eminence in painting and engraving. *Claude*, the first of the family, was the son of Louis, who lived in the reign of Henry IV. of France. He was born at Paris in 1592; but as he made no great progress in the art of engraving, his prints are held in little or no estimation. He resided at Lyons, and died there in 1677.

Carl, or Karl, was the brother, or as some say, the cotemporary of Claude, and born at Paris in 1594. For the purpose of gratifying and improving an early taste for the arts, he went to Rome, and at his return adopted that species of engraving, which is performed merely with the graver. His style was that of Cornelius Glocmart, but neater. The abbé Blouin, who speaks of this art in terms of high commendation, attributes 130 prints to him, amongst which "The Annunciation," a middling-sized plate, upright, from Annabale Caracci; and "The Assumption," in a circle from Dommenichino, are the most esteemed. His first prints were marked with the letter C; and he afterwards, by way of distinguishing his prints from those of his brother Claude, used the letter K. He died at Paris, in 1674.

Germain was the eldest son of Claude, first mentioned, and born at Lyons in 1631. At Paris he perfected himself under his uncle Carl, and on his return to Lyons, published several prints which did honour to his graver. Such was the estimation in which he was held, that he was a member and professor of the Academy established in this town. He died at Lyons in 1710, and left four sons, all artists.

Claude

Claude was the second son of Claude, and born at Lyons in 1639: having studied painting at Rome, he was, on his return, employed by Le Brun, to assist him in the battles of Alexander, which he was then painting for the king of France. He was admitted into the Royal Academy in 1675, and died at Paris in 1684, applauded no less for his virtues than his talents.

Girard, the most celebrated artist of the whole family of Audrans, was the third son of Claude, and born at Lyons in 1640. Having learned from his father the first principles of design and engraving, he removed to Paris, where his reputation introduced him to the acquaintance of Le Brun, by whom he was employed in engraving the battle of Constantine, and the triumph of that emperor. At Rome, he studied under Carlo Maratti, and engraved several fine plates, and particularly the portrait of pope Clement IX. Recalled to Paris by Louis XIV. at the instigation of M. Colbert, after a residence of three years at Rome, he assiduously applied to engraving, and was appointed engraver to the king, who greatly encouraged him. In 1681, he was named counsellor of the Royal Academy, and died at Paris in 1703. Strutt considers him as one of the greatest engravers, without any exception, that ever existed in the historical line; and a careful examination, he says, of the battles of Alexander, engraved by this artist, will of itself justify this assertion. His distinguishing excellence consists in his contracting no manner of his own, but transferring on copper simply, with great truth and spirit, the style of the master whose pictures he copied. "On viewing his prints, you lose sight of the engraver, and naturally say, it is Le Brun, it is Poussin, it is Mignard, or it is Le Seur, &c. as you turn to the prints which he engraved from those masters." His works, exclusively of his portraits, are distributed into four classes; viz. 1. his slight prints or etchings, to which little or nothing was done with the graver, among which are the "deluge," the "passage through the red sea;" the "combat of Joshua against the Amalekites;" the "empire of Flora;" the "preservation of Pyrrhus;" a "ceiling" from Le Brun, representing the "four seasons" of the year. 2. Those more finished, but in a rough, bold manner; e. g. "Paul and Barnabas at Lystra;" "Coriolanus appeared by his family;" "Time supporting Truth;" the ceiling of the chapel de Saulx, representing the "Accomplishment of the old law by the new one," engraved in 1681, from Le Brun, wonderfully uniting great spirit, character, expression, and beautiful drawing; and the "death of St. Francis." 3. Those in his most finished manner; as the "battles of Alexander," from Le Brun; viz. "The passage of the Granicus;" "the battle of Arbela;" "Porus brought to Alexander" after his defeat;" "Alexander entering the tent of Darius;" and "the triumphal entry of Alexander into Babylon;" the "Pest," from Peter Mignard; the "baptism of the Pharisees," from N. Poussin; the "martyrdom of St. Laurence," from Le Sueur; the "martyrdom of St. Agnes," from Dominichino. 4. Such as he did with the graver only, which are few, and of inferior merit; such as "Æneas saving his father Anchises," after Dominichino; and a small folio "Frontispiece" to the effigies of the popes and cardinals, from Cyro Ferri.

Benoît, second son of Germain Audran, was born at Lyons in 1661, and after receiving instruction from his father, removed to Paris, to enjoy the tuition of his uncle Girard, where he acquired great reputation. He died at Louzouer in 1721, "His manner was founded upon the bold clear style of his uncle. His outlines were firm, and determined; his drawing correct; the heads of his figures are in general very expressive; and the other extremities well marked." But his works, compared with those of his uncle, want the mellowness and harmony, which are so

conspicuous in the latter. Among his neatest prints may be reckoned that which represents "Alexander sick," from Le Sueur.

John, the third son of Germain, was born at Lyons in 1667, and perfected himself in the art of engraving, at Paris, under his uncle Girard. His reputation began to display itself at the age of twenty years; and such was his future success, that in 1707, he obtained the title of engraver to the king, and had a pension from his majesty, with apartments in the Gobelins; and in 1708, he was made a member of the royal academy. He was eighty years of age before he quitted the graver, and near ninety when he died. In his most masterly and best prints, the etching constitutes a great part; and he has finished them in a bold, rough style. The drawing of the human figure is correct; the heads are expressive, and finely finished; the other extremities are well marked; but he is inferior to his uncle. He wants that harmony in the effect; his lights are too much and too equally covered; and there is not sufficient difference in the style, in which he has engraved his back grounds, and his draperies. The following prints, besides many others, are usually much esteemed; viz. "Moses saved by Pharaoh's daughter," "Athaliah rending her clothes, on discovering the king in the temple;" "Either before Ahasuerus;" "Cupid and Psyche;" all from Ant. Coypel. "The presentation of Christ in the temple," from Corneille. "The miraculous draught of fishes," and its companion "The resurrection of Lazarus," from Jouvenet. "The battles of Alexander," small, from the large prints; "Moses defending the daughters of Jethro," and its companion, "Moses espousing the daughter of Jethro;" the miracle of the five loaves;" "Christ healing the sick and lame;" and "Christ carrying the cross," both from Ant. Dieu, &c.

Louis, the last son of Germain, was born at Lyons in 1670, and studied at Paris in the school of his uncle Girard. He died suddenly at Paris in 1712. Among his most esteemed prints are, "The seven acts of mercy," from Seb. Bourdon, and "The Cadavre or Corps," from R. A. Houasse. Strutt's Dict.

AUDRUICK, in *Geography*, a town of France, in the department of the straits of Calais, and chief place of a canton in the district of Calais, $3\frac{1}{2}$ leagues north-west of St. Omer.

AUDUN LE ROMANT, a town of France, in the department of the Moselle, and chief place of a canton in the district of Longwy, $3\frac{1}{2}$ leagues west of Thionville.

AUDUS, in *Ancient Geography*, a river of Africa, placed by Ptolemy at the bottom of the Sinus Numidicus, but no traces of it now remain.—Also, a mountainous district in the interior part of Mauritania Sitifensis, the Mons Auralius of the middle age, and Jibbel-Aurefs, as the Turks pronounce it. It is a chain of eminences running one into another, with several beautiful little plains and vallies intervening. The higher and the lower parts of it are very fertile, and are regarded as the garden of this province. The whole mountainous tract is reckoned to be about 120 miles in circuit, and the northern part, which is visited every year by a flying camp of the Algerines, is possessed by such a number of clans, viz. the Boozeenah, Lashash, Maifah, and Booaref, that it requires 40 of their stations to bring them all under contribution. Shaw's Trav. p. 57. This mountain, according to Bruce (Travels, &c. Introd. p. 28.), is inhabited by a savage tribe, of fair complexion, red hair, and blue eyes; called Neardie, and supposed to be a remnant of Vandals, who have maintained themselves in the fastnesses, in defiance of the Moors and Arabs. Each of the people of this tribe have in the middle of the face, between their eyes, a Greek cross, marked with antimony; and

and this mark seems to be the chief vestige of Christianity among them, which religion they not only acknowledge, but boast that their ancestors possessed it. Procopius (Bell. Vand. l. ii. c. 13.) mentions the defeat of an army of the Vandal nation near this place, of which there are probably remains. They pay no taxes to the Bey, but live in constant defiance of him. In this mountain is the *Laubesa* of Ptolemy.—Also, the name of a small port in the eastern part of Mauritania Cæsariensis, mentioned by Ptolemy, and placed by him in the promontory Jarfath, north-east of the mouth of the river Nafavah.

AVE, in *Geography*, a river of Germany, which runs into the Weser, three miles south of Nienburg, in the circle of Westphalia.—Also, a river of Germany, in Lower Saxony, which runs into the Fuhse, two miles S. S. E. of Zell.—Also, a town of Germany, in Upper Saxony, and circle of Erzgebirg, five miles north-west of Schwartzenberg.

AVE, a river of Portugal, which runs into the sea near Villa de Conde, in the province of Entre Duero e Minho.

AVEBURY, or ABURY, a name given to a village in England, situated in the county of Wilts, about five miles west of the town of Marlborough, nineteen north of Stonehenge, and eighty west from London. As a village it presents no particular claims to public notice, but as the site of the most remarkable and stupendous monument of *British Antiquity* in the island, it becomes exceedingly interesting to the antiquary and historian.

The British bards and druids have been repeatedly noticed and often described by our ancient historians; some of whom have given very copious accounts of their religious and juridical rites and ceremonies; but none of them have left complete and satisfactory information relating to the men, their manners, or monuments. Hence arises the great difficulty of giving decisive descriptions of those subjects; and the repeated wars and invasions that have harassed this country, have nearly destroyed all documents and monuments of British antiquity. Among the vestiges of former times, we recognize the stupendous temple at Avebury, which was unquestionably the most considerable and important in Great Britain. It consisted of a number of large unhewn stones placed perpendicularly in the ground, and disposed in parallel rows and circles. There were four of the latter included within a fifth of larger circumference, and at the end of the southern avenue, about one mile distant from the great circle, were two concentric oval arrangements of stones. The number of stones originally employed in the whole work amounted to six hundred and fifty, and most of them measured from ten to nineteen feet in height above the ground, forty feet in circumference, and weighed from forty to fifty-four tons each. The large circle, and the principal part of the temple, were surrounded with a very considerable vallum and ditch, which included an area of twenty-two acres of ground, and measured about 1400 feet in a transverse diameter. This bank and ditch must have been produced with immense labour, and its peculiarity of formation proves that it was never intended for a fortified place in time of war, as the bank is thrown up on the outer verge of the ditch; whereas all military encampments have the bank within the ditch, to give an advantageous height of ground to the besieged inhabitant. The vallum measures about 30 feet in height from the top to the middle of the ditch. Supposing that it was raised for spectators to behold any ceremonies performed in the inclosed area, it would accommodate above 70,000 persons, and allow two square feet to each. This boundary embraced one large, and four small circular arrangements of stones. The first was about thirty-five feet within the ditch, and

consisted of 100 stones, placed at nearly regular distances from each other. Within this circle were two double concentric circles composed with eighty-eight stones, three others called the cove, and one called the east oblong. From the large circle proceeded two avenues, or double rows of large upright stones, placed at nearly regular distances in each row, and from one row to the other. These consisted of 200 stones, extended about one mile in length each way, and were called the Peckhampton and Kennett avenues. The first proceeded from the temple in a westerly direction, and was terminated with a single stone; whilst the other took a south-eastern course, and had two oval rows of stones at the extremity. The objects we have already described, are considered by some persons as the whole of this extraordinary monument; but it seems very probable that Silbury Hill, some cromlechs, other circles, and numerous relics, were originally connected with it. Silbury Hill is considered as the largest tumulus, or barrow, in England, and its situation implies that it was intended to mark the meridian line from the centre of the temple. Dr. Stukeley states, that it is directly south of the great circle. It measures 105 feet diameter at top, 560 feet at the base, 240 feet in height, following the surface of its northern side, and 1680 feet in circumference at the bottom. From the top of this artificial hill a spectator commands a view of the western avenue, and the whole area of the temple, with a considerable tract of flat country to the north and west. This barrow has been dug into by some persons, who expected to make interesting discoveries; but for want of perseverance, or well-directed research, they discontinued their operations, without gratifying their curiosity, or rewarding their labour.

The Goths, Vandals, and Turks, have often been stigmatized as the merciless destroyers of every venerable and interesting monument of antiquity; but surely they are not more reprehensible than many of the inhabitants of this highly-civilized and refined country; some of whom have exercised much ingenuity and labour in wantonly and deliberately destroying this singular monument of ancient customs. We have already stated that it originally consisted of 650 stones, but most of these have been broken to pieces, by means of fire and manual labour, and the dissevered fragments appropriated to the construction of walls, hovels, and common roads. In 1722, only forty remained of the great circle, of which number seventeen were standing; but these are now reduced to nine. The interior circles were almost entire in 1716, but in 1723 only two stones were left erect belonging to the outward circle of the northern temple. Of the Kennett avenue, there were seventy-two stones in 1772, of which only eight or ten remain; and only two of the Beckhampton avenue.

The stones used in forming this temple are called by the inhabitants, Bolderstones and Sarsens. They are of siliceous grit, being of the same species as those that accompany the great stratum of chalk, which crosses England from E. N. E. to W. S. W. These stones lie on the surface of the ground in detached masses, unconnected with any stratum of rock.

Having shewn what the temple was, and what it is, we will next endeavour to explain its appropriation and uses; in doing which, we found our deductions principally on the traditions of the Welsh bards, a class of people more likely to preserve correct memorials of the ancient British, than will be found in any of the Roman histories. By these writers we learn that Avebury was the great national temple, or circle of convention of the Ancient Britons; in which they assembled from all parts of the island, on the four grand festivals, which were held at the time of the two solstices.

and the two equinoxes, but more particularly on midsummer day, and new-year's day, or the winter solstice. The Bardic triads call the temple at Avebury, one of the three primary *Gorseddau*, or supreme seats of the island of Britain; the other two were those of *Bisgarwen* and *Mool Evor*.

The circles at Avebury and Silbury Hill had their names reciprocally from each other, for the former was termed *Gorsedd Bryn-Gwynon*, or the supreme seat of the Hill of presence, or cognition; and the other was called *Cluder-Cyrringon*, or the tumulus of the circle of conventions. In this place the legislative, sacerdotal, and scientific classes, which formed the ancient British constitution, held their meetings, under the appellations of *Beirz*, *Derwynon*, and *Ovizon*, or Bards, Druids, and Ovates. We are informed by Cæsar, that the Druids of Gaul, "who wished to be perfectly skilled in the Druidical science," occasionally visited England to learn it. From the magnitude and situation of Avebury, we are induced to believe that it was their place of meeting or convention. The situation was the most convenient of any in Great Britain; and that it was the grand metropolitan station, seems satisfactorily ascertained by its magnitude above all others in the island; by the various British roads or ridgeways which converged to this spot; by the vast number of barrows scattered all over these plains, and by several other relics of remote antiquity to be found in the neighbourhood. To Dr. Stukeley we are indebted for much information concerning this place, and but for his diligent inquiries and researches in 1722, &c. we should never have been able to ascertain the figure and dimensions of the temple; with his assistance, aided by repeated examination of the spot, we are enabled to present our readers with an account which we hope will prove as satisfactory as it is faithful. To those who wish for a more minute description, we must refer to Britton's Beauties of Wiltshire, vol. iii.; and for accounts of some subjects collaterally connected with this, see BARD, BARROW, CRONLECH, DRUID, KISTVAEN, STONEHENGE, &c.

AVEHEN, a town of North America, in the country of Mexico, and district of Chiametlan.

AVEIA, in *Ancient Geography*, a town of Italy, in Samnium, south of Amiternum.

AVEIN, in *Geography*, a village of the Netherlands, in the duchy of Luxemburg, near which the army of France defeated the Spaniards; two leagues from Rochefort.

AVEIRO, or BRAGANZA NOVA, a sea-port town of Portugal, in the province of Beira, situated in a flat and marshy country, at the mouth of the Vouga, and containing about 1400 houses, divided into four parishes, and six monasteries. The river Vouga flows through the town, where it is very narrow; but it is adorned with a handsome quay. Near the town it divides into two branches, one to the left and running southward to the sea, the other flowing northward to Ovar. Its trade is inconsiderable, as small boats only come to the town; and as the bar is continually shifting, none but small ships can pass it. The fishery of this place is alone worthy of notice; for Aveiro chiefly supplies the province of Beira with Sardinas, which are carried by large troops of mules into the higher parts of the province. Salt is also produced here in large quantities; though it is not reckoned so good as that at St. Ubes and Lisbon. The town is, on account of its marshy situation, unhealthy, which exposes the inhabitants to frequent attacks of agues and putrid disorders. Aveiro is nine leagues from Coimbra, and eleven south of Oporto. N. lat. 40° 30'. W. long. 9° 8'.

AVEIRO, a river of France, which runs into the Tarn, four leagues below Montauban.

AVELINE, in *Conchology*, a name given by French naturalists to one kind of land-snail found in Amboyna, and called by Linnæus *helix scarabeus*.

AVELLA, in *Geography*, a town of Italy, in the kingdom of Naples, and country of Lavora, four miles north-east of Nola. The situation of this town, with its castle, is delightful, and it commands a view as far as Naples. Not far from this place are the ruins of Abella. It now gives the title of prince to the family of Doria.

AVELLANA, in *Botany*. See CORYLUS.

AVELLANA, in *Conchology*, a species of HELIX, with a slightly umbilicated shell, of an obtuse and somewhat triangular form, rough, plaited, and silvery within; aperture smooth and eared; and an elevated circle on the first whorls of the spire.

AVELLANA, a species of PATELLA with a thin white shell, very finely striated; and an oblong perforation divided by a ligament. Native place unknown. Meuschen. Naturf.

AVELLANA, in *Entomology*, a species of PHALÆNA (*Tortrix*) found on the nut-tree in the north of Europe. The wings testaceous, with three short bands. Linn. Gmel. &c.

AVELLANÆ, a species of ATTELABUS, of a black colour, with the wing-cases, thorax, and legs red. This insect Gmelin conjectures, may be only a variety of *attelabus coryli*; it inhabits Germany, and is called by Scopoli *curculio collaris*.

AVELLANÆ, a species of CIMEX, of a black colour, with brown upper-wings that are white at the base and tip; legs fulvous. Found on the nut-tree. Gmel. Scop. &c.

AVELLANÆ, a species of PHALÆNA (*Bombyx*) that is found on the nut-trees in Europe. The wings are dull ash-coloured, with an obscure sinous band, and without spots. Fabr. Gmel. &c.

AVELLANE, in *Heraldry*, is a term peculiar to the form of a cross, whose quarters resemble the *nux avellana*, or silberd-nut.

AVELLINO, in *Geography*, a town of Italy, in the kingdom of Naples, and Principato Ultra, the see of a bishop, and suffragan of the archbishop of Benevento. Avellino, which was probably founded by the Lombards, is a considerable city, extending a mile in length down the cavity of a hill, with ugly streets, but tolerable houses. The churches are crowded with monstrous ornaments in a barbarous style, which the Neapolitans seem to have borrowed from the Spaniards. The cathedral is a poor building, adorned merely with uncouth Latin distichs, and shapeless Gothic sculpture. The inhabitants have access to a statue of St. Laurence, with a phial of his blood, which for eight days in the month of August entertains them with a miraculous liquefaction similar to that of St. Januarius at Naples. The only edifice of note is a public granary, of the composite order, adorned with antique statues, and an elegant bronze one of Charles II. king of Spain, while a boy, cast by Cavalier Cosimo. The number of inhabitants amounts to 8 or 10,000. The bishop's revenue is about 6000 ducats or 1,125 l. a year. The magistracy consists of a syndic and four eletti, who are chosen annually; but these offices are engrossed by a certain number of families of some distinction, who neither intermarry nor associate with the other burghers. The estates of the prince amount to the yearly value of 20,000 ducats or 3,750 l. and 2000 arise from duties on the dye of cloth, which is made of various qualities and colours, but chiefly blue. The finest sells for thirty carlini a canna, and pays twenty-six grana duty of entrance into Naples. Many wealthy merchants are concerned in this cloth manufacture, some of whom employ in it a capital of 80,000 ducats, or 15,000 l. The poor women who spin the wool, must work very diligently to earn about four grana.

grana a day. The second article of trade is macaroni and paste of many kinds, which are of excellent quality, and much esteemed through the country. Wooden chairs are also made and sold here in great quantities. Avellino abounds with all sorts of provisions; each street is supplied with fresh water; but the wine is indifferent. The soil of this district, consisting chiefly of volcanic substances, produces little corn, but abundance of fruit, of which the apple is held in high estimation. The most profitable of all fruit-trees, however, is the hazel. Nut-bushes cover the face of the valley, and in good years yield a profit of 60,000 ducats or 11,250 l. The nuts are mostly of the large round species of filberd, which we call Spanish; and the bushes were originally imported into Italy from Pontus, and known among the Romans by the appellation of "Nux Pontica," which, in progress of time, was changed into that of "Nux Avellana," from the place where they had been most successfully propagated. The proprietors plant them in rows, and by dressing, form them into large bushes of many stems. Every year they refresh the roots with new earth, and prune off the straggling roots with great attention. Swinburne's Travels, vol. i. p. 171, &c.

AVE-MARIA, or AVE-MARY, the angel Gabriel's salutation of the Virgin Mary, at his bringing her the tidings of the incarnation; thus called, as beginning with these words, *Ave, Maria*, q. d. *Hail, Mary*.

The ave-mary is a prayer or formula of devotion very usual in the Romish church. It was added to their prayers by order of pope John XXII. in the fourteenth century.— Their chaplets and rosaries are divided into so many *ave-marys*, and so many *pater-nosters*; and hence the beads themselves which indicate them, are also called *aves*, or *avemarys*.

AVENA, in *Botany*, oat-grass (supposed from *avo*, to desire, or covet; cattle being fond of it). Lin. g. 91. Schreb. 122. Juss. 32. Class, *triandria digynia*. Nat. Ord. *gramina*. Gen. Char. *Cal.* glume generally many-flowered, two-valved, loosely collecting the flowers; valves lanceolate, acute, ventricose, loose, large, awnless. *Cor.* two-valved; lower valve harder than the calyx, the size of the calyx, roundish, ventricose, acuminate at both ends, emitting from the back an awn spirally twisted, reflex; nectary two-leaved; leaflets lanceolate, gibbous at the base. *Stam.* filaments three, capillary; anthers oblong, forked. *Pist.* germ obtuse; styles two, reflex, hairy; stigma simple. *Per.* none. *Cor.* most firmly closed, grows to the seed and does not gape. *Seed*, one, slender, oblong, acuminate at both ends, marked with a longitudinal furrow.

Eff. Gen. Char. *Cal.* two-valved, many-flowered; awn from the back of the corolla, jointed, twisted.

Species, 1. *A. flavida*, Siberian oat-grass; festuca glumis villosis, arillis calyce triplo longioribus. Gmel. Sib. 1. 113. t. 22. "Panicked; calyxes one-flowered; seeds hirsute; awns thrice the length of the calyx." Culms very slender, from two to three feet high; leaves rolled up at the edges, from six to twelve inches long; panicle resembling a spike, often directed to one side; glumes of the calyx almost equal, dagger-pointed, membranaceous towards the point; glumes of the corolla of the same length, extremely villose. A native of Siberia, introduced in 1777 by Mess. Kennedy and Lee. It flowers in July and August. 2. *A. chloris*, tall oat-grass. Hudf. With. Curt. Lond. 3. 6. (2) gramin caninum nodosum; Ger. "Panicked; calyxes two-flowered; hermaphrodite, fuscule almost awnless, male awned." Root perennial; stems erect, round, smooth, with four or five purplish joints, above three feet high; leaves striated from seven inches to a foot in length; panicle erect, shining, numerously branched; spikelets two-flowered, one male and the

other hermaphrodite; valves of the calyx unequal, the largest marked with three, the smallest with one green nerve. In the hermaphrodite flower, the middle of the outer valve forms a short awn, and the bottom very hairy; the upper a small lanceolate glume, somewhat gibbous at the base; germ villose. It is common on banks, in hedge-rows, the borders of fields, and sometimes in wet meadows. It flowers in June and July. It is a very early sward, very productive, and yields a plentiful aftermath. In particular situations the base of the stem becomes scabrous, and forms the variety above noticed, which is found in the fields near troublesome, and is one of the several grasses mentioned in the range of *quick-settles*. 3. *A. flavida*, panicled; calyxes two-flowered; awn twice the length of the seed; culm branching. Culms four high, entire, smooth, with brown joints; branches from each axil, from one glume of the calyx lanceolate, the others shorter; two, fertile; corolla smooth, except the outer glume, which is rough with hairs. A range of the *Car. g.* 4. *A. prostrata*, Pennsylvania oat-grass. "Panicle arched; calyxes two-flowered; seeds villose; awns twice the length of the calyx." Observed in Pennsylvania by Kalm, introduced here in 1785, by Dr. Pitcairn. 5. *A. fistulosa*, Spanish oat-grass. Cavan. Hipp. t. 45. f. 1. "Panicle contracted; florets in pairs, hirsute; one pedicelled, with two awns at the top, the middle awn largest." Root annual, capillary; culms several, slender, from two to four inches high; leaves short, striated; one of the florets is fertile, the other on a villose pedicel; valves of the corolla little marked at the tip, with a twisted awn on the back twice the length of the valve. It grows near Madrid, and at the Cape of Good Hope. Introduced here by Mons. Richard, in 1772. 6. *A. fistulosa*, cultivated oat. Of this there are four varieties, the white, black, brown or red, and the blue oat. "Panicked; calyxes two-fecded; seeds very smooth, one awned." Annual; culm or straw upwards of two feet high; panicle various in different varieties, but always loose and pendulous; the two glumes or chaffs of the calyx are marked with lines, pointed at the end, longer than the flower, and unequal. There are usually two flowers and so on in each calyx; they are alternate, conical, the smaller one is awnless, the larger puts forth a strong, two coloured, bent awn, from the middle of the back. No botanist has been able to ascertain satisfactorily the native place of growth of this, or indeed of any other sort of grass now commonly cultivated in Europe. The varieties mentioned above have been long known, and others have been introduced, as the Poland, the Friesland or Dutch, and the Siberian or Tartarian oat. The blue oat is probably what is called Scotch greys. The white sort is most common about London, and these countries where the inhabitants live much upon oat-cake, as it makes the whitest meal. The black is more cultivated in the northern parts of England, and is esteemed a heavy food for horses. The red oat is much cultivated in Derbyshire, Staffordshire, and Cheshire; it is a very hardy sort, and gives a good increase. The straw is of a brownish red colour, very heavy, and esteemed a better food for horses than either of the former sorts. In Lincoln they cultivate the sort called the Scotch greys. The Poland oat has a short plump grain, but the thickness of the panicle seems to have brought it into disrepute among farmers. All to this the straw is very short. It was sown by Mr. Lister, in 1709. Friesland, or Dutch, oat is still more slender, and is thinner skinned, and the grains mostly double. A white oat, called the *patate*, it in Cumberland, where it was lately discovered, promises, from the size of the grain and the length of the straw, to be the most valuable we possess; it

is now very generally bought for sowing. The oat is a very profitable grain, and a great improvement to many estates in the north of England, Scotland, and Wales; for it will thrive in cold barren soils, which will produce no other sort of grain; it will also thrive on the hottest land; in short there is no soil too rich, or too poor, too hot, or too cold for it; and in wet harvests, when other grain is spoiled, this will receive little or no damage. The meal of this grain makes a tolerably good bread, and is the common food of the country people in the north. It is also esteemed for pottage and other messes, and in some places they make beer with it. 7. *A. nuda*, naked oat, pilcorn, or pillis. "Panicle; calyxes three-flowered; receptacle exceeding the calyx; petals awned at the back; the third floret awnless." This has been considered as a British plant by Ray, Hudson, and Withering; but Dr. Smith says it is by no means to be classed among our indigenous plants. Linnæus observes it is very nearly allied to the *silva*; and Haller remarks that the calyx is sometimes two-flowered, but that the awn is neither twisted nor jointed. We are told the seeds have been cultivated, and for the uses of the poor answer all the purposes of oatmeal. 8. *A. sativa*, wild oat or haver. Hudf. With. Smith. Brit. 139. Mart. Fl. Ruil. 81. "Panicle; calyxes mostly three-flowered; florets awned, and hairy at the base." Annual; culm erect, simple, three feet high, a little leafy, striated, very smooth; leaves linear, patent, nerve, scabrous; sheaths thin, nerve, smooth; stipules obtuse, tooth-letted, lacerated; panicle erect, much branched, and spreading; peduncles alternate, capillary, scabrous, thickened towards the apex, nodding; calycine glumes equal, lanceolate, acute, nerved, smooth, longer than the florets; florets for the most part three, remote, gradually diminishing, roundish, beset with tufts of hair at the base, awned from the middle of the back, awn twice the length of the calyx, rough, jointed, twisted at the end; interior glume concave, naked, ciliated. Seed has a soft hairy covering. It grows in fields and hedges, and is one of our most destructive annual weeds among corn. The awns are sometimes used for hydrometers, and the seeds instead of artificial flies, in fishing for trout. 9. *A. sesquiteria*. Scheuch. Gram. 220. t. 4. f. 17. "Panicle; calyxes mostly three-flowered; all the florets awned; receptacles bearded." Panicle oblong; the flowers appear to be hairy, but all the hairs sit on pedicels or receptacles within the calyx among the flowers. The third flower is imperfect. Haller thinks it to be only a variety of the *flavescens*. A native of Germany, Switzerland, &c. 10. *A. pubescens*, soft oat-grass. Hudf. With. Smith. "Panicle erect, almost simple, calyxes commonly three-flowered, receptacle bearded, leaves flat, pubescent." Perennial; culm one or two feet high, erect, simple, roundish, smooth, striated, leafy; leaves spreading, short, obtuse, flat, which together with the sheaths are covered with a soft down; stipule short, deltoid; panicle contracted so as to appear like a spike; calycine glumes very unequal, keeled, scabrous, pointed, membranaceous, naked; interior much longer, three-nerved; florets three, the third often abortive, remotish, clubbed-cylindric, nerve, roughish, diaphanous, awned towards the middle of the back; interior glume smaller and weaker, rough at the edge; common receptacle elongated above the florets, beset with white hairs. It grows in dry meadows and chalky pastures, flowering in June. 11. *A. sterilis*, great wild, or bearded oat-grass. "Panicle; calyxes five-flowered; the outer florets and awns hairy at the base, the inner ones awnless." Annual; culms three or four feet high, smooth; leaves smooth, flat, sharp, very long; flowers pendulous; calyxes four or five-flowered; valves lanceolate, acuminate, concave, equal,

smooth, white with green streaks. In the two outer florets, the outer valve of the corolla resembles a valve of the calyx in form, but shorter, and puts forth an awn two inches long. The other florets are awnless. A native of Barbary and Spain. Introduced into the Kew garden by M. Thouin, in 1777. 12. *A. flavescens*, yellow oat-grass. Hudf. With. Smith. Curt. Lond. 3. t. 5. "Panicle much branched, loose, calyxes mostly three-flowered, unequal; receptacle hairy; leaves flat, subpubescent." Culm erect, but curved at the base, a foot and a half high, striated, jointed; leaves flat, acute, striated, more or less pubescent; panicle somewhat nodding, spreading, branched very much, many-flowered, of a shining gold colour; calycine glumes acute, keeled, scabrous on the back, one twice the size of the other, three-nerved; florets two or three, remotish, lanceolate, compressed, obscurely nerve, awned; awn twice the length of the floret, scabrous; interior glume narrower; receptacle hairy. It grows in meadows, pastures, and the sides of roads, flowering in June and July. In many of our counties, this species forms the principal part of the finest pasturage on the downs, and in some meadows it contributes to the goodness as well as greatness of the crop. 13. *A. hispida*. "Panicle; calyxes three-flowered, hairy." Culms a foot high, smooth; sheaths hairy; panicle or raceme with undivided pedicels, three or four; glumes oblong, acuminate, hairy, upright; corolla awl-shaped; awns twisted, twice or three times the length of the flowers. 14. *A. capensis*. "Panicle contracted; calyxes three-flowered, subulate; corolla pubescent; middle awn twisted, curved." Root creeping; leaves few, smooth, with a rugged edge; culms a foot high, smooth; panicle spike-like, ovate-oblong, purple; the last pedicels capillary; calyx the length of the flower; valves equal, attenuated into an awn; outer valve of the corolla subpubescent, bifid, terminated by two straight awns, and an intermediate one twisted, double the length of the others; inner valve short. This and the *hispida* are natives of the Cape. 15. *A. purpurea*. "Panicle contracted; calyxes two-flowered, ovate; corollas villose; outer glume bifid; awn terminal, bent ju." A very little, smooth, jointed grass; leaves bristle-shaped, smooth, tufted, short, like those of *festuca ovina*; panicle small; glumes of the calyx purple; valves lanceolate, keeled, smooth; all the florets are awned, and covered with a white down. A native of Martinico. 16. *A. lutea*. "Panicle spreading; calyxes two-flowered, subulate; corollas naked, three-awned, middle awn flexuose." This resembles *aira flexuosa* both in habit and colour. A native of Martinico. 17. *A. lupulina*. "Panicle contracted, ovate; calyxes three-flowered, lanceolate; corollas villose, outer glume bifid; middle awn reflex." This is not readily distinguished from the 15th. It is larger, with sheaths extremely tomentose. Panicle yellow, closely crowded; flowers longer than those of the 15th, with the corollas bifid and more hirvute; the divisions subulate, awned. A native of the Cape, found by Thunberg. 18. *A. fragilis*, brittle oat-grass. Schreb. Gram. t. 24. "Spiked; calyxes four-flowered, longer than the floret." Culms many, smooth, with three joints, six or seven inches high; leaves flat, ciliate; spike the length of the culm; florets in a double row, pressed close, and alternate; calyx two or four-flowered, lateral, oblong, pubescent; one valve twice the length of the other; outer valve of the corolla sharp, with an awn from the back. This is the only *avena* truly spiked. A native of Spain. Introduced by Mons. Richard, in 1770. 19. *A. pratensis*, narrow-leaved oat-grass. Hudf. With. Smith. Gramen aven, &c. Ray Syn. t. 2. f. 1. ed. 2. 252. n. 2. & 345. Scheuch. Agr. 230. "Spike erect; calyxes mostly five-flowered; receptacles hairy; leaves involute,

lute, ferrulate, naked." Root perennial; culms many, a foot or a foot and a half high, erect, simple, with a flag joint near the base, above naked, striated, roughish; radical leaves linear, acute, rigid, incurved, smooth on both sides, with the edges ferrulate-scabrous; those on the culms broadest, nervose, with long sheaths which are nervose and smooth; stipule lanceolate; spike erect, commonly very simple; upper spikelets subsessile; under ones long, pedunculated; calycine glumes subequal, acute, three-nerved, a little keeled, scabrous of the length of the lower floret; florets four or more, subrenate, roundish, roughish, nervose at the apex, membranaceous, lacerated, awned from above the middle of the back; awn double the length of the floret, purple, with a white apex; interior glume smaller, very slender, minutely ciliate; receptacle under the floret, beset with short hairs. It grows on dry pastures and heaths, flowering in July. 20. *A. spicata*. "Spiked; calyxes five-flowered, longer than the outer petal, which is awned and forked at top." Spike compounded of three or four remote upright spikelets; flowers five, sessile, upright; calyx subulate, equal, longer than the spikelet; outer petal bilid at the top, with a jointed awn between the divisions, the length of the spikelet. It has the habit of *festuca decumbens*. A native of Pennsylvania. 21. *A. bromoides*, Gr. alpinum aven. &c. Scheuch. Gram. 228. t. 4. f. 21. "Subspiked; spicules binate, one peduncled; awns divaricate; calyxes eight-flowered." Two feet high; culm slender; spikelets round, generally in pairs, one sessile, the other peduncled; calyxes from four to eight-flowered; awns from the middle of the back, twisted. A native of Switzerland, and about Montpellier. 22. *A. strigosa*. "Panicked; calyxes two-flowered; corolla smooth at the base; outer valve ending in two awns, shorter than the valve, and with a bent awn from the back." Annual; culm and leaves bare; peduncles from one to four, rough; calyx the length of the florets; valves seven or ten-ribbed, bordered with a row of minute dots; valve of the corolla smooth below; segments terminating in purple awns white at the tip; feeds hairy. This has been found growing with the cultivated oat, but it is not a native of this country. See Smith. 23. *A. aurata*, golden oat-grass. "Calyxes two-flowered; panicle feathery, erect; corollas golden, villose at the base." A handsome grass, nine inches high; leaves very slender, brittle-shaped; panicle stiff, with mucronate spikelets, one shorter than the other; corolla elliptic, pubescent at the base; top plaited, ferrate; at the base of the outer glume, a jointed awn, longer than the flower. When this grass arrives at maturity, it is of a resplendent gold colour. A native of the Alps, of Switzerland, and Piedmont. 24. *A. feuchszeri*. Schench. Gram. 23. t. 3. "Spikelets five-flowered, pubescent at the base; peduncles branching." Culm from six to twelve inches high; leaves smooth, two lines broad, keeled; panicle narrow like a spike; calyx purple, shining, curved at the top; glumes unequal, mucronate; outer glume of the corolla mucronate, green, variegated with bay and gold colour; inner with a gold and silver colour, membranaceous, awn long, brown, jointed, twisted. A native of the same places as *A. aurata*. 25. *A. filiformis*. Forst. Flor. n. 46. "Panicle erect, very slender; calyxes one-flowered; awns twice the length of the calyx." A native of New Zealand and Easter Island.

Propagation and Culture. For the grasses, see Grass. *Oat.* The best time for sowing oats is in February or March, according as the season is early or late. The black and red oats may be sown a month earlier than the white, because they are hardier. The advantage of early sowing is proved by experiment to be found in the papers of the

Bath Agricultural Society. White oats sown the last week in May have produced seven quarters the acre, and in Hertfordshire they do not sow them till after they have done sowing barley, which is found to be a good practice; this oat being more tender than the others. Mr. Marshall mentions the blowing of the fallow as a disadvantage for the sowing of this grain. He says, "most people sow four bushels of oats to an acre, but I am convinced that three bushels are more than enough; that of the best is about twenty-five bushels to an acre, though I have sometimes known more than thirty." But forty bushels and more are certainly no useful crop. It appears from Mr. Young's "Tour through the South of Scotland," that the quantity of oats sown varies from five to ten bushels; to two bushels and a half, and that the produce follows:

	Q.	R.	P.
From 5 bushels and upwards	-	-	6 0 3
4 bushels	-	-	4 2 2
4 to 5 bushels	-	-	7 6 0
3 bushels and a half	-	-	2 2 0
2 bushels and a half	-	-	2 0 0

He thinks the quantity of seed should be proportioned to the poverty of the ground; for in rich land considerable quantities of seed are sown, as apparently to cover the field; but in poor land it does not tiller at all, consequently the grain is small, much the nearer. Mr. Young, in his "North of England," gives another table of the different quantities of seed sown, with their respective average produce, as follows:

From 7 bushels sown, average produce	-	-	6 0 3
6 bushels	-	-	6 0 1
5 bushels	-	-	4 4 2
4 bushels and a half	-	-	4 5 1
4 bushels	-	-	4 1 0
3 bushels	-	-	4 1 0

Or thus:

From 6 and 7 bushels	-	-	6 0 2
4 bushels and a half and five	-	-	4 4 3
3 and 4 bushels	-	-	4 0 2

Hence it appears, that although some points remain doubtful, yet the superiority of six or seven bushels is so great, that there is abundant reason to think the other quantities are not equal to these in advantage, and that the modern ideas of sowing small quantities of seed are not universally to be adopted. Mr. Young therefore recommends that experiments should be tried on all sorts of soils, and in every situation, on small pieces of land, to decide this important point.

AVENACEA, in *Conchology*, a species of *ASOMIA*, with a pyriform shell, protracted, and somewhat compressed near the hinges. Mil. Zool. Dan. A native of the North seas.

AVENÆ, in *Entomology*, a species of *MUSCA*, of a black colour and shining; eyes brownish; wings red and green and very shining. Inhabits Sweden. Grælin. &c.

AVENAGE, formed of the Latin *avena*, oats, in *Law*, a certain quantity of oats paid to a landlord in lieu of some other duties, or as a rent from the tenant.

AVENAY, in *Geography*, a town of France, in the department of the Marne, seated on the river Marne, one league and a half north-east of Epemay, and five W.N.W. of Chalons sur Marne.

AVENCHIE, or **AVASCHIE**, a town of Switzerland, in the canton of Bern, and the principal burgh of a bailliage in the Pays de Vaud. Some contend that it was the capital of Helvetia, because Tacitus H. d. l. i. c. (8.) calls it "Aventicum gentis caput;" while others have endeavoured to prove that by this expression the historian only intended to denote

denote the capital town of its particular district. According to some accounts, the city was built, and a Roman colony founded, by Vespasian; but with greater probability, according to others, it was only repaired and beautified by Vespasian, after it had been laid waste and almost ruined by Cæcina, one of the lieutenants of Vitellius, when many thousands were slain, and many thousands sold for slaves. It was afterwards taken and pillaged by the Burgundians; and reduced to a heap of ruins by Attila. Without doubt it was formerly a very considerable town, and subject to the dominion of the Romans, as we may conclude not only from several mile stones found in many parts of the Pays de Vaud, most of which are numbered from Aventicum, as the principal place of reference, and more particularly from the present ruins. The ancient walls appear to have inclosed a space near five miles in circumference; of which the present town occupies but a very small spot; the remainder being covered with corn fields and meadows. In an adjoining field is a mosaic pavement, which was the floor of an ancient bath, about sixty feet long, and forty broad; consisting of three compartments, in which are represented human figures in various attitudes, but chiefly bacchanals. From a glory that surrounds the head of Bacchus in this Mosaic, it has been inferred that it was wrought during some part of the intervening age between Vespasian and Marcus Aurelius; because that mark of divinity is not usual upon monuments of Roman antiquity before that period. Besides the head-dress of a Bacchanalian woman represented in this Mosaic, resembles the head-dress on the medals of the empresses Plotina and Sabina. The ancient amphitheatre appears, from the ruins that remain, to have had an arena of about 80 yards in diameter; and under a tower is a cell from which the animals were probably let loose upon the arena. On the outside, remains of five dens are visible; and the walls are adorned with several pieces of rude sculpture dilapidated. Not far from these ruins stands a column of white marble about fifty feet high, composed of large masses neatly joined without cement; and near it lies a considerable fragment of defaced sculpture, which seems once to have formed part of the portal belonging to a magnificent temple. There are also several other relics of the ancient extent and grandeur of this place. Cox's Travels in Switzerland, vol. ii. p. 175, &c. Avenche is situated at the south end of the lake Morat, 16 miles south-west of Bern. N. lat. 46° 50' E. long 7° 7'.

AVENIA FOLIA, in *Botany*, denote leaves which have no visible veins.

AVENIO, now *Avignon*, in *Ancient Geography*, a town of Gallia Narbonensis, upon the left bank of the Rhone. See AVIGNON.

AVENOR, in *Antiquity*, an officer under the master of the horse, who by order or warrant from him, made up the accounts of the stables, and issued debentures for paying the officers and servants.

In a stat. Car. II. we find the avenor mentioned as an officer who provides oats for the stables. In the Rot. Parl. Edw. III. we also read of avenor of the queen, of the prince, &c.

AVENPACE, in *Biography*, a philosopher among the Spanish Saracens, who flourished about the middle of the twelfth century, and was a follower of Aristotle. He wrote a commentary upon Euclid, as well as philosophical and theological epistles. He was intimately conversant with the Peripatetic philosophy, and applied it to the illustration of the Islamic system of theology, and to the explanation of the Koran; and on this account he was suspected of heresy, and thrown into prison at Corduba. It is said that he was

poisoned at Fez, in the year of the Hegira 533, A.D. 1138; or, according to others, 525, A.D. 1130. Pococke Spec. Hist. Arab. p. 373. Gen. Dict. Among the Arabian writers he is commonly known by the name of Ebn al Sâyegeh; and was born in Spain, of Jewish ancestors.

AVENS, in *Botany*. See GEBUM.

AVENS, in *Ancient Geography*, a river of Italy, in the Sabine territory, which discharged itself into the Tiber, and which is supposed to have given the name of Ager Aventinus to the neighbouring district.

AVENTIA, now *Avenna*, a river of Italy, in Etruria.

AVENTINE, JOHN, in *Biography*, a German historian, was the son of an inn-keeper at Abensberg in Bavaria, and born in 1466. Having studied at Ingoldstadt and Paris, he gave private lectures on eloquence and poetry at Vienna, in 1503, and in 1507 taught the Greek language at Cracow in Poland. After spending some time at Ratisbon, upon his return to Germany, he removed to Ingoldstadt, in 1509, and explained some books of Cicero; and in 1512, he was sent to Munich, to undertake the office of preceptor to prince Lewis and prince Ernest. His remaining time was principally devoted to the collection and compilation of materials for the work, intitled, "Annales Boiorum," or "Annals of the Bavarians," by which he gained great reputation. This work, which was not published till the year 1554, several years after his death, contained some severe strictures on the conduct of the Romish clergy, and portions of secret clerical history, which Zieglerus, the first editor, chose to suppress, but which were afterwards published from an un mutilated MS. by Cifer, at Basil, in 1580. In the year 1529, Aventine, for some reason now unknown, was committed to prison, but he was soon released by the duke of Bavaria; and after a celibacy of sixty-four years, he formed an imprudent matrimonial connection, which disturbed the tranquillity of his latter days. He died in the year 1534. The catholics charged him with being secretly a protestant; but though he corresponded with some of the reformers, and disapproved some of the popish doctrines, it does not appear that he ever abandoned the Romish church. On the contrary, his adherence to it may be inferred from his having been buried at Ratisbon, in the monastery of St. Hemeran, with the usual popish ceremonies. Like Erasmus, he seems to have been well inclined to the reformation; but he contented himself with serving it within the pale of the church, by lashing the vices of the monks and clergy. Another curious work of Aventine, intitled, "Numerandi per digitos manusque, &c." was published in 1532, at Ratisbon, together with heads of a plan for a large work on the antiquities of Germany. His "Annals of Bavaria" were reprinted in folio, in 1710. Gen. Dict. Nouv. Dict. Hist.

AVENTINUS MOUNTS, in *Ancient Geography*, one of the seven hills which formed the site of ancient Rome, and the fourteenth region of the city. The origin of the name is uncertain; but some have derived it from Avens, the river which watered the district, whose inhabitants were afterwards transplanted thither. It was also called "Murcius," from Murcia, the goddess of sloth, who had a little chapel there; and "Cellis Dianæ," from the temple of Diana; and also "Remuria," from the time when Remus resolved to build the city there. But Dionysius of Halicarnassus speaks of mount Aventine and Remuria as two different places; and Stephanus says, that Remuria was a city in the neighbourhood of Rome. The Aventine mount was taken within the compass of the city by Ancus Martius, who, thinking it might serve as a place of defence against surprise, surrounded it with a wall and a ditch. To the east, it had the city walls; to the south the campus Figulinus; to the west, the

Tiber;

Tiber; and to the north, Mons Palatinus. It had a good height, and was 18 stadia in compass. It is now called the mount of St. Sabine; and it is thought that the church of St. Sabine was built on the ruins of the temple of Diana. The street that passed from the gate of Ostia to the amphitheatre and Coliseum, divided the Aventine mount into two summits; whence it was called "Biceps."

AVENTURÆ, in our *Ancient Writers*, signify tournaments, or military exercises on horseback.

AVENTURE, or rather ADVENTURE, in our *Laws Books*, a mischance, causing the death of a man, without felony; as, when he is suddenly drowned, or burnt by an accident or mischance, falling into the water or fire. See MISADVENTURE, and CHANCE-MEDLEY.

AVENTURINE, in *Minerology*. See QUARTZ, and FELSPAR.

AVENUE, formed of *avenir*, or *advenir*, to *arrive at*, in *Fortification*, an opening or inlet into a fort, bastion, or the like place; or the passes and ways to and from it. See FORT, and BASTION.

AVENUE, in *Ornamental Gardening*, is a large and generally straight walk, bounded on each side by one, two, or more rows of forest or other trees, designed sometimes as a principal way from the common road to the mansion house of a country-seat, and often to form views, or to lead to different districts of the neighbouring country. But though avenues of the more regular kind, when formed about extensive seats, or detached in parks, or other extensive pleasure-grounds, always exhibit an air of grandeur, it is more agreeable to the present taste to have the principal front of the mansion entirely open, and unincumbered with these or any other kind of plantation, as it is certainly a great absurdity to hide a good front, and obstruct the prospect; an avenue can therefore seldom be admitted with propriety in that part of the ground. A spacious lawn of grass should, as frequently as possible, be exhibited in due extension in the most conspicuous fronts of such dwellings. See LAWN.

But in directions from the wings, detached at considerable distance, avenues may perhaps with propriety be occasionally introduced, and extended on the sides of spacious lawns, serving by way of boundaries, being backed up next the lawns with shrubs and lower trees, disposed irregularly; and if they be carried in an oblique direction, the lawns will widen gradually, and the prospects be more comprehensive.

Avenues may also be admitted at some distance from either the ends or the back fronts of the dwellings, in either of which situations, one may be extended towards any common road, village, or town, serving as the common entrance to the habitation, or merely by way of ornament, &c. And in still more extensive situations, they may occupy different parts at a distance, being directed towards woods, groves, edifices, or particular districts about an estate; which, when formed of considerable width, and bounded on each side by a proper variety of trees, the noblest of the forest, and other kinds, afford a striking effect as well as an air of dignity to the site.

Avenues of this sort should always be planted with the stateliest trees; an assemblage of the different sorts of which effects the most agreeable variety.

The width of the avenue in such cases should seldom be less than sixty feet; and when it is to be extended any considerable length, an hundred feet in width is not too much; as when the trees grow up, the branches on the opposite sides continue to approach each other, which by degrees greatly contract the views; so that if a considerable width be not at first allowed, the avenues in time appear narrow and confined.

The trees in the rows on the sides should be planted at least thirty feet distant from each other, that they may have full scope to display their heads, and each sort exhibit itself conspicuously, according to its natural form and habit.

The sorts of trees most proper for this purpose are those of the deciduous tree; as the *elm*, *beech*, *Spanish chestnut*, *horse-chestnut*, *white poplar*, *sycamore*, *maple*, *ash*, *hawthorn*, *cherry*, &c. all of which, as being of holly growth, when disposed in a proper manner, will have a fine effect. Sometime, evergreen trees are used among these: where taller is intended, the most proper sorts are the various species of the pine, including all the different varieties of the fir, most of which attain a great height and magnitude, with beautiful spreading heads, that are extremely ornamental and pleasing.

Avenues of the more rural kind, such as common ways or roads through parks or other pleasure grounds, to habitation, may be continued either in direct lines, or carried round in a moderate sweep, or the course directed in two, three, or more very gentle bends, or easy serpentine turns, each side being ornamented with different sorts of trees, thinly dispersed, some singly, others in clumps or groups, of two, three, or more together, exhibiting them variously, some breaking forward, others standing more backward; and, for the still greater diversity, a clump of tall flowering shrubs may here and there be introduced: having the whole so considerably detached, as to admit a full prospect of the adjacent lawns, fields, or plantations, in the whole extent. This is the most modern method of forming avenues, but it cannot be practised with full effect except where the situation is of considerable extent. In short, in walks and confined situations, the row method is mostly to be preferred, as having a better effect.

All the trees that are employed in this way, whether deciduous or evergreen, should be permitted to take their natural growth, without being much cut or pruned.

AVENZOAR, whose true name was, AL WAZIR ABU MERWAN AEDELMELICH IBS ZOHR, in *Biography*, was the son of a physician of considerable eminence of Seville in Spain, under whom he received the first rudiments of his education, which he afterwards improved by close application and by travel. He appears also to have had the care of an hospital, and to have acquired an uncommon share of knowledge for the age in which he lived, both in the theory and practice of medicine. He was for some time under the displeasure of Heli, the governor of Seville, by whom he was imprisoned, but seems at length to have surmounted all his difficulties, as he was made physician to king Abulcor, in which post he continued probably to the end of his life. He is said to have died at Morocco in 1176, at the great age of 135 years; though it is probable the age of his son, who succeeded to his fame and practice, is included in this term. From a manuscript in the Journal Bibl. tom. ii. p. 132, cited by Dr. Radcliff in the appendix to his *History of Aleppo*, vol. ii. p. 30. it appears that Avanzoar died at Seville, and not at Morocco, about the year 1162, and if it be true, that he had lived to the age of 135 years, and began to practise very young, he must have made a figure in the 13th century, and been born eight or nine years before the death of Avicenna. He prepared his own medicines, reduced luxated bones, and performed other chirurgic operations, but did not cut for the stone; the Malabarian religion, which he professed, prohibiting him from inspecting or handling the naked genitals.

The work by which he is principally known, called "Al Theoric," is a compendium of the practice of medicine, in which some diseases are described, not found in other

writers. It includes a number of cases, candidly, it should seem, related, as the author does not conceal those in which he was unsuccessful. Averrhoes, not ordinarily profuse in his commendation of other writers, speaks very favourably of our author, whom he esteemed as the best physician that had appeared since the time of Galen. From his active and inquisitive turn of mind, and the pains he took to learn from practice the real powers of the medicines he used, he was called the "Experimenter."

"Al Theifer," which has been several times reprinted, was first published at Venice, in folio, 1490. In 1628, J. Celler published "De cognitu difficilibus in praxi ex libro Avenzoar," 4to. Venet. Le Clerc Histoire de Med. Haller Bib. Med. Pract.

AVÈR, in *Agriculture*, a general name, in some districts, for a labouring beast of any kind.

AUER, in *Geography*, a river of Lithuanian Russia, which runs into the Pregel, twelve miles west of Iustenburg.

AVERA, in *Dominical-Book*, denotes a day's work of a ploughman, or other labourer, which the king's tenants in his demesne lands were obliged to pay the sheriff, and which was valued at eight-pence.

AVERAGE, in *Agriculture*, a term used by the farmers in many parts of England, for the stubble, or remainder of straw or grafs left in corn fields after the harvest is carried away. In Kent, it is called gratten, in other places roughings, &c. In this sense it may be derived from *baver*, an English name for oats; or from *averia*, *beasts*; being as much as feeding for cattle, or pasturage. Ray.

AVERAGE, AVERAGIUM, in *Law*, that duty or service which the tenant is to pay the king, or other lord, by his beasts and carriages. The word is derived from the base Latin *averia*, *cattle* or *goods*; or the French *avoir*, *work*.

AVERAGE, or *Averidge*, in *Navigation* and *Commerce*, is used to denote the damage which happens to ships and their cargoes, from the time of their loading and sailing, till their return and unloading. It is divided into three kinds.

1. The simple average, which consists in the extraordinary expences incurred for the ship, such as the loss of anchors, masts, and rigging, by common accidents at sea; or for the merchandize, such as the damages which they have sustained by storms, capture, shipwreck, wet, or rotting; all which must be defrayed by the thing that suffered the damage. 2. The large and common average, being expences incurred, and damage sustained, for the common security both of the merchandize and ship, which were to be borne by the ship and cargo: such are ransom-money, goods thrown overboard, expences of unloading, or entering into a river or harbour, and the provisions and hire of the failors, when the ship is detained by embargo. 3. The small averages, which are charges of towing and piloting the ship, one third of which must be charged to the ship, and two-thirds to the cargo.

AVERAGE, is more particularly used for the quota or proportion which each merchant or proprietor in the ship or loading is adjudged, upon a reasonable estimation, to contribute to a common average.

Such sum shall be divided among the several claimers, by way of average, in proportion to their respective interests and demands. 10 Ann. cap. 17.

AVERAGE is also a small duty, which those merchants who send goods in another man's ship pay to the master thereof, for his care of them, over and above the freight.

Hence, in bills of lading it is expressed:—Paying so much for the said goods, with primage and average accounted.

AVERANI, BENEDICT, in *Biography*, a learned Floren-

tine, was born in 1652, and taught the Greek language with great reputation in the university of Pisa. He wrote excellent "Dissertations," on the "Anthologia" on Thucydides, on Euripides, and other ancient Greek classics. His acquaintance with Roman literature was accurate and profound, as appears from his "Remarks and Discourses on Livy, Cicero, and Virgil;" and his lectures and writings were well calculated to promote a correct and elegant taste in polite literature; so that he contributed much to reform the bad taste of his age, and to bring back in Italy the golden period of the 16th century. Averani died at Pisa in 1707, in the 55th year of his age. His works were collected and printed at Florence, in 3 large volumes, in 1716 and 1717. Gen. Biog.

AVERANO, in *Ornithology*, the name of the variegated Chatterer (*Ampelis variegata*, Gmel.), in Buffon's History of Birds.

AUERBACH, in *Geography*, a town of Germany, in the circle of Upper Saxony, 14 miles south of Zwickau, and 60 W. S. W. of Dresden. N. lat. 50° 26'. E. long. 12° 26'.

AVER-CORN, in *Ancient Writings*, such corn as by custom is brought by the tenants' carriages, to the lord's granary.

AVERDUPOIS Pound. See POUND.

AVERDUPOIS Weight. See WEIGHT.

AUERHAHN, in *Ornithology*, a name assigned by Frisch, Bloch, and others, to the wood grouse, or Mountain cock, *tetrao urogallus* of Linnæus.

AVERIA, in our *Law Books*, properly signify oxen or horses used for the plough; but, in a general sense, any cattle; and sometimes the term includes all personal estate.

When mention is made of one beast, they say, *quidam equus*, *vel quidam bos*: when of two or more, they do not say, *equi* or *boves*, but *averia*.

AVERIA, in *Commerce*, a branch of the Spanish revenue, denotes a tax paid on account of convoys to guard the ships sailing to and from America, which was first imposed when sir Francis Drake filled the New World with terror by his expedition to the South sea. It amounts to 2 per cent. on the value of goods. Robertson's Amer. vol. iii. p. 490.

AVERIA, *Replegiare de Averis*. See REPLEGIARE.

AVERIIS *captis in Wüthernam*, in *Law*, a writ for the taking of cattle to his use who hath cattle unlawfully distrained by another, and driven out of the county where they were taken, so that they cannot be replevied by the sheriff. Reg. Orig. 82. See DISTRESS.

AVERIUM. See HERIOT.

AVER-LAND, a term employed, under the feudal system, to signify such lands as were ploughed by the tenants for the use of their lords.

AVERMENT, in *Law*, usually signifies an offer of the defendant to make good or justify an exception, pleaded in abatement or bar of the plaintiff's action.

The word also sometimes signifies the act, as well as the offer, of justifying the exception; and not only the form, but the matter thereof. Co. Litt. 362. Averment is either general or particular.

AVERMENT, *general*, is the conclusion of every plea to the writ, or in bar of replications or other pleadings (for counts, or avowries in nature of counts, need not to be averred), containing matter affirmative; and ought to be with the words, "*hoc paratus est verificare*." See PLEADING.

AVERMENT, *particular*, is when the life of a tenant for life, or tenant in tail, or the parson of a church, is averred, &c.

&c. The use of averment being to ascertain what is alleged doubtfully, deeds may sometimes be made good by averment, where a person is not certainly named; but where the deed itself is void for uncertainty, it cannot be made good by averment. 5 Rep. 155. Averment, which is merely the allegation of a party, cannot be made against a record, which imports an uncontrollable verity. Co. Litt. 246. Jenk. 232. Lil. P. R. 155. Averment does not lie against the proceedings of a court of record. 2 Hawk. P. C. c. i. § 14. Nor shall it be admitted against a will concerning lands. 5 Rep. 68. And an averment shall not be allowed where the intent of the testator cannot be collected out of the words of the will. 4 Rep. 44. Nor shall any one aver a thing contrary to the condition of an obligation, which is supposed to be made upon good consideration, and before witnesses, and therefore not to be contradicted by a bare averment. 1 Lil. Abr. 156. If an heir is sued on the bond of his ancestor, it must be averred that the heirs of the obligor were expressly bound. 2 Saund. 136. Another consideration than that mentioned in a deed may be averred, where it is not repugnant or contrary to the deed. Dyer, 196. But a consideration may not be averred, that is against a particular express consideration; nor may averment be made against a consideration mentioned in the deed, that there was no consideration given. 1 Rep. 176. 8 Rep. 155. If one has two manors known by the name of W. and levies a fine, or grants an annuity out of his manor of W., he shall by averment ascertain which of them it was. 6 Mod. 235. Cha. Rep. 138. If a piece of ground was anciently called by one name, and of late is called by another, and it is granted to me by this new name, an averment that it is the same will make it good. Dyer, 37. 44. No averment lies against any returns of writs, that are definitive to the trial of the thing returned; as the return of a sheriff upon his writs, &c.; but it may be where such are not definitive; and again certifies upon commissions out of any court; also against the returns of bailiffs of franchises, so that the lords be not prejudiced by it. Dyer, 348. 8 Rep. 121. 2 Cro. 13. A special averment must be made upon the pleading of a general pardon, for the party to bring himself within the pardon. Hob. 67. A person may aver he is not the same person on appeal of death in favour of life. 1 Nels. Abr. 305. Where a man is to take a benefit by an act of parliament, he must aver in pleading, that he is not a person excepted. Plow. Com. 87. 488. Pleas merely in the negative shall not be averred, because they cannot be proved; nor shall what is against presumption of law or any thing apparent to the court. Co. Litt. 362. 373. By Stat. 4 & 5 Ann. c. 16. no exception or advantage shall be taken upon a demurrer, for want of averment *hoc paratus est*, &c. except the same be specially set down for cause of demurrer.

AVERNI, among the *Ancient Naturalists*, certain lakes, grottoes, and other places, which infect the air with poisonous steams or vapours; called also *mphites*.

The word is formed of the privative *a*, and *avn*, *Urd*, as intimating that birds could not fly over them, but dropped down dead. *Avernus*, q. d. *avornus*, *beus sine avibus*.

Averni are said to be frequent in Hungary, on account of the abundance of mines therein. The Grotto del Cami, in Italy, is a famous one. But the most celebrated Avernus was a lake near Baia, in Campania, by the modern Italians called Lago di Tripergola, and situate in the county of Lavora in Naples, near Puzzuoli, and said to be about 600 yards in diameter, and in some places 188 feet deep.—The tuncs it emitted are represented by the ancients as being of so malignant a nature, that birds could not fly over it, but sunk down dead;

which some later writers have chosen to attribute to this, that its sulphurous effluvia not being of confidence to sustain the birds, they dropped by their own weight. This circumstance, joined with the great depth of the lake, occasioned the ancients to take it for the gate or entrance of hell; and accordingly Homer brings Ulysses to Avernus, as to the mouth of the infernal regions; and in imitation of the Grecian bard, Virgil makes Æneas descend this way into the same abode.—Vibius Sequenter says, that no bottom of it has been found. (See HELL.) Next to the *Boia* (says Strabo) lies the *Lucerine* bay, and within it the lake Avernus; which is a deep darksome lake, with a narrow entry from the outer bay: it is surrounded with steep banks, that hang threatening over it; and is only accessible by the narrow passage through which you sail in. These banks were anciently quite overgrown with a wild wood, impenetrable by a human foot. Its gloomy shade impressed an awful superstition upon the minds of the beholders; whence it was reputed the seat of the Cimmerian, who dwelt in perpetual night. Whoevcr failed hither, first offered sacrifice; and endeavoured to propitiate the infernal powers, with the assistance of some priest, who attended upon the place, and directed the mystic performance. Within a fountain of pure water broke out just over the sea; but no creature ever tasted of it, believing it to be a vein of the river Styx: somewhat near this fountain was the oracle: and the hot waters frequent in these parts, made them think they were branches of the burning Pilegethon.

The holiness of these shades (says a modern traveller) remained unimpached for many ages. Hannibal marched his army to offer incense at this altar; though, perhaps, he was led to this act of devotion, rather by the hopes of surprising the garrison of Puteoli, than by his piety. After a long reign of undisturbed gloom and celebrity, a sudden glare of light was let in upon Avernus; the horrors were dispelled, and with them vanished the sanctity of the lake: the axe of Agrippa brought its forest to the ground, disturbed its sleepy waters with ships, and gave room for all its malignant effluvia to escape. The violence of these exhalations is described by ancient authors as very extraordinary; but modern writers, who know the place merely in a cleared state, charge these accounts with exaggeration; and yet it must be owned that they claim some respect, as the air is even now feverish and dangerous, which the jaundiced faces of the vine-dressers, who have succeeded the Snyls and Cimmerians in the possession of the temple, most ruefully testify. Boccaccio relates, that during his residence at the Neapolitan court, the surface of this lake was suddenly covered with dead fish, black and singed, as if killed by some subaqueous eruption of fire. At present, however, it abounds with tench, and the dusky Avernus is become clear and serene; so that it offers a most alluring surface and a charming scene for amusements, similar to those which were sought for at the Lucrine lake in the time of Seneea, and which he has described. Spallanzani informs us, that he saw great numbers of seals swimming on its surface; and the peasants assured him, that the lake abounded with water-fowl in the winter. "Nor do I know," says this writer, "any cause which can at present drive them from a place where they may find plenty of food, as neither the environs, nor the lake itself, afford any indication of noxious exhalations." There can be no doubt that this lake was the center of an ancient volcano. Like other volcanic centers, its internal fire became narrow towards the bottom; and both the bottom and the external part of Monte Nuovo, so called because it was produced by subterranean fires in 1538, consist of a stupendous mass of tuffa, in many places covered with plants. The sea bathes

the sides of this volcano, which, if dug into as well within the water as without, are found very warm. The same warmth is likewise perceived at the bottom of the crater. From such excavations likewise arise thin warm vapours. In fact, in the internal parts of Monte Nuovo, we find all the last remains of volcanic conflagration. In the external sides of the mountain many pieces of lava were found, which were of a middle character between lava and pumice-stone, and which Spallanzani on this account denominates pumice of lavas. The base of these stones is a horn-stone, mixed with a few felspar scales; they scarcely adhere to the tongue, and emit a slight argillaceous odour. In the furnace they produce a compact enamel of a dark grey colour, transparent at the angles, and which gives a few sparks with steel. Towards the internal bottom of the crater, Spallanzani found, projecting from the tufa, the same kind of lava, penetrated with fissures, but more compact and heavy, and interspersed with beautiful and shining veins of black enamel of various thickness. On the side of the bottom, within the tufa, this sagacious observer discovered a small cavity, formed either by nature or art, that abounds with saline efflorescence, which he at first imagined to be muriate of ammoniac (sal ammoniac), or sulphate of alumine (alum); but their mucous acrid taste, the green colour which they gave to syrup of violets, and other qualities that are proper to soda, left no doubt that they were formed from that salt. On the tufaceous sides of the crater, both internal and external, Spallanzani perceived, as he had done in the lake Agnano, a great number of frogs that were leaping about, nearly half an inch long, and about a quarter in breadth. They had the complete form of the frog, were of a dark yellow colour, and their fore-feet were divided into four toes, and their hinder into five; though they have not the shape of the hand, which constitutes an essential difference between these frogs, and the others of those countries. It was difficult to account for the production of these amphibious animals. "Among all the different species of European frogs," says Spallanzani " (and under this genus, I, with Linnæus, likewise include toads), I know none, which do not begin their existence in water, and continue to live in it some time, until they throw off the mask of the tadpole, and assume the shape of frogs. But Monte Nuovo is not only entirely without moisture, but as I learned from the peasants who reside in the neighbourhood, even when heavy rains fall, the bottom of the crater, which is the only place where rain water can be collected and retained, imbibes all the water immediately, as in fact it must, since it consists of a light spongy tufa, full of cracks and fissures. The only water near is that of the lake Agnano, about half a mile distant, from which these animals might be supposed to have derived their origin, were it not that the frogs of that lake are of a totally different species." Upon the whole this ingenious naturalist concludes, that the presence of these creatures in this place was to him an ænigma, which it required a longer stay in this volcanic country to enable him to solve.

The cave, called the Sibyl's Grotto, near Avernus, which is opposite to the temple, seems more likely, as Mr. Swinburne apprehends, to have been the mouth of a communication between Cuma and Avernus, than the abode of a prophetess; especially as the Sibyl is positively said by historians to have dwelt in a cavern under the Cumæan citadel. Some have conjectured that it was part of the canal absurdly projected by Nero, from the mouth of the Tiber to the Julian port. On every hill, and in every vale of these environs, appear the ruins of extensive villas, once embellished with all the elegancies of combined art, but now

traced only by half-buried mouldering walls, and some marble fragments, the remaining indications of the taste and costliness with which they were constructed. Among the ruins of this country, one, in particular, claims attention; and this is the villa in which Cicero had his academy, where he penned some of his most admirable productions, and which probably stood on a spot covered by the eruption of 1538. Swinburne's Travels, vol. iii. p. 51, &c. Spallanzani's Travels, vol. i. p. 128, &c.

AUEROCHS, in *Ornithology*, a synonymous name of the wild ox, given by Gesner and Ridinger. See BOS FERUS.

AVERON, in *Geography*, an island in the North sea, near the coast of Norway. N. lat. 63° 6'. E. long. 7° 44'.

AVERPENNY, q. d. AVERAGE-PENNY, in *Antiquity*, money contributed towards the king's averages, or money given to be freed thereof. See AVERAGE.

AVERRHOA, in *Botany* (so named after the famous commentator on Aristotle and Avicenna; commonly called Averrhoes, of Corduba, in Spain; his "Colliget," or the plants used in food, &c. was written about the end of the twelfth century). Lin. g. 576. Schreb. 784. Juss. 375. Class, *decandria pentagynia*. (*Pentandria*, Lour.) Nat. Order, *grainales—terebintaceæ*. Juss. Gen. Char. Cal. perianth five-leaved, erect funnel; leaflets lanceolate, permanent. Cor. petals five, lanceolate, the lower part erect, the upper spreading. Stam. filaments ten, setaceous, alternately the length of the corolla, and shorter; anthers roundish. Pyl. germ oblong, obscurely five-cornered; styles five, setaceous, erect; stigma simple. Per. pome turbinate, five-cornered, five-celled; seeds angular, separated by membranes.

Ess. Gen. Char. Cal. five-leaved. Pet. five, expanding above; pome five-cornered, five-celled.

Species, 1. *A. Bilimbi*. Rumph. Amb. 1. 118. t. 36. Rheed. Mal. 3. 55. t. 45, 46. Lour. Cochinch. 289. "Trunk naked, fruit-bearing; pomes oblong, obtuse-angled." A tree about eight feet in height, with few reclining branches; leaves pinnate, with ten or more pairs of leaflets; flowers on racemes adhering to the trunk, of a red purple colour; calyx five-cleft; fruit an oblong pome, the thickness of a finger, smooth. A native of Goa, and of both sides of the Ganges. 2. *A. Carambola*. Rumph. l. c. t. 35. Rheed. l. c. t. 43, 44. Phil. Transf. vol. 75. Lour. l. c. "Axillæ of the leaves fruit-bearing; pomes oblong, acute-angled. This is a tree above the middle size, with spreading branches, and a very close head; leaves with about four pairs of leaflets, which are ovate, acuminate, entire, opposite, the upper ones largest; flowers lateral, on short racemes; corolla bell-shaped, variegated with purple and white; stamens always five; pome the size of a hen's egg, with a yellow rind. Dr. Bruce gives a curious detail of the sensibility of the petioles and even branches of this tree. The fruit of both the species affords a pleasant acid juice, especially the former. The Brahmans and Portuguese call this tree carambola; in Malabar it is named tamara-tonga; and in Bengal, camru, or camruna. Both these Indian trees have been introduced into the Kew garden.

AVERRHOES, or AVERROES, or *Abu al Waked Mohammed Ebn Ahmed Ebn Rofhd*, in *Biography*, an eminent philosopher and physician, was born about the middle of the twelfth century, at Corduba, the chief city of the Saracens in Spain, where his grandfather and father had occupied the posts of chief priest and chief magistrate. The first care of his education was entrusted with Thophail of Seville, who instructed him in the Islamic law; and after the manner of the Arabian schools, in the Mahometan theology,

theology, connected with the Aristotelian philosophy. Under Avenzear he studied medicine; and under Abu-Süg, the mathematical sciences; and he connected himself with the Mahometan sect of the Aharites. Upon his father's demise, he was chosen to succeed him in the chief magistracy at Corduba. The fame of his talents and erudition having reached the caliph Jacob Al-Manfor, king of Mauritania, he was appointed by this prince supreme magistrate and priest of Morocco and all Mauritania, and allowed to retain his former honours. Averroes accepted the appointment; and having provided a substitute at Corduba, removed to Morocco, and continued there till he had instituted, through the kingdom, judges well skilled in the Mahometan law, and settled the whole plan of administration. He then returned home, and resumed his offices. This rapid advancement excited the envy of his rivals at Corduba; and, in order to justify an accusation of his having deserted the true Mahometan faith, they engaged a number of young persons to request his instruction in philosophy, that they might detect his heresy. Averroes frankly communicated his theological sentiments, of which they took minutes for the use of his accusers. Accordingly, a charge of heresy attested upon oath, and signed by one hundred witnesses, was conveyed to Al-Manfor. The caliph admitted the accusation, and proceeded to punish him by an order for the confiscation of his goods, and by requiring him to reside in those precincts of Corduba which were inhabited by the Jews. Here he became an object of general obloquy and persecution; and he was pelted by the boys in the streets, whenever he repaired to perform his devotions at the mosque of the city. His pupil Maimonides, in order to prevent the necessity of joining in this general outcry against him, left Corduba; and Averroes himself at length finding means to escape, fled to Fez; but here he was soon discovered, and committed by the magistrates to prison. The king, as soon as he heard of his flight, convened an assembly to deliberate upon the measures which were proper to be pursued against this heretic. In the assembly, a diversity of opinions prevailed; some recommended death, and others public penance and a recantation of his errors. Al-Manfor approved the sentiments of those who were most mild and moderate in their judgment; and Averroes was conducted, at the time of public prayers, to the gate of the mosque; and being placed upon the upper step, every one that passed was allowed to spit upon his face. At the close of the service, he was interrogated by the judge, accompanied by his attendants, whether he repented of his heresies. Averroes professed his penitence, and was released. During his continuance at Fez he opened a course of lectures on the civil law; but finding little encouragement, he obtained leave of the king to return to Corduba, where he experienced all the miseries of poverty and contempt. The people, however, dissatisfied with the regent who had succeeded him, petitioned the king that their former governor might be restored. Al-Manfor, unwilling to act on his own judgment, called a general assembly, and it was determined, that the penitent heretic should be restored, by the royal mandate, to all his former honours. In consequence of this fortunate change in his circumstances, Averroes removed to Morocco, taught in its schools, and spent there the remainder of his days. According to Leo Africanus, his death happened in the year of the Hegira 603, A. D. 1206; others say that he died about the year 1198.

This philosopher has been highly celebrated for his personal virtues. Such was his temperance, that he partook only once in the day of the plainest food. In his application he was unremitting and indefatigable; allowing him-

self no other recreation in the course of the day than the change of severer literary occupations for that of poetry or history, and spending whole nights in study. In his judicial capacity, he discharged his duty with great wisdom and integrity; and his humanity was such, that he could not pass sentence of death upon any criminal, but he caused this office by his deputies. In the exercise of his justice, meekness, and self-command, he was a still more exemplary. When a servant, employed by a gentleman, complained upon him in one of his public lectures, he rebuked him with some abusive language, Averroes, without being apprized, turned round to him, and said, "All will be well, I have proceeded with his business." The servant, who was present the next day to inquire his pardon for the insult, had offered him, "God forgive thee," but he answered, "I had half publicly shewn me to be a patient man, and for a little injury, it is not worthy of notice." He never gave him money, and dissuaded him with the proverb, "as what thou hast done to me, do not to another." In the exercise of his liberality to learned men, Averroes made no discrimination between his friends and his enemies; and for his conduct in this respect, his apology was, that in giving to his friends and relations, he merely followed the dictates of nature; but in giving to his enemies, he fulfilled the obligations of virtue; and he also boasted that by this method he had converted enemies into friends. Upon the occasion of burning some amatory verses which he had written in his youth, he remarked, that when he was young, he was disobedient to reason; but now in his old age, he followed it; and he added this singular wish, that he had been born an old man: "utinam natus fuissen senex." However, when he was requested to exercise his magisterial authority in the suppression of some licentious poems that had been published by a learned Jew, and informed that his own son had copied some of the verses, and that there was not a man, woman, or child in Corduba, who had not learnt some of the songs of Sahl, he exclaimed, "Can a single hand stop a thousand mouths?"

In philosophy, Averroes was an enthusiastic admirer of Aristotle, and yielded a superstitious deference to his authority; he even indulged his admiration to such an excess, that he ascribed to the writings of the Stagirite a degree of perfection "which is truly miraculous, and which proves him to have been rather a divine than a human being."—"The doctrine of Aristotle," says he, "is the perfection of truth, and his understanding attained the utmost limit of human ability; so that it might be truly said of him, that he was created and given to the world by divine providence, that we might see in him how much it is possible for man to know." This extravagance of admiration on the part of Averroes is the more surprising, as he was unacquainted with the Greek language, and was therefore obliged to peruse the writings of his oracle in wretched Arabic translations, taken immediately from Latin or Syriac versions. His commentaries, however, though they abound with error, misrepresentation, and confusion, have been held in such high estimation, even since the revival of letters, that Averroes has been styled by way of eminence, "The Commentator." Many of his writings, in this way were so much admired by the Jews, that several of them were translated into Hebrew. Averroes also wrote a paraphrase of Plato's Republic; and a treatise in defence of philosophy against Al-Gazel, intitled, "Habapalah Alhabapalah," or "Destructiones Destructionum;" the design of which was to confute the metaphysical opinions maintained against those philosophers, who assert two uncreated natures.

Though it is evident from the whole tenor of his life, that

Averroes could have little time for the practice of physic, whence Bayle, as well as several other writers, have supposed, that his knowledge of medicine was merely theoretical, yet we have the authority of his own words to prove, he was engaged in the practice also, though probably to no great extent. One observation (Friend says) we find made by him, which does not occur in any earlier writer, is "that the same person could have the small-pox but once." His principal medical work, the "Colliget," or "Universal," written at the command of the Miramamolin of Morocco, is a compendium of physic, collected from the writings of other authors, with some not very material additions from his own stores. He wrote also a Commentary on the Cantica of Avicenna, which he calls the best introduction to the knowledge of medicine extant. This affords a complete answer to those who accuse him of having been jealous of the fame of that celebrated physician. As a proof, however, that he regarded him as a rival, it is alleged, that he avoids the mention of him, and in confuting a doctrine maintained by Avicenna, he treats it merely as the opinion of Galen. Besides the works above mentioned, Averroes wrote, "De Venenis," "De Febribus," "De Theriaca," and "De Simplicibus Medicinis;" all of which have been translated into Latin, and published in various forms. Averroes wrote many other treatises in theology, philosophy, jurisprudence, and medicine. In the Escurial catalogue (t. i. p. 299.), mention is made of an index of his books, amounting in all to seventy-eight. His commentary on Aristotle was published in Latin, at Venice, in folio, in 1495. An edition of his works was published in 4to., at Lyons, in 1537; another, in folio, with the famous Latin translation, by Bagolin, at Venice, in 1552; and a third by Mofa, at Venice, in 1608. Of the MSS. preserved in different libraries, and particularly at Vienna, many are either Hebrew translations from the Arabic, or Arabic written in Hebrew characters.

As to the religious opinions of Averroes, he was by profession a Mahometan; but he does not seem to have entertained any great reverence for his prophet. It is related of him, that he called Christianity an impossible religion, because it taught men to eat their god; similar to the reflection of Cicero (De Nat. Deor. l. iii. c. 16.), when he considered, that the name of Ceres was given to bread, and that of Bacchus to wine: "Eequem tam amentem esse putas qui illud, quo vescatur, Deum credat esse?" that Judaism, on account of its rites and ceremonies, was a religion for children; that Mahometanism, offering only sensual rewards, was the religion of swine; and that he exclaimed, "Let my soul, at death, be among the philosophers." It is also said, that he wrote against the three great law-givers, Moses, Christ, and Mahomet; and that he furnished materials for the book "De tribus Impostoribus." His doctrine concerning the soul is supposed, not to have been peculiarly his own, but to have been asserted by Aristotle, and to have been embraced by Theophrastus, Simplicius, and Themistius; which was this, that intellect does not exist individually in this or that man; but that there is one intellect belonging to the whole race of human beings, the common source of all individual thought, as the sun is the common source of light to the world. Similar to this was the doctrine of Malebranche, who ascribed the production of ideas immediately to God, and taught that the human mind perceives God, and sees all things in him. Averroes, however, proceeded farther; and he seems to have conceived, that there was no other cause of thought in individual men, than one universal intelligence, which, without multiplying itself, is actually united to all the individuals of the species, as a

common soul. This notion, with its obvious consequences, as they concern the distinct existence and immortality of the human soul, obtained so much credit among philosophers for several centuries, and particularly in Italy, where their advocates were denominated "Averrhoists," that it was thought necessary to employ the papal authority for its suppression. At present, the notions of Averroes are exploded, and his writings are forgotten. Dr. Friend (Hist. Physic. p. 118.), anxious to vindicate Averroes from the charge of infidelity, with regard to a future state, refers to two passages in his works; in one of which (Physic. Disput. 3.) he asserts, that the soul is not mortal; and in another, (Id. 4.) that it is immortal. Leo. Afric. de Vir. Illust. Arab. Gen. Dict. Brucker's Philos. by Enfield, vol. ii. p. 245, &c. Fabr. Bib. Græc. t. xiii. p. 95, 282, &c. Friend's Hist. of Physic, vol. ii. p. 115, &c. Haller, Bib. Med. Pract.

AVERRHOISTS, a sect of Peripatetic philosophers, who appeared in Italy some time before the restoration of learning, and attacked the natural immortality of the soul; and who took their denomination from Averrhoes. The opinion of this sect was condemned by the last council of the Lateran, under Leo X.

AVERRUNCATION, from *averruncare*, *I pruncare*, in *Agriculture*, the act of cutting or lopping off the superfluous branches of trees. See PRUNING.

AVERRUNCI, from *averruncare*, *I averti*, in *Antiquity*, an order of deities among the Romans, whose peculiar office was to avert dangers and evils. The Greeks called these deities *alexicaei*, and *apopompæi*. They were Hercules, Apollo, the Dioscuri, and Jupiter.

The Egyptians had also their *di averrunci*, or *apotropæi*, who were pictured in a menacing posture, and sometimes with whips in their hands.—Isis was a divinity of this kind; as is shown by Kircher. See Oedip. Egypt. tom. iii. p. 487.

AVERSA, in *Geography*, a town of Italy, in the kingdom of Naples, and territory of Lavora, the see of a bishop, who is suffragan to the archbishop of Naples. This town was built and fortified A. D. 1029, by count Rainulf, the first leader of the Normans, who came into Italy to seek their fortunes in the service of the Italian princes. The seat of this town was chosen, in a fertile district, as a central spot to which the Normans might resort, and where they might obtain a fixed settlement. Accordingly, it attracted every year new swarms of pilgrims and soldiers; some urged by necessity, and others by the hope of ease and renown. The outlaws of every province associated with the settlers in this place, and were soon assimilated in manners and language to the Gallic colony. The spot was situated near the ruins of ATELLA, at the junction of two highways, that formed an easy communication with every part of the country, and from its being opposed to Capua, and from his aversion to Pandulph, prince of that city, Rainulf called it Aversa. This town was burnt to the ground by king Roger; and many years after, it underwent a similar fate, by order of Charles of Anjou. Its ancient palace, on the foundation of which a convent has been since erected, was frequently the residence of the sovereign, before the murder of Andrew of Hungary, husband to Joan the first, who was assassinated by the infatigation of a brutal monk, called friar Robert, in the year 1345. It is situated ten miles north of Naples. N. lat. 41° 0'. E. long. 14° 20'.

AVERSATA, in *Entomology*, a species of PHALÆNA, (*Geometra*), with pale wings; streak at the base; band in the middle and dot brown. Linn. Fn. Suec. Inhabits Europe.

AVER-SILVER, a name formerly given to a custom or rent. Cowel.

AVERSION, compounded of *a*, from, and *vertere*, to turn, denotes abhorrence, or dislike. Some oppose it to desire; others, with lord Kames, to affection. See **AVERT-PATHY**.

AVERSIONE venire, or *to-are*, in *Writers of the Civil Law*, seems to denote the selling, or letting thing, in the lump, without fixing particular prices for each piece.

AVERSPERG, in *Geography*, a town of Germany, in Carniola, eleven miles north-east of Cirknitz.

AVERTI, in *Horsemanship*, is applied to a regular step or motion enjoined in the lessons. In this sense they say, *par averti*, sometimes *pas ecoué*, and *pas d'ecole*, which all denote the same. The word is mere French, and signifies *advised*.

AVERTO, in *Geography*, a small island in the gulf of Venice, near the coast of Friuli. N. lat. 45° 46'. E. long. 13° 32'.

AVERY, a place where oats, or provender; are kept for the king's horses. See **AVERIA**.

AVES. See **AVIS**.

AVES, or *Birds, Island of*, in *Geography*, an island of the West Indies, nearly west from Dominica, and south from the Virgin islands; so called from the number of birds which breed here, and lay their eggs in the sand. N. lat. 15° 26'. W. long. 66° 20'.—Also, a small island, not far from the coast of Terra Firma, south-east from Bonair island. N. lat. 11° 50'. W. long. 67° 25'. On the north side it has a good harbour for careening ships, and some wells. It is about four miles long, and half a mile broad at the east end. Within three miles there is a dangerous reef of rocks, extending from east to north, and then trending to the west.—Also, an island near the eastern coast of Newfoundland. N. lat. 50° 5'.

AVESA, a river of Italy, which runs into the Adriatic, near Rimini.

AVESBURY, *Robert of*, in *Biography*, an ancient English historian, flourished in the fourteenth century. He was register of the archbishop of Canterbury's court, and wrote a history of England in his own times, intitled, "Mirabilia Gestæ Magnifici Regis Angliæ Domini Edwardi Tertii, &c." As this history reaches only to the 30th of Edward III. A. D. 1356, the author was probably prevented by death from finishing his plan. He appears to have taken great pains in procuring the most authentic information; his facts are authenticated by original papers; his dates are accurate; and the defect of his style is compensated by his candor and impartiality as an historian. This valuable work lay long concealed; till, in the year 1725, the indefatigable antiquary, Thomas Hearne, printed it at Oxford, from a MS. belonging to sir Thomas Seabright, which had been formerly in the hands of archbishop Parker, and two other MSS., one in the Haulim library, and the other in the university library at Cambridge; all which are thought to be as old as the time when the author flourished. Mr. Tyrrell, in the preface to the third volume of his General History of England, cites this historian, and says, that he was a considerable writer of that age, and very exact in his account of king Edward's actions beyond the sea, as having taken them from several original letters of persons of note. To Hearne's edition is added an appendix, containing several curious pieces in English antiquities, unconnected with the work itself; and particularly, a transcript of the love-letters between Henry VIII. and Anne Bullen, taken from the originals kept in the Vatican at Rome, A. D. 1682. *Biog. Brit.*

AVESNE, in *Geography*, a town of France, in the de-

partment of the straits of Calais, and chief place of a canton in the district of St. Pol, three leagues west of Arras.

AVESNES, a strong town of France, in the department of the North, and principal place of a district. It is situated in Hainault, on the small river Hefpre. Its fortifications were repaired by Vauban; and it was ceded to the French by the Spaniards in 1659. It is distant ten leagues east from Cambrai, seven from Valenciennes, and forty north-east from Paris. N. lat. 50° 7'. E. long. 3° 43'.

AVEYRON, a department of France, comprehending part of the province of Guyenne; bounded on the north by the department of Cantal; on the east, by those of Luyere and Gard; on the south, by those of Gard, Hérault, and Tarn; and on the west, by those of Tarn and Lot. Its superficies is about 1,767,424 square acres, or 902,264 hectares. Its population consists of about 332,000 persons, and it is divided into five cantonal districts. Its chief city is Rhodéz.

AVEZARAS, a river of France, in Gascogne, waters the territory of Aire, and discharges itself into the Adour, between Grande and St. Sever.

AVEZZANO, a town of Italy, in the kingdom of Naples, and province of Abruzzo Ultra. This town was founded in 863, and contains 2700 inhabitants. It is built on an almost imperceptible declivity one mile from the lake of Celano, to which an avenue of poplar leads from the baronial castle, which is a square edifice, flanked with towers, at a small distance from the town.

AUFEDO, a town of Italy, in the kingdom of Naples, and province of Abruzzo Ultra, twenty-one miles W. S. W. of Aquila.

AUFENA, or **AUFISA**, in *Ancient Geography*, *Ofuna*, a town of Italy, in Sannium, belonging to the Vestini; south-east of Amiternum.

AUFENTE, in *Geography*, a river of Italy, in the Campagna of Rome, has its source near Sezzu, and its mouth in the sea, near Terracina.

AUFFAY, a town of France, in the department of the Lower Seine, and chief place of a canton in the district of Dieppe, six leagues north of Rouen.

AUFIDENA, in *Ancient Geography*, *Afidena*, a town of Italy, in Sannium, and the capital of the people called Caraceni, situate near Sagunt. The inhabitants were called Aufidenses.

AUFIDUS, a river of Italy, the most considerable in Apulia. For the particulars of the description given of it by Horace, see **ORONTO**.

AUFINA, or **AUFINUM**. See **AUFENA**.

AUFINAY, in *Geography*, a small island of Switzerland, in the lake of Zurich, containing two churches.

AUFENA, in *Ancient Geography*, a town of Macedonia, in the Chalcidic territory. Ptolemy.

AUGULA, a town of Africa, in Mauritania Cæsariensis, at some distance from the sea. Ptolemy.

AUGALI, a people of Asia, in Sogdiana. Ptolemy.

AUGARA, a town of Asia, in Aria. Ptolemy.

AUGARRAS, in *Geography*, a people of South America, in Brazil, in the province of government of Puerto-Seguro.

AUGER, in *Zoology*, a species of **SPHINX**. *Zygocera Tabaci* of a black colour, with large veins on the sides of the abdomen; wings transparent, like a cloud; and the anterior peduncled. Fabricius. *Oris.* This is *Papilio egrus* of Cramer. It is a native of America.

AUGER. This French name Cramer has given to a variety of *Papilio lobatus*. Linn.

AUGES, in *Geography*, a district of France, in the late province of Normandy, extending from Falaise and Argentan, as far as the sea, between the rivers Dives, Vie, and Touques,

Tongues, formerly giving name to a viscount. Its productions are grain, flax, and apples. The pastures are rich, and fatten the cattle that are brought thither from Poitou and Brittany.

AUGÉE, in *Ancient Geography*, a town of Greece, in the Peloponnesus, written *Augia*, *Augiaie*, by Homer, and supposed by Paulinus to be the same with the small town of *Ægia*, situate on the coast of Laconia, and at the distance of thirty stadia from Githium. It had a temple consecrated to Neptune.

AUGELA, AUGUELA, or AGUILA, in *Geography*, one of the Oases, or islands, in the eastern division of that ocean of sand, called the Great Desert, or Sairra, in Africa. It lies on the western part of the desert of Barca, and is separated from the kingdom of Tripoli by mount Meys. Although it is generally sandy and barren, it has some spots so well watered as to afford plenty of dates; and mount Meys has excellent pasture. In this territory, besides the town of Augda, or Augela, from which the canton takes its name, and which was one of the stations of the caravans that formerly carried on the inland trade of Africa, is another, seated at the foot of that mountain, called Siwah, Siuah, or Saah-Rey, which is the last on that side that belongs to the government of Tripoli. Augda lies in N. lat. 30°. and E. long. 22° 30'.

AUGENIO, HORACE, *De Monte Sancto*, in Ancona, in *Biography*, professor of medicine, born about the year 1527. He was early initiated into the knowledge of medicine by his father, Lewis Augenio, physician to pope Clement VII. Horace was first advanced to the chair of professor at Rome, which office he filled five years. He afterwards gave lectures with success at Turin; and in the year 1592, he was appointed professor at Padua; where he continued to the time of his death in 1603. Haller is diffuse in his account of his works, which however were principally controversial, and not now much noticed. In his "Epist. et Consult. Med." fol. Ven. 1580, he recommends millepedes, in calculous cases, by which, he says, he saw a boy cured, after he had been condemned to the knife; he forbids injecting the bladder in these cases, as frequently mischievous. He gave water, in which quicksilver had been boiled, for the cure of worms in the bowels; and in diabetes, he gave, he says, narcotics, with advantage.

His works were collected and published under the title of, "Opera Omnia," at Venice, in 1597,—1602, and 1657, in folio. His treatises, published separately were, "Epist. Medicinal." tom. 1, 2, 3, fol. "De Modo preservandi a Pelle," lib. iv. 1577, 8vo. "De Medendis Calculosis," &c. 1575, 4to. "Quod Homini non sit certum nascendi Tempus," lib. ii. Ven. 1595, 8vo. Haller. Bib. Med. Pract.

AUGER, EDMUND, a French jesuit, was born of poor parents, in 1530, at Alleman near Sazanne, in the diocese of Troyes; and having received the rudiments of education under an uncle who was a clergyman, was sent by his brother, a physician at Lyons, to Rome, with a recommendation to the celebrated father Le Fevre; but with a supply of money so scanty, that he was obliged to beg alms before he arrived to the end of his journey. Le Fevre was dead before he reached Rome; and he was obliged to hire himself as a domestic servant to a jesuit. In this humble situation his talents and conduct attracted the notice of his master, who procured for him, as a novice, the means of further instruction. In the order of jesuits, to which he was admitted, he taught rhetoric and poetry, and manifested great powers of eloquence. His talents recommended him to a mission, employed by father Lauey, the general of the society of jesuits, and dispatched to France, in the year 1559, for stopping the progress of the reformation. On this occasion he distinguished himself by his zeal and success in the

conversion of heretics; and he was appointed preacher and confessor to Henry III. His attachment to the king rendered him odious to the catholics who had entered into the league, and by an order of the general he returned to Rome, where he was treated as an excommunicated person, and obliged to travel on foot in the midst of winter. In the year 1591, he died in consequence of the fatigue and vexation which he endured, in the sixty-first year of his age. Such was the closing scene of a man, who is said to have converted 40,000 heretics. The intolerant spirit of Auger was sufficiently displayed in his work, intitled "Le Pedagogue des Armes," designed to instruct a Christian prince, how to undertake, and happily complete a good war, victorious over all the enemies of the state and the church. *Nouv. Dict. Histor.*

AUGER, in *Geography*, a small town of Ireland, in the county of Tyrone and province of Ulster, which before the union, returned two members of parliament; but is now deprived of that privilege. It is distant seventy-five Irish miles north-west from Dublin.

AUGES, in *Astronomy*, two points in a planet's orbit, otherwise called *apsides*. See *APSIDES*.

One of the auges is particularly denominated the *apogee*, the other *perigee*.

AVGHANS, in *Geography*. See *AFGHANS*.

AUGHNACLOY, a post and market town of the county of Tyrone in Ireland, seated on the river Blackwater, at the distance of 70½ Irish miles from Dublin, on the high road to Londonderry. The linen manufacture is carried on briskly in its neighbourhood. N. lat. 54° 25'. W. long. 6° 53'.

AUGHRIM. See *AGHRIM*.

AUGIAN, a town of Asia, in the province of Aderbigan or AIDERBEITZAN.

AUGIAN MS, *Codex Augiensis*, in *Biblical History*, is a Greek-Latin MS. of the epistles of St. Paul, which is however defective from the beginning to Rom. iii. 8, and the epistle to the Hebrews is found only in the Latin version. This MS. is noted F in the second part of Wettstein's N. T. It is supposed to have been written in the ninth century, and has taken its title from Augia-Major, the name of a monastery at Rheinau, to which it belonged at the time of the council of Basle. It was purchased by Bentley in 1718, for 250 Dutch florins, and is at present in the library of Trinity college in Cambridge, where it was deposited in 1787, after the death of the younger Bentley, together with the other MSS. of the celebrated Dr. Richard Bentley. The Greek text is written in uncial letters and without accents; there are intervals between the words, and at the end of every word there is a dot. The Latin is written in Anglo-Saxon letters; whence it is inferred that it must have been written in the west of Europe, where that formation of the Latin letters, vulgarly called Anglo-Saxon, was in general use between the seventh and twelfth centuries. This MS. has been collated by Wettstein. Marth's Michaelis, vol. ii. p. 210. vol. iii. p. 662.

AUGIAS, or AUGIUS, in *Ancient History and Mythology*, a king of Elis, who was one of the Argonauts. Fabulous history reports that he had a stable, which contained a great number of cattle, as some say 3000 oxen, and which had not been cleaned for thirty years, so that the exhalations which proceeded from it infested the country; and to cleanse it was considered as a work surpassing human effort. Hercules undertook the labour, and engaged to perform it in one day, on condition that Augias should give him a tenth part of the cattle. This work Hercules is said to have accomplished by making the river Alpheus to pass through the stable. Augias withheld the promised recompence; upon which Hercules slew him, and placed his son Phileus

Phileus upon the throne, because he advised his father to fulfil his promise. This fable, however, is variously related by different authors. Hence has arisen the ancient proverb of "cleaning the stables of Augias," for expressing a difficult or impracticable enterprise.

AUGIAS, in *Entomology*, a species of **PAPILIO** (*Hefferia* Fabr.). The wings are divaricate and fulvous, with an oblique band, and margin behind black. Fabricius.—Donov. Inf. India. Inhabits India.

AUGICOURT, in *Geography*, a town of France, in the department of the Upper Saone, and chief place of a canton, in the district of Jussey, $4\frac{1}{2}$ leagues north-west from Vesoul.

AUGILES, or **AUGILITES**, in *Ancient Geography*, a people of Africa, who inhabited the country by which the Garamantes were separated from the Troglodites. Pomponius Mela says, they were savages, who acknowledged no other deities besides the manes of their ancestors, whom they invoked on all interesting occasions. They are said to have slept upon the tombs, in order to receive the inspiration from which they derived the rules of their conduct. It was a custom amongst their women, to grant the first favour after their marriage to any who solicited it, and who made them presents; and they valued themselves upon the number of their votaries on this occasion. In other respects, says P. Mela, they were distinguished by their wisdom and discretion.

AUGIT, **SILEX AUGITES**, in *Mineralogy*, *pyroxens* of Haüy; a var. of *basaltic hornblende* of Kirwan; *feldspat volcanique* Daubenton, &c. *Volcanite* Lamtherie.

The colour of this mineral is a very deep olive or pear green, which at first may be mistaken for a blackish green.

It occurs sometimes in rounded fragments; but more usually crystallized. Its varieties of figure are,

1. A six-sided prism, of which two opposite ones are broader than the rest. The two bases, which are oblique, are terminated by wedges more or less obtuse.

2. Var. 1. with the edges that separate the small sides of the prism, truncated; or an eight-sided prism.

3. Two or more crystals connected by their lateral faces, so as to form a right or oblique-angled cross.

The crystals are usually small and very small, rarely of middling size. They are also, for the most part, imbedded.

Externally, when no decomposition has taken place, the surface of the augit is smooth and shining; but when it begins to be decomposed, it becomes dull. Internally, it is shining or much shining with a greasy lustre.

Its fracture is perfectly frain lamellar. It lies when broken into rhomboidal parallelepipeds.

It is translucent on the edges, but rarely so throughout.

It is hard, scratches glass, and gives fire plentifully with the steel: it is brittle, and easily broken. Sp. gr. 3.182—3.377.

The augit is not easily fusible before the blowpipe, but in small pieces it affords a black enamel. Its analysis by Vauquelin afforded

	52	Silex
	13.2	Lime
	3.33	Alumine
	10	Magnesia
	14.66	Oxyd of iron.
	2	Oxyd of manganese.

100

This mineral is found in basalt, with olivin and hornblende;

it is also met with in certain amygdaloids. It abounds in Bohemia, and is found besides in Hungary, Transylvania, Tyrol, Hesse, &c.

It resists decomposition much longer than olivin; but not so long as basaltic hornblende. It is at length, however, reduced to a greenish yellow argillaceous mat, and next, as the olivin, to a ferruginous ochre. Brochant, vol. i. p. 179.

AUGMENT, in the *Greek Grammar*, an accident of certain tenses; being either the prefixing of a syllable, or an increase of the quantity of the initial vowels. There are two kinds of augment.—*Temporal*, or of a *letter*; when a short vowel is changed into a long one; or a diphthong into another longer one: thus called, because the time of its pronunciation is now lengthened; and *augmentum syllabum*, or of a *syllable*, which is, when a letter, viz. *h*, is added at the beginning of the word; so that the number of syllables is increased.

AUGMENTS, in *Mathematics*. See **FLUXIONS**, and **MOMENTS**.

AUGMENTATION, in a general sense, the act of *augmenting*; that is, of adding or joining something to another, to render it larger or more considerable.

The governors of the bounty of queen Anne, for the "augmentation of the maintenance of the poor clergy" (see **FIRST FRUITS**), by virtue of the several acts of parliament made for that purpose, are empowered to augment all livings not exceeding 50*l. per annum*; and the number of livings following were certified to be capable of augmentation.

1071	Livings not exceeding 10 <i>l. per annum</i> , which may be augmented (with the bounty alone) six times each, pursuant to the present rules of the governors, which will make 6426 augmentations.	} 6426
1467	Livings above 10 <i>l.</i> and not exceeding 20 <i>l. per annum</i> , may be augmented four times each, which will make 5868 augmentations.	
1126	Livings above 20 <i>l.</i> and not exceeding 30 <i>l. per annum</i> , may be augmented three times each, which will make 3378 augmentations.	} 3378
1049	Livings above 30 <i>l.</i> and not exceeding 40 <i>l. per annum</i> , may be augmented twice each, which will make 2098 augmentations.	
884	Livings above 40 <i>l.</i> and not exceeding 50 <i>l. per annum</i> , may be each once augmented, which will make 884 augmentations.	} 884
5597	Total number of augmentations, which must be made (by the bounty alone) before the livings already certified will exceed 50 <i>l. per annum</i> .	

Computing the clear amount of the bounty to make 55 augmentations yearly, it will be 339 years, from the year 1714 (which was the first year in which any livings were augmented), before all the small livings above certified can exceed 50*l. per annum*; and if it be computed, that one half of such augmentations may be made in conjunction with other benefactors (which is very improbable), it will require 226 years before all the livings above certified will exceed 50*l. per annum*.

Dr. Warner, in the appendix to his "Ecclesiastical History," published in 1757, observes, that it will be 50 years before every living can be raised to 60*l.* a year by queen Anne's bounty, supposing the same money to be distributed as there has been for some years past. In the course of between eighty and ninety years, many livings have been augmented

mented by this bounty; nevertheless, the bounty, afforded by private benefactions, has been found inadequate to the end of making a reasonable and competent provision for the parochial clergy in a short time. In order to accelerate the beneficial effect of this bounty, it was proposed by the learned Dr. Watson, the present bishop of Landaff, in a "Letter to his grace the archbishop of Canterbury," printed in 1783, that a bill should be introduced into parliament, for appropriating, as they become vacant, one-third, or some other definite part, of the income of every deanery, prebend, or canonry, of the churches of Westminster, Windsor, Chichester, Canterbury, Worcester, Durham, Norwich, Ely, Peterborough, Carlisle, &c. to the same purpose, *mutatis mutandis*, as the first-fruits and tenths were appropriated by the act, passed in the fifth of queen Anne. This plan, it is suggested, would produce a wonderful change for the better, in 80 or 100 years, in the condition of the inferior clergy, and it would immediately begin to operate for their benefit. "If the reduction of deans and chapters," says this excellent writer, "should be looked upon as a step towards their annihilation, and should, on that account, be disliked by those who think them of use in our ecclesiastical establishment; there is another method in which the poor clergy might be, in no great length of time, well provided for. The clergy at present pay into the exchequer about 14,000*l.* a year for first-fruits and tenths, according to a valuation of the church revenues, which was made above 250 years ago; the *clear* revenue, arising to the governors of queen Anne's bounty from this source, may be estimated at near 12,000*l.* a year. If the clergy were to pay first-fruits and tenths according to a new valuation of their benefices, and the sum thence arising was applied to the augmentation of small livings, every one must see how greatly the operation of what is called queen Anne's bounty would be accelerated. See CURATE, Ecclesiastical REVENUE, and VICAR.

AUGMENTATION is also used for the *augment*; i. e. for the addition, or the thing added. Thus it is said, such a minister petitioned the king for an augmentation of salary, wages, &c.

AUGMENTATION, *Court of*. See COURT, &c.

AUGMENTATION, in *Heraldry*, denotes additional charges to a coat armour frequently given as particular marks of honour, and generally borne, either on an escutcheon, or a canton.—Such are the arms of Ulster, borne by all the barons of England.

AUGON, in *Geography*, a mountain of Italy, being part of the Apennines, on the confines of Liguria and Pavcan.

AUGOXAS, a small island of Africa, on the coast of Mozambique.

AUGRE, or AWGRE, a carpenter's and joiner's instrument, serving to bore large round holes.

The augre consists of a wooden handle, and an iron blade, terminated at bottom with a steel bit.

AUGSBURG, or AUSBURG, i. e. *Augustus-burgh*, anciently called *Augusta Vindelicorum*, in *Geography*, an imperial city of Germany, and the capital of Swabia. It is situated in a delightful and fertile country, betwixt the rivers Lech and Wertach, near their confluence. It is not only one of the most ancient, but one of the largest cities in Germany. According to Richebeck (*Tour through Germany*, p. 111.) its circumference is 9½ miles, and it contains about 30,000 people; others say, that the number of inhabitants amounts to 35,000, and some reckon them at 40,000. It is environed with ramparts, walls, and deep ditches; and besides four large and six small gates, which open and shut without any visible interference, it has a secret wicket, of curious con-

struction, for admitting both horse and foot in the night, or in time of war. The town is supplied with water from the river Lech, by means of aqueducts, and of engines and towers, which furnish a sufficient quantity for working several mills of different sorts, for cleaning the streets, and for the domestic uses of the inhabitants. Some of its streets are steep and incommodious; but others are broad and well paved. This city, since the earliest periods, had small subterraneous passages under the streets, like our sewers, and the Roman cloaca, for conveying away filth; and the whole town was paved soon after the year 1415, when a rich merchant suggested the utility of it by causing a foot-path to be made before his own house. Many of the houses are built of wood, and others of stone, and they serve as specimens of the architecture that prevailed at the period of its construction; and, compared with other houses built in German towns, they exhibit the superior improvement and magnificence to which Augsburg had arrived. The more modern part of this town may be reckoned handsome; many of its churches are stately edifices, and adorned with curious workmanship and paintings. The town-house, completed after six years' labour, in 1620, is a magnificent edifice, and reckoned little inferior to that of Amsterdam. It is a large square building of stone, with a marble portico; at the top of the front, within the pediment, is a large spread eagle, holding in its talons a sceptre and globe of gilt brass; the great portal is formed of a beautiful reddish marble, over which is a balcony of the same colour, supported by two pillars of white marble; over the gate are two large griffins of brass; and most of the rooms are wainscotted, and ciled with very fine timber. The saloon is 110 feet long, 58 broad, and 52 high; its roof is supported by eight columns of red marble; the ciling is constructed of polished ash, and divided into compartments, enriched with gilded sculptures; it is filled with pictures and other ornaments; and supported by eight pillars with bases and chapters of brass. In the square, near the town-house, is the fountain of Augustus, or a large marble basin, surrounded with iron ballustrades, with four brass statues as large as life at the four corners: in the middle is a pedestal, having on its top the statue of Augustus, and at the foot are four large sphinxes discharging water from their breasts, with four infants above them, holding in their arms four dolphins which pour water out of their mouths, and over these infants are festoons and pine-apples of brass. Near this basin is a fountain, called that of Hercules, of an hexagonal form, with several brass figures, and particularly Hercules engaging the Hydra. Besides the cathedral, which is a large, gloomy, gothic building, with two spire steeples, adorned with paintings, and opening with a brass gate, with its fourteen chapels; there are six Roman catholic parochial churches, a splendid college belonging to the Jesuits, five monasteries, three nunneries, and six Lutheran parish churches; and also a Lutheran gymnasium, which contains a good library. The Benedictine abbey is a large Gothic building, the ceiling of which is said to be the highest in Germany; it is adorned with several statues and a grand altar. The church of St. Croix surpasses the others in its architecture, sculpture, gilding, and fine spire. The Imperial Franciscan academy for arts and sciences, was instituted here in 1775. It is under the protection of the magistrates, and its principal aim is to produce good mechanics, and to preserve the manufactures of the city. The part of the city that was erected in 1519, by the noble family of the Fuggers, who are lords of the adjacent country, and in some measure endowed by them, consists of 106 houses, inhabited by the poor burghers at a low rent; some of whom are maintained by

an annual pension. The burghers of this city are computed at 6000. The inhabitants are partly Lutherans, and partly Catholics. The Jews are excluded from the town; but they occupy a village at the distance of about a league, and pay a tax for the liberty of trading in the day. The aspect of the inhabitants is very different; that of the Protestants resembling the Suabians; and the Catholics being like the Bavarians. The government is aristocratical; it is vested with 45 persons, of whom 31 are patricians, 4 such as have married the daughters of patricians, 5 merchants, and five of the commonalty; the council is formed of an equal number of Lutherans and Roman Catholics. The police is good; and though the town has no territory, it has no debts. In former times, Augsburg was the great mart for Indian commodities in the interior parts of that extensive country: its trade was very considerable; and we meet with many examples of such large fortunes accumulated by mercantile industry, as raised the proprietors of them to high rank and consideration in the empire. It was celebrated for its curious artists, whose manufactures, particularly in tin and silver, were much admired. Augsburg, however, is no longer what it was in this respect. It has no longer a Fugger and a Welfer in it, to lend the emperor millions. Here are no merchants who have capitals of more than 20,000 l.; others, with small capitals, do the business of brokers and commissioners; and next to these are the engravers, statuaries, and painters. Their productions, like the toys of Nuremberg, have a general circulation. Augsburg supplies all Germany with little pictures for prayer-books: and in various ways, its trade is still considerable, though far from being so great as it formerly was. The bishop takes his name from this town, though he resides at Dillengen. His income is about 20,000 l. per annum. He is a prince of the empire; and he sits and votes in the college of princes, betwixt the bishops of Constance and Hildesheim; the territory belonging to the bishoprick lies between the rivers Lech, Iler, and Danube.

In the diet of the empire, Augsburg was originally called Vindelicia, and was the capital of the Vindelici; afterwards it had the name of Augusta Vindelicorum, and Rhetorum, when it came under the dominion of the Romans, and a colony was settled in it by Drusus. Tacitus (Germ. c. xli.) calls it the most splendid city of Rhetia. From the Romans it was transferred to the Alemanni, the Goths, and the Franks; under the last of whom it declined much; but it recovered again under Charles the Fat. The emperor Henry III. took it under his protection, but it suffered much by its contels with the bishops, and its condition became very precarious. From Frederic I. it obtained several privileges; and in 1275, king Rudolph I. confirmed and enlarged its imperial rights.

Augsburg has acquired celebrity, not merely on account of its antiquity and pre-eminence for a long series of ages, and for the extent of its commerce in the 14th and 15th centuries, but from its having been the scene of several considerable transactions. In this place, a council held in 952, confirmed the order for the celibacy of priests. In 1518, a diet was held at this place, for concerting and promoting a general crusade against the Turks. At a diet, attended by the emperor Charles V. in the 1530, the creed of the Protestants called the Augustan or Augsburg confession, was presented and publicly read. In 1547, the emperor held a diet in this place for finally composing the controversies with regard to religion, which had long disturbed the empire; and having, at the head of his Spanish troops, taken possession of the cathedral and one of the principal churches, he re-established with great pomp the rites of the Romish worship. Before this diet, he laid the system of doctrine, known afterwards by the name of the INTERIM; and in 1548, he made his first attack upon

this city, on account of the part it took in its opposition to this system, issuing a decree, after he had taken possession of the town, by which he abolished the form of government, dissolved all its corporations, and that of its burghesses, and nominated a small number of patricians, whom he vested the future right of administration, and each of whom was constrained to take an oath for observing the Interim. In 1550, a diet was summoned by the emperor at this place for further enforcing the observance of the Interim. The diet held here in 1555, settled the religious peace of Germany, by an act called the Diet of Augsburg, which was concluded in 1686, betwixt the emperor, the king of Spain, the republic of Holland, the elector Palatine, Bavaria, and the duke of Savoy; the principal object of which was to restrain the ambition of the House of Brandenburg; but the real motive, says M. A. de la Harpe, in his "Méthode des Guerres et des Traites de Paix de la France," c. 1798," which led William prince of Orange to effect this league was, to keep Louis busy on the continent, while he, whose sagacity foretaw to what the intemperance of James II. of England would lead, might with a more easy access to the English throne in his stead. The hostile contest on this league commenced in 1688, which was followed by a continental war, terminated by the peace of Ryfwick in 1699. Although the Protestants were very powerful at Augsburg, they were driven from thence by the Bavarians, and restored again by GuLAVUS ADOLPHUS in 1632; since which time they have continued, and forced the government with the Catholics. In 1753, the elector of Bavaria besieged the city and took it, and demolished its fortifications; but the battle of Hockstedt restored its liberty, which it enjoys under its own magistrates; the bishop having no temporal dominion in the city. The chapter is composed of persons who can produce proofs of their nobility. The canons have a right of electing their bishop, who is a sovereign, like several of the other German bishops. Augsburg is situated in N. lat. 48° 24'. E. long. 10° 58'.

AUGSBURG Confession. See AUGUSTAN.

AUGST, a village of Switzerland, near the Rhine, formerly a celebrated city called *Augstli Romanorum*, which Marcus Minutius Plancus conducted a Roman colony under the empire of Augustus, A. U. C. 740, B. C. 14. It is seated on the river Ergetz, two leagues from Basle. It was ruined by Attila. Of its ancient magnificence many monuments have been discovered; such as the ruins of an amphitheatre, of towers, of subterranean vaults, and also medals, and fragments of statues and inscriptions.

AUGUR, in *Antiquity*, a minister of religion among the Romans, appointed to take auguries or presages concerning futurity from birds, beads, and the appearances of the heavens.

The word is by some derived from *avis, bird*, and *guttur, chattering*; whence the original office of the augur is supposed to have been to observe, and take indications from, the noise, calling, flying, circling, and chattering of birds. Agreeably to which, augur is commonly distinguished from *auspex*, as the latter was supposed employed in observing the flight of birds.—Perron derives it from the Celtic *aug, to see*, and *gar, man*; so that, according to him, an augur was properly a person who inspected the entrails, and divined by means of the liver. On which principle, augur would have been the same with *ARUSPICES*.

The augurs constituted a college or community, which at first consisted of three persons, one being appointed by Romulus for each tribe; then of four, when Servius Tullius increased the tribes to that number; then of nine, four of them patricians, and five plebeians, added in the year of

Rome 454, at the solicitation of the tribunes, and elected from among the common people; lastly, Sylla, in the year 672, increased the number to fifteen. They were at first chosen, like the other priests, by the *comitia curiata*, but their election afterwards underwent the same changes with that of the pontifices.

The eldest of these presided over the rest, and was honoured with the title of "Magister Collegii." Their office, which terminated only with their death, and of which no crime or forfeiture could deprive them, as it is comprised in the augural law mentioned by Cicero (De Divin. l. ii.), was to interpret dreams, oracles, prodigies, &c. and to tell whether any action should be fortunate or prejudicial to particular persons, or to the whole state. Thus they were the interpreters of the will of the gods with respect to the making of war or peace; and all were obliged to obey them in so important an article.

They bore an augural staff, or wand, called *lituus*, as the ensign of their office and authority. The other badges of their office were a kind of robe called *trabea*, and a cap of a conical shape like that of the pontifices. No affair of moment could be resolved on, without first consulting them; and their advice, be it what it would, was, by a decree of the senate, appointed to be exactly and religiously observed.

The office was important and honourable. It was aspired after by some of the principal persons of the Roman state. Cato was a member of the college of augurs; and Cicero also was dignified with this title, and perfectly understood the whole art practised by himself and his colleagues. Although he ridicules the profession (De Divin. l. ii.), and demonstrates by various proofs the inutility, impotence, and absolute impossibility of the art, and relates a saying of Cato concerning it, "that he could not imagine how one aruspex could look another in the face without laughing;" yet, notwithstanding his contempt of its superstitions, he blamed those generals and magistrates, who on important occasions had neglected them; and maintains, that this practice, though allowed to be subject to many abuses and frauds, ought to be regarded on account of religion and the prejudices of the people. Pliny was also raised by Trajan to the dignity of augur; and through every period of the Roman state, this office was the highest rank in the priesthood to which any senator could be raised. Of this Augustus was so well apprized, that by seizing the office of high priest on the death of Lepidus in the year of Rome 725, B. C. 29, he, and his successors in the empire, obtained a control over all religious matters; and by thus placing themselves at the head of all the colleges of priests, augurs, and keepers of the Sibylline books and others, they became the sole arbitrators in all sacred as well as profane concerns. For an abstract of the history and office of augurs, see AUGURY.

AUGUR, in *Entomology*, a species of CIMEK, of a rufous colour, with the antennæ, under-wings, and legs black. A native of the East Indies, and the cape of Good Hope.

AUGUR, a species of PHALÆNA (*Noctua*), with brown wings, charactered with black. Inhabits Germany. Fabricius.

AUGUR, a species of MUSCA that inhabits New Holland. It is cinereous; abdomen blueish; sides testaceous and diaphanous. Fabricius, &c.

AUGURAL, something relating to the AUGURS.

The augural instruments are represented on several ancient medals. Evelyn on Medals, chap. ii.

AUGURAL supper, *cena auguralis*, that given by a priest on his first admission into the order, called also by Varro *adjuvialis*. De Re Rustic. lib. iii. cap. 6.

AUGURAL books, *libri augurales*, those wherein the dis-

cipline and rules of augury were laid down. Cic. de Divin. lib. i. cap. 33. Priscian (l. 708.) says, that Julius Cæsar composed augural books.

AUGURALE, the place in a camp where the general took auspicia. This answered to the *auguratorium* in the city.

AUGURALE is also used, in Seneca, for the ensign or badge of an augur, as the *lituus*. De Tranquil. cap. xii.

AUGURATORIUM, a building on the Palatine Mount, where public auguries were taken. This is also called *auguraculum* and *ars*.

AUGURELLO, GIOVANNI AURELIO, in *Biography*, a learned Italian, was born at Rimini about 1441, studied at Padua, and became professor of polite literature at Trevigi, where he had a canonry, and where he died in 1524. He was addicted to the study of alchemy; and it is said that pope Leo X. in return for the dedication of his Latin poem, intitled "Chrysopeia," gave him a large empty purse, saying, that he knew how to fill it. From this poem, however, it appears that Angurello was no believer in the art. He published, besides the Chrysopeia many Latin poems, odes, elegies, and cantos; some of which possess elegance and purity. The poems in his own language were not published till 1765. Tiraboschi. Gen. Biog.

AUGURY, the discipline of the augurs, or the practice of consulting the gods, and learning their will, by divers kinds of omens.

The observation of auguries is very ancient, as having been prohibited by Moses in Leviticus.—The cup put in Benjamin's sack, in Egypt, is said to have been that used by Joseph for making auguries.

However this be, augury was undoubtedly a very ancient superstition. Hesiod informs us, that the operations of agriculture were regulated by the migration of birds; and it had probably been in use long before his time, for marking the changes of the seasons. At length the flight of birds was more particularly observed; and their different motions were thought to be of such consequence, that no concern of importance, either private or public, was undertaken without consulting them. Absurd as this superstition may now appear, and as it certainly was in the extensive application and use of it, it seems to have derived its origin from nature. The appearance and disappearance of particular birds at different seasons, would probably suggest to those who were ignorant of the places to which they migrated, and from which they occasionally returned, that they might visit the ethereal regions, and there converse with the gods, and acquire an instinct or faculty for foretelling future events. A superstitious people might argue in this manner; and as birds are found capable of imitating the human voice, some impostor might have availed himself of this circumstance, and deduced presumptions in favour of the fallacious system of augury. An ingenious writer suggests (see Stillingfleet's Calendar of Flora), that this might have been the case; and it is alleged, that the institution of augury seems to have been more ancient than that of aruspicy; for Homer supplies us with several instances of the former, but none of the latter. Upon the whole, it is not improbable that natural augury gave rise to religious augury; and this again, by a transition not unnatural, to aruspicy. A passage in Aristophanes furnishes a hint that led to these observations. In his comedy of the birds, he represents one of them as saying, "The greatest blessing which can happen to you, mortals, are derived from us; first, we shew you the seasons, spring, autumn, and winter; the crane points out the time for sowing, when she flies with her warning notes into Egypt; she bids the sailor hang up his rudder and take his rest, and every prudent man provide himself with winter garments; the kite appears next, announcing another

another season, when it is time to shear the sheep; after that, the swallow informs you when it is time to put on summer clothes: we are to you, adds the Chorus, Ammon, Dodona, Apollo; for after consulting us, you undertake every thing; merchandise, purchases, marriages, &c.

“Εἴματα δ’ ὕμιν Ἀμμων, Διὸς Δοδώνη, Ζεῦδος Ἀπὸλλων.”

Now, it seems not improbable, that the same transition was made in the speculations of men which appear in the words of the poet; and that they were easily induced to think that the surprising foresight of birds as to the time of migration, indicated something of a divine nature in them; against which opinion, Virgil, as an Epicurean, protests, when he says,

“Haud equidem credo, quia sit divinitas illis ingenium.”

From these speculations of a conjectural kind we proceed to observe, that some have ascribed the invention of this art to Prometheus, or Melampus, the sons of Amythaon and Dorippe. Pliny (l. vii. c. 55.), says, that the Carians were the first observers of birds, and that Orpheus first directed his attention to other animals. Pausanias (Phocic.) attributes the first observation of the flight of birds to Parnassus, who gave his name to mount Parnassus. Clement of Alexandria reports, that the Phrygians were the inventors of this art. Upon the whole, it seems probable, that this species of divination was transmitted from the Chaldeans, Asiatics, and perhaps the Egyptians, to the Greeks; from them to the Hetrurians; and from the Hetrurians to the Latins and Romans.

We find five sorts of auguries mentioned by the ancients. 1. From the appearances in the heavens, as thunder, lightning, and other meteors. 2. From birds, whence they derived the name of Auspices. Some birds furnished them with observations from their chattering or singing, and others from their flying. The former were called *Osceines*, and the latter *Præpetes*. For the taking of both these sorts of auguries, the augur went up to some high place, took the augural staff, bent at one end like a crozier, and marked out with it the four *templa* or quarters of the heavens. Then he turned to the east, and in that situation, waited for the omen; which was of no signification, unless it was confirmed by another of the same sort. In this manner Romulus perceived Jupiter's approbation of his election to the crown; having seen lightning that came out on his left side and proceeded to his right. This ceremony, which was also observed when Numa was called to the crown, is largely described by Livy, l. i. c. 18. 3. From birds kept in a coop for that purpose. The manner of divining from them was as follows: early in the morning the augur that was to take the observation, after having commanded a general silence, ordered the coop to be opened, and then threw in a handful of crumbs or corn. If the chickens did not eat greedily, scattered the food about with their wings, let fall a great deal of it from their mouths to the ground, or, above all, refused to eat, the omen was reckoned unlucky, and some great mischief portended; but if they fed greedily, and let none of the food drop out of their mouths, they obtained all desirable assurance of happiness and success. This sort of augury was called *tripudium*, from the ancient Latin word *parire*, to *strike*, and *terra*, the *earth*: because the birds, in eating greedily, struck the ground with their beaks. The story of P. Claudius the consul is well known (Val. Max. l. i. c. 4.), who, ready to engage at sea in the first Punic war, and hearing that the chickens would not come out of their coop, ordered them to be thrown into the sea, with this jest, “If they will not eat, let them drink.” But he was vanquished; not, it will be thought, by the contempt of this silly and childish ceremony, but in consequence of his own rashness. 4. The next sort of augury

was from beasts, viz. wolves, goats, foxes, heifers, asses, rams, hares, weasels, and mice. The general observations about them were, whether they appeared in a strange place, or crossed the way; whether they ran to the right or left, &c. 5. The last sort of divination by auguries was from what they called *diræ*, or unusual accidents happening to any person, as tumbling, seeing apparitions, hearing strange voices, persons falling from the table, meeting a wolf, fox, a hare, &c. Many curious circumstances of Roman superstition with respect to omens and other things are enumerated by Pliny, xxviii. 2.; and among the Greeks, by Pausanias, iv. 13. Cæsar, in landing at Adrumetum in Africa with his army, happened to fall on his face, which was reckoned a bad omen; but he, with great presence of mind, turned it to his own advantage: for taking hold of the ground with his right hand, and kissing it, as if he had fallen on purpose, he exclaimed, “Tene te, Africa,” “I take possession of thee, O Africa.” *De. xli. in. Suet. Jul. 59.*

AUGURY, in its more general signification, comprises all the different kinds of divination; which Varro distinguishes into four species of augury, according to the four elements.—*Pyromancy*, or augury by fire; *aeromancy*, or augury by the air; *hydromancy*, or augury by the water; and *geomancy*, or augury by the earth.

The particular branches are *alchymancy*, *anthropomancy*, *belomancy*, *catoptromancy*, *capnomancy*, *gastro-mancy*, *geomancy*, *aruspicina*, *libanomancy*, *lecanomancy*, *necomancy*, &c. See each described under its proper article.

AUGUST, AUGUSTUS, in a general sense, something majestic, venerable, or sacred.

The title Augustus was first given by the Roman senate to Octavius, Jan. 13th. A. U. C. 727. B. C. 27. after his being confirmed by them in the sovereign power.—It was conceived as expressing something divine, or elevated above the pitch of mankind, being derived from the verb *augere*. *I increase*, “tanquam supra humanam fortem auctus.” When some of the senators, in concurrence with his own first inclination, would have given him the name of Romulus, as a second founder of Rome; Manlius Plancus proposed his being denominated Augustus, because it denoted a person or thing consecrated by some augur, or some of religion, and nearly allied to the deity. Accordingly, Ovid gives us this reason for the appellation in his “Fasti,” l. i. v. 609.

“Sancta vocant Augusta patres: Augusta vocantur
Templa, Sacerdotum rite dicata manua.

Hujus et augurium dependet origine verbi,

Et quodcumque sua Jupiter auget opè.”

The successors of Octavius assumed the same quality; so that thenceforward *Emperor* and *Augustus* became synonymous terms.

The Greeks rendered the name Augustus by ΣΕΒΑΣΤΟΣ, and gave it to all the successors of Augustus, after the example of the Romans.

Augustus, the title expressive of the character of peace and sanctity, which Octavius uniformly affected, was a personal, and *Cæsar* a family distinction. The former, therefore, should naturally have expired with the prince on whom it was bestowed; and however the latter was diffused by adoption and female alliance, Nero was the last prince who could allege any hereditary claim to the honours of the Julian line. But, at the time of his death, the practice of a century had inseparably connected these appellations with the imperial dignity, and they have been preserved by a long succession of emperors, Romans, Greeks, Franks, and Germans, from the fall of the republic to the present time. A distinction was, however, soon introduced. The sacred title of Augustus was reserved for the monarch, whilst the name of Cæsar was more freely communicated.

to his relations; and from the reign of Adrian, at least, was appropriated to the second person of the state, who was considered as the presumptive heir of the empire. Accordingly, the person, who was destined to succeed to the dignity, was first created Cæsar; which was a step necessary to arrive at that of *Augustus* or emperor.—YET F. Pagi maintains the reverse; viz. that it was necessary to be *Augustus* previously to the being *Cæsar*; and alleges the instance of Valentinian I., who proclaimed his brother Valens *Augustus* before he was created *Cæsar*; but this single fact is not sufficient to invalidate the evidence of common practice.

The empresses also took the quality of *Augustæ*; and even some ladies of the imperial family, who had never been wives of emperors, but mothers or daughters.

On medals and coins, some of the ancient kings of France are also found with the appellation *Augusti*; particularly Childeric, Clothaire, and Clovis; add, that the wife of this last, Christchilda, is also called by Heric, in his book of the miracles of St. Germain, indifferently either *Augusta*, or *queen*.

AUGUST, in respect of *Chronology*, denotes the eighth month of the Julian year.

This was called in the ancient Roman calendar, *sextilis*, as being the sixth from March, from which the Romans began their computation. The emperor *Augustus* changed the name, and gave it his own; not that it was the month in which he was born, which was September, and which was first proposed for bearing his name, but because it had been fortunate to him by several victories which he had gained in it.

He preferred this month to September for the reasons mentioned in the deliberations of the senate, preserved by Macrobius. The tenor of them is as follows: "As it was in the month, hitherto called *sextilis*, that the emperor Cæsar Augustus took possession of his first consulship; that he celebrated three triumphs; that he received the oath of allegiance of the legions that occupied the janiculum; that he reduced Egypt under the power of the Roman people; that he put an end to all civil wars; it appears that this month is and has been a most happy month to this empire; the senate therefore ordains, that this month shall henceforth be called Augustus. This decree of the senate was ratified by an order of the people.

Our Saxon ancestors called it *Weed-month*, that is *weed-month*, on account of the plenty of weeds in this season. Spelman.

This month is esteemed one of the richest in the whole year, because of the harvest of the several sorts of grain which is produced in that season. Hence is to be derived the French proverb, *a man has made his August*; which proverb is much used among merchants, to signify that a man has been successful in trade, and got an estate.

AUGUST is also used, in *Middle Age Writers*, for a power or licence, of going out of a city in harvest-time, to reap, &c. Du-Cange.

AUGUSTA, in *Ancient Geography*, a name given singly, or in connection with some epithets, to several towns in honour of *Augustus* the Roman emperor. Thus, *Augusta* was a town of Gallia Narbonensis, founded by Augustus, with the title of a colony; situate $1\frac{1}{2}$ league from the Rhone, and having a temple of Jupiter, a circus, and an amphitheatre.—Also, a town of Cilicia, seated on mount Taurus, five or six leagues north from Adanz. Pliny, l. v. c. 27. It became subject to Rome in the reign of Augustus.—Also, a town of Dacia Ripensis.—Also, a town of Rætia.—Also, a port of Sicily, nearly north of Syracuse. *Augusta Aspurica, Aspora*, an ancient town of Spain, in Asturia.—A. *Aufiorum*, a town of Aquitania, originally called *Glinberum*, which name it

afterwards refused. In the middle age it took the name of the people *Aufci*, and is now AUCH.—A. *Batenorum*, or *Bacinnorum*, an ancient town of Italy, in Liguria; called also A. *Vagiennorum*.—A. *Bracarum*, Braga, an ancient town of Hispania Citerior. Pliny.—A. *Emerita*, a town of Lusitania, on the river Anas, the capital of the province: it was a colony of the Emeriti, or of such soldiers as had served out their legal time, were men of experience, or had received marks of favour, founded by Augustus; adorned by him with stately buildings, a long and magnificent bridge over the Gaudiana, and two aqueducts. It is now called MERIDA.—A. *Euphratesia*, a town of Asia, in Comagene, on the banks of the Euphrates.—A. *Gemella*, a town of Bætica in Spain, in the country of the Turduli.—A. *Magna*, a town of Asia, situate at the confluence of the Apia and Phais. Ptolemy.—*Augustamica*, a division of Egypt, which commenced about the time of Theodore II. comprehending that part of Lower Egypt, which extends from the right arm of the Nile to the east of Delta, to the frontier of Arabia.—A. *Nova*, a town of Hispania Tarragonensis, on the river Areva, in the country of the Arevaci; called by Ptolemy *Porta Augustæ*.—A. *Prætoria*, a town of Gallia Cisalpina, at the foot of the Alpes Graie, in Duria, so called because Augustus sent thither a colony of the prætorian soldiers; inhabited by the Salassi: now Aousté.—A. *Rauracorum*, a town of Helvetia, now called AUGST.—A. *Suffonum*, a town of Gallia Belgica, on the Axona, now SOISSONS.—A. *Taurinorum*, a town of the Taurini, at the foot of the Alps, where the Duria Minor falls into the Po, so called because Augustus established here a Roman colony; now TURIN.—A. *Tiberii*, a town upon the Danube, on the confines of Rætia and Dorica; now RATISBON.—A. *Treba*, a town of the Æqui, near the springs of the river Anio in Italy, now TREVÌ, in Umbria.—A. *Trevirorum*, a town of Gallia Belgica, belonging to the Treviri, a people inhabiting the territory between the Rhine and the Moselle, now TREVES or TRIERS.—A. *Trinobantum*, a town of the Trinobantes, in the isle of Albion, called Augustæ from its grandeur; now LONDON.—A. *Vagiennorum*, the seat of a Roman colony, among the mountains, now Vico near MONDOVI.—A. *Veromanducorum*, a town of Gallia Belgica, now St. QUINTIN.—A. *Valeria*, a town of Hispania Tarragonensis, belonging to the Celtiberians. Ptolemy.—A. *Vindelicorum*, a town of Vindelicia, now AUGSBURG.

AUGUSTA, in *Geography*, a town of Sicily, eighteen miles by land, and nine by sea, distant from Syracuse, was built by the emperor Frederick II. near the ruins of the Greek city of Megara; and covered a small low peninsula, joined to Sicily on the north side by a long causeway, having on each side extensive salt-ponds. This projection forms a very fine harbour, the largest and most easy of access in Sicily, opening to a southern exposure, but sheltered by the points of the coast from both wind and swell, with nine fathoms of water in almost every part. A ruinous citadel guards the land gate; and three forts, built on little islands, defend the entrance of the port. The country along the opposite shore is beautifully diversified in its culture. The order of Malta has established at Augusta magazines of salt meat, biscuit, and flour, for the supply of their ships that are continually passing between the islands. The town is scarcely recovered from the devastation caused by the earthquake in 1693, which destroyed by the falling of the houses about one third of the inhabitants, set fire to the powder magazine in the citadel, which blew up, and threw the light-house precipitately into the sea. Since that time the town has been rebuilt on a regular plan, with low houses to prevent injury from another shock if it should occur. The number of inhabitants

habitants is reckoned at 9205 by an enumeration. Swinburne says its population amounts to 16,000 persons. *Travels*, vol. iv. p. 116.

AUGUSTA, a county of Virginia, in North America, lying partly on the east and partly on the west of the North Mount, a ridge of the Alleghany. The soil is fertile, and the country contains 10,886 inhabitants, including 1567 slaves. In this district there is a remarkable cascade, called "the falling spring," which is a branch of the James, where it is called Jackson's river, rising in the mountains twenty miles south-west from the "warm or hot spring," in N. lat. $38^{\circ} 9'$. W. long. $80^{\circ} 6'$. At the "falling spring," the water falls two hundred feet, being fifty feet higher than the fall of Niagara; and the sheet of water is only twelve or fifteen feet wide above, and somewhat wider below.

AUGUSTA, a town of North America, in the upper district of Georgia, situate on a fine plain in Richmond county, on the south-west bank of the Savannah river, where it is near five hundred yards broad, at a bend of the river, 127 miles north-west from Savannah, and 934 south-west from Philadelphia. At the first settlement of the colony, general Oglethorpe erected a fort here for protecting the Indian trade, and holding treaties with the natives. In 1787, it contained 200 houses. The country round it has an excellent soil, which, together with its central situation between the upper and lower countries, insures its improvement. N. lat. $33^{\circ} 19'$. W. long. $80^{\circ} 46'$.

AUGUSTA, a town of Upper Canada.

AUGUSTA, a river in the north-east part of the island of Cuba, in the West Indies, navigable for several leagues from the mouth, in which is Cumberland harbour.

AUGUSTA, *Historia*, is the history of the Roman emperors from the time of Adrian to Carinus, composed by six Latin writers, *Æl. Spartianus*, *Julius Capitolinus*, *Æl. Lampridius*, *Vulcatius Gallicanus*, *Trebellius Pollio*, and *Flavius Vopiscus*. They all lived in the reign of Dioclesian, though some of them flourished under his successors, near the end of the third and beginning of the fourth century. They are rather biographers than historians, and take more care to inform us of the good and bad qualities of the emperors, of their birth, education, stature, mien, and even their diet, and the clothes they wear, than to describe their wars, the laws they enacted, and the great revolutions that happened during their respective reigns. Vopiscus, who was a Syracusan, and who is said, in the life of Probus, to have imitated Suetonius, according to the general opinion of the learned, far excels the rest, both as to his method and style; nevertheless he has many imperfections, and is not to be compared with any of the Latin historians. The other five betray great want of judgment in their choice, and of method in digesting their materials. Of these six writers, Capitolinus is the most confused and injudicious; whence some have suspected that the author of this collection had blended together the relations of Capitolinus, Spartian, and some others. Their style is vulgar and unpolished, their expressions uncouth, and sometimes hardly intelligible. Vopiscus observes, that Lampridius and Capitolinus attended more to truth than to elegance in their narrations. Pollio acknowledges that his style has nothing of the dignity of the ancients. *Fabr. Bibl. Latin. vol. ii. p. 37. See. Anc. Un. Hist. vol. xiv. p. 67.* The histories of these writers were published together, with the notes of Casaubon, Salmastius, and Gruter, in two vols. Svo. 1671; and re-published by I. P. Schmidt, in 1771.

AUGUSTALES, or *Sodal's AUGUSTALES*, or *Æmines AUGUSTALES*, were the priests of Augustus, appointed

after the deification of that emperor by Tiberius, and instituted by him, to perform the service of the new god. Three of these were Drusus, Claudius, and Germanicus; and the others, who supplied the number of twenty-one, were chosen by lot among the citizens of the first families in Rome. The same name of Augustales was also applied to other colleges of priests, instituted in honour of the successors of Augustus, and who like him were deified. The appellation is also extended to those who constituted the first ranks of the army; to the prefects of the prætor, who were established by Augustus after the defeat of Antony and Cleopatra; to all the officers of the imperial palace; and to those citizens in the colonies and municipalities, who held the middle rank between the decurions and the people. The Augustales of the provinces were probably distinguished by the worship of Augustus in the same manner with those of Rome.

AUGUSTALIA, in *Antiquity*, a fast instituted in honour of the emperor Augustus.

This festival was first established in the year of Rome 735, being the fourth after he had ended all his wars, and settled the affairs of Sely, Greece, Asia, Syria, and the Parthians. The day whereon he made his entry into Rome, being the fourth of the ides of October, was appointed to be kept a feast, and was called *Augustalis*.

AUGUSTARIA was also a name given to the games celebrated in honour of the same prince, on the fourth of the ides of October.

AUGUSTALIS, or *Præfatus Augustalis*, a Roman magistrate who was appointed to govern Egypt, with a power much like that of a præsul in other provinces.

AUGUSTAN, relating to Augustus or Augusta.

AUGUSTAN ÆRA. See *ACTIAN*.

AUGUSTAN, or *AUGSBURG Confession*, in *Ecclesiastical History*, denotes a celebrated confession of faith, drawn up by Luther and Melancthon, on behalf of themselves and other ancient reformers, and presented, in 1530, to the emperor Charles V. at the diet of Augusta or Augsburg, in the name of the evangelic body. This confession contains twenty-eight chapters, of which the greater part is employed, in representing, with perspicuity and truth, the religious opinions of the protestants, and the rest in pointing out the errors and abuses that occasioned their separation from the church of Rome. The style in which it is written is plain, elegant, grave, and perspicuous, such as becomes the nature of the subject, and does honour to the eloquent pen of Melancthon. The matter of this confession was supplied by Luther, who, during the diet, resided at Camburg, a town in the neighbourhood of Augsburg; and even the form it received from the acute judgment of his colleagues was authorized by his counsel and approbation. The Roman Catholics attempted a refutation of this confession: this objection was read publicly in the assembly; and the emperor demanded submission on the part of the Protestant members; but the Protestants were not satisfied, and requested a copy of this reply, that they might demonstrate at large its insufficiency and valence. The emperor resisted this request, interposed by his authority to suspend any further proceeding, and solemnly prohibited the publication of any new writings or declarations that might contribute to lengthen out these religious debates. Melancthon prepared an answer, which was presented to the emperor, but he refused to receive it. This answer was afterwards enlarged and published in 1531, with the other pieces that related to the doctrine and discipline of the Lutheran church, under the title of "A Defence of the Confession of Augsburg," or "Apologia Confessionis Augustanæ." In composing this

defence, Melancthon's love of peace and concord seems to have carried him beyond what he owed to the truth; and through servile fear, excessive charity, or indecision of mind, he makes several strange concessions to the church of Rome. Mosheim's *Ecccl. Hist.* vol. iv. p. 283. In some subsequent editions of the "Apologia," the obnoxious passages were omitted, and the phraseology that had given just offence materially altered. See PHILIPPISTS.

AUGUSTANICUM, in *Middle Age Writers*, denotes a largesse, or donative, of an emperor to the people or soldiery.

AUGUSTENBERG, in *Geography*, a town of Germany, in the circle of Upper Saxony, and county of Schwartzburg; three miles east of Arnstadt.

AUGUSTENBERG, a town of Denmark, in the duchy of Sleswick, six miles east of Sonderborg.

AUGUSTEUM MARBORA, in the *Natural History of the Ancients*, a name given to the common green and white marble so frequent in use with us for tables, &c.; and called by our artificers, Egyptian marble.

AUGUSTIN, ANTHONY, in *Biography*, archbishop of Tarragona, was born at Saragossa, of parents of distinction, and studied in various universities both of Spain and Italy. At the age of twenty-five, he published a treatise of law, intitled, "Emendationes et Opiniones Juris Civilis." He was sent as nuncio to England by pope Julius III. in 1554; and in 1562, he distinguished himself at the council of Trent. From the year 1574 to 1586, the time of his death, he possessed the archbishopric of Tarragona. His liberality to the poor was such, that when he died, there was not found money sufficient to defray the expences of a funeral suitable to his rank. Of many writings in law, which he left, the most valuable is a treatise "De Emendatione Gratiani," first printed at Tarragona in 1587, and afterwards published in 1672, by Balzar, 8vo., and esteemed an elaborate treatise on the canon law. He wrote also "Anrique Collecciones Decretalium," printed at Paris in 1621, folio, with notes; "Dialogues on Medals," published at Tarragona, in 1587; and other treatises, chiefly on canon law; with skill in the law, he united purity of language. *Nouv. Dict. Hist.*

AUGUSTIN, and by contraction AUSTIN, St. usually styled "the Apostle of the English," was the first archbishop of Canterbury, and flourished about the close of the sixth century. He was originally a monk in the convent of St. Andrew at Rome, educated under St. Gregory, afterwards pope Gregory I.; and about the year 596, deputed by him on a mission to Britain, for the conversion of the English Saxons. Whilst Augustin, and forty monks, who were his associates in this mission, were pursuing their journey, they were discouraged by apprehension of the dangers which they were likely to encounter; and Augustin was sent back from France to Rome, with a petition to be recalled from this hazardous undertaking. Gregory, however, was determined not to abandon his project; he therefore encouraged them to proceed, furnished them with commendatory letters to the king and queen of France, and to the bishop of Arles, and instructed them to take with them some interpreters from the Franks, whose language still resembled that of the Anglo-Saxons. In the year 597, the missionaries landed in the isle of Thanet; and having informed Ethelbert, king of Kent, whose queen Bertha was a Christian, and who was disposed to give them a favourable reception, of their arrival, and of the design of their mission, they were introduced into the royal presence. The king, however, chose to receive them in the open air, from a superstitious notion that he would be thus

more secure from the delusive influence of their magical arts, than within the walls of a house. Augustin, by means of his interpreters, opened his commission; and after stating to Ethelbert the leading doctrines of Christianity, he allured him to embrace the religion of Christ by the assurance of an eternal kingdom in heaven. The king, after a candid hearing, hesitated in abandoning the religion of his ancestors; but with a liberality which reflects honour upon his memory, and under a due sense of the kind intention with which the missionaries had undertaken so long a journey, he allowed them to remain in the country, and to use their efforts for the conversion of his subjects. Accordingly he assigned for their residence that part of the ancient Durovenum, or the modern Canterbury, which is now called "Stable-gate," and which had been formerly a kind of oratory or chapel for the royal family, where they worshipped and offered sacrifice to their gods. The missionaries entered the city in procession, singing an hymn. Their ministerial labours were at first confined to the precincts of the city, where the accession of new converts was inconsiderable; but as soon as the king himself was profelyted and baptized, they obtained liberty to extend their commission to every part of his dominions; and their success was so great, that Augustin is said to have baptized 10,000 persons of both sexes in one day, in the river Swale, at the mouth of the Medway. In the commencement of his mission, he thought it expedient to refrain from coercive measures; and, as Bede informs us (*Ecccl. Hist.* l. i. c. 26.), he instructed Ethelbert, that the service of Christ must be voluntary, and that no compulsion ought to be used in propagating the gospel; nor does it appear that any violence was used in the first establishment of Christianity in England, besides that of demolishing idols, and converting Pagan temples into Christian churches.

Augustin, who seems to have been consecrated archbishop of Canterbury before his arrival in England, was actuated by his rapid success with the ambition of possessing, under the sanction of the pope, the supreme authority in the English churches. For the purpose of soliciting this honour, or that of primate of England, and also of obtaining instructions with regard to other subjects, which may now be deemed of very questionable or trivial importance, he deputed messengers to the pope, who speedily returned with a full answer to the archbishop's inquiries. They also brought with them a pall (see PALL), as a badge of archiepiscopal dignity, and various other ecclesiastical vestments and utensils. The pope also gave Augustin directions for erecting twelve sees within his province, and particularly for appointing one at York, which, if the country should become Christian, he was to form into a province with twelve suffragans. Among the counsels communicated by the pontiff to Augustus on this occasion, was an admonition not to be elated with pride on account of the miracles which he had been enabled to perform in confirmation of his ministry, but to consider that this power was given him, not for his own sake, but for the sake of those whose salvation he was appointed to procure. Augustin, having fixed his see at Canterbury, dedicated an ancient church, formerly built by some Roman Christians, to the honour of Christ; and king Ethelbert founded the abbey of St. Peter and St. Paul, afterwards called St. Augustin's, and since converted into the archbishop's palace. Such was the attachment of St. Augustin to the see of Rome, that he attempted to bring the British bishops in Wales under the authority of the Roman see. From the time when the ancient Britons, or Welsh, were first instructed in the Christian faith by Faganus and Damianus, who had been sent at the request

request of Lucius, in the second century, as missionaries by Eleutherius bishop of Rome, these churches had followed the rules of their first masters, without regarding the subsequent alterations prescribed by the church of Rome. But pope Gregory, by appointing Augustin metropolitan of the whole island, had claimed jurisdiction over the churches of Wales; and Augustin was well inclined to support the claim. Two conferences were held on this business; both of which were unsuccessful. At the second conference, seven British bishops attended, and many monks from the monastery of Bangor, under the direction of their abbot Dinoh. Disposed as they were to pay all due respect to the archiepiscopal dignity of Augustin, they took measures, principally to their meeting, for preventing a termination of their contests which would be unfavourable to their interest. Accordingly they consulted a hermit of acknowledged understanding, and requested his opinion, whether they should surrender their independence, and their ancient customs and privileges, to the pretensions of Augustin. The hermit, probably apprized of the disposition and character of the metropolitan, gave them the following instructions: "If this man follows the example of his master, who was meek and lowly of heart, he is a servant of God, and you ought to obey him; if not, his claim is not to be regarded: let Augustin and his brethren be first seated in the place of meeting; if upon your entrance, he rise up to salute you, honour him as a messenger from God; if he neglect to shew you this civility, reject his offers, for he has not taken upon him the yoke of Christ." When the British bishops and monks entered the hall, Augustin, who had taken the chair, received them sitting. Upon which, conformably to the advice of the hermit, they declined complying with the proposals of the haughty prelate, and disclaimed all subjection to the see of Canterbury, and virtually to that of Rome. Augustin, incensed by their conduct, took leave of the assembly, and denounced upon the British clergy this menacing sentence: "If you will not accept of peace with your brethren, receive war from your enemies; if ye will not preach the way of life to the English, suffer death from their hands." The event corresponded with the menace: Ethelfrid, king of Northumberland, soon afterwards marched with a large army to Caerleon, and made a great slaughter, in which near 1200 of the monks of Bangor were put to the sword. The memory of Augustin has been loaded with the infamy of having, to satiate his revenge, fulfilled his own prophecy. Bishop Godwin (*De Presul. Angl.* p. 43. ed. 1616.) exclaims, "Excellent prophet! who could predict what he knew so well how to accomplish!" and he asserts, upon the authority of an anonymous manuscript, and of an old French annalist, that Augustin, resenting the rejection of his proposal by the Welsh bishops, stimulated Ethelbert to fall upon them, as a wolf upon a flock of sheep, with a large army, borrowed in part from Ethelfrid; and that the bishop himself joined the army of Ethelfrid at Chester, and assisted him to gain a complete victory. In opposition to this testimony, however, it is urged by the learned Wharton (*Angl. Sacr.* t. i. p. 89.), on the credit of an ancient book cited by William Thorn, that Augustin and pope Gregory both died in the same year, that is, in the year 604, when it is certain Gregory died; whereas the slaughter of the monks happened, according to Godwin (*ubi supra*), in 605. Bede, who mentions this battle (*l. ii. c. 2.*), adds, that it was fought after the death of Augustin; and though this passage has been suspected of interpolation, the suspicion has been founded merely on the omission of it in Alfred's Saxon version, though it is found in all the most ancient manuscripts; and

on Augustin's having signed a charter with Ethelbert, in 605; whereas the custom of signing written instruments is not older than the year 700. It is not easy to decide with any degree of certainty, whether Augustin assisted in the war against Wales; but however that be, he cannot be excused from the charge of having entered into arrangements of revenge against the Welsh bishops, and may be justly suspected of having at least advised the hermits, which, in the issue, proved so fatal to the monks. (*See Cave Hist. lit. t. i. p. 549.*) Augustin, after having appointed Laurence for his successor in the see of Canterbury, died, as some say, and particularly Wharton, who gives good reasons for his opinion, in the year 604, and according to others, in 608 or 611. The remains of the prelate were deposited first in the monastery, and afterwards in the cathedral of Canterbury. In 1291, some of them were rescued by an abbot in a small urn, guarded by iron and lead, and hid in a wall, till the precious treasure should fall into the sacrilegious hands of the Danes and Normans. After the lapse of another century, what yet remained of the holy skull was by another abbot ornamented with gold and precious stones, and repositied by itself; and in the year 1300, a third abbot hid what he could find of the holy relics in a marble tomb adorned with beautiful carved work, and bearing an inscription of the following juggling couplet:

"Ad tumulum laudis patris almi ductus amore,

Abbas hunc tumulum Thomae dictavit honore."

As to the miracles ascribed to St. Augustin, they are authenticated merely by lying legends, to which no credit is due. Besides restoring a blind man to sight, for the purpose of establishing his authority and vindicating his claims in the first conference with the British bishops, he is said to have left the print of his foot on the stone which received his first step on his landing in the isle of Thanet; to have caused a fountain of water to spring up for baptizing; and to have called up first the corpse of an excommunicated man to make confession of having refused the payment of tithes, and then that of the priest who had excommunicated him, to give him absolution, in the presence of the people; after which both of them returned to their graves!

"As the apostle of the English, Augustin may deserve to be remembered with honour, as the immediate agent in the dispersion of Pagan superstition, and the introduction of a purer system of religion; but other superstitions, it must be confessed, were introduced in the room of those which were removed, and the people, under the dominion of Christian priests and monks, still remained in a state of mental vassalage. The personal merit of this missionary will bear no comparison with that of the first Christian apostle. While Paul and his brethren, in their journeys for the propagation of the gospel, exposed themselves to innumerable perils, without any prospect of temporal advantage, this apostle travelled under the protection of princes, enjoyed the support and assistance of the civil power, and found his spiritual labours the direct path to worldly honour and emolument. A pope was his master; a king was first his patron, and then his disciple; and the sole government of his new church, with all the advantages of supremacy in a well-arranged hierarchy, was his recompence. That which decisively fixes the reproach of inordinate ambition upon his character is, that he not only eagerly seized the metropolitan dignity in the English church before it was well formed, but endeavoured to bring the ancient and independent British churches under his yoke; and that meeting with more resistance than he expected from the free spirit of the ancient Britons, his haughty temper could not brook

the opposition, and he at last *met* revenge. We can only judge of the character of this apostle by his actions, imperfectly recorded; for none of his writings remain." *Biog. Brit. Gen. Biog.*

AUGUSTINE, SAVERI, a celebrated Christian divine of the catholic church, the son of Patritius, a citizen of mean rank, and Monica, celebrated for her piety, was born at Tagaste, a small town of Africa, in the year 354. His mother, anxious for his imbibing the principles of the Christian religion, placed him among the catechumens; and during a dangerous illness, he expressed a desire of being baptized; but upon his recovery, he postponed the ceremony, from a superstitious notion that sins committed after baptism were more heinous than those committed before. By his father he was sent for classical learning, much against his own inclination, first to a school in the place of his nativity, and afterwards to Madaura. But he was idle and dissipated; and guilty of deceiving his masters, and of pilfering from his parents. To the study of Greek he was at this time particularly averse; nor does he seem in mature life to have made any great proficiency in it, as he confesses that he read the Platonists in a Latin version. At the age of sixteen, and in the year 371, he was removed to the schools of Carthage; but, in the mean while, notwithstanding the counsel and remonstrances of his mother, he acquired habits of incontinence, which were not soon abandoned, and which he ingenuously acknowledges and laments, in a book of "Confessions," written by him at a subsequent period, when he became sensible of his folly. At Carthage he devoted himself to the study of rhetoric and polite literature; and still possessing sentiments not wholly depraved, he found great pleasure in perusing the philosophical writings of Cicero, particularly his Hortensius, or "An exhortation to the study of Philosophy," not now extant. Having been betimes instructed in religion, he occasionally read the scriptures; but not finding in them that kind of eloquence which he met with in Pagan writers, he disliked their simplicity, and threw them aside. However, during his continuance at Carthage, he attached himself to the Manichees, and from the nineteenth to the twenty-eighth or twenty-ninth year of his age, he was a disciple and advocate of this sect. When he was about eighteen, his mother, who was then become a widow, visited him at Carthage, and made every effort in her power for reclaiming him from debauchery and heresy; and she persuaded him to return to Tagaste, where he opened a school of grammar and rhetoric. Notwithstanding the reputation he acquired, his mother had still reason to bewail his conduct; and Augustine himself, in his "Confessions," (l. iii.) expresses, with great tenderness, his sense of the prayers which she presented, and the tears which she shed, on his account. About the close of the year 379, Augustine removed to Carthage, and taught rhetoric in that city. He was also at this time a strenuous advocate for the Manichean system. But his love of pleasure, whatever were his other engagements, continued to be his predominant passion; and he formed a connection with a mistress, by whom he had a child, and to whom he remained constant. Regardless of decorum, he named this child "Adeodatus," the gift of God; and he speaks of him, at the age of fifteen, as a young person of extraordinary talents. Provoked by the insolence of his scholars at Carthage, Augustine removed with his mistress and child to Rome, and taught grammar and rhetoric in that city; but having reason to be dissatisfied with his situation, he sought a new settlement; and, by the recommendation of Symmachus, prefect of Rome, he was appointed, in the year 383, professor of rhetoric at Milan. Here he had an opportunity of attend-

ing the sermons of Ambrose, bishop of this city, which led him to waver between Manicheism and the Catholic faith. In this state of hesitation his mother came to Milan, and renewed her intreaties that he would forsake the Manichees, and quit his irregular course of life. The intreaties of his mother were enforced by the conversation of two worthy men, Simplician and Patilian; and he was thus prepared for the change which soon followed, both in his sentiments and conduct. Whilst he was in a state of deliberation and suspense, praying to God for illumination, he heard, as he says, or imagined that he heard, a voice like that of a singing-boy, addressing him in these words, "Tolle, lege; tolle, lege;" or "Take, read; take, read;" and opening the New Testament, he turned to this passage; "Not in rioting and drunkenness, not in chambering and wantonness, &c." Accordingly, he immediately resolved to become a member of the Catholic church, and entered himself among the catechumens; and further to testify the sincerity of his conversion, he yielded to the persuasion of his mother, and determined to marry. But before he had an opportunity of executing this purpose, his character was reproached by another connection of an illicit nature. (Confess. l. vi. c. 15.) At the close of the year 386, Augustine relinquished his profession, devoted himself to the study of theology, and employed the interval previous to his baptism, in explaining the scriptures, and vindicating the Catholic faith. In compliance with the advice of father Ambrose, he dedicated himself to the ministry; and having dismissed his new mistress, and abandoned his intended wife, and having received baptism with his illegitimate son, and his friend Alypius, on Easter-eve, in the year 387, he consecrated the remainder of his life to religion. In the year 388, his mother died at Ostia; and Augustine returned to Africa. Having spent three years in his native city, where he exhibited an example of abstinence and piety, and of diligent application to the study of the scriptures, he visited Hippo; and by the recommendation of Valerius, the bishop, he was elected and ordained presbyter in the year 391. Here he founded a religious society, composed of persons who were required to throw their property into a common stock, and to devote themselves to the exercise of piety. In 395, he was appointed coadjutor, or joint bishop with Valerius, to the church at Hippo. After his advancement to the episcopal office, he distinguished himself, on various occasions, by the ardour of his zeal against heretics of every denomination; and against the Manichees, Donatists, and Pelagians; he waged a perpetual controversy. From the time of his conversion to that of his death, his manners were, in general, pure and austere; although from one of his confessions (l. x. c. 31.) there is reason to infer, that he was addicted to hard drinking. His encomiasts have indeed extolled his moderation and urbanity; and the following inscription on his table deserves being recorded:

"Quisquis amet dictis absentem rodere vitam,
Hanc mensam indignam noverit esse sibi."

"Far from this table be the worthless guest,
Who wounds another's fame, though but in jest."

After a life of varied fortune and mixed character, Augustine died in the year 430, at the age of 76 years; having been harassed, at the close of his days, by seeing his country invaded by the Vandals, and the city of which he was bishop besieged. The Vandals, however, who took Hippo, and burnt it, saved his library, which contained his voluminous writings, consisting of 232 separate treatises on theological subjects, besides a complete exposition of the psalter and the gospel, and a copious magazine of epistles and homilies. They are collected together in the Benedictine edition,

printed at Paris in 1679, and reprinted at Antwerp in 1700; and fill eleven volumes in folio. His remains were carried by the Catholic bishops of Africa into Sardinia, the place of their exile; and from thence, after an interval of 200 years, they were conveyed by Luitprand, king of the Lombards, to Pavia, his capital.

In estimating the talents and learning, the disposition and character, and the value of the writings of Augustine, some have exalted him far above, and others have degraded him as much below his just rank. Mosheim observes, that his fame filled the whole Christian world; and "not without reason, as a variety of great and striking qualities were united in the character of that illustrious man. A sublime genius, an uninterrupted and zealous pursuit of truth, an indefatigable application, an invincible patience, a sincere piety, and a subtle and lively wit, conspired to establish his fame upon the most lasting foundations. It is however certain, that the accuracy and solidity of his judgment were by no means proportionable to the eminent talents now mentioned; and that, upon many occasions, he was more guided by the violent impulse of a warm imagination, than by the cool dictates of reason and prudence. Hence that ambiguity which appears in his writings, and which has sometimes rendered the most attentive readers uncertain with respect to his real sentiments; and hence also the just complaints which many have made of the contradictions that are so frequent in his works, and of the levity and precipitation with which he set himself to write upon a variety of subjects, before he had examined them with a sufficient degree of attention and diligence." That he possessed a strong, capacious, argumentative mind, is generally allowed; but his style, though sometimes animated by the eloquence of passion, is usually clouded by false and affected rhetoric. "It has (says one of his biographers) more argument than oratory, more fluency than elegance, and more wit than learning; he has a certain subtlety and intricate involution of ideas through long periods, which require in the reader acute penetration, close attention, and quick recollection. In fine, he is, as Erasmus has observed, a writer of obscure subtlety, and unpleasent prolixity." And, as many of his speculations are in themselves uninteresting, it is no wonder that his voluminous writings are now very much, and perhaps unduly, neglected. At the same time it is much to be lamented, that the doctrines of this father in the church should have led men to adopt a gloomy system of religion, and to support it with all the rigour of persecution. Such particularly are those charged upon him by Le Clerc (Letter prefixed to Supplement to Hammond's Paraphrase), which take away goodness and justice both from God and man; the one representing God as consigning men to eternal torments, for sins which they could not avoid: the other, stirring up magistrates to persecute those who differ from them in religion. It has also been regretted, that no writings, those of Aristotle excepted, have contributed more than Augustine's, to encourage that spirit of subtle disputation which distinguished the scholastic age. The learning of Augustine, and particularly his knowledge of the Greek language, have been disputed: and hence the importance of his scripture criticisms has been depreciated. But although it be allowed that his commentaries chiefly consist of popular reflections, spiritual and moral, or allegorical and mystical perversions of the literal meaning; yet the works of this father are not wholly destitute of remarks and critical interpretations, that are pertinent and judicious. To such, after a detail of extracts from the writings of Augustine, the impartial and candid Dr. Lardner has referred. With regard to his knowledge of the Greek language, this excellent writer is of opinion, that he understood Greek better than some

have supposed; and he has cited several passages, from which it may be argued, that Augustine frequently compared his copies of the Latin version with those of the Greek original. M. Le Clerc himself allows, that Augustine does sometimes very happily explain Greek words: but on such occasions he suspects, without sufficient reason, that he had the assistance of another.

As to the character of Augustine, it must be acknowledged that his "Confessions," whatever claim they may have to the praise of ingenuity and honesty, must remain a perpetual memorial of disgrace. Besides, although this father of the church entertained, in the earlier period of his ministry, sentiments of mildness and charity toward heretics, he appears at a later period, and under the influence of passions kindled by polemical disputes, the advocate of intolerance and persecution. In a letter to Vincentius (Ep. 189), a Donatist bishop, written about the year 418, he affirms his objection for the coercive exercise of secular authority against heretics; and urges the good effects which the terror of the imperial laws had produced in the conversion of several whole cities. Having once thought, as he confesses, that no man ought to be forced, he at last yielded to despair. In another letter of the same date, he treats the provincial of Africa to restrain the Donatists, but not to punish them with death; and yet in this letter, written professedly for the purpose of exhortation to perfection, Augustine, with an inconsistency, the reproach of which he too often incurs, thus liberally concludes (Ep. 100.): "it is a more troublesome than profitable labour to compel men to forsake a great evil by force, rather than by instruction." Upon this inconsistency Veltaire pleasantly remarks (Treatise on Toleration): "I would say to the bishop of Hippo, as your reverence has two opinions, you will have the pockets to permit me to abide by the first, since I really think it the best." Although his conduct in procuring the first law to compel Christians to baptize their infants, in a council at Mela in Numidia, in the year 416, is altogether indefensible; and the writer of this article, abhorring every species of religious constraint and persecution, cannot attempt its vindication; yet he cannot adopt the severe strictures of the sprightly writer that refers to this fact, in their whole extent and unqualified acrimony. "The name of Augustine (says he) had sunk, before this time, below contempt in every free country. He was a crafty irritable man, often disappointed, and foiled by able opponents; passion for power was his ruling disposition, after his sensual appetites had spent their force in debauchery. Too insignificant to obtain distinction in the state, he reconnoitred the church, and felt himself excellently qualified to cart out of Solomon's feng to unsuspecting Christians, especially single sisters and monks. A superannuated bishop, to whom he made himself convenient, lifted him into preferment. From that day he became a merciless tyrant, and trampled to the bishop of Rome only for the sake of playing Jupiter in Africa. When he obtained the support of the emperor, and got his dreams backed to imperial decrees, he became the scourge of all good men within his reach, whole confessions, banishment, and death, with the ruin of their families, lay at his door. He considered himself as an oracle of God, emperors only as officers whom heaven had appointed to execute his decrees." Robinson's History of Baptism, p. 217. Geil's D. D. Mosheim's Ecel. Hist. vol. 1, p. 362. Dupin's Ecel. Hist. v. century, vol. 1, p. 125. Lardner's works, vol. v, c. 117, p. 81—123. Gibbon's Hist. vol. v, p. 27. Geil, loc. cit.

AUGUSTINE, St. in Ge. 327, a town of America, the capital of East Florida, is situated on the coast, about eighty leagues from the mouth of the gulf of Florida, 180 miles east from St. Mark's, and 315 south-west from

Charlestown, in South Carolina. Its figure is oblong, and it is intersected by four streets at right angles. It is well fortified, and has a church and monastery of the order of its name. N. lat. 30°. W. long. 81° 30'.

AUGUSTINE, *Cape St.*, lies on the coast of Brazil, in the Atlantic ocean, 300 miles north-east from the bay of All-Souls. S. lat. 8° 30'. W. long. 35° 40'.—Also, a cape of the Mindanaos islands in the Eastern ocean. N. lat. 6° 40'. E. long. 126° 20'.

AUGUSTINE'S, *St.*, a port and river on the coast of Labrador, near the Straits of Bellisle, and opposite to St. John's bay in Newfoundland. In the harbour are two small islands, and about two miles south-west, a chain of little islands, called "St. Augustine's chain." It is about 25 miles from Great Mecatina island. N. lat. 51° 10'. W. long. 58° 50'.

AUGUSTINE'S *Square, St.*, a number of small islands on the coast of Labrador, in the gulf of St. Lawrence, near its mouth.

AUGUSTINE'S, *St. Bay*, is a commodious bay that lies on the west side of Madagascar island, near the south entrance of the Mozambique channel, between the east coast of Africa and the west coast of the island. It abounds with fish, and furnishes a plentiful supply of beef, mutton, goats, and fowls. S. lat. 23° 35' 20". E. long. 43° 8'.

AUGUSTINS, or AUGUSTINIANS, in *Ecclesiastical History*, an order of religious; thus called from St. Augustin, whose rule they observe. The Augustins, properly also called *Austin Friars*, were originally hermits, whom pope Alexander IV. first congregated into one body, under their general Lanfranc, in 1256. Soon after this institution, this order was brought into England, where they had about thirty-two houses at the time of their suppression. The Augustins are clothed in black, and make one of the four orders of mendicants. From these arose a reform, under the denomination of *Bare-foot Augustins*, or *Minorites*, or *Friars Minor*.

There are also canons regular of St. Augustin, who are clothed in white, excepting their cope, which is black.

At Paris they are known under the denomination of *Religious of GENEVIEVE*; that abbey being the chief of the order.

There are also nuns and canonesses, who observe the rules of St. Augustin.

AUGUSTINIANS are also those divines who maintain, on the authority of St. Augustin, that grace is effectual from its nature, absolutely and morally, and not relatively and gradually. They are divided into rigid, and relaxed.

AUGUSTOBONA, or AUGUSTOMANA, in *Ancient Geography*, a city of Gaul, belonging to the Senones, called also *Civitas Tricassium*; now TROYES.

AUGUSTOBRIGA, or AUGUSTOBRICA, a city of Hispania Tarragonensis, in the country of the people denominated "Pelendones;" east of Numantia, and north-west of Bilbilis.

AUGUSTODUNUM, a famous city of Gaul, the capital of the Ædui; now AUTUN.

AUGUSTOMAGUS, an ancient town of Belgic Gaul, placed, in the Itinerary of Antonine, between Cæsaromagus and Sueffone; now SENLIS.

AUGUSTONOMETUM, a city of Gaul, the capital of the Averni; now CLERMONT in *Auvergne*.

AUGUSTOPOLIS, an episcopal town of Arabia.—Also, a town of Phrygia Salutaris.

AUGUSTORITUM, a town of Gallia Aquitanica, and capital of the Lemovices; now LIMOGES.

AUGUSTOW, in *Geography*, a town of Poland, in the palatinate of Belsk, fifty-six miles N. N. W. of Belsk.

AUGUSTULUS, or ROMULUS AUGUSTUS, in *Biography*, the last of the Roman emperors in the west, was the son

of Orestes, who, having deposed Julius Nepos by means of the troops in Gaul, of which he was general, and declining the imperial rank, advanced him to the throne, in the year 476. Orestes, however, retained the administration on account of the youth of his son; but in a year after he had attained the object of his ambition, his tranquillity was interrupted by Odoacer, a bold barbarian, who put himself at the head of those mercenaries that formed a part of the armies of Italy. These barbarians had made a peremptory demand, that a third part of the lands of Italy should be immediately divided among them; and Odoacer assured his fellow soldiers, that if they dared to associate under his command, they might soon extort the justice which had been denied to their dutiful petitions. Orestes was soon compelled by this confederate band to retire to the strong city of Pavia, which was besieged, taken, and pillaged. Odoacer, having put Orestes to death, proceeded to Ravenna, and seizing the young emperor, Augustulus, he stripped him of his imperial ensigns, and obliged him to signify his resignation to the Roman senate. The life of this inoffensive youth was spared by the generous clemency of Odoacer; who dismissed him, with his whole family, from the imperial palace, fixed his annual allowance at six thousand pieces of gold, and assigned the castle of Lucullus, in Campania, for the place of his exile or retirement. Thus, in the person of a youth, who united the names of the first king and first emperor of Rome, was the Roman empire finally extinguished, A. D. 476, or A. D. 479; about 507 years after the battle of Actium, when the Roman emperors properly begin; 523 years after the battle of Pharfalia, when the kingdom of Italy begins; and 1229 years from the foundation of Rome. Gibbon's *Un. Hist.* vol. vi. p. 222.

AUGUSTUM, in *Ancient Geography*, a town of Africa Propria. Ptolemy.—Also, a place of Gallia Narbonensis, fourteen miles from Labisco, and sixteen miles east from Bergusia, upon the Rhone; now *Ajste*.

AUGUSTURSHUNN, in *Geography*, a town of Germany, in the circle of Upper Saxony, and marquise of Meissen, near Radeberg.

AUGUSTUS, in *Biography*, a name given first and by way of eminence to Octavius Cæsar, and afterwards appropriated to his successors. (See AUGUST.) *Caius Julius Cæsar Octavianus*, originally called *Caius Octavius*, was the son of a senator of the same name, who had been prætor of Macedon, and of Accia, daughter to Julia, the sister of Julius Cæsar. He was born, during the consulate of Cicero and Caius Antonius, in the year of Rome, 691. B. C. 63; at the age of four years he lost his father; and his mother Accia contracted a second marriage with Lucius Marcus Philippus. The charge of his education was entrusted by his mother and father-in-law with the best masters in Rome; and such was his proficiency that when he was nine years old, he harangued the people with extraordinary confidence, and before he had quite attained the age of twelve, he pronounced the funeral oration of his grandmother Julia. His talents and accomplishments recommended him to Julius Cæsar, his great uncle; who at an early period formed the design of adopting him, if he died without children. Whilst Octavius was at Apollonia, improving his powers of eloquence under the famous rhetorician, Apollodorus of Pergamus, he received the news of his uncle's tragical death, and of his own adoption. Although he was dissuaded by his father and mother, and other timid friends, from declaring either his pretensions or his resentment, he determined to pass over into Italy without delay, and to judge for himself what measures it would be proper for him to adopt. Accordingly he landed at Lupia, now La Rocca, a small port between Brundisium and Hydruntum.

tum. Upon his arrival, the garrison of Brundisium, which was very numerous, and which consisted of veteran soldiers, went out to meet him, and introduced him by a kind of triumph into the city. Octavianus thanked them for their attachment and respect; and having offered a solemn sacrifice to the gods, declared himself Cæsar's heir, and assumed the titles of Caius Julius Cæsar Octavianus; avowing himself by the latter of these appellations to be of the Octavian family. Having supplied himself with money, arms, and provisions, he pursued his route through Campania, and after paying a visit to Cicero in the neighbourhood of Cumæ, arrived at Rome, where the party of Antony and Lepidus, which, under a pretence of avenging Cæsar's death, aimed at establishing its own power, had obtained an universal sway. As Octavianus approached the capital, he was met by most of the magistrates, the officers of the army, and the people; but Antony declined shewing him any token of respect. As soon as his adoption was publicly ratified in the forum, and duly registered, he waited upon Antony; and requested to have delivered to him, as Cæsar's chief heir, the money which he had conveyed from Cæsar's house to his own, that he might be enabled to discharge his legacies. Antony's behaviour, at this interview, was haughty and imperious; his reply with regard to the money which he demanded, and of which part had been appropriated to the purposes of avarice and ambition, was unsatisfactory; and his address closed with reminding Octavianus, in a style of authority and menace, that the favourites of the people are, generally speaking, short-lived, and that popular affection is more inconstant than the waves of the ocean. Octavianus retired, disgusted and offended; and apprised, that the consul withheld his father's money and estate from him in order to disable him from purchasing the favour of the people, he sold his own patrimony, and the estates of his mother and father-in-law, and with the produce of these sales, he paid part of Cæsar's legacies: and by this act of generosity he so charmed the populace, that they unanimously espoused his interest, and broke out into bitter invectives against Antony, for withholding his father's estate. An attempt, however, was made towards reconciling these two competitors for the public favour; and it was attended with a partial and temporary success. But new occasions of variance occurred; and at length Octavianus was charged with a design of assassinating his rival. This furnished Antony with a pretence for drawing into Italy a considerable army. Octavianus, alarmed by this hostile preparation, hastened into Campania, and having collected 10,000 brave veterans who had served under Cæsar, marched immediately towards Rome. But as he had no military title, nor any magistracy which gave him a right to command the forces of the republic, especially against a consul, he thought it advisable to halt at the temple of Mars, within two miles of the city, till he obtained the consent of the people for his entry, which was soon granted him. Antony was at this time at Brundisium, and as he was hourly expected with a considerable force, it was justly apprehended that the flames of a civil war would be instantly kindled within the walls of the city. Parties were formed for one and the other of these formidable rivals; and whilst many of the senators were deliberating which side to take, Cicero, probably, as it has been said, more with a view of procuring for himself a bountiful master, than for rescuing his country from tyranny, declared for Octavianus. At his motion, Antony, who had actually invaded the province of Cisalpine Gaul, and laid siege to Mutina, was declared an enemy to his country. Two new consuls, viz. Pansa and Hirtius, who had both served under Cæsar, and who were the inti-

mate friends of Cicero, were ordered to raise troops, and to march to the relief of Decimus Brutus, who was already besieged in Mutina. In two battles that were fought by the contending armies in the neighbourhood of the town, both the consuls fell; and Octavianus became commander in chief of the whole army. Pansa, when he was dying of the wounds which he had received, earnestly advised Octavianus to compromise his difference with Antony, as the only means of saving his life and advancing his fortune; and the consul's dying words made a deep impression on the mind of Octavianus. The senate, conceiving Antony to be utterly ruined, began to slight Octavianus, of whose services, as they thought, they should have no farther occasion; and refused his demand of a triumph, which they granted to Decimus Brutus; heaping upon him various honours, and appointing him commander of all the forces in Cisalpine Gaul; charging him at the same time, without even mentioning Octavianus, to pursue Antony, and treat him as a public enemy. Whilst Antony, after experiencing some vicissitudes, and after having fled before Brutus and abandoned Italy, was ready to re-enter it with the command of twenty-three legions and above 10,000 horse, Octavianus was at Bononia, where he had been endeavouring, by the interest of Cicero, to obtain the consulate. But being disappointed with regard to this object of his ambition, he resolved no longer to defer his reconciliation with Antony. Accordingly, this business being settled, and a treaty having been concluded between them and Lepidus, of which the senate was wholly ignorant; Octavianus being placed at the head of an army, for the purpose of conducting the war, in conjunction with Decimus Brutus, against Antony and Lepidus, marched towards Rome in order to demand the consulate. It was now too late to concert or to carry into effect any measures of resistance. Octavianus was received in the capital with the loudest acclamations of the people; he was immediately joined by the legions stationed in the city; and he was unanimously elected first consul, though he had not yet completed his twentieth year. A. U. C. 711. B. C. 43. Immediately after his promotion to the consulship, he procured the confirmation of his adoption in a general assembly of the people; he caused the decree against Antony and Lepidus to be revoked; and he invited them into Italy. As they advanced, he went out to meet them; and their meeting took place at a small island formed by the river Rhenus, now Reno, which falls into the Po, after having watered the territory of Bononia, or Bologna. Here was planned the famous system of power called the TRIUMVIRATE; which see. Having cemented and disgraced their new connection by the detestable PROSCRIPTION, which was to cut off all their enemies public and private, and to fill their treasury by confiscations, and by the mutual sacrifice of some of their nearest friends and relations, among whom was CICERO; they proceeded to Rome, and filled the city with blood and rapine. In fulfilment of one article of the treaty, settled on this occasion, Octavianus and Antony prepared for an expedition against Marcus Brutus and Cassius, who had made themselves masters of most of the provinces in the East. Accordingly they passed over into Macedon; and met the republican leaders on the plains of Philippi, where the contest was decided by two battles, the second of which terminated with the death of Brutus. (See BRUTUS.) On this occasion, Octavianus, who was actuated by an implacable spirit of revenge against the authors of Cæsar's death, is chargeable with a degree of cruelty which fixed an indelible stain upon his reputation. Before his return to Rome, he found a difficulty, and incurred considerable danger, in the distribution of the forfeited

feited lands among the soldiers. He was also involved in a civil war by the violence of Fulvia, and of Lucius the brother of Antony, which was terminated by the surrender and capitulation of Perugia. On this occasion, Octavianus exceeded the most inhuman barbarity. See PERUSIA. After the conclusion of this war, a partition was made of the Roman empire between Antony (see ANTONY) and Octavianus: Rome and the west being assigned to the latter. The next and most important event that engaged the attention of the triumvirs, was the war with Sextus Pompey. Whilst Octavianus was preparing for this war, he was captivated by the personal and mental charms of Livia, then the wife of Claudius Tiberius Nero. In order to obtain possession of her, he divorced his own wife Scribonia, and caused Livia to be divorced from her husband, though she was at the time far advanced in her pregnancy, and was, within three months after he married her, delivered of a son, who was named Tiberius, and who was afterwards emperor. The war with Pompey, though at first disastrous, was soon concluded by a general engagement, in which Pompey was entirely defeated.

Upon the deposition of Lepidus from his authority as one of the triumvirs, the Roman state was governed by a duumvirate; which was not likely to be of long duration. Antony, advancing to old age, and yet addicted to youthful follies, gave Octavianus advantages, which he had discernment to perceive, and of which he availed himself by his political wisdom. Whilst he ingratiated himself with the people by several popular acts, and was invested with the dignity of perpetual tribune of the people, which rendered his person sacred and inviolable, he contributed by various charges to degrade Antony in the public estimation. The commencement and termination of the civil war, in which Antony and Octavianus were engaged, have been already related under the article ANTONY. It will be sufficient here to say, that it was the success gained by Octavianus, for which he was chiefly indebted to the conduct of his admiral Agrippa, at the famous battle of Actium, fought in the year B. C. 31, which made him master of the Roman world. Having followed his rival into Egypt, and there terminated the war, he remained in the east two years, and settled all the affairs of Egypt, Greece, Syria, Asia Minor, and the islands.

Upon his return to Rome, he triumphed for three successive days with great splendor. Having attained the summit of his ambition, it now remained with him to determine under what title, and in what mode he should exercise the supreme authority which he had acquired. That he ever seriously intended to surrender the power which he possessed, and to which he had made such sacrifices, is not at all probable; and yet it is by no means unlikely that he should have conferred with his confidential friends, Mæcenas and Agrippa, in the manner which historians have recorded. Agrippa, a man no less famous for his probity than his valour, recommended a generous resignation; represented the inevitable dangers which attend monarchy, insupportable to a free people and to men educated in a common-wealth; portrayed the examples of Sylla and Cæsar; and closed his speech with exhorting Octavianus to convince the world, by restoring liberty to his country, that the only motive for his taking up arms was to revenge his father's death. Mæcenas, a man of great penetration, and generally esteemed the most refined politician of his age, urged, that he had gone too far to recede; that he could be safe only on the throne; and that it was absolutely necessary for the welfare and tranquillity of the republic, that the sovereign power should be lodged in one person,

and not divided among many individuals, whose ambitious views would still occasion a perpetual succession of miseries to the public. Octavianus thanked them both for their friendly advice, but avowed his purpose, a purpose without doubt previously formed, of adhering to the opinion of Mæcenas: upon which this sage counsellor recommended his governing others as he would wish to be governed himself, if he had been bound to obey and not to command; that he might then secure success in all his undertakings, happiness during his life, and reputation after his death; adding, that if he dreaded the name of king, so odious in a common-wealth, he might content himself with the title of "Cæsar," or "Imperator," and under that appellation, which was familiar to the Romans, enjoy all the authority of a sovereign. Dio. Cassius, l. iii. p. 464.

Octavianus, having formed his purpose, began to amuse and gratify the people, to adorn the city by public buildings, to new-model the senate by introducing his own partisans, by annulling many unjust and severe laws that had been enacted during the triumvirate, and by reforming a variety of abuses. At length, in his 7th consulate, B. C. 27, in the 36th year of his age, he went to the senate-house, and in a studied oration, which displayed his patriotism and disguised his ambition, he proposed to abdicate his authority. Those who were in the secret applauded; others were greatly embarrassed. But amidst this confusion of sentiments, the answer of the senate was unanimous and decisive. They refused to accept his resignation, and conjured him not to desert the republic which he had saved. After a decent resistance, the crafty tyrant submitted to the orders of the senate; and consented to receive the government of the provinces, and the general command of the Roman armies, under the well-known names of "Proconsul" and "Imperator." But he would receive it only for ten years. At the motion of Munatius Plancus, he also assumed the title of *Augustus*. The powers which he united in himself, of which some, indeed, were not conferred immediately, were those of 1. "Imperator" or "Emperor," extended to signify commander-in-chief of all the forces of the state, arbiter of peace and war, and uncontrolled head of the executive power, as well over the citizens as soldiers: 2. Of "Proconsul," giving him the legal supremacy in every province which he might visit: 3. Of "Tribune," rendering his person sacred, and conferring upon him the right of *veto* on all public proceedings: 4. Of "Censor," or superintendent of manners: 5. Of "Supreme Pontiff," or the head of religion: 6. Of "Dispensation" from observing the laws, when he should think fit to exercise it. To the preceding privileges of an absolute prince was added the venerable and respectable character of "Father of his Country," implying a kind of paternal relation to his people.

Augustus, besides the limitation of ten years which he annexed to the possession of his authority, flattered the senate by sharing with it the government of the provinces, reserving to himself those which were most liable to tumults and seditions, that he might thus have at his command all the forces of the empire. He also contrived to retain ancient names, forms, and institutions; and to commit a portion of real authority to the senate, the people, and officers of state; so that his government was rather a monarchy than a despotism.

The first and chief care of Augustus, after he had obtained the dignity of absolute master of the empire, was to satisfy his soldiers, and attach them more firmly to his interest. With this view he dispersed them all over Italy in 32 colonies, and thus they might easily be re-assembled

in case of any sudden commotion. His land forces consisted of 25 legions, of which eight were on the Rhine, four on the Danube, three in Spain, and two in Dalmatia. The other eight were sent into Asia and Africa, four being quartered in the neighbourhood of the Euphrates and in Syria, two in Egypt, and two in the province of Africa, consisting of the ancient dominions of Carthage. The whole number of these, constantly maintained by Augustus, and for some ages by his successors, amounted to 170,650 men. In the vicinity of Rome were always quartered 12 cohorts, about 10,000 men, of which nine were called praetorian cohorts, and the other three city cohorts. They were established to guard the emperor's person, and to maintain the peace of the city. That the former might be vigilant and faithful in their duty for the safety of the emperor's person, the state ordered their pay to be doubled. Besides these numerous and well-disciplined land-forces, Augustus kept constantly at sea two powerful fleets; one riding at anchor near Ravenna, in the Upper or Adriatic sea, the other at Misenum, in the Lower or Mediterranean sea.

Augustus, having settled all affairs in the capital, passed into Gaul, towards the close of the year B. C. 27, with a design of proceeding to the reduction of the British islands; but on his arrival at Narbonne, he received information that the Salassians at the foot of the Alps, and the Cantabrians and Asturians in Spain, had shaken off the Roman yoke: he therefore discontinued his progress, and marched in person into Spain, for the purpose of subduing those nations that had revolted. The conquest of the Salassians he committed to his generals. In the year B. C. 23, Augustus married his daughter Julia to his nephew Marcellus; and in the course of the year he was seized with a dangerous disorder, which threatened his life, of which he was cured by his physician Antonius Musa, who deviated from the common practice in administering cooling potions, and recommending the use of the cold bath. His health was not only restored, but his constitution was rendered more firm and vigorous than it had ever been before. When his life was thought to be in danger, he delivered his ring to Agrippa, thus intimating that he deemed him to be a proper successor. Marcellus, who was generally regarded as his intended successor, was disgusted by this preference; but the death of this prince, who was greatly regretted by the Roman people, made way for the introduction of Agrippa to court, and from this time he continued the most confidential friend of Augustus. At this time the administration of the empire was conducted with great equity and moderation; and many instances are recorded, in which Augustus exercised lenity and self-denial, and recommended himself by the respect which he manifested to the senate and to the courts of justice. In the year B. C. 22, he declined the offices of dictator and of censor, which were offered him by the senate, and in his general conduct he affected to appear no otherwise than as a private citizen. To him it is said, the title of "lord" and "master" was always an object of detestation, because its counterpart was that of a "slave;" and to those who behaved to him with disrespect, and who libelled him in their speeches or writings, he was singularly meek and forgiving. Nevertheless, mild and equitable as was the government of Augustus, several conspiracies were formed against him, during the course of his reign; that of Pannius Capio and Licinius Murena, which was detected, so that the principals were punished, gave occasion to two new laws in the administration of criminal justice; one of which was, that accused persons might be sued and condemned, though they did not appear, as if they were present; and the other,

that judges in criminal cases should give their opinions verbally, and not by ballot.

Rome being now at peace, Augustus determined to visit the eastern part of the empire; but as it was necessary to invest some person with authority for keeping the city in order during his absence, he appointed Agrippa for this purpose; and in order to a more additional security to his character in the discharge of the trust that was committed to him, he gave him in marriage his daughter Julia, the widow of Marcellus. Such was the respect with which Agrippa was treated, and so noble a yet so firm was his administration, that Rome hardly perceived that it was deprived of the authority of Augustus. In his progress through the eastern provinces during the years B. C. 21 and 20, the emperor received from Pirætes, king of Pontus, the Roman islands, and captives that had been taken from Cilicia; he placed the natives of the province of Armenia and Armenia the Great under the protection of Rome, and at the same time the inhabitants of which he granted the liberty and use of their own laws; he received ambassadors from the remote part of India. A philosopher, who accompanied these ambassadors, attended the emperor to Athens, and committed himself to the flames in his presence. Augustus, after his return, directed his attention to various abuses which needed reform, and to the enactment of regulations that contributed to the perfection of government. He reduced the number of senators from one thousand to six hundred, and fixed at a higher rate the fortune that was requisite for qualifying a person to be elected of that body; and that no person, who were eminently fit for the office, might be excluded, he made up their deficiencies of fortune by his own liberality. He also introduced some other regulations for restraining the licentiousness and depravity of morals that too generally prevailed; and particularly such as concerned the moral state, though rigour in this latter respect did not well become the emperor, who was known to have intrigue with the wives of several men of rank, and who had taken great licence in the privilege of divorce. Augustus increased the tax on celibacy, and granted privileges and rewards to married persons who had several children. See *PARRAS-POPPEAN-LAW*. Sumptuary laws and regulations respecting the public spectacles, and the suppression of riots and disorders among the spectators, also occupied his attention. In the year of Rome 737, B. C. 17, he celebrated the secular games with extraordinary splendor. About this time he also adopted his two grandsons Caius and Lucius; the children of Agrippa and Julia. Having received from Gaul many complaints against the intendants whom he had appointed to levy the tributes and imposts, and particularly against Licinius, he visited that country; but the principal aggressor, Licinius, contrived to soothe his displeasure by giving him a great part of the treasures which he had amassed. Upon his return from Gaul, B. C. 13, the death of Lepidus afforded him an opportunity of assuming the office of supreme pontiff; and in the first exercise of this authority, he collected all books of divination and pretended oracles, of which more than 2000 were committed to the flames. The books of the Sibyl, however, were entrusted to the custody of the priests. The death of Agrippa was, at this time, a very distressing event to Augustus (see *AGRIPPA*); but it served to advance his aims in the family of the emperor, who by an unwarrantable act of tyranny caused him to be divorced from a wife to whom he was affectionately attached, and to marry the widowed Julia, of whose irregularities he was well apprised.

In the prosecution of the German war, Drusus distinguished himself by his successes, and extended his arms as far

far as the Elbe; but as he was returning to the banks of the Rhine, illness or accident occasioned his death, B. C. 9. His brother Tiberius also reduced the Pannonians and Dacians, and completed the work which Drusus had begun. These events terminated in a general peace through the whole Roman empire; and the temple of Janus was shut, for the third time, in this reign, and remained in this state about 12 years. Before this time Augustus had lost his beloved sister Octavia, who never recovered the death of her son Marcellus; and this afflictive event was succeeded by the decease of his favourite minister Mæcenas, between whom and Augustus a coolness had subsisted, which is said to have been owing to the emperor's intrigues with his wife, Terentia. During this period, however, Augustus received many unequivocal testimonies of the attachment and affection of the people (Suet. Aug. 57—60.); and after enjoying the imperial authority for 20 years, he was unanimously requested to accept it for 10 years more. The year 8 B. C. was rendered memorable by the reformation introduced by Augustus into the calendar. (See BISSEXTILE, and CALENDAR.) About the year B. C. 6. the ambition of the young Cæsars, Caius and Lucius, the adopted sons of Augustus, began to give him uneasiness; and the jealousy which subsisted between them and Tiberius induced the latter to request the liberty of retiring to Rhodes, which was reluctantly granted, and whence he was not allowed to return for seven years. On occasion of Caius Cæsar's assuming the toga virilis in the year 5 B. C. Augustus accepted the consulate for the twelfth time; and this year (four years before the vulgar æra), was rendered singularly illustrious by the birth of JESUS CHRIST. When Lucius Cæsar took the toga virilis in the year 2 B. C.; Augustus became consul for the thirteenth and last time. But this year was embittered to him by the discovery of the very licentious and shameful conduct of his daughter Julia, which had been for some time known to every one but himself. After deliberating whether her punishment should be death or exile, he determined to divorce her from Tiberius, and to banish her to the island of Pandataria on the coast of Campania, where she was allowed merely necessaries, and whence she was never recalled. Of those with whom she had criminal intercourse, some were exiled, and others put to death.

Augustus, having lost his two adopted sons; Caius having died A. D. 3, of a wound which he received in Armenia, and Lucius at Marseilles, A. D. 2.; had no hopes of perpetuating any of his own family on the imperial throne. He therefore recalled Tiberius from Rhodes, and adopted him some months after the death of Caius Cæsar. He also adopted the last of his grandchildren Agrippa Posthumus; but his untractable disposition and gross manners induced him afterwards to annul his adoption, and to banish him to the isle of Planasia or Pianosa, on the south of the isle of the Elbe. The emperor likewise obliged Tiberius to adopt Germanicus, the son of Drusus.

In the year 4, Augustus, who was a fifth time continued as commander in chief of the armies, and in the government of the provinces in his department, prosecuted his labours for settling the civil administration of the republic. He again reviewed the senate, numbered the inhabitants of Italy, and established some other regulations for the benefit of the state. But of all the occurrences of this year, the most glorious for Augustus was the pardon of Cinna, Pompey's grandson; who was accused of a conspiracy against his life. Having admitted the criminal into his closet, he reminded him of the favours which had been conferred upon him, and charged him with the ingratitude of his design; and then closed an address of two hours with these

words; "Again, Cinna, I give you your life: I spared you, though you were my enemy; I now forgive you, though to that name you have added those of traitor and parricide. Let us from this day begin to be sincere friends: let us vie with each other; I, to support the good I have done; you, to make a suitable return: let us try to make it a doubt, whether I am most generous, or you most grateful." The emperor named him consul for the next year; and from this time, Cinna, overcome by the emperor's goodness, became his faithful and zealous friend; and when he died, made Augustus his sole heir. The clemency of Augustus on this occasion interested the people so much in his favour, that no conspiracy was ever more attempted against him.

The conduct of Julia, the grand-daughter of Augustus, who copied after her mother's example, offended and grieved him; and he banished her A. D. 9, to the isle of Trime-tum, now Tremeti, on the gulf of Venice. The poet Ovid, who is supposed to have participated her guilt, was banished at the same time, to Tomi in Scythia, on the borders of the Euxine sea. The two Julias, and Agrippa Posthumus, sadly interrupted the domestic felicity of Augustus, so that he used to call them his three *cankers*, his three *abscesses*; he never heard their names without a sigh, and often applied to them a verse of Homer, Il. iii. 40.

“Δὶς ὄφελίς τ' ἄγχιος τ' ἔμμενοι, ἀγαμος τ' ἀπολλείσθαι.”
i. e. “Would to heaven I had never married, but had died without posterity.”

In the following year, A. D. 10, the destruction of Varus with three entire legions in Germany, in consequence of a confederacy formed by Arminius, the loss of the standards of the legions, and two of their eagles, and the insolence and cruelty with which the captives were treated by the conqueror, were the occasion of great distress and terror at Rome. Augustus, accustomed to glory and prosperity, lamented this humiliating and disastrous event with the excess of sorrow. He not only put on mourning, and suffered his beard and hair to grow, but often exclaimed in an agony; “Return me my legions, Varus.” As long as he lived, the day of Varus's defeat was observed by him as a day of annual regret and sorrow. Tiberius, however, by his military skill restrained the ravages of the Germans, re-established the reputation of the Roman arms, and relieved Rome amidst its anxiety and fears. Augustus was highly gratified by his success, expressed his approbation in very strong and affectionate terms, and raised him to an equal share of the imperial authority. Upon his return to Rome A. D. 12, he obtained a magnificent triumph. Towards the close of his life Augustus enacted several regulations, which under succeeding emperors became the means of extending and viciating tyranny and despotism. As he was unable to go frequently to the senate, he caused his privy council to be invested with the authority of the whole body; he also weakened the power of the people, which his successor actually annihilated, by nominating magistrates, whom they had been accustomed to elect, and by authoritatively recommending to the people such as he chose to have employed. He likewise revived and extended an old law, which was levelled against actions detrimental to the state, by enacting, that all authors of defamatory libels should be guilty of high treason, and punished accordingly. As his health and strength declined, he devolved the principal cares of empire upon Tiberius. The access of the complaint that terminated in his death has been, without sufficient reason, attributed to poison, administered by his wife Livia, who was alarmed, on account of her own son, by his returning affection to his grandson, Agrippa Posthumus. But the truth is, that his disorder

was owing to a weakness of the stomach and bowels; and he was seized with it, as he was conducting Tiberius towards Illyrium. On his return towards Rome, his complaint increased, and obliged him to stop at Nola, where he took to his bed, and patiently waited the approach of death. On the last day of his life, he called for a mirror; he had his head dressed, and something to be done which might prevent his cheeks from appearing sunk; and then calling his friends to his bed-side, asked them, whether they did not think he had acted his part pretty well in the comedy of human life? and then addressed them in a Greek verse, with which they generally closed their plays:

“ Δοτε κελαι, και παθη τανη ρησι χαιρη διπασα:”

i. e. “ Clap your hands, and let all applaud with joy.”

After this kind of comic adieu, he ordered every body to retire, and died in Livia's arms; saying, “ Livia, conjugii nostri memor, vive et vale;” i. e. “ Livia, farewell, forget not a husband who has loved you tenderly.” His death happened on the 19th of August, A. D. 14, A. U. C. 767, and in the seventy-sixth year of his age. The duration of his power, if we reckon from the time of the commencement, of which he took possession the 27th of November, in the year of Rome 711, B. C. 43, was about 56 years. If we reckon from the battle of Actium, fought the 2d of September, in the year of Rome 723, B. C. 31, when his sole possession of the Roman empire properly commenced, Augustus will then appear to have enjoyed the sovereign power about forty-four years. Crevier states the true time of his becoming emperor to have been the 7th of January, in the year of his seventh consulship, which, according to his reckoning, was the 725th of Rome, and referring his death to the 765th of Rome, he governed as prince and emperor forty years, seven months, and thirteen days. “ All the rest (he says) was manifest usurpation and tyranny.” Josephus (*Ant. l. xviii. c. 2. § 2. De Bell. l. ii. c. 9. § 1.*), and others after him, compute the beginning of the reign of Augustus from the year in which Cæsar was killed, A. U. C. 710. B. C. 44, and make its duration fifty-seven years, six months, and some odd days. Ptolemy, in his canon, and St. Clement of Alexandria (*Strom. l. i. t. i. p. 405. ed. Potter.*), date the commencement of his reign in the year after the battle of Actium, A. U. C. 724, and compute its duration to be forty-three years.

Before the funeral of Augustus, his will was presented to the senate-house by the vestal virgins, in whose custody it had been deposited, and read aloud by Polybius, one of his freedmen. By this will, made sixteen months before his death, Tiberius and Livia were appointed his first heirs, his grand-children and their children his second, and the great men of Rome his third heirs. Livia was adopted into the Julian family, and honoured with the title of Augusta. He bequeathed, as a legacy, forty millions of sesterces (about 5,000,000 livres) to the Roman people; three millions five hundred thousand (437,500 livres) to the tribes, that is an hundred thousand (12,500 livres) to each; to each of his guards a thousand sesterces (125 livres); to each of the soldiers appointed to guard the city 500 sesterces (62 livres); and to each legionary soldier 300 sesterces (37 livres). Augustus left also four memorials, written by his own hand, which were produced to the senate by Drusus. The first of these contained regulations relating to his obsequies; the second was a journal of the most memorable actions of his life, which he ordered to be engraved on the pillars of brass which supported the frontispiece of his stately mausoleum; part of which has been preserved in an ancient marble, found about 200 years ago in the city of Ancyra; the third contained a summary of the strength and income of the empire;

and the fourth was a summary of instructions for the use of Tiberius, and the other governors and magistrates of the republic.

The funeral of Augustus was performed with very extraordinary magnificence. After a short eulogium by Drusus, and a funeral oration by Tiberius, fire was set to the pile in the Campus Martius, on which his body was laid, and at this moment an eagle was let loose from the top of it, to carry his soul to heaven. His ashes were collected by Livia, and inclosed in an urn of gold, which she deposited in the mausoleum erected by Augustus in a grove between the Tiber and the Flaminian way. After the funeral, divine worship was decreed to him, with a temple and priests; the house in which he was born, that in which he died, and most of the houses in which he had lived, were converted into sanctuaries. Livia assumed the office of chief priestess to the new deity; and made a present of a million of sesterces to an old pretor, named Numerius Atticus, who swore that he saw the soul of Augustus in its flight to heaven.

The character of Augustus appears under very different aspects in the various periods of his life and reign. In the outset of his career of ambition, he was crafty and dissimulating (*Gen. Biog.*), violent and sanguinary; but as he advanced in years, and after he had attained the object of his views, he was, in his general conduct, mild, affable, and conciliating. In the exercise of that sovereign and absolute power, which he acquired by means which none can attempt to justify, and which he contrived most effectually to secure by apparent moderation and self-denial, he seems to have been solicitous for making the people contented and happy; and in many respects he was entitled to the character of a wise and equitable governor. “ As a compensation for liberty,” says one of his biographers, “ he gave his subjects security, ease, prosperity, and all the advantages of high civilization, with as little as possible of the severity of restraint and coercion. He filled Rome and all Italy with improvements of every kind; made highways, constructed harbours, raised edifices for use and convenience, and could boast that he received a capital built of brick, and left one of marble. He encouraged letters, that one of the great *ages* of excellent human productions takes its name from him.” (*See Agricola*) Those whom he encouraged by his liberality, repaid him with an adulation, which was not honourable to themselves, and which made no addition to his reputation. The love of flattery, however, is not charged upon him as one of his predominant faults. In private life he had many estimable qualities. Affectionate to his family and friends, condescending and indulgent to his domestics and dependents, frugal and sober with regard to every indulgence, one excepted, which regarded himself; he commanded affection and respect. But his disposition to gallantry and fecundities in his conduct towards the female sex, exposed him to just censure and reproach; nor did the counsel of his friends (*see Athenopolites*), nor the wisdom of experience avail to the due restraint of his criminal passions. Sometimes indeed, it has been said, his intrigues were the result of that policy which directed his general conduct, as they served to discover secrets of state, and to obtain information concerning any plot or sedition that might have been formed by the husbands of those wives with whom he was connected. In other respects he paid a high regard to external decorum; and whatever might have been his sentiments with regard to religion in early life, he appears in mature and more advanced age to have been much inclined to superstition. He took great pains to establish order in every branch of the administration whilst he lived; and recommended it to his successors not to extend the limits of an empire that was already

ready too large. "Upon the whole," says the biographer above cited, "if not entitled to rank among the greatest and best of mankind, he will be ever respected as one of those sovereigns whose personal qualities had a great influence in promoting the happiness of the people he governed."

A popular historian (see Gibbon's Hist. vol. i. p. 114.) has given the following sketch of the character and history of Augustus. "The tender respect of Augustus for a free constitution which he had destroyed, can only be explained by an attentive consideration of the character of that subtle tyrant. A cool head, an unfeeling heart, and a cowardly disposition, prompted him, at the age of nineteen, to assume the mask of hypocrisy, which he never afterwards laid aside. With the same hand, and probably with the same temper, he signed the proscription of Cicero, and the pardon of Cinnæ. His virtues, and even his vices, were artificial, and according to the various dictates of his interest, he was at first the enemy, and at last the father of the Roman world. When he framed the artful system of the imperial authority, his moderation was inspired by his fears. He wished to deceive the people by an image of civil liberty, and the armies by an image of civil government." Among the ancient, the principal writers who have portrayed the character and reign of Augustus, are Suetonius, Dio Cassius, Valerius Paternulus, and Tacitus. Julian (Cæsar, p. 359.) says of him, that as Octavianus advanced to the banquet of the Cæsars, his colour changed like that of the camelion; pale at first, then red, afterwards black, he at last assumed the mild livery of Venus and the graces. Horace, in the introduction to the first epistle of the second book, gives the following sober and judicious summary of the emperor's characteristic merits:

"Cum tot fultineas, et tanta negotia, solus:
Res Italas armis tuteris, moribus ornes,
Legibus emendes; in publica commoda peccem,
Si longo sermone morer tua tempora, Cæsar."

See also Odes v. and xiv. Auc. Un. Hist. vol. xii. p. 1—115. Crevier's Hist. Emperors, vol. i. passim. vol. ii. p. 1—14.

AUGUSTUS, *Fort.* in *Geography*, a small fortress seated on a plain at the head of Loch Ness, in Scotland, between the rivers Tarff and Oich, just where they discharge themselves into the lake. The fortress consists of four small bastions; and now exhibits tokens of decay, though a governor constantly resides in it, and all the regulations of a garrison are observed in it. It was taken by the rebels in 1746, who, after doing it all the injury in their power, deserted it. Its distance from the sea prevents its being of any further service, in a tranquil state of the country, than that of affording a retreat for a few invalid officers and soldiers. A small village lies behind the fort, and it serves as a kind of resting place in the way to the isle of Sky, distant from it about 52 miles.

AUGUSTUSBURG, a town of Germany, in Upper Saxony, and circle of Erzgebirg, seven miles east of Chemnitz.

AU-GUY-L'AN-NEUF, or AUGILLANNEUF. See MISLETO.

AUHAF, in *Geography*, a town of Germany, in the archduchy of Austria, six miles south-south-west of Ips.

AVIA, in *Ancient Geography*, a town of Hispania Tarraconensis, in the country of the Vaccæans.—Also, a town of Italy, in the territory of the Velini. Ptolemy.

AVIANO, in *Geography*, a town of Italy, belonging to the state of Venice, in the province of Friuli, twenty-eight miles west of Udina, and fifteen E. S. E. of Belluno.

AVIARY, formed of *avis*, bird, a house or apartment kept for the keeping, feeding, and propagating of birds.

AVICENNA, or ABU ALY HASSEIN EBN ABDULLAH, or EBU SINA, in *Biography*, the son of Hali of Bochara, in Chorasan, a celebrated philosopher and physician, born about the year of the Hegira 370, A. D. 980, became early distinguished for his proficiency in literature. He had a ready genius, and extraordinary memory, so that at the age of ten he could repeat the whole Koran by heart. Serfamus, or Giuzgani, his disciple, says, he was master of Euclid at the age of sixteen. Having completed his studies under Abdallah, a private tutor, who taught him logic and philosophy, and in the school of Bagdat, he was made doctor in medicine, and began to practise at the age of eighteen. He is said to have discovered by the pulse, the distemper which Cabous, nephew to the emperor, laboured under. The story as related by the Arabic writers, is so like, Friend observes, what is told by Appian of the sagacity of Erifistratus, in discovering the disease of Antiochus, son of Seleucus, that it seems to have been borrowed thence, to raise the character of this physician. However this may be, Avicenna was in high repute, and attained to great wealth and honour in the court of the caliph. During the latter part of his life, after having spent several years in travelling, he resided at Hbahan, where by his irregularities he so impaired his constitution, that it was observed of him, that he had totally lost his labour. His philosophy neither enabling him to govern his passions, nor his knowledge of medicine to preserve him from disease. He died of a dysentery, owing in some measure to his intemperance, at Hamadan, in the year 1036 of the Hegira, A. D. 428, in the 58th year of his age. The works of Avicenna were numerous, but whatever may have been said of his genius and learning, they have contributed little to the improvement of philosophy, being for the most part imperfect and obscure representations of the doctrine of Aristotle: they consist of "Twenty Books on the Utility of the Sciences;" "The Heads of Logic;" and treatises on metaphysics and morals. The principal of them, the Canon, or "Canon Medicinæ," though almost entirely borrowed from Galen, Dioscorides, and other Greek writers, acquired such reputation, that it was taught at all the European colleges, and retained its popularity until near the middle of the 17th century. Haller fills several pages of his Bib. Med. Pract. and of his Bib. Botan. with the titles of his books, their different editions, and of the commentators upon them. The earliest edition was published at Padua, in folio, 1473.

"One would naturally expect, Friend says (Hist. of Physic, vol. ii. p. 73.), to find in this author something answerable to the fame he acquired, but though I have very often looked into his writings upon several occasions, I could meet with little or nothing there, but what is taken from Galen, or what at least, occurs, with a very small variation, in Rhazes, or Haly Abbas;" and Haller says (Bib. Med. Pract. vol. i. p. 384.) "Mihi, supra omnem patientiam, loquax, et diffusus videtur;" and adds, though you should spend whole months in poring over his works, you would scarce meet a single original observation. He had, however, before (Bib. Botan. vol. i. p. 187.) bestowed some commendations on his industry in investigating the properties of plants, and acknowledged he had enriched that part of medicine, by the introduction of several vegetables unknown to Dioscorides. The works of this physician and philosopher were printed in the original Arabic, at Rome, in 1503. A Latin translation of them, by Gerard of Cremona and others, was published in folio at Venice, in 1595, and 1658; and Vopiscus Fortunatus published a new translation, with notes by various authors, in folio,

folio, at Louvain, in 1658. The Arabic MSS. of Avicenna, says Dr. Ruffell (Hist. Aleppo, vol. ii. append. p. 19), are common enough at Aleppo, and are found in several of the European libraries. Friend's History of Physic. Hall. Bib. Med. Pract. ct. Bib. Botan. Brucker's Hist. Phil. by Euf. vol. ii. p. 241. Fabr. Bibl. Græc. l. xiii. c. 9.

AVICENNIA, in *Botany* (called after the famous oriental physician Avicenna). Linn. g. 1237. Schreb. 1263. Jacq. Amer. 178. t. 112. Juss. 108. Clus. *del. coriaria angiosperma*. Nat. Oed. *Perforata*. Juss. Gen. Char. Cal. perianth five-parted, permanent, leaflets subovate, obtuse, concave, erect; increased by three scales. Cor. monopetalous; tube bell-shaped, short; border bilobate; upper lip square, emarginate, flat; lower trifid; divisions ovate, equal, flat. Stam. filament four, filulate, erect, the two front ones rather shorter, bent back to the upper lip; anthers roundish, twin. Pist. germ ovate; style filulose, erect, the length of the stamens. Stigma blunt, acute; the lower division bent down. Per. capsule coriaceous, rhomboidal, compressed, one-celled, two-valved; seed one, large, the form of the capsule, constructed of four fleshy folds, germinating.

Ess. Gen. Char. Cal. five-parted. Cor. two-lipped; upper lip square. Caps. coriaceous, rhomboidal, one-seeded.

Species, 1. *A. tomentosa*, Jacq. l. c. Bontia germinans, Brown Jan. 263. Mangle, Sloane Jam. 2. 66. Oepata, Rheed. Mal. 4. t. 45. "Leaves cordate, ovate, tomentose underneath." This tree is like the mangrove, rising about sixteen feet high. Its trunk is covered with smooth, whitish green bark, and the twigs from the stem propagate the tree like those of the mangrove. The leaves appear at the joints of the branches, on very small petioles, opposite, smooth, soft, having a large dark-green rib; flowers many, at the top of the branches, white, four-petalled. A native of the East and West Indies. 2. *A. niuhia*. Jacq. Amer. 177. t. 112. f. 1. Pict. 1. 169. "Leaves lanceolate, shining on both sides." Height forty feet; leaves sharp, entire, opposite, on short petioles; peduncles racemed, a little branched, terminal; flowers sessile, white, with a brown mark on the middle segment of the under lip. A native of Martinico. 3. *A. repens*. Forst. "Leaves ovate-lanceolate, tomentose underneath." The leaves of this tree are opposite, petioled, coriaceous, entire, sharp, shining above, and having a yellowish sap beneath; peduncles terminating, subtrifid, loaded with a head of flowers. A native of New Zealand. The much esteemed green-coloured gum used by the natives of New Zealand, is supposed to be the produce of this tree.

AVICULA, in *Conehology*, a name assigned by Rumphius, to that species of *Mytilus* since called *MYTILUS HIKUNDO*. Linn. and Gmel.

AVICULARIA, in *Entomology*, a species of *ARANEA* or spider that inhabits South America. The thorax is orbiculated and convex, with a transverse excavation in the centre. This is the largest species of its genus known; and is such a formidable creature that it not only attacks insects, but even small birds, dropping from the branches of trees into their nests and sucking their blood. The fangs are as large as the talons of a hawk; body brown; abdomen oblong; legs with brown rings.

AVICULARIA, a species of *HIRPOSCA*, with obtuse wings and thorax of one colour, or immaculate. It feeds the body of birds, and particularly swallows. Degeer. Donov. Brit. Inf. &c.

AVIDA, a species of *PHALENA* (*Nocua*), that inhabits India. The wings are shining brown; stigmata spot, and band behind ferruginous; posterior wings white. Fabricius. This is of the middle size, and blackish.

AVIENUS, RUFUS FESTUS, in *Biography*, a Latin poet, lived towards the close of the fourth century, under the emperors Gratian and Theodosius. His works are translations in Latin verse of the "Phænomena of Aratus;" and the "Periegesis of Dionysius;" a description in Iambic verse "Of the Maritime coasts," "Æsop's Fables," in elegiac verse; "The Allegory of the Siren;" "The History of Æly," in Iambics; and the "Fables of Æsop;" in the same kind of verse; and a few other pieces. Some of the former performances are now extant. The best edition is that of Camusseter, 8vo. 1731. Gen. Biog.

AUJEST, in *Geography*, a town of Padania, in the circle of Cherdim, five miles north of Polesina.

AUJESTIZ, a town of Padania, in the circle of Cherdim, five miles west of Leutmisil.

AVIGLIANO, a town of Italy, in the Kingdom of Naples, and province of Otranto, seven miles east of Otranto.

AVIGLIANO, a town of Italy, in the principality of Piedmont, and marquisate of Susa, situated on a hill near the Cottian Alps, in an open and exposed situation; the air is salubrious, and the land about it fertile. The town is fortified and defended by a castle. It contains three parish churches, and several religious houses; eleven miles west of Turin, and twelve E. S. E. of Susa. Lat. 44° 40'. E. long. 7° 5'.

AVIGNON, a city of France, the capital of one of its re-united departments, viz. VAUCLUSE, with the Bouches du Rhone, formerly the capital of the county of Venaissin in Provence, situate on the east side of the Rhone. Before the revolution, it belonged to the pope, whose legate resided here, and it was the see of an archbishop, erected in 1475. In the year 1309, the papal see was transferred to Avignon by pope Clement V.; and this city flourished, about seventy years, the seat of the Roman pontiff, and the metropolis of Christendom. By land, by sea, and by the Rhone, the position of Avignon was on all sides accessible; the southern provinces of France are not inferior even to Italy; new palaces arose for the accommodation of the pope and cardinals; and the arts of luxury were soon attained by the treasures of the church. They were already possessed of the adjacent territory, the Venaissin country, a populous and fertile spot, which had been ceded to the popes, in 1273, by Philip III. king of France; and the sovereignty of Avignon was afterwards purchased from the youth and distresses of Jane, the first queen of Naples, and countess of Provence, for the inadequate price of 80,000 florins. Under the shadow of the French monarchy, amidst an obedient people, the popes enjoyed an honourable and tranquil state, to which they had long been strangers: but Italy deplored their absence; and Rome, in solitude and poverty, might repent of the un-governable freedom which had driven from the Vatican the successor of St. Peter. As the old members of the sacred college died, it was filled with French cardinals, who beheld Rome and Italy with abhorrence and contempt, and perpetuated a series of national, and even provincial popes, attached by insoluble ties to their native country. At length the celebrated Petrarch warmly interested himself in restoring the Roman bishop to his ancient and peculiar diocese; and he addressed his exhortations to five successive popes, with an eloquence that was inspired by the enthusiasm of sentiment, and the freedom of language. As soon, which had become the sink of vice and corruption, was the object of his abhorrence and contempt; and whilst he allowed that the successor of St. Peter was the bishop of the universal church, he was of opinion, that it was not on the banks of the Rhone, but of the Tiber, that the apostle had

fixed his everlasting throne. Since the removal of the holy see, the sacred buildings of the Lateran and the Vatican, their altars and their fountains, were left in a state of poverty and decay; and Rome was often painted under the image of a disconsolate matron. But it was alleged, that the cloud which hung over the seven hills, would be dispelled by the presence of their lawful sovereign; eternal fame, the prosperity of Rome, and the peace of Italy, would be the recompense of the pope who should dare to embrace this generous resolution. Of the five popes to whom Petrarch addressed his exhortations, the three first, John XXII., Benedict XII., and Clement VI., were importuned or amused by the boldness of the orator; but the menorable change, which had been attempted by Urban V., between the years 1367 and 1370, was finally accomplished by Gregory XI. A. D. 1377, who did not sur vive his return to the Vatican above fourteen months. His decease was followed by the "Great western schism," which began after the decease of Gregory XI., A. D. 1378, by the election of Clement VII. in opposition to Urban VI., and continued for about forty years, till the council of Constance, A. D. 1417—1418, when the elevation of Martin V. was the era of the restoration and establishment of the popes in the Vatican. During this interval, there were two popes, one residing at Rome or in Italy, and the other at Avignon. See SCHISM.

This city is about three miles and two furlongs in circumference, and is in general irregular and badly built; but it is surrounded by walls and turrets with battlements, not unlike those of Rome, and its public edifices are large and grand, according to the taste of the fourteenth century. The church of Notre Dame is ancient, and is one of the best adorned in the city; the archiepiscopal palace overlooks the Rhone, the city, and the fields. These buildings, together with the mint, adorn a large square, which is the common walk of the inhabitants. The church of the Cœlestines is very magnificent, and is full of fine monuments. The university has four colleges; the place in which the Jews have been accustomed to live is a distinct quarter; and those who pay tribute are forbidden to leave it without yellow hats, and the women also wear something yellow about their heads; and they are thus distinguished from the Christians. Their number is considerable, though the district of their residence is very confined. Near the Rhone is a large rock, within the circuit of the walls, upon which is a platform, whence the whole city and the places about it may be seen. The bridge, about a quarter of a mile in length, that crossed the Rhone, was demolished by an inundation in 1699. The fountain of Vaucluse, which is the source of the river Sorgues that waters the city, and whither Petrarch often retired to indulge his grief and hopeless love, is situated in a winding valley, forming the figure of a horse-shoe, about five miles from Avignon. The fountain is a basin of water, several hundred feet in circumference, very deep, and clear as crystal, but overshadowed by an incumbent rock. The water discharged from this fountain, by a narrow passage, forms a cascade, which is precipitated along a rocky channel. The rocks, which invest this romantic spot, are worn by time and the inclemency of the weather, into a thousand fantastic forms. And on one of the pointed extremities, in a situation almost inaccessible, are seen the remains of an ancient castle, projecting over the water, called by the peasants "Il Castell di Petrarca;" and they add, that Laura died upon the opposite side of the river, under the bed of which was a subterraneous passage, by which the two lovers visited each other. The residence of the poet was much lower down, and nearer to the banks of the Sorgues, as appears from his account of it, and from his relation of his

contests with the naiads of the stream, who during winter encroached on his small adjoining territory: but no remains of it are now to be discovered. Below the bridge is an island, where the Sorgues joins the Rhone, in which are several houses of pleasure. The inhabitants of Avignon were estimated before the revolution at 30,000, 1000 of these being ecclesiastics; and some hundreds Jews. N. lat. 43° 56' 5". E. long. 4° 48' 10".

AVIGNON-BERRY, called also *French-berry*, in *Botany*, is the fruit of a shrub, by some authors called lycium; growing plentifully near Avignon, and other parts of France. See LYCIUM.

AVIGNONNET, in *Geography*, a town of France, in the department of the Upper Garonne, and chief place of a canton in the district of Villefranche, twenty miles south-east of Toulouse, and four miles south-east of Villefranche.

AVILA, GILLES GONZALES, in *Biography*, a Spanish ecclesiastic and historian of the seventeenth century, was a native of Avila, and acquired at Rome, where he studied, a great knowledge of sacred and civil history. On his return to Spain, he had an ecclesiastical benefice at Salamanca; and in 1612, he removed to Madrid, and was appointed historiographer to the king. He died in 1658, at the age of 80 years. His principal works, published in Spanish, were "The History of the Antiquities of Salamanca," and "The theatre of the Churches of the Indies, &c." *Nouv. Dict. Hist.*

AVILA, in *Geography*, a city of Spain, in Old Castile, seated on the river Adaja, on a large plain, surrounded with mountains and plantations of fruit-trees and vineyards, and having a manufacture of cloths, that are said to be equal to those of Segovia. It is fortified by nature and art, having a wall 9075 feet in circuit, with twenty-six lofty towers, and ten handsome gates. It has seventeen principal streets, containing several good and stately houses; nine squares, 2000 houses, nine parishes, and as many monasteries, seven nunneries, two colleges, nine hospitals, eighteen chapels, and an annual allowance of 10,000 ducats for the maintenance of orphans and other poor people. The university was founded in 1445, confirmed by pope Gregory XIII. in 1538, and afterwards enlarged; and its cathedral has eight dignitaries, twenty canons, and the same number of minor canons. N. lat. 40° 35'. W. long. 4° 13'.

This city has been rendered famous by the deposition of Henry IV. A. D. 1465. The indignation of the Castilian nobility against the weak and flagitious administration of this prince, led them to combine against him, and to exercise the right, which they arrogated as one of the privileges of their order, of trying and of passing sentence on their sovereign. For this purpose they erected a spacious theatre in a place without the walls of the town, and having prepared an image, clad in royal robes, representing the king, they placed it on a throne, with a crown on its head, a sceptre in its hand, and the sword of justice by its side. The accusation against the king was then read, and the sentence of deposition was pronounced in presence of a numerous assembly; and whilst the several charges were delivered, they proceeded to tear the crown from the head of the image, to snatch the sword of justice from its side, to writ the sceptre from its hand, and, at the close of the whole, to tumble it headlong from the throne. When this ceremony was finished, Don Alfonso, Henry's brother, was proclaimed king of Castile and Leon in his stead. *Robertson's Hist. Ch. V. vol. i. p. 179.*

AVILA, or *Avila*, a town of Spain, in Asturia, near the bay of Biscay, nine leagues from Oviedo.

AVILA, a city of South America, in the province of Quito, and government of Quixos, situate in S. lat. $0^{\circ} 44'$, and about $2^{\circ} 20'$ E. of Quito. It is less than Archidona, a small city lying in S. lat. one degree and a few minutes, and about one degree fifty minutes E. of Quito. Like this latter place, its houses are of wood covered with straw; and as the whole number of inhabitants in Archidona is reckoned at 650 or 700, and consists of Spaniards, Indians, Mestizos, and Mulattoes, those of Avila scarcely amount to 300 of both sexes. Like the other it has one priest; and his ecclesiastical jurisdiction comprehends six towns: viz. La Concepcion, Loreto, San Salvador, Motte, Cota Pini, and Santa Rosa.

AVILA Fuente, a town of Spain, in Old Castile, six leagues from Segovia.

AVILER, AUGUSTIN-CHARLES D', in *Biography*, an eminent French architect, was born at Paris in 1653, and from his youth devoted himself to the study of architecture. In his way to Rome, whither he was sent for improvement by the royal academy, at the age of twenty, he was carried into slavery by an Algerine corsair, and in this situation he manifested his talents by making a design for a grand mosque at Tunis. After sixteen months he was liberated, and pursued his studies at Rome for five years. On his return he was placed under Mansart, first architect to the king, and had a principal concern in the conduct of all public works. His "Course of Architecture" was founded on the work of Vignola; but by the enlargement of that writer's plan, was rendered a complete treatise of the art. It has been much esteemed; the first edition was that of 1691, 2 vols. 4to.; and it has since passed through several other editions. Being invited to Montpellier, he superintended the construction of a grand triumphal arch to Louis XIV., was afterwards appointed architect to the province of Languedoc, and, besides other buildings in which he was employed, he erected the archiepiscopal palace at Touloufe. He died at Montpellier in 1700. Moreri. Gen. Biog.

AVINO, in *Geography*, a town of North America, in the province of New Galicia, where the Spaniards have a silver mine; between Durango and Ellereña.

AVINO, *La Panca*, a town of North America, in the western part of the kingdom of Leon, between two of the head-branches of Nassas river.

AVIORA, a town of Asiatic Turkey, in Caramania, sixty miles north-east of Teocat.

AVIOTH, a town of France, in the department of the Meuse, and chief place of a canton in the district of Stenay, three miles north of Montmedy.

AVIRA, in *Ancient Geography*, a town of Asia, in the Palmyrene. Ptolemy.

AVIS INDICUS, in *Astronomy*. See APUS.

AVIS, or **AVIZ**, in *Geography*, a town of Portugal, in the province of Alentejo, giving name to an order of knights; three leagues west of Estremos. The land surrounding it is covered with citrus, which is usually cut down once in eight years and burnt, and the ground sown with corn. N. lat. $38^{\circ} 40'$. W. long. 7° .

AVIS, in *Herakly*, a military order of knighthood, instituted by Alphonso Henriques king of Portugal, in 1142, in testimony of the great services done for him at the siege of Lisbon, by the nobility led to his assistance by Don Ferdinand Rodrigues de Monteyro, whom he appointed to be their grand master. For some years after they were called Nouvelle Milice, or the New Military; which appellation continued until the year 1166, when they having taken Evora by surprise, the king conferred on them the govern-

ment of that town, and commanded that they should thenceforth be called Knights of Evora: lastly, the same king having, in the year 1181, taken from the Moors a place very advantageously situated, and called Avis, granted the same to the before-mentioned knights, on condition that they should build a fort in that place, and reside therein. The knights accordingly transplanted themselves thither, and from that time took the denomination of *Freres d'Aviz*. In the year 1204, pope Innocent III. confirmed this order. The badge of the order is a *croix flory*, enamelled *vert*, between each angle a *fleur-de-lis or*; which they wear pendant to a green ribbon round the neck; and the same badge is embroidered on the left shoulder of the robe of state, which is of white fattia.

AVIS, *Bird*. *Aves*, Birds, among *Naturalists*, the second class of animals; a race of creatures sufficiently distinguished from the others in having the body covered with feather, two feet, and two wings formed for flight. Birds have the mandible protracted and naked, and are destitute of external ears, lips, teeth, scrotum, womb, urinary vessel or bladder, epiglottis, corpus callosum, or its fornix (covering of the two lateral ventricles of the brain, or its arch) and diaphragm.—In the Linnæan system, birds are divided into six orders: viz. accipitres, picæ, anseres, gallæ, gallinæ, and passeres. See ORNITHOLOGY.

AVIS, *Longa*, in *Ornithology*, a name given by Nieremberg to the hoitattotl of the Americans, a bird remarkable for its swiftness in running. The hoitattotl appears to be the *phasianus mexicanus* of Gmelin, and *courier phœnix* of Latham.

AVIS Nivea, a name under which Nieremberg has described an American bird of the size of a thrush; of a brown and black colour on the back, and yellow under the belly; it imitates the human voice, and is called by the natives *ccoan*.

AVIS Pennipulebra, the name of an American bird described by Nieremberg, and called by the Indians *quitzalcoatl*. It is the size of a pigeon, and is said to be all over the body of the more beautiful colours of the peacock. The species alluded to is not accurately known; and Ray has arranged it with some others as doubtful kinds.

AVIS Seica, or *Hoactli*. See ARDEA HOACTLI, Gmelin; and *Hoëi*, Buffon.

AVIS Tropicorum, and *avis rabos forcados*, the name of a bird, among old authors, called in English the *tropic bird*; and by Gmelin PHÆTON ÆTHEREUS.

AVIS Venti, "the bird of the wind," or heattototl; ceatototl, f. avis venti altera, Ray, &c. obsolete names of the MERGUS ESCULATUS, or *hooded merganser*, of America.

AVIS Paradisi, bird of Paradise. See PARADISEA.

AVIS Mexicana grandis rubra, Seba. See LOXIA MEXICANA.

AVIS Ignota piperini, Gessner. See EMBERIZA NIVALIS.

AVIS Americana cristata rubetra, Seba. See PIPRA RUBETRA.

AVIS Mexicana altera, Seba. See PIPRA ERYTHROCEPHALA, &c. &c.

AVISE, in *Geography*, a town of Piedmont, in the duchy of Aosta, in the grand Doria, eight miles west of Aosta.

AVISO, a town of Italy, in the kingdom of Naples, and country of Iavora, six miles east of Sora.

AVISO, Italian, *advise*, chiefly used in matters of Commerce, denotes advice, piece of intelligence, or advertisement, to notify some event or matter worthy of knowledge.

AVISON, CHARLES, in *Biography*, organist of Newcastle.

castle, was an ingenious and polished man, esteemed and respected by all who knew him; and an elegant writer upon his art. He had visited Italy early in his youth, and at his return, having received instructions from Geminiani, a bias in his Compositions for Violins, and in his Essay on Musical Expression, towards that master, is manifest. Rameau was likewise his model in harpsichord music; and Marcello's psalms were much over-rated by him, in order to depreciate Handel; whom he censured more by implication than open hostility. We find in his book, which is elegantly written, and in the prefaces to his musical compositions, many prejudices, particularly against German symphonies; ascribing to them the corruption and decay of music! His compositions for the harpsichord, when played by the late lady Milbanke, and accompanied by Gardini, had a pleasing effect. They were formed on the plan of Rameau's concertos, as those for violins were on the concertos of Geminiani; and there was the same difference between them in point of excellence, as is always discoverable between an original production, and an imitation.

His violin concertos were revived, after they became of age, at the concert of ancient music; where 20 years are the period which renders musical compositions venerable. Here they are still played in turn with those of Corelli, Geminiani, Handel, and San Martini; with whose productions, however, they but ill support a parallel: they want force, correctness, and originality, sufficient to be ranked very high among the works of masters of the first class.

AVITUS, SEXTUS ALCIMUS ECDICIUS, a Christian divine, bishop of Vienne in France, was nephew to Marcus Mæcilius Avitus, emperor of the West, and flourished at the beginning of the sixth century. He succeeded his father Isychius in the see of Vienne, in the year 490. He was the friend of Clovis, the first Christian king of France, and contributed to his conversion. As a zealous opponent of the Arians, he reclaimed Gondebaud, king of the Burgundians, from his connection with this sect, to the Catholic faith; he presided in the council of Epaon in 517, and in that of Lyons in 523, in which year he died. He wrote 87 letters on subjects that formed the disputes of the age in which he lived, sermons, and poems on the Mosaic history, and in praise of virginity. His style is said to have been harsh, obscure, and intricate. His works were published by Sirmond in 8vo. with notes, in 1643. His poems have been printed separately at Frankfort, in 1507, at Paris in 1509, and at Lyons in 1536. Cave Hist. Lit. vol. i. p. 461. Nouv. Dict. Hist.

AVIUS, in *Entomology*, a species of PAPILIO (*Hesperia*, Fabr.), with entire wings, above and beneath brown, with two blue streaks near the tip. This insect inhabits India.

AVIZE, in *Geography*, a town of France, in the department of the Marne, and chief place of a canton, in the district of Epemay, six leagues south of Rheims.

AUK, or AWK, in *Ornithology*. See ALCA.

AUKER, the Arabic name of the great eagle.

AUKLAND, or BISHOP AUKLAND, in *Geography*. See AUCLAND.

AUL. See AWL.

AULA, in our *Ancient Law Books*, signifies a court baron.—*Aula ibidem tanta quarto die Augusti*, &c.

Aula ecclesiæ is sometimes used for what we now call *navis ecclesiæ*. See NAVI.

AULA regia, or regis, a court established by William the Conqueror in his own hall, composed of the king's great officers of state, who resided in his palace, and were usually attendant on his person. These were the lord high constable and lord marshal, who chiefly presided in mat-

ters of honour and of arms, determining according to the law military and the law of nations; the lord high steward, and lord great chamberlain; the steward of the household; the lord chancellor, whose peculiar office it was to keep the king's seal, and examine all such writs, grants, and letters, as were to pass under that authority; and the lord high treasurer, who was the principal adviser in all matters relating to the revenue. These high officers were assisted by certain persons learned in the laws, who were called the king's justiciars or justices; and by the greater barons of parliament, all of whom had a seat in the "Aula Regia," and formed a kind of court of appeal, or rather of advice, in matters of great moment and difficulty. All these, in their several departments, transacted all secular business both criminal and civil, and likewise the matters of the revenue; and over all presided one special magistrate, called the chief justiciar, or "capitalis justiciarius totius Angliæ;" who was also the principal minister of state, the second man in the kingdom, and by virtue of his office guardian of the realm in the king's absence. This great officer principally determined the vast variety of causes that arose in his extensive jurisdiction; and from the plenitude of his power, he became obnoxious to the people, and dangerous to the government which employed him. This formidable tribunal, which received appeals from all the courts of the barons, and decided in the last resort on the estates, honour, and lives of the barons themselves; and which, being wholly composed of the great officers of the crown, removeable at the king's pleasure, and having the king himself for president, kept the first nobleman in the kingdom under the same control as the meanest subject.

This great universal court being bound to follow the king's household in all his progresses and expeditions, the trial of common causes was found very burthenfome to the subject; and, therefore, king John, who also dreaded the power of the justiciar, very readily consented to that article, which now forms the 11th chapter of Magna Charta, and enacts, "that *communia placita non sequantur curiam regis, sed teneantur in aliquo certo loco*." This certain place was established in Westminster-Hall, the place where the "aula regis" originally sat, when the king resided in that city; and there it hath ever since continued. The court being thus rendered fixed and stationary, the judges became so too, and a chief, with other justices of the Common Pleas, was thereupon appointed; with jurisdiction to hear and determine all pleas of land, and injuries merely civil between one subject and another. The "aula regia" being thus stripped of so considerable a branch of its jurisdiction, and the power of the chief justiciar being also considerably curbed by many articles in the Great Charter, the authority of both began to decline apace under the long and troublesome reign of king Henry III. In pursuance of this example, the other several offices of the chief justiciar were, under Edward I. (who new modelled the whole frame of our judicial polity), subdivided and broken into distinct courts of judicature. Blackst. Com. vol. i. p. 38—40. De Lolme on the Constitution of England, p. 14, &c. See the articles COURT of Common Pleas, of Exchequer, and of King's Bench, &c. &c.

AULA, in *Geography*. See AVOLA.

AULA, in *Ancient Geography*, a place of Peloponnesus, in Arcadia, where was a temple dedicated to the god Pan.

AULADIS, a town of Asia, in Mesopotamia. Ptolemy.

AULÆ, a part of Asia, in Cilicia, between Tarsus and Anchiæ. Suidas.

AULÆI MENIA, the walls of Aulæ, a maritime place of Thrace, upon the Euxine sea, not far from Apollonia, and at some distance north from Salmydessus.

AULANA, a town of Palestine, 32 stadia distant from Jerusalem. Hegefippus.

AULAS, in *Geography*, a town of France, in the department of the Gard, and chief place of a canton in the district of Le Vigan, near Le Vigan.

AULAX, in *Botany*. See **PROTEA**.

AULCESTER. See **ALCESTER**.

AULENDORF, in *Geography*, a town of Germany, in the circle of Swabia, and barony belonging to the family of Königsegg, seated on a hill near the Schus, eight miles north of Ravenspurg. N. lat. 47° 56'. E. long. 9° 30'.

AULEON SINUS, in *Ancient Geography*, a gulf of Thrace, near Byzantium.

AULERCI BRANNOVICIS, a people subject to the Ædui, who are supposed to have inhabited that part of Gaul, where is now the canton called Briennois, near the Loire, in the diocese of Macon.—**A. Cenomani**, a people who inhabited that part of Gaul which now forms the diocese of Mans.—**A. Ebuovices**, a people who occupied the country which is now the diocese of Evreux: their capital was Mediolanum.

AULETES, *αυλητης*, in *Antiquity*, denotes a flute-player. One of the Ptolemies, kings of Egypt, father of Cleopatra, bore the surname or denomination of *Auletes*.

AULETTA, in *Geography*, a town of Italy, in the kingdom of Naples, and province of Principato Citra, four miles W. S. W. from Cangiano.

AULI, in *Ancient Geography*, a people of Europe, in Macedonia, who occupied a town, to which they gave their name.

AULIC, **AULICA**, an act which a young divine maintains in some foreign universities, upon the admission of a new doctor of divinity. It is so called from the Latin *aula*, a hall; it being in the hall of the university that this act is usually held.

The person who presides at the disputation, is the same that is to take the doctor's cap.

AULIC, *Aulicus*, is also an appellation given to certain officers of the emperor, who compose a superior court of council, which has an universal jurisdiction, and without appeal, over all the subjects of the empire, in all processes entered therein.

All causes relating to points of feudal right or jurisdiction, together with such as respect the territories which held of the empire in Italy, belong properly to the jurisdiction of the aulic council. This tribunal was formed upon the model of the ancient court of the palace instituted by the emperors of Germany. It depended not upon the states of the empire, but upon the emperor; who has the right of appointing, at pleasure, all the judges of whom it is composed. Maximilian, in order to procure some compensation for the diminution of his authority, by the powers vested in the imperial chamber, prevailed on the diet A. D. 1512, to give its consent to the establishment of the aulic council. Since that time it has been a great object of policy in the court of Vienna, to extend the jurisdiction, and support the authority of the aulic council, and to circumscribe and weaken those of the imperial chamber, for which the tedious forms and dilatory proceeding of this chamber have furnished the emperor with pretexts. "Lites Spiræ," according to the witticism of a German lawyer, "Spirant, sed nunquam expirant;" such delays are unavoidable in a court composed of members named by states, jealous of each other.

Whereas the judges of the aulic council, depending on one master, and being responsible to him alone, are more vigorous and decisive. Puffendorf, de Statu Imper. Germ. c. v. § 20.

The aulic council is established by the emperor, who nominates the officers; but the elector of Mentz has a right of visiting it.—It is composed of a president, who is a catholic; a vice-chancellor, presented by the elector of Mentz; and of eighteen assessors, or counsellors, nine whereof are Protestants, and nine Romanists. They are divided into two benches, one of which is occupied by the nobles, and the other by the lawyers.—They hold their assemblies in the presence of the emperor; and for that reason are called "judicium imperatoris," the "emperor's justice;" and "aulic council," because their follows the emperor's court, *aula*, and has its residence in the place where he is.—This court clashes a little with the imperial chamber of Spres; as they are preventive of each other; it not being allowed to move any cause from the one to the other. Nor can the emperor himself hinder or suspend the decisions of either court; much less call any cause before himself, which has been once before them, without the consent of the states of the empire. Yet, in some cases, the same council forbears making any peremptory conclusion, without the emperor's participation; and only decrees thus, "Fuit votum ad Cæsarem;" that is, make a report hereof to the emperor in his privy-council.

AULICA, in *Entomology*, a species of **PHALÆNA** (*Bombyx*) that inhabits Europe and Siberia. The anterior wings are greyish dotted with yellow; posterior ones fulvous, spotted with black. Lin. Fñ. Succ.

AULICK, in *Geography*, a town of Germany, in the circle of Upper Saxony and bishopric of Naumberg, six miles north of Zeitz.

AULICUS, in *Conchology*, a species of **CONUS**, marked with brown reticulated veins, and interrupted bands of the same colour. It is a native of Asia, and may be only a variety of the *conus textile*, being extremely variable in its colours and marks. Gmelin mentions seven different kinds, with references to different figures in the works of Martini, Knorr, and Seba; the most remarkable is the fourth variety, the shell of which is yellowish-brown instead of white, and marked reticularly with heart-shaped spots, disposed in a perpendicular direction.

AULICUS, in *Entomology*, a species of **CERAMBYX** (*Callidium* Fab.) Thorax smooth and shining; body opaque, black; wing-cases smooth; antennæ short. Inhabits Europe.

AULICUS, a species of **CIMEX**, that inhabits South America; the colour is red and black, varied with a black band on the upper wings; lower wings black with a white line at the base. This is *cimex irroratus* of Thunberg, Nov. Inf. or at least a variety of it.

AULICUS, a species of **CRYPTOCEPHALUS** (*Cybele*) found in Africa, especially at the cape of Good Hope. It is black, with a rufous thorax, and azure-blue wing-cases. Fabricius.

AULICUS, in *Zoology*, a species of **COLUBER**, having 184 abdominal plates, and sixty sub-caudal scales. It is of a greyish colour with numerous linear white bands which bifurcate on the sides; on each side behind the head is a triangular white spot, and these almost unite at the nape. The length of this kind is about six inches, and its diameter one third of an inch. It inhabits America, and is deemed a poisonous snake.

AULIS, in *Ancient Geography*, a sea-port town of Bœotia, situate at the bottom of a small gulf, opposite to Chalcis of Eubœa; and famous for being the place where the

the Grecian chiefs resolved upon the destruction of Troy. The district belonging to it, and called "Aulide," lay toward Euripus, in that part which separated Boeotia from Eubœa. Diana had a temple in this territory, with a statue of white marble holding a flambeau in the hand.

AULIENE, in *Geography*, a town of the island of Corsica, four miles north of Tallano.

AULNAGER, in *Commerce*. See **ALNAGER**.

AULNAY, in *Geography*, a town of France, in the department of the Calvados, and chief place of a canton in the district of Vire, $\frac{1}{2}$ leagues south-west of Caen.

AULO, a Grecian long measure. See **MEASURE**.

AULOCRENE, in *Ancient Geography*, a mountain of Phrygia, towards the north-east of Apamea-Cibotos.

AULON, a valley of Palestine, extending along the banks of Jordan, from Libanus to the desert of Pheran. Scythopolis, Jericho, and Tiberias were situated in this valley.—Also, a town of Messenia, upon a river of the same name, north of Eleetra.—Also, a town and port of the Macedonian sea, in the country of the Taulantians. Ptolemy.—Also, a town of Peloponnesus, in Laconia.—Also, another in Arcadia.—Another ancient town in the isle of Crete.—Also, a hill of Italy, near Tarentum, which was fertile in vines, and said by Horace not to be inferior to those of Falernum.

AULOS, in *Conchology*, a name by which several of the ancient writers call the *solen*, or as it is rather improperly named the *razor-shell*.

AULPS, or **AUPS**, in *Geography*, a town of France, in the department of the Var, and chief place of a canton in the district of Barjols, $8\frac{1}{2}$ leagues W. N. W. of Frejus.

AULT, a town of France, in the department of the Somme, and chief place of a canton in the district of Abbeville, five leagues west of Abbeville.

AULUS GELLIUS, or **AGELLIUS**, in *Biography*, a Roman grammarian and critic, flourished at Rome, where he was born, in the second century, under the emperors Adrian and Antoninus Pius; and died in the beginning of the reign of Marcus Aurelius Antoninus. He studied grammar and rhetoric at Rome, and philosophy at Athens, where he enjoyed the society of Calpurnius Taurus, Peregrinus Proteus, Herodes Atticus and other learned persons. Having travelled through Greece, he returned to Rome, devoted himself to the study and practice of the law, and was appointed a judge. From the frequent citations of his works by writers on Roman law, it may be inferred, that he attained to considerable reputation in his profession. His "Noctes Atticæ," or "Attic Nights," the only work extant, and the greatest part of which was written at Athens, furnishing an amusing occupation for many long winter evenings, is a collection of incidents, and anecdotes, historical and biographical, with critical observations and reflections on various authors and topics, originally compiled for the instruction and entertainment of his children, and rendered valuable by many fragments of ancient authors, that are not elsewhere to be found. It was edited in folio, at Rome, in 1469, by Swinheim and Panertz; a second edition was published in 1472, by Jenfonat at Venice; in the sixteenth century are found the editions of Aldus, 8vo. at Venice, in 1515; of Paris, in folio, 1519, 1524, 1536; of Basil, 8vo. in 1526; of Paris, 8vo. in 1585, with the critical notes of H. Stephens. Editions of a later date are those, in usum Delphini, 8vo., 1681; of the Elzevirs at Amsterdam, 1651, 18mo.; at Leyden. *in notis variorum*, 1660; by Gronovius 4to. in 1706; and at Lipsick, in two vols. 8vo. by Conradus, in 1762. An elegant translation of this amusing, but frequently obscure and difficult author, with valuable

notes, was given in English, in 3 vols. 8vo. by Mr. Beloe, in 1795. Pref. to Beloe's translation. Fabr. Bib. Lat. l. i. c. 1. t. ii. p. 1, &c.

AUMA, in *Geography*, a town of Germany, in Upper Saxony, and circle of Neustadt, forty-four miles S. S. W. of Lipsick, and six E. S. E. of Neustadt.

AUMA WERINGEN, a town of Germany, in Upper Saxony, two miles S. E. of Auma.

AUMALE, a town of France, in the department of the Lower Seine, and chief place of a canton in the district of Neufchatel, nine leagues S. E. of Dieppe, and eleven N. E. of Rouen. N. lat. $49^{\circ} 46'$. E. long. $1^{\circ} 38'$.

AUMONE, or **ALMS**. See **ALMS**.

AUMONT, in *Geography*, a town of France, in the department of the Lozere, and chief place of a canton in the district of St. Chely; five leagues N. W. of Mende.

AUN, a town of Persia, in the province of Segestan, forty four leagues S. S. E. of Zareng.

AUNALASCHKENSIS, in *Ornithology*, a species of *ORIOLEUS* that inhabits the island of Oonalaschka. The length of this bird is eight inches; it is of a brown colour, with a spot under the eyes, and chin white; throat and breast ferruginous brown. Gmelin. The beak and legs are brown.

AUNAY, in *Geography*, a town of France, in the department of the Nyevre, and chief place of a canton in the district of Chateau-Chinon; nine miles north of Moulins.

—Also, a town of France, in the department of the Lower Charente, and chief place of a canton in the district of St. Jean d'Angely: eight miles north-east of St. Jean d'Angely.

AUNCEL-WEIGHT, quasi *Handjule-Weight*, an ancient mode of weighing by a kind of balance, consisting of scales hanging on hooks fastened at each end of a beam or staff, which a man lifts up by his hand or fore-finger, and so discovers the equality or difference between the weight and the thing weighed. There being great deceits practised in these weights, they were prohibited by several statutes: and the even balance alone commanded. The word is still used in some parts of England, to signify meat sold by poising in the hand, without putting it into the scales. See **STIL-YARD**.

AUNCESTOR, *Affixe of Mort d'*. See **ASSISE**.

AUNCESTREL HOMAGE. See **HOMAGE**.

AUNE, in *Commerce*, a long measure used in France and other countries, of different lengths in different places. See **ELL**.

AUNE, in *Geography*, a river of England, which runs into the sea near Plymouth.

AUNEAU, a town of France, in the department of the Eure and Loire, and chief place of a canton, in the district of Chartres; four leagues east of Chartres.

AUNEUIL, a town of France, in the department of the Oise, and chief place of a canton in the district of Beauvais; five miles S. S. W. of Beauvais.

AUNGERVYLE, **RICHARD**, or *Richard of Bury*, in *Biography*, an English bishop, was born at St. Edmundsbury, in Suffolk, in 1281, studied at Oxford, and became a Benedictine monk at Durham. He was tutor to prince Edward, afterwards Edward III.; and upon his accession to the throne, he was loaded with honours and preferments. In 1333, he was consecrated bishop of Durham; in 1334, he was appointed high chancellor; and in 1336, treasurer of England. He was himself eminently learned, and a great patron and encourager of learning. Petrarch, with whom he corresponded, calls him "virum ardentis ingenii." He was a great collector of books, and possessed, it is said,

more

more books than all the bishops of England together. Notwithstanding the expence which he incurred in this way, by employing persons to collect books for him abroad, and also binders, illuminators, and writers in his several palaces, he was distinguished by his charity and beneficence. He does not seem to have contented himself merely with the possession of a large library; for he was a diligent student; and it was his custom for some of his attendants to read to him at his meals, and afterwards to discourse with his chaplains on the subjects that occurred. His "Philobiblos" was a curious treatise, finished at Auckland in 1345, when he was sixty-three years of age, and containing a declaration in praise of books, with directions concerning the preservation and use of them. It was printed at Spire in 1483; at Paris, in 1500; at Oxford, in 1599, 4to.; and at Leipzig, in 1673, at the close of "Philologicarum Epitolarum Centuriarum." This work is distributed into twenty chapters; in which, among other particulars, he asserts, that books are to be preferred to riches and pleasures; that they are misused only by ignorant people; that the ancients surpassed the moderns in hard study; that learning arrives at perfection by degrees, and that he had provided for students Greek and Hebrew grammars in his libraries; that the law and law books are not properly learning; that grammar is peculiarly useful and necessary; that poetry also is useful; but he makes an apology for admitting poets into his collection, observing, "we have not neglected the fables of the poets." Aungervyle founded a noble library at Oxford for the use of students, and appointed five keepers, to whom he granted yearly salaries. This learned and worthy prelate died at Auckland, in his diocese of Durham, April 24, 1345. Biog. Brit. Wharton's Hist. Poet. vol. i. 2d Prel. Diss. p. 120, 121.

AUNIS, in *Geography*, a district of France, which, before the revolution, was reckoned a part of Saintonge, but is now with Saintonge included in the department of the Lower Charente; is bounded on the east and south by Saintonge, on the west by the ocean, and on the north by Poitou, and comprehends the isles of Ré and Oleron. It is watered by the rivers Sevre and Charente, and has several good harbours along the coast. The soil is fertile, and produces great quantities of corn and wine; the swampy parts afford good pasturage, and the salt-marshes yield an excellent salt, which is a considerable article of commerce.

AUNOT. See ANNOT.

AUNOY, MARY CATHERINE JUELLE De BERNEVILLE, *Countess of*, in *Biography*, a distinguished writer of fiction and romance towards the close of the seventeenth century, was niece of the celebrated Madame Desloges, and wife of the count D'Aunoy. She wrote with fluency of style and facility of invention: and her "Contes des Fées" or merry tales, and "Aventures d'Hippolyte Comte de Douglas," or adventures of Hippolytus earl Douglas, are read with pleasure by those who merely seek amusement. Some of her other pieces, uniting history with fable, such as "Historical Memoirs of the most remarkable Events in Europe from 1672 to 1679," "Memoirs of the Court of Spain," "History of John of Bourbon, prince de Carancy," are less valued. She died in 1705. *Nouv. Dict. Hist.*

AUNUS, in *Entomology*, a species of PAPILIO, of a blue colour with a black border and three small tails; black beneath and striped with white. *Cramer, Gaedlin, &c.*

AVOCADO, or AVOCATO, *Plant*, in *Botany*, a species of LAURUS. See LAURUS.

AVOCATORIA, a mandate of the emperor of Germany, directed to some prince or subject of the empire, to

stop his unlawful proceedings in any cause brought by way of appeal before him.

AVOCETTA, in *Ornithology*, a species of RECURVIROSTRA that is distinguished from two other birds of the same genus, in being variegated only with black and white. *Linn. Gmel. &c.*

The length of this bird is from eighteen to twenty inches; it has a small body, and legs remarkably long; irides hazel; crown black; front of the neck, breast, back, belly, and outer part of the wings white; legs bluish-black; beak black, about three inches and a half in length, and like the rest of the genus, slender, flexible, turning upwards towards the end, and terminating in a point.

"This bird is common in winter on the eastern coasts of England, particularly those of Suffolk and Norfolk; and sometimes on the lakes of Shropshire. They are found in great plenty in the breeding season, in the fens about Goss-dyke Wash in Lincolnshire, and in the fens of Cambridge-shire. They feed on worms and insects, which they scoop out of the mud and sand; and are sometimes observed to wade or swim, but always close to the shore.

"They lay two eggs, which are about the size of those of a pigeon. Pennant says they are white, tinged with green, and marked with large black spots. In the description of them given by Latham it is observed, they are of a cinereous grey, whimsically marked with deep brownish-black patches of irregular sizes and shapes, beside some under markings of a dusky hue.

"The avocet is far more frequent in some other parts of Europe than in this country. Albin says, in Rome and Venice they are common; and according to Salerne, they are so plentiful on the coasts of Bas Poictou, that the peasants take their eggs by thousands. They are also found in Russia and Siberia, Denmark, Sweden, and other northern countries." *Donov. Brit. Birds, &c.*

This bird is called *avocetta f. recurvirostra*, by Gesner; *avocette*, by Buffon; *krummkehnl*, by Cramer; *skershaka*, *Alit. Linn. Fn. Succ.*; the *jacoper*, by Charlt.; *crooked bill*, by Dale; and *avocet*, or *avjet*, by English writers.

AVOGLIA, in *Geography*, a town of Persia, in the province of Adhbeitzan, eighteen leagues south-east of Tauris.

AVOIDANCE, in *Law*, is applied generally to a benefice which becomes void of an incumbent, and is opposed to plenary. Avoidances are either in *fact*, as by the death of the incumbent; or in *law*; and may be by cession, deprivation, resignation, &c. See USURPATION.

AVOIRDUPOIS, or AVERDUPOIS *Weight*, a kind of weight used in England; the pound whereof contains sixteen ounces. See WEIGHT.

The proportion of a pound avoirdupois to a pound troy is as 17 to 14; or the avoirdupois pound contains 7000 grains, and the troy pound 5760.

All the larger and coarser commodities are weighed by avoirdupois weight; as groceries, cheese, wool, lead, hops, &c.

AVOISE, in *Geography*, a town of France, in the department of the Sarthe, four leagues from La Fleche.

AVOLA, or AVLA, a town of Sicily, in the valley of Noto, six miles from Noto, and sixteen from Syracuse. This city, which formerly stood on a hill, boasted of being the "Hybla Minor," so celebrated for its honey; but the justice of its claim, in common with many other cities, cannot be easily decided. After its destruction by the earthquake of 1693, the inhabitants rebuilt it more commodiously in the plain, in a fertile territory, luxuriant in corn and fruits, and principally in almonds, a considerable article

of commerce. The houses still prove, by being extremely low, the dread entertained of earthquakes. The streets are wide and regular.

AVOLTOJO, in *Ornithology*, a name given by Cetti to some birds of the VULTUR genus; as for example, *vultur fuscus* is called by that writer *avolajo Griffone*; and *vultur niger*, *avolajo nero*.

AVON, or AFXN, in the *British Language*, signifies a river generally; but in its present application designates only a few of the streams in Great Britain. The principal are the *Warwickshire Avon*, and the *Wiltshire Avon*. The former is sometimes called "The *Upper Avon*." It brings a great influx of waters from the north-east, rising on the borders of Leicestershire, and adds great beauty to the delightful territory of Warwick castle, as it flows beneath the cliff on which those lofty towers are situated. It then glides through a charming country, to the celebrated spot of Stratford-on-Avon, the birth-place of our immortal Shakspeare, and the repository of his bones. Hence it traverses the great level of Worcestershire, by Evesham, having received the *Essex Stour* at Stratford, and turning to the south at Perthore, meets the Severn at the flourishing town of Tewkesbury. Ireland's picturesque Views on the Avon.

The Wiltshire or *Lower Avon* derives its source from various springs in the north of Wilts, and becomes a considerable river at the ancient town of Malmesbury. In this part of the country, we are informed by Ethelward, that it formed a boundary line between the West Saxon and Mercian kingdoms, and was often stained with the blood of murdered soldiers during the direful warfare between those two powers. Leaving Malmesbury, it meanders through a level tract of fine pasture land to Great Somersford, Dantsley, and Chippenham, where its stream becomes expanded by many contributory rivulets. Quitting Chippenham, its windings are numerous, from the hilly nature of the country through which it flows. Having passed the clothier towns of Melkham and Bradford, it moves slowly through the gay city of Bath, thence passes on to Bristol, and soon afterwards unites its waters with the Severn. It is navigable for small vessels up to Bristol, and some considerable barges come up as high as Bath.

The *Upper Avon*, another Wiltshire river, rises among the hills near the centre of that county, and flows southward through a number of small villages to Amesbury and Salisbury, where it receives the united streams of the Willey and the Nadder; and, running through Downton, crosses the county of Hants, and discharges itself into the British channel at Christ-church.

Another *Avon* rises in the north part of Glamorgan-shire, and running south, falls into the Severn at Aber-Avon, south-west of Neath.

Avon, or *Avon Fane*, a river in Merionethshire, rises among the high mountains of that county, and after passing by the small town of Dolgelly, soon discharges itself into the Irish sea at the town of Barmouth.—*Avon* gives name to two rivers in Scotland. Britton's Beauties of Wiltshire, vol. i. and Skirnes General Account of Rivers.

Avon is also the name of a river of Nova Scotia, which discharges itself into the Atlantic ocean, east of Halifax. It is navigable as far as fort Edward for vessels of 400 tons; and for vessels of 60 tons, two miles higher.

AVORTON, Fr. in *Midwifery*, an abortive child.

AVOSTOLA, in *Geography*, a river of Piedmont, which runs into the Cervo; 2½ miles west of Barozza, in the Verceillois.

AVOWEE, ADVOCATUS, in *Law*. Avowee is the person to whom the right of advowson of any church belongs, so that he may present to it in his own name; thus called by way of distinction from those who sometimes present in another man's name, as a guardian, who presents in the name of his ward; as also from those who only have the lands to which an advowson belongs for term of life or years, by intrusion or dissein. See ADVOWEE, and ADVOCATE.

AVOWRY, in *Law*, is where one takes a distress for rent, or other thing, and the other sues replevin. In which case the taker shall justify, in his plea, for what cause he took it; and if he took it in his own right, he is to shew it, and so avow the taking; which is called his avowry. If he took it in the right of another, when he has shewed the cause, he is to make cognizance of the taking, as being a bailiff or servant to him in whose right he did it. See REPLEVIN.

AVOYER, in *Ecclesiastical Antiquity*, was originally the advocate of a monastery; and in times of confusion the avoyers became captains and protectors of convents, to whom the said convents gave lands in consideration of their protection; but when these monasteries erected themselves into principalities, the avoyers became noblemen; and the title was connected with great dignity. Thus we find, that when Otho was elected to the empire, A. D. 1209, and his election was approved by pope Innocent III., who invited him to Italy to be crowned, he appointed Rodolphus, count of Hapsburg, prefect, vicar of the empire, and principal avoyer of all Upper Germany, with power to maintain the imperial rights, inspect the finances, levy subsidies, tributes, tolls, and taxes, and, in a word, to represent the person of the emperor in his absence.

AUPELLARTOK, in *Geography*, an island of Greenland, near Bear island, about eight or ten leagues long, and very high. These two islands, which are about the same form and extent, divide the channel, in which they are situated, into two bays.

AU-PIS-ALLER, a French phrase, sometimes used among English writers, signifying, *at the worst*.

AUPS, in *Geography*. See AULPS.

AURA, in *Chemistry*, a certain fine and pure spirit, supposed to be found in every animal and vegetable body, but so subtle as only to be perceptible by smell and taste.

This term was much employed by the ancient alchemists, and even some of the most eminent chemists, but is now disused. It is nearly equivalent to *spiritus rector*, concerning which see the article AROMA.

AURA, in *Ornithology*, a species of VULTUR, of a brownish grey colour, with black wings, and white bill. This bird is described by authors under several different names. In Hernand. Mex. it is called tzopilotl f. aura; by Willughby, urubu, tzopilotl, or aura; by Ullo, gallinazo; vultur Brasiliensis by Ray; vautour du Brésil by Buffon; Turkey buzzard by Catesby; carrion-crow by Sloane; and carrion vulture by Pennant and Latham. Inhabits Brasil.

AURA, among *Physiologists*, an airy exhalation or vapour.

The word is derived from the Greek *αυρα*, *gale*.

AURACH, in *Geography*, a town of Germany, in the circle of Swabia, and county of Waldburg; nine miles E. N. E. of Warzach.—Also, a river of Germany, in Franconia, which runs into the Rednitz; three miles south of Erlang.

AURÆ, in *Mythology*, a name given by the Romans to the nymphs of the air. They are mostly to be found in the ancient paintings of ceilings; where they are represented as light and airy; generally with long robes, and flying veils,

wells, of some lively colour or other, and fluttering about in the rare and pleasing element assigned to them. They are sportive and happy in themselves, and well-wishers to mankind.

AURAGO, in *Entomology*, a species of *PUSILANA* (*Noctua*) that inhabits Austria. The wings are brownish; splash at the base, and broad band in the middle, yellow. Hybner, Gmel. &c.

AVRANVILLE, in *Geography*, a town of France, in the department of the Meuse, and chief place of a canton in the district of Toul; two leagues north of Toul.

AURAN, a town of Arabia, sixty miles south of Damascus.

AURANA, in *Entomology*, a species of *PAALANA* (*Tertris*), with brown wings, and two golden-yellow spots in each. Fabricius. Donovan. Brit. Inf.

AURANA, *Laurana*, or *Brama*, in *Geography*, one of the most delightful places of Dalmatia, in the county of Zara, on a lake of the same name. It had formerly a rich convent of Benedictines, whose revenues were, about the year 1217, alienated in favour of the knights templars, by Andrew II. king of Hungary, who instituted a commanderie in this place. About this time the place was fortified. The suburbs are large. It continued for some time in the hands of the Turks; but, in 1684, they were dispossessed of it.

AVRANCHES, *Abricantæ*, or *Africa*, or *Abricantarum oppidum*, a city of France, and principal town of a district in the department of the Channel, seated on an eminence near the river See. Before the revolution, it was the see of a bishop, suffragan of Rouen. Besides the cathedral, which stands on a hill, terminating abruptly, it had three parish churches, a convent, a college, a public school, and an hospital. This is a very ancient town, and, before the county of Bretagne was united to the crown of France, it was called the "Boulevard of France;" but when the Bretons made themselves masters of it, they destroyed its fortifications, in 1203. These were rebuilt in the reign of St. Louis. Here, it is said, Henry II. of England received absolution from the pope's nuncio for the murder of St. Thomas à Becket, in 1172; and the stone on which he kneeled during the ceremony is still shewn to strangers; and on it is engraved a chalice, in commemoration of the event. The ruins of the castle are extensive, and near it is an extent of fertile country, abounding in grain and orchards, which produce the best cider in this part of France. N. lat. 48° 41' 18". W. long. 1° 22' 38".

AURANTIA, in *Conchology*, a species of *VOLUTA*, of a tapering shape, and orange colour; the first four whorls are fasciated with white; lip denticulated, and four plaits on the pillar. Gmelin.

AURANTIA, a species of *PATELLA*, the shell of which is ovate, solid, citron colour, with brown waves; elevated, crowded, wrinkled striae, and white bottom. Native country unknown. Schret. n. Litt.

AURANTIA, a species of *OSTREA*. The shell is subrotund, plaited, and finely striated longitudinally, with a semi-circular white band near the hinge. Native country unknown. Regenf. Conch.

AURANTIA, a species of *VENUS*, with an orbicular orange-coloured shell. This shell is two inches long, and two inches and a quarter in breadth. Its native country is unknown.

AURANTIA, in *Ornithology*, a species of *LOXIA*, of an orange colour; crown black; wing and tail-feathers black, edged with orange. Gmelin.

The length of this bird is four inches and a half; bill

dusky; base of the inner quill-feather edged with buff, and pale red. In the female, the whole of the head and fore-part of the body are white; the rest buff-orange. Inhabits the Ile of Bourbon.

AURANTIA, a species of *MICROPTERA*, called by Latham orange-breasted n. catcher, and by our authors *aurantia*; *orange de Cayenne* by Buffon. The colour is rufous, tinged in parts with green; beneath white; breast orange; head and nape yellowish brown; quill feathers black, edged with rufous. Gmelin. Length of this bird four inches and three quarters; bill flat and broad; tail rufous; legs pale. Dr. Latham observes, in his Gen. Orn., that it frequents the skirts of woods, and the savannahs; and is perhaps a scarce species, only a single specimen of it having been brought to Europe.

AURANTIA, a species of *MOTACILLA* that inhabits the cape of Good Hope. It is brown above, beneath orange; chin whitish, varied below with black; larger wing and tail-coverts white; tail-feathers brown, lateral ones tipped with white. This is the *orange-breasted warbler* of Latham. Length six inches.

AURANTIA, a species of *CERTHIA*, called by Latham the *orange-breasted creeper*. It is green; beneath yellowish, breast orange; wings and tail black. Length four inches; bill black; legs dusky. Inhabits Surinam, and was first discovered by Mr. Smeatman.

AURANTIA, in *Zoology*, a species of *RANA*, described by Dr. Shaw, as being of an orange-colour, with very slender body and limbs. This is a native of South America, and is of a smaller size than the European tree-frog; it inhabits trees.

AURANTII CORTEX, in *Pharmacy*, orange-peel. The aurantium Hispalense, or Seville orange, is the only one of this species which is employed in pharmacy.

The outer yellow rind of the fruit is a grateful aromatic bitter, highly esteemed as a stomachic. It is kept in the shops, dried with a gentle heat. It contains a large portion of aromatic essential oil, which admirably increases the stomachic power, and renders it highly grateful to the taste. The virtue of the orange-peel is readily extracted by proof spirit; and accordingly this is the form in which it is usually employed. The London college have ordered a simple tincture of this substance (*tinctura aurantii corticis*), in the proportion of three ounces to a quart of proof spirit. It is also employed in several of the compound tinctures, such as Huxham's tincture of bark, to give an agreeable flavour, and to add to the stomachic virtue. A syrup of a very grateful flavour is also prepared, by dissolving the requisite proportion of sugar in a strong infusion of the peel. See *CITRUS Aurantium*.

AURANTIUM, in *Botany*. See *CITRUS*.

AURANTIUM, in *Natural History*, a species of *ASCIDIA*, of a somewhat globose shape, with a scarlet pouch, and covered with rough hardish dots; papillæ terminal, cylindrical, and rugose. This kind is described by Pallas; it inhabits the sea about the Kurile islands, adhering by its base to shells and stones; and is about the size of an orange.

AURANTIUM, the specific name assigned by Pallas to that species of *ALCONIUM*, called by Gmelin *lycurium*.

AURANTIUS, in *Entomology*, a species of *CIMEX* found in China and Java. It is of an orange colour; head, anterior margin of the thorax, spots on the margin of the abdomen, and the legs, black. Stoll. Fabr. Donovan. Inf. China, &c.

AURANTIUS Pijis, in *Ichthyology*, a name given by Nieremberg to a fish of the *coryphaena* genus, called the *dorado*, and supposed to be of the species *equilus*, Gmelin; or perhaps *hippurus*.

AURANTIUS, in *Ornithology*, a species of **FALCO** that inhabits Surinam, the bill and legs of which are lead colour; body above dusky brown, with decussating narrow whitish lines; chin with long narrow whitish feathers; throat and breast orange; belly and tail brown, with interrupted streaks. Gmelin. This bird is about fifteen inches in length; bill three quarters of an inch long, and whitish at the base; on the throat a round white spot; lower coverts of the tail ferruginous; tail near the base lined with white; legs long, slender, with black claws.

AURANTIUS, a species of **PICUS** or wood-pecker, about ten inches in length. It inhabits the cape of Good Hope; is of an orange colour above, with the nape, rump, and tail black. Gmelin. Brisson calls this bird *picus capitis Bone Spici*; and Latham the *orange wood-pecker*.

AURANTIUS, a species of **TROCHILUS**, called by Latham the orange-throated humming-bird. It is of a brown colour, with the head orange; chin and breast yellow; wings purple; tail ferruginous. Gmelin. Native place unknown.

AURANTIUS, a species of **TURDUS**, of a blackish brown colour, with the chin and abdomen whitish; beak and legs orange. Gmelin. This is the white-chinned thrush of Latham; *merula Jamaicensis* of Brisson; and *merle brun de la Jamaïque* of Buffon. This kind lives in the woods in Jamaica. Of this species Gmelin mentions three varieties; namely, (*♂*) *merula gula fusca* (with the chin brown) that has been discovered in New Caledonia; (*♀*) *merula nigra* (with the body black), a native of Surinam; and *merula Americana* of Brisson, and which, as its name implies, is an inhabitant of America.

AURARIA *functio, pensio, or preslatio*, in *Antiquity*, a tax or tribute to be paid in gold. The collector of it was denominated *susceptor aurarius*, or *chrysofodectes*.

AURAS, in *Geography*, a town of Silesia, in the principality of Breslaw, situate near the Oder; twelve miles north-west of Breslaw.

AURASIUS Mons, in *Ancient Geography*. See **AUDUS**.

AURATA, in *Entomology*, a species of **BUPESTRIS**, of a large size, that is found in America. This kind is golden; wing-cases ferrated; thorax brassy. Fabricius, Olivier, &c. *Obs.* The head is grooved; eyes testaceous; teeth of the antennæ black; thorax smooth.

AURATA, a species of **CHRYSIS** that inhabits Europe. It is glabrous and shining, with a green thorax, and golden abdomen, with two teeth at the vent. Linn. Fabr. &c.

AURATA, a species of **MUTILLA** that inhabits New Holland. It is blueish, with a large golden spot on the abdomen. Fabricius.

AURATA, a species of **MUSCA** found in Europe. This insect is shining; thorax brassy; abdomen obtuse and golden. Fabricius, &c.

AURATA, a species of **PHALÆNA** (*Geometra*), described by Linnæus as a native of Europe. The wings are yellow, and without spots.

AURATA, a species of **PHALÆNA** (*Geometra*) that inhabits Surinam; and is figured by Cramer under the name of *phalæna aura*. The wings are fulvous, with a dot and posterior streak golden. Fabricius, &c.

AURATA, a species of **VESPA**, of a small size, that is found in Sierra Leona. The colour is black; abdomen golden and polished. Fabr. &c.

AURATA, in *Ichthyology*, a species of **SPARUS**, called in England the lunated gilt-head, and distinguished by having a lunated golden mark between the eyes. Linnæus Mus. Ad. Fr. It inhabits the Mediterranean and American seas.

AURATA *Delamensis*, Catesby's name of the fish called *sparus edryjops* by Gmelin.

AURATA, in *Zoology*, a species of **LACERTA** found in the island of Jersey. When living, it is said to be of a fine golden colour, but after death this splendid colour disappears. It has a round and rather longish tail; scales rounded and glabrous; sides brownish. Gmelin. The body is round, and apparently corpulent, and the ears are concave. This kind is *Lacerta barbara* of Mus. Ad. Fr.

AURATUS, in *Entomology*, a species of **SCARABÆUS** (*Cetonia* Fabr.) that inhabits Europe. This insect is golden, with a single tooth on each side of the first segment; wing-cases spotted with white. Fabricius. The colours in this species are variable. From the vent, it emits a fetid liquor when handled. Degeer calls it *scarabæus smaragdus*.

AURATUS, a species of **CARABUS**, of the apterous kind; wing-cases golden and furrowed; antennæ and legs rufous. Fabricius. Found in woods in Europe.

AURATUS, a species of **CERAMBYX** that inhabits America. It is green, bronzed, with a lateral depressed tooth on the thorax; antennæ black, and posterior thighs blue. Gmelin.

AURATUS, a species of **CURCULIO**, of a green-gold colour; antennæ and dilated tip of the beak black. A native of Italy. Scopoli.

AURATUS, a species of **ELATER** that inhabits China. The colour is green-gold; legs black. Fabricius.

AURATUS, in *Ichthyology*, a species of **SPARUS**, that inhabits the Mediterranean and European seas, and is called in England the *lunated gilt-head*. It is distinguished by having a semi-lunar golden spot between the eyes. Linn. Mus. Ad. Fr. This kind feeds chiefly on worms and shell-fish, the latter of which it grinds with its teeth before it swallows them. The back is greenish, sides rather pale and glossed with gold; on the upper part of the gills is a black spot, and beneath that another of purple; inside of the mouth fine red; dorsal fin extending nearly the whole length of the back; tail much forked.

AURATUS, a species of **CYPRINUS**, well known in England by the name of *gold-fish*. Authors are by no means agreed; on the precise characters by which this fish ought to be distinguished; some think the trifurcated tail is a striking character of the species; but this is rather accidental, for it is sometimes found with a bifurcated tail; and the telescope carp *cyprinus baphtalmus* of Dr. Shaw, has a trifurcated tail likewise; the anal fin is sometimes single, and sometimes double; so that the Linnæan definition in the Faun. Suec. is equally liable to objection. The specific character assigned by Bloch is taken exclusively from the brilliant, or golden red colour, by which, as he observes, this fish is distinguished from all the other species of the **CARP** or **CYPRINUS** genus.

This fish is without dispute, the most superb creature of the funny tribes at this time known. It was originally confined to a certain lake, on or near the mountain Tienking, at a small distance from the village of Tehanghou in the province of The-Kiang in China, from whence it was transported to other parts of that empire, and Japan; and afterwards brought to Europe. The Chinese have completely domesticated this fish, and they are now generally kept in ponds, basons, or vessels of porcelain, as ornaments in the gardens of the rich; and afford one of the few amusements the ladies are allowed to enjoy in that country by their jealous husbands. One writer has observed that the fish is no larger than a pilchard; but in this he is mistaken, for we know instances of its increasing to the size of a herring. The male is said to be of a bright red colour, from the top of the head to the middle of the body; the rest of a bright gold

gold colour, superior to the richest gilding with that metal; the female white, with the tail and half the body emulating the finest silver. Du Halde observes that the red and white colours are not always the distinguishing marks of the male and female; but that the female is known by several white spots which are seen round the orifices that serve them as organs of hearing, and the male by having these spots much brighter. Grosier, in his description of China, says, great care is necessary to preserve them; for they are extremely delicate, and sensible of the least injuries of the air; a loud noise, such as that of thunder or cannons; a strong smell; a violent shaking of the vessel; or even a single touch, will oftentimes destroy them. These fish live with little nourishment; those small worms which are engendered in the water, or the earthy particles that are mixed with it, are sufficient for their food. The Chinese, however, take great care from time to time to throw into the basons and reservoirs where they are kept, small balls of paste, which they are very fond of, when dissolved; they give them also lean pork dried in the sun, and reduced to a fine and delicate powder, and sometimes snails; the slime which these insects leave at the bottom of the vessel is a great delicacy for them, and they eagerly feed on it. In winter they are removed from the grounds or open air to a warm chamber, where they are kept generally in vessels of porcelain. During this season, they receive no nourishment; but however in the spring, when they are carried back to their former basons or reservoirs, they sport and play with the same strength and liveliness as they did in the preceding year. In warm countries these fish multiply fast, provided care be taken to collect their spawn, which floats on the water, and which they almost entirely devour. This spawn is put into a particular kind of vessel, exposed to the sun, and preserved there until vivified by the heat; gold-fish, however, seldom multiply when they are kept in close vases, because they are then too much confined. In order to render them fruitful, they must be put into reservoirs of considerable depth, in some places at least, and which are constantly supplied with fresh water. At certain times of the year a prodigious number of barks may be seen in the great river Yangtse-Kiang, which go thither to purchase the spawn of these fish. Towards the month of May, the neighbouring inhabitants shut up the river in several places with mats and hurdles, which occupy an extent of almost nine or ten leagues, and they leave only a place in the middle sufficient for the passage of barks. The spawn of this fish, which the Chinese can distinguish at first sight, although a stranger could perceive no traces of it in the water, is stopped by these hurdles. The water mixed with spawn is then drawn up, and after it has been put into large vessels, it is sold to the merchants, who transport it afterwards to every part of the empire. This water is sold by measure, and purchased by those who are desirous of stocking their ponds and rivers with gold-fish.

Notwithstanding the tenderness of this fish in its native climate, it is now naturalized in England, France, Holland, several parts of Germany, and other countries of Europe. They are said to have been first introduced into Great Britain about the year 1691, but were not generally known, according to Pennant, till 1728, when a great number were brought over, and presented first to Sir Matthew Dekker, and by him circulated round the neighbourhood of London, from whence they were distributed to most parts of the country. "Nothing," says one writer, (Enc. Brit.) "can be more amusing than a glass bowl containing such fishes; the double refractions of the glass and water represent them, when moving, in a shifting and changeable variety of dimensions, shades, and colours; while the two mediums assisted by the

concavo-convex shape of the vessel, magnify and distort them vainly; not to mention that the introduction of another element and its inhabitants into our parlours engages the fancy in an agreeable manner. Some people exhibit this sort of fish in a very fanciful way; for they cause a glass bowl to be blown with a large hollow space within, that does not communicate with it. In this cavity, they put a bird occasionally; so that you see a gold finch or a linnet hopping as it were in the midst of the water, and the fishes swimming in a circle round it. The simple exhibition of the fishes is agreeable and pleasant; but in so complicated a way becomes whimsical and unnatural, and liable to the objection due to him, *qui variare cupit rem prodigialiter unam.*"

One circumstance that has been remarked of the fish, deserves particular mention. It is said, when young, to be not unfrequently of a deep black colour, and that after a time little silvery specks begin to appear through the black; these increasing in size very gradually, till the black entirely disappears, the whole fish becomes of a fine and resplendent silver; from which it at last changes to a red. Sometimes, however, it appears of a beautiful golden-red in the first instance.

AURATUS, in *Ornithology*, a species of **CUCULUS**, about seven inches in length, that inhabits the cape of Good Hope. Buffon calls this bird *coucou vert doré et blanc*; Hist. Ois., and in his Pl. Enlum. *coucou vert du cap de Bonne Esperance*. The tail is wedge-shaped; body above golden-green, beneath white; on the head five streaks; wing-coverts, secondary quill-feathers, with those of the tail, white at the tips. By Latham, it is named in English the *gilded cuckoo*.

AURATUS, a species of **PICUS** or wood-pecker, called by Brisson *picus Canadensis striatus*; *pic rayé de Canada*, et *pic aux ailes dorées* by Buffon; *picus major alis aureis* by Kalm; *cuculus auratus*, Linn. Syst. Nat. X.; and gold-winged wood-pecker by Catesby and other English writers. Forster and Gmelin describe it as being transversely streaked with grey and black; chin and breast black; nape red; rump white.

The length of this bird is eleven inches; bill an inch and a half long, black, and rather bent; and contrary to others of the same genus, is rounded and ridged only on the top, with the point sharp. The female differs from the male in having the crown and neck behind grey brown; the red of the hind head less vivid; greater quill feathers not spotted on the edges, and being destitute of the black stripe on the throat. It inhabits Virginia, Canada, and other parts of North America. About New Jersey, and New York, it is called by some *hitcock* or *pint*, and by others *high-hole*; the two former, from the sound of its note, and the latter from the situation of its nest. It is almost continually on the ground, and is not observed to climb on the trees like other birds of the same genus.

The food of this bird is chiefly insects, and berries of the red cedar; it is very fat, and in esteem for the table. Forster, in the Philosophical Transactions, informs us that it is a bird of passage in the northern parts of America, visiting the neighbourhood of Albany fort in April, and leaving it in September; that it lays four, five, or six eggs in hollow trees, and feeds on worms and insects. It is called by the natives *outhee-quan-owu*.

AURATUS, a species of **TURDUS**, the general colour of which is violet; back and wings golden-green; band on the inner margin of the wings, tail, and upper tail-coverts, blue. Gmelin. This beautiful bird is rather larger than *turdus merula*, or common black bird, and inhabits the kingdom of Whidah, in Africa. Buffon calls it *le merle violet du royaume de juida*; and Latham the *gilded thrush*.

AURATUS, a species of **TROCHILUS**, called by Latham

the *garnet-throated humming-bird*. The colour is golden-green; chin, throat, and breast golden-red; belly black. Gmelin.—*Obs.* There is a variety of this brilliantly coloured species, in which the cheeks, nape, and chin are of a golden-red; and the head and body of a dark glossy green. The latter is called *grenat* by Buffon; and it measured five inches in length, being half an inch more than the first mentioned kind.—The legs and bill are black, and in the female, the chin, throat, and breast are golden-green.

AURATUS *Equus*. See EQUUS.

AURAY, in *Geography*, a sea-port town of France, in the department and in the gulf of Morbihan, and principal place of a district; at the mouth of a river of the same name. N. lat. 47° 48'. W. long. 2° 55'.

AURBACH, a town of Germany, in the circle of Bavaria, and Upper Palatinate; thirty miles north-east of Nuremberg.

AURBURG, a town and castle of Germany, in Upper Bavaria; four miles north of Kuffstein.

AURE, a river of France, which runs into the Eure, near Anet.

AUREA, in *Conchology*, a species of VENUS of a suborbicular form, golden, inequilateral, with crowded, minute, transverse striae. Lister, Gmelin. Inhabits Europe.

AUREA, in *Entomology*, a species of LEPTURA, described by Degeer. The colour is greenish gold, thorax spinous; two black longitudinal stripes on the wing-cases; thighs rufous. About two-thirds of an inch in length.

AUREA, a species of MELŒ (*Mylabris*) of a green-gold colour, with fulvous wings. Length one third of an inch. Degeer. Native country unknown.

AUREA, a species of CICADA (*Cercopis* Sec.) of an ash-colour, glossed with gold, shining, and without spots. This is of the middle size, and inhabits Cayenne.

AUREA, in *Ornithology*, a species of PARADISEA, about the size of the turtle-dove. It is crested; crown, cheeks, and chin violaceous and shining; throat, breast, and spot on the neck, golden-green. Gmelin. This is *Poisson paradis à gorge dorée* of Sonnerat; *sifilet ou mancode à six filets* of Buffon; and gold-breasted bird of paradise of Latham.

The bill is blackish; irides yellow; plumage very brilliant; legs blackish; beneath each wing arise long black feathers, which fall over the wings, when the bird is at rest; the webs of these feathers are loose like those of the ostrich. From the mutilated state in which the skins of these birds are sent to Europe, these feathers are not always observable in specimens of this species: Buffon mentions a figure of it published by M. Marvi, in which even the crest is wanting. This kind inhabits New Guinea.

AUREA, a species of LOXYA that inhabits Benguela. It is of a black colour; back golden; wing coverts pale brown, spotted with black. This bird is the golden-backed tuck of Brown; and gold-backed grosbeak of Latham. According to the last author, it is six inches in length; bill, head, and neck, deep black; the feathers not velvety, as in the Cape grosbeak; breast and belly black; legs bluish; rump and upper tail-coverts yellow; the latter fringed with a dusky colour; and all the tail feathers very pale at the edges.

AUREA *Zinzibibina*, in *Pharmacy*, a compound opiate confection, much in repute among the ancient physicians, but now entirely disused, like all the other medicines of this class: it was considered as a powerful alexipharmic, or antidote to poison.

AUREC, in *Geography*, a town of France, in the department of the Upper Loire, and chief place of a canton in the district of Montbrion; three leagues south-west of St. Etienne, and 11 north of Montbrion.

AURELIA, in *Natural History*, a term employed by naturalists,

about the middle of the last century, to express that intermediate state in which all lepidopterous, and most other insects, remain for some time, between the caterpillar form and the period in which they are furnished with wings, with antennæ, and other organs appertaining to the perfect insect. Aurelia and chrysalis are synonymous words, both alluding to the metallic or golden splendor of the case in which the creature, during that state, is contained. This brilliant appearance, it must be observed however, seems confined alone to insects of the papilio or butterfly tribe; and it is even peculiar only to certain kinds of those; so that the terms aurelia and chrysalis are altogether inapplicable, in a general manner, to insects in that state. Among entomologists of the higher class, these terms have been long since discarded in favour of the more expressive one pupa, which Linnaeus had adopted in their stead; a term implying that the insect, like an infant, yet remains in its swaddling clothes; and nothing can be more applicable than this comparative allusion, while the tender insect yet remains enveloped in the drapery of its membranaceous covering; a creature now exposed to every danger, and yet unable to defend itself from the slightest harm; in helpless infancy it must wait the more complete formation of its limbs, and new accession of strength, ere it can burst from these, its trammels of youth, and appear what nature had ultimately designed it for—a mature and perfect creature.—See ENTOMOLOGY, and PUPA.

The term aurelia is still retained by some few practical entomologists in this country; or, in other words, by those who amuse themselves with collecting and breeding insects, without regarding them scientifically; and persons, engaged in this agreeable pursuit, occasionally denominate themselves Aurelians. The word chrysalis is in more general use than its precise meaning can justify; that of aurelia, as before remarked, is nearly obsolete. The current denominations of an insect in the pupa state among the French naturalists, are nymphæ, or nymphe, and chrysalide.

“The Aurelian” was likewise the title which Moses Harris gave to his well-known folio work on Insects; a wretched plagiarism from the beautiful etchings of Ammiral, which had been published a short time before in Holland; and in which Harris, by a singular good fortune, not only escaped detection, but actually acquired that very celebrity as a delineator of insects, which attaches an importance to his memory in the present day.

AURELIA, in *Natural History*, a species of PARAMECIUM (*vermes infusoria*), of an oblong form, plaited longitudinally on the anterior part. Müll. Hermann, &c. Hill describes it thus; *paramecium veris suboblongo medio versus angusto*. It is found in great abundance in ditch water, and vegetable infusions, about the month of June; it is membranaceous; breadth one fourth of the length; anterior part obtuse, hyaline; posterior part filled with molecules of various sizes; longitudinal fold extending from the middle to the front of the head.

AURELIAN, in *Biography*, a Roman emperor, was a native of Simbrun, in Pannonia. His father cultivated the lands which a Roman senator, called Aurelius, possessed in the country where he lived; and his mother was a priestess of the sun, and pretended to divination. Aurelian was from his youth distinguished by his strength and courage, and addicted to military exercises and achievements. On this career he entered betimes; and, from his warlike passion and exploits, he obtained, by way of distinction from another Aurelian, the name of “Aurelianus manu ad ferrum,” or “Aurelian sword in hand;” as he was ready on all occasions to draw his sword, and encounter the enemy. He is said to have killed with his own hand forty-eight Sarmatians

matians in one day; and within some few succeeding days, 950; so that he became the subject of popular songs, which were sung by the youth at the public festivals. Aurelian was the first Roman who fought against the Franks, and subdued them. As chief commander of the cavalry, to which office he was advanced from the low station of a common soldier, he was a strict observer of military discipline, and punished with the utmost severity the smallest neglect of duty on the part of his soldiers, and the slightest injury done by any of them to the inhabitants of the provinces through which he marched. His military talents and conduct attracted the peculiar attention of the emperor Valerian, who appointed him inspector and reformer of all the Roman camps, gave him the command of Illyricum, under Ulpus Crinitus, a descendant of the same family with Trajan, by whom he was adopted, and whose daughter he married; and at length, A. D. 258, created him consul, with a special order, that, on account of his poverty, the public treasury should defray the expenses which that high office incurred. Under Gallienus we find no mention of him, either because that emperor had removed him from jealousy of his merit, or because he himself did not chuse to serve a prince so indolent and despicable. Claudius II. upon his advancement to the empire, duly appreciated the merit of Aurelian, and was assisted by him in the defeat of Aureolus. In the war against the Goths he was eminently distinguished; and this discerning emperor on his death-bed recommended him as the fittest person to be his successor. Accordingly Aurelian was elected to the empire by the legions of Illyricum, in the year 270; and after the death of Quintillus, the brother of Claudius, who closed a short reign of seventeen days by opening his veins, the election of Aurelian was confirmed by the senate, and he was honoured with the title of Augustus. Having been thus acknowledged and invested with the imperial dignity at Rome, he returned to Pannonia, which the Goths had threatened with a new invasion. The Goths before his arrival had passed the Danube; but, after an indecisive battle, which was terminated by the approach of night, the Barbarians retreated, and re-crossed the river, and sent deputies to sue for peace, which was granted them by the emperor. Having withdrawn the Roman troops from Dacia, and relinquished that province to the Goths and Vandals, he hastened to Italy to repel an incursion of the Allemanni, and other German tribes. After three successive victories, the first near Placentia, a second at Faventia, near the river Metaurus, and a third in the plains of Picenum, now Pavia, he drove those Barbarians out of Italy, and rescued Rome from the calamities which were apprehended, and which the city had endeavoured to avert by a variety of superstitious practices, sanctioned by the concurrence of the emperor himself, with a view of appeasing the anger of the gods.

Aurelian, on his return to the capital, put to death several senators, who were suspected of having been concerned in conspiracies against him; and having enlarged the city, he provided for its future security by erecting new walls, which bore his name, though they were not finished till the reign of Probus. The extent of these walls was magnified by popular estimation to near fifty, but has been reduced by accurate admeasurement to about twenty one, miles.

About this time Aurelian marched into Gaul, which had been for some time distracted and oppressed by a rapid succession of usurpers, and where Tetricus, who, from being governor of the peaceful province of Aquitaine, had assumed the ensigns of royalty, and reigned four or five years over Gaul, Spain, and Britain, "the slave and sovereign," says Gibbon, "of a licentious army, whom he dreaded, and by

whom he was despised." The power of Tetricus, however, was of precarious duration; and he invited Aurelian to hasten to his relief. Accordingly, in the summer of the year 271, Aurelian arrived in Gaul; and Tetricus, in order to disguise the act of treason by which he was about to resign the sceptre of the west, affected the appearance of a civil war, and led his forces into the field against the emperor; but he posted them in the most disadvantageous manner, betrayed his own counsels to the enemy, and with a few chosen friends deserted in the beginning of the action. The rebel legions, though disordered and dismayed by the unexpected treachery of their chief, defended themselves with desperate valour, till they were cut in pieces almost to a man, in the bloody and memorable battle, which was fought near Chalons, in Champagne. The retreat of the irregular auxiliaries, Franks and Batavians, whom the conqueror soon compelled or persuaded to re-pass the Rhine, restored the general tranquillity, and the power of Aurelian was acknowledged from the wall of Antoninus to the columns of Hercules.

Aurelian, having secured the person and the provinces of Tetricus, turned his arms, A. D. 272, against Zenobia, the celebrated queen of Palmyra and the East. Upon his arrival in Asia, he advanced at the head of his legions, and took possession of Ancyra and Tyana; and as he approached Antioch, it was deserted by the inhabitants: but by his salutary edicts he recalled the fugitives, and granted a general pardon to all, who, from necessity rather than choice, had been engaged in the service of the Palmyrenian queen. This unexpected mildness of conduct, on the part of the emperor, conciliated the minds of the Syrians; and as far as the gates of Emesa, the wishes of the people seconded the terror of his arms. Zenobia attempted to check his further progress: but the fate of the east was decided in two great battles; the first of which was fought near Antioch, and the second near Emesa. In both these battles, Zenobia animated the armies by her presence; but the veteran troops of Aurelian, whose valour had been severely tried in the Alemannic war, prevailed. After the defeat at Emesa, Zenobia found it impossible to collect a third army. As far as the frontier of Egypt, the nations subject to her empire had joined the standard of the conqueror, who detached Probus, the bravest of his generals, to possess himself of the Egyptian provinces. The queen retired within the walls of her capital, Palmyra; and for some time resisted, with the intrepidity and firmness of a heroine, the army of the emperor, who invested the city. But disappointed of adequate succours, and alarmed by the return of Probus with his victorious troops from the conquest of Egypt, she at length resolved to fly. She mounted the fastest of her diomedaries, and had already reached the banks of the Euphrates, about 60 miles from Palmyra, when she was overtaken by the pursuit of Aurelian's light horse, seized, and brought back a captive to the East of the emperor, A. D. 273. To the complaints of her friends, she imputed the guilt of her obstinate resistance; and on their heads, and particularly against the celebrated Longinus, she directed the vengeance of the cruel Aurelian. (See ZENOBIA.) Soon after her capture she rendered, and was treated with unexpected lenity. By a war thus terminated, those provinces that had renounced their allegiance to the captivity of Valerian, were restored to the obedience of Rome.

Aurelian, on his return from the conquest of the East, had already crossed the straits which divide Europe from Asia, when he was suddenly recalled by the news of the revolt of the Palmyrenians, who had massacred the governor and garrison, and proclaimed a new emperor. Without a

moment's deliberation, he turned his face towards Syria, and soon arrived to execute vengeance on the revolted city, which for three days was delivered to the unrestrained rage and rapine of the soldiers. Women, children, and servants, were involved in this dreadful execution, which ought to have been confined to armed rebellion; and although the emperor's principal concern seems to have been directed to the re-establishment of a temple of the Sun, he discovered some pity for the remnant of the Palmyrenians, to whom he granted the permission of rebuilding and inhabiting their city. See PALMYRA.

Aurelian, having thus completely reduced Palmyra, and having also suppressed a rebellion in Egypt, excited by Firmus, a wealthy merchant, and a friend and ally of Odenathus and Zenobia, who had taken possession of Alexandria, and assumed the purple, and whom he first tortured and then put to death; returned to Rome; congratulating the senate, himself, and the people, that in little less than three years he had restored universal peace and order to the Roman world.

Since the foundation of Rome, no general had more nobly deserved a triumph than Aurelian; nor was any triumph ever celebrated with superior pride and magnificence. It is thus described by Gibbon: "The pomp was opened by twenty elephants, four royal tigers, and above two hundred of the most curious animals from every climate of the North, the East, and the South. They were followed by 1600 gladiators, devoted to the cruel amusement of the amphitheatre. The wealth of Asia, the arms and ensigns of so many conquered nations, and the magnificent plate and wardrobe of the Syrian queen, were disposed in exact symmetry or artful disorder. The ambassadors of the most remote parts of the earth, of Æthiopia, Arabia, Persia, Bactriana, India, and China, all remarkable by their rich or singular dresses, displayed the fame and power of the Roman emperor, who exposed likewise to the public view the presents he had received, and particularly a great number of crowns of gold, the offerings of grateful cities. The victories of Aurelian were attested by the long train of captives who reluctantly attended his triumph; Goths, Vandals, Sarmatians, Alemanni, Franks, Gauls, Syrians, and Egyptians. Each people was distinguished by its peculiar inscription; and the title of Amazons was bestowed on ten martial heroines of the Gothic nation, who had been taken in arms. But every eye, disregarding the crowd of captives, was fixed on the emperor Tetricus, and the queen of the East. The former, as well as his son, whom he had created Augustus, was dressed in Gallic trowsers, a saffron tunic, and a robe of purple. The beautiful figure of Zenobia was confined by fetters of gold; a slave supported the gold chain which encircled her neck, and the almost fainting under the intolerable weight of jewels. She preceded on foot the magnificent chariot, in which she once hoped to enter the gates of Rome. It was followed by two other chariots, still more sumptuous, of Odenathus, and of the Persian monarch. The triumphal car of Aurelian (it had formerly been used by a Gothic king) was drawn, on this memorable occasion, either by four stags or by four elephants. The most illustrious of the senate, the people, and the army, closed the solemn procession. Unfeigned joy, wonder, and gratitude, swelled the acclamations of the multitude; but the satisfaction of the senate was clouded by the appearance of Tetricus; nor could they suppress a rising murmur, that the haughty emperor should thus expose to public ignominy the person of a Roman and a magistrate.

"But, however, in the treatment of his unfortunate rivals, Aurelian might indulge his pride, he behaved towards them

with a generous clemency, which was seldom exercised by the ancient conquerors. Princes who, without success, had defended their throne or freedom, were frequently strangled in prison, as soon as the triumphal pomp ascended the Capitol. These usurpers, whom their defeat had convicted of the crime of treason, were permitted to spend their lives in affluence and honourable repose. The emperor presented Zenobia with an elegant villa at Tibur, or Tivoli, about twenty miles from the capital: the Syrian queen insensibly sunk into a Roman matron, her daughters married into noble families, and her race was not yet extinct in the fifth century. Tetricus and his sons were re-instated in their rank and fortunes. They erected on the Cælian hill a magnificent palace, and as soon as it was finished, invited Aurelian to supper. On his entrance, he was agreeably surprised with a picture which represented their singular history. They were delineated offering to the emperor a civic crown and the sceptre of Gaul, and again receiving at his hands the ornaments of the senatorial dignity. The father was afterwards invested with the government of Lucania; and Aurelian, who soon admitted the abdicated monarch to his friendship and conversation, familiarly asked him, Whether it were not more desirable to administer a province of Italy, than to reign beyond the Alps? The son long continued a respectable member of the senate; nor was there any one of the Roman nobility more esteemed by Aurelian, as well as by his successors.

"The festival was protracted by theatrical representations, the games of the circus, the hunting of wild beasts, combats of gladiators, and naval engagements. Liberal donations were distributed to the army and people; and several institutions, agreeable or beneficial to the city, contributed to perpetuate the glory of Aurelian. A considerable portion of his oriental spoils was consecrated to the gods of Rome; the Capitol, and every other temple, glittered with the offerings of his ostentatious piety; and the temple of the sun alone received above 15,000 pounds of gold."

The arms of Aurelian vanquished the foreign and domestic foes of the republic; and we are assured, that by his salutary rigour, crimes and factions, mischievous arts and pernicious connivance, the luxuriant growth of a feeble and oppressive government, were eradicated through the Roman world. Nevertheless, a few short intervals of peace were insufficient for the arduous work of reformation; and even his attempt to restore the integrity of the coin was opposed by a formidable insurrection, which originated with the workmen of the mint, and terminated by a bloody battle, in which the emperor lost 7000 of his troops. Of this insurrection, the real cause was disguised, and the reformation of the coin furnished merely a feigned pretence to a party already powerful and discontented. The emperor, who was himself a plebeian, and who always expressed a peculiar fondness for this order, had excited the jealousy and incurred the hatred and opposition of the senate, the equestrian order, and the Prætorian guards; and it was a conspiracy of these several orders that procured a strength capable of contending in battle with the veteran legions of the Danube. The rebellion, however, was suppressed, and Aurelian used his victory with unrelenting rigour. The noblest families of the capital were involved in the guilt or suspicion of this dark conspiracy; and it was punished with a spirit of revenge that produced the most sanguinary effects. The executioners, says Calpurnius a contemporary poet, were fatigued; the prisons were crowded; and the unhappy senate lamented the death or absence of its most illustrious members.

Some of the concluding months of Aurelian's reign were occupied

occupied by a visit to Gaul, where he rebuilt the ancient city of Genabum, called after his own name "Aurelianum," now Orleans, and by an expedition against the barbarians who had made an incursion into Vindelicia. But the object, which engaged his principal attention, was an expedition against Persia; in the prosecution of which he advanced as far as the straits which divide Europe from Asia. Here a conspiracy was formed against his life by one of his secretaries, who was accused of extortion. This criminal, dreading the effects of the emperor's displeasure, determined to involve some of the principal officers of the army in his danger, or at least in his fears. With this view he artfully counterfeited his master's hand, and shewed them in a long and bloody list their own names devoted to death. Without suspecting or examining the fraud, they resolved to secure their lives by the murder of the emperor. On his march, between Byzantium and Heraclea, Aurelian was suddenly attacked by the conspirators, and, after a short resistance, fell by the hand of Mucapor, a general whom he had always loved and trusted. Accordingly he died, A. D. 275, regretted by the army, detested by the senate, but universally acknowledged as a warlike and fortunate prince, the useful, though severe, reformer of a degenerate state.

As to his general disposition and character, it has been observed by Dioclesian, one of the most sagacious of the Roman princes, that the talents of his predecessor Aurelian were better suited to the command of an army, than to the government of an empire. His temper was haughty and vindictive. Trained from his youth in the exercise of arms, he transferred the discipline of the camp into the civil administration of the laws; and his love of justice often became a blind and furious passion. Ignorant or impatient of the restraints of civil institutions, he disdained to hold his power by any other title than that of the sword, and governed by right of conquest an empire which he had saved and subdued. Aurelian has been reckoned by several Christian authors among the persecutors of the church; and it is said that he not only intended persecution and framed cruel edicts for this purpose just before his death, but did actually persecute. His persecution, however, reckoned by Augustine the ninth, was short; as he died soon after the publication of his edicts, and before they could reach the more distant provinces. Mosheim is of opinion that many Christians did not suffer at this time; but considering Aurelian's cruel temper, and how much he was addicted to the Gentile superstitions, he thinks that if he had lived, his persecution would have exceeded all the former persecutions in severity.

The historians of this reign are Vopiscus, the Victors, Pollio, Zosimus, and Eutropius. Crevier's *Hist. Rom. Emp.* vol. ix. p. 149—186. Gibbon's *Hist.* vol. ii. p. 15—56. Lardner's works, vol. viii. p. 172—176. Mosheim's *Ecel. Hist.* vol. i. p. 153.

AURELIANA, in *Botany*. See PANAX.

AURELIOPOLIS, in *Ancient Geography*, an episcopal city of Asia Minor, in Lydia.—Also, another episcopal city of Asia Minor, in Asia properly so called.

AURELIUS, AMBROSIVS. See AMBROSIVS.

AURELIUS, MARCUS. See ANTONIVS.

AURELIUS VICTOR, SEXTUS, in *Biography*, a Roman historian, flourished in the 4th century, probably from the reign of Constantius to that of Theodosius; was born of mean and illiterate parents, perhaps in Africa, and notwithstanding the obscurity of his origin, was advanced by his talents to distinction. In 361, he was appointed by Julian, prefect of the second Pannonia; afterwards prefect of Rome; and

in 369, consul with Valentinian. The abridgment of the Roman history, intitled "Libellus de origine Gentis Romanæ," and by some ascribed to Asconius Pedianus, though it bears the names of Victor and Livius, proposes a history of the whole period, from the uncertain time of Janus and Saturn to the 12th consulship of Constantius, but really closes in the first year of the city. This treatise was published, together with the works of Dionysius Halicarnassensis, at Frankfort, in 1586; and with a collection of ancient historians, by Gothofred, in 18mo. at Lyons, in 1591. The biographical treatise under the title "De Viris Illustribus Urbis Romæ," received by many as the work of Aurelius Victor, commences with Proca king of the Albans, and terminates with Pompey; it was published in 4to. with notes, by Machæus, at Leipzig, in 1516, and with those of Lycophtenes, in folio, at Basil, in 1563. "The History of the Cæsars from Augustus to Constantius," the unquestionable production of Victor, was first published by Schurerus at Strasburg, in 8vo. in 1505; at Venice, by Aldus, in 1516; by Schottus, at Antwerp, in 1579, in 8vo.; and at Basil, in folio, in 1546, with Suetonius and other Augustan writers. The first general edition of all the writings of Aurelius Victor was printed at Antwerp, in 8vo. with the commentary of Schottus, in 1579, by Plantin, and in 1582, again by Gruter, at Hanau, in the 2d volume of the "Historiæ Augustæ Scriptores," in folio, in 1610. An elegant edition, with heads, "cum notis variorum," was printed in 8vo. in 1671; another by Pitiscus, at Utrecht, in 8vo. 1696; and a third by Arnezius, in 4to. at Amsterdam, in 1733. Aurelius Victor is reckoned an industrious and faithful historian; but his style is much less elegant than that of the earlier writers of the Roman history. Fabr. Bib. Lat. l. iiii. c. 9. t. 2. p. 79. &c. See AUGUSTA *Historia*.

AURELIUS, in *Entomology*, a species of PAPILIO that inhabits India. The wings are brown, black at the tip, and spotted with white; two eye-shaped spots on the posterior ones beneath. Fabricius, &c.

AURELIUS, in *Geography*, a military township of New York, in Onondago county, on the Owaseo lake, having the Cayuga reservation lands on the west, and Marcellus to the east, nine miles east of the ferry on the Cayuga lake. By the state census of 1796, 123 of the inhabitants are electors.

AURELLA, in *Entomology*, a species of PHALÆNA (*Tinea*), wings golden, posterior ones black, with a stripe of silver on the first pair. A minute insect that inhabits Europe, and feeds on apple trees.

AURENG-ZEBE, AURUNG-ZEBE, or AURUNG-ZEBE, denoting "Ornament of the throne," in *Biography*, the great mogul, was the third son of Shah Jehan, and born in the year 1618. His disposition was serious and thoughtful; and in order to prevent jealousy and suspicion, he assumed the austerity of a religious mendicant. Dara, however, his elder brother, discovered his real character through this disguise; and as he had contrived to gain the esteem and confidence of his father, Dara used to say of him, "I fear none of all my brothers but this teller of beads." Shah Jehan, who thought it most prudent and safe to remove all his sons from court, sent Aurung-Zebe to govern the Deccan, where he made an unsuccessful attempt against the king of Golkonda. Towards the close of the year 1656, Dara, endeavouring to gain possession of the empire, confined his father Shah Jehan; upon which Aurung-Zebe began to make preparations, and with the professed design of securing the throne to his brother Morad, who was then at Akmedabad, requested that he would join him with his forces at Eugene, the capital of the province of Malva. In the beginning of the year 1658, he marched
form

from Aurungabad in the Deccan, and the two brothers joined at Eugene, near which place they encountered and defeated the troops which Dara had sent to oppose them. They afterwards marched towards Delhi; and in the fields of Kejoul, near Agra, obtained a complete victory over Dara and his army; so that Dara himself fled towards Lahore, and Aureng-Zebe entered the castle of Agra. After this victory he took possession of the throne, July 23, A.D. 1658, and was proclaimed emperor at the town of Farabad, about six miles from Delhi. On the 15th of May 1659, he was proclaimed a second time, and he then issued a decree, that for the future the beginning of his reign should be dated from the first Ramazan, in the year 1069 of the Hijrah, or the 12th of May 1659. For the security of his throne, he confined his father at Agra; and his brother Morad, in violation of a solemn oath of fidelity, he imprisoned in a fortress near Delhi, where he was afterwards beheaded. During the civil war which commenced at the time of his accession to the throne, and which was continued till his power was completely established, his brother Sujah was first defeated at a place called Kaura, in the province of Bengal, and compelled to fly; but being concerned in a plot for dethroning him, he was put to death, and his whole family was extirpated. Dara was taken prisoner, and brought in triumph to Delhi, and sent from thence to Khesrabad, a place at the distance of about 118 miles, where he was murdered by Aureng-Zebe's order, August 28th, 1659. In 1661, Aureng-Zebe confined his own son Mahommed, and the son of Dara, in the castle of Gualiar, where the former died, as some say, in consequence of confinement, and the latter was dispatched by slow poison. Aureng-Zebe, after his accession to the throne, found some difficulty in persuading the chief cadi to acknowledge his sovereignty, because the old king, Shah Jehan, was still living. But another cadi being appointed in his room, the ceremonial of coronation was performed, and Aureng-Zebe obtained undisputed and peaceable possession of the throne. The recollection, however, of the crimes by which he had gained the sovereignty, was an occasion of remorse; and in order to quiet his mind, he imposed upon himself a rigorous penance; eating only barley bread, herbs, and fruits, and drinking nothing but water. This abstemious diet brought on an illness, which endangered his life; and during the agitation which ensued at court, he had an opportunity of displaying that resolution and firmness of mind for which he was always distinguished. Although he had deposed his father, his behaviour to him was so respectful and submissive, that he at length obtained, before his death in 1666, his forgiveness and paternal blessing. When Aureng-Zebe became emperor, he assumed the titles of "Mohy o'din," i. e. the reviver of religion; and "Alumguir," or the conqueror of the world, of which his ignorance and vanity led him to believe that he possessed three parts in four.

From the year 1660 until the year 1678, there prevailed, through Hindostan in general, the most profound peace that had ever perhaps been known; but Aureng-Zebe disdained to have any other boundary on the south besides the ocean. Accordingly, the conquest of the remote part of the Deccan employed a very considerable part of his leisure, during the latter part of his reign, when the whole of that region, together with the peninsula, a few mountainous and inaccessible tracts excepted, were either entirely subjected, or rendered tributary to the throne of Delhi. Aureng-Zebe was particularly induced to subdue the Deccan, by the determined spirit and growing power of Sevajee, the founder of the Marhatta state, who, by his conquests in Vishapour, appeared under the character of his rival. Soon after he had quelled by

his personal valiance a rebellion of the Patans beyond the Indus, in 1678, his persecution of the Hindoos flurried up the Rajpoot tribes in Agimere. This war he also undertook in person; but he and his whole army were shut up between the mountains, and the empress herself was taken prisoner. She, however, and also the emperor, were permitted to escape. This disaster did not discourage him from carrying the war into the Rajpoot country again, in 1681; when he took and destroyed Chettore, the famous capital of the Rana, as well as all the objects of Hindoo worship which he found in this place. Nevertheless the spirits of these gallant people were still unsubdued, and Aureng-Zebe was under a necessity of granting them peace. In Mr. Orme's "Historical Fragments of the Mogul Empire," we have a letter written by Jeivont Sing, raja of Joudypour, to Aureng-Zebe, expostulating with him on the unjust measures he was pursuing with respect to the Hindoos. This letter breathes the most admirable spirit of philanthropy, and of toleration in matters of religion, together with the most determined resolution to oppose the meditated attack on the civil and religious rights of the Hindoos. Whilst Aureng-Zebe was engaged in his contests with the Rajpoots, consisting of several of the most warlike tribes among the Indians, his son, Sultan Mahommed Akbar, revolted from him, and joined them; but he was pursued by the emperor to Deccan, from whence he found means for escaping to Persia. In the year 1688, upon the death of Sevajee, the rising state of the Marhattas devolved on his son Sambajee, who was afterwards betrayed into the hands of Aureng-Zebe, and barbarously put to death. Still, however, the mountainous parts of Baglana were unsubdued; and although the kingdom of Vishapour was reduced in 1686, and Golconda in the following year, he found it very difficult to prosecute his conquests towards the west, as we may infer from his camp's being fixed on the Kiltuah river, about 200 miles to the north-east of Goa, in 1695. But we have no regular history of any later period than the 10th year of Aureng-Zebe, or the year 1670, when Mr. Dow's history terminates. It is said, that Aureng-Zebe was employed in the Deccan from the year 1678 to the time of his death, and was actually in the field during the greatest part of the last fifteen years of his life. This dereliction of his original empire and capital for nearly thirty years, was the occasion of various disorders. To this circumstance were owing the second rebellion of the Rajpoots in Agimere, that of the Patans towards the Indus, and also that of the Jats, or Jates, in the province of Agra. Besides the conquests of Vishapour, Golconda, and the Carnatic, to the south; and those in the kingdom of Afam to the north, Aureng-Zebe reduced Bengal, and rescued the mouths of the Ganges from the Portuguese pirates, who had long infested them. Under his reign the empire attained its full measure of extent. His authority reached from the 10th to the 35th degree of latitude, and nearly as much in longitude; and his revenue, says major Rennell, exceeded thirty-two millions of pounds sterling, in a country where the products of the earth are about four times as cheap as in England. Fraser estimates the whole revenue of the empire from 21 soubahs, or provinces, at 12,071,876,840 dams, which at 320 dams to a pound sterling, amount to 37,724,615 l. 2s. 6d. Such indeed was the reputation for power and wealth which Aureng-Zebe acquired, that embassies were sent to him from all the neighbouring nations, as well as from the European powers, who wished to obtain commercial advantages in his dominions. But under an apprehension of the designs of his sons both against himself and against each other, he was obliged to pass most of his time

in his camp, which formed a kind of moving city. It is described by the curious traveller Bernier, who followed it from Dehli to Cashmir. The guard of cavalry consisted of 35,000 men, that of infantry of 10,000. The number of horses, mules, and elephants, was computed at 150,000; of camels and oxen at 50,000 each; and of persons between 300,000 and 400,000. Almost all Dehli followed the court, whose magnificence supported the industry of its trades and artificers.

Aureng-Zebe fixed his residence, when in winter quarters, at Ahmednagar in the Deccan; and here he died, February 21st, 1707, in the 96th year of his age. According to the directions of his will, he was buried in the cell of a holy dervise near this city; and as he professed great zeal for Mahometanism, the votaries of this religion deemed it a meritorious pilgrimage to visit his tomb, particularly on the 28th of the month Zeccadil, the day on which he died. In his will, after making this declaration, "I came naked into the world, and naked I go out of it," he prohibits any ensigns or royal pomp to accompany his funeral, and any concern to be manifested by his fortunate children about a monument; and he orders 120,000 rups, about 125 l. to be distributed among the poor at his funeral. Aureng-Zebe foresaw the contests that would arise between his sons for the empire; and it has been asserted that he made a partition of it among them. His will expressly intimates, that he had made a division among his children, for preventing confusion and bloodshed; and he says, that as there were two imperial seats, Agra and Dehli, whoever settled in Agra might have the provinces thereof, Deccan, Malva, and Guzerat; and he who resided at Dehli, might have Cabul and the other provinces. Nevertheless, two letters, written by Aureng-Zebe to two of his sons a few days before his death, cited by major Rennell, indicate no intention of dividing the empire, but express in doubtful terms his apprehension of a civil war. These letters furnish this striking lesson to frail mortality, that however men may forget themselves during the tide of prosperity, a day of 'recollection' will inevitably come sooner or later. Here we are presented with the dying confession of an aged monarch, who made his way to the throne by the murder of his brethren, and the imprisonment of his father, and who, after being in peaceable possession of it, persecuted the most inoffensive part of his subjects, either through bigotry or hypocrisy. Here we behold him in the act of resigning *that*, to obtain possession of which he incurred his guilt; and presented to us as a mere sinful man, trembling on the verge of eternity; equally deploring the past, and dreading the future. How awful must his situation appear to him, when he says, 'wherever I look, I see nothing but the DIVINITY.'

Aureng-Zebe left four sons; Mauzum, afterwards emperor, under the title of Bahader Shah; Azem, and Kaum Bukh, who severally contended the empire with their elder brother; and Akbar, who had rebelled against his father, and fled to Persia. The death of their father was the signal of hostility between Mauzum and Azem; the former approached from Cabul, and the latter from the Deccan, and disputed the possession of the whole empire (for Azem had proposed a partition of it), with armies of about 300,000 men each. Near Agra it was decided by a battle, and the death of Azem. Mauzum was proclaimed emperor, and reigned between five and six years. In the course of fifty years after the death of Aureng-Zebe, a succession of weak princes and wicked ministers annihilated the extensive and mighty empire which he had established.

Aureng-Zebe possessed many talents which qualified him
VOL. III.

for governing a large empire. He was sober, active, and resolute, and though he was not scrupulous as to the means by which he acquired power, he was generally mild in the exercise of it; but he allowed his subordinate governors and courts to oppress the people with impunity. In the observance of the outward ceremonies of religion, he was rigidly exact; and his zeal for making proselytes, whatever were the views in which it originated, led him to adopt measures of violence and persecution. In his dress, he was plain; in his mode of living, abstemious; in his ordinary occupations, when his politics did not afford him intervals of leisure, he condescended to employ himself in menial employments, which he deemed to be a great lord's duty. The traveller Gerbel, who saw him in 1695, gives the following description of his person. "He was of a low stature, with a large nose, a white beard, and olive complexion. He wore a turban, and slooping with age, and broad shoulders. He wore a buff, yellow, and old pattern waistcoat, and a long black coat, which he wore lined with long hair, and a purple saddle." Frazer's History of the East, vol. iv. p. 26—29. French's Memoir of a Map of the East, vol. ii. p. 61—64. Mod. Un. Hist. vol. vi. p. 426—449.

AURFOLA, the crown of glory, given by painters and statuary to saints, martyrs, and confessors, as a mark of the victory which they have obtained.

F. Sirmond says, this custom was borrowed from the heathens, who used to encompass the heads of their deities with such rays.

AUREOLARIA, in *Entomology*, a species of PHALANX (*Geometra*), of a small size, that inhabits Germany. The wings are deep yellow, with three streaks and the margin brown. Fabricius.

AUREOLUS, MARIUS ACHIUS, in *Biography*, a native of Dacia, was advanced from the humble occupation of a shepherd, by enlisting in the Roman army, to the command of a body of cavalry, and distinguished himself by the service he performed to the emperor Gallienus, in a battle against the rebel Ingenuus. Whilst he commanded in Illyricum, he defeated Maerianus, who assumed the purple, and continued to maintain a partial attachment to Gallienus. At length, A. D. 268, a considerable army, stationed on the Upper Danube, invested with the imperial purple their leader Aureolus; who, detaining a confined and barren reign over the mountains of Rhetia, passed the Alps, occupied Milan, threatened Rome, and challenged Gallienus to dispute in the field the sovereignty of Italy. Defeated by the emperor in a battle near Milan, Aureolus retired into the city; and during the siege, he contrived to form a conspiracy in the besieging army of Gallienus, which terminated in his death. Upon the accession of Claudius II., Aureolus was compelled to deliver up the city and himself to the discretion of the new emperor. The judgment of the army pronounced him worthy of death; and Claudius, after a feeble resistance, consented to the execution of the sentence. Crevier's Hist. Emp. vol. iii. p. 77, &c. Gibbon's Hist. vol. ii. p. 2—7.

AUREOLUS, in *Entomology*, a species of SCARABEUS, of a depressed and somewhat angulated shape, and powdered with gold; thorax and shells dotted with black. Inhabits Davia. Pallas.

AUREOLUS PONS, now PONTISOLS, in *Geography*, a bridge of Italy, over the Adda, 13 miles from Bergamo, and 32 from Milan, near which the usurper Aureolus was defeated by the army of the emperor Gallienus. Near this place, in 1703, the obstinate battle of Cassino was fought between the French and the Austrians.

AURESS, AUREL, or HERRS, JIBEL, the name gives
3 A

to the mons Aurafius of the middle age, and the mons Audus of Ptolemy, being a part of the *ARIAS*, extending southward from Constantina, quite to Biledulgerid. See *AUREUS*.

AURETTE, a river of France, which runs into the Eure, near Bourges.

AUREUS, in *Entomology*, a species of *STAPHYLINUS*, that inhabits Siam. The head, thorax, and wing-cases, are covered with yellowish or golden down; abdomen black, fasciated with ash colour. Fabricius, &c.

AUREUS, in *Geography*, a mountain of Mœsia Prima, near the Danube.—And also, a town of the same name at the foot of it on the same river.—Also, a mountain of the northern part of the island of Corfica, the ridge of which runs out to the north-east and south-east, and forms a kind of elbow. The emperor Probus planted vines on this mountain. Ptolemy.

AUREUS, in *Ichthyology*, a very splendid species of *CHÆTODON*, figured and described by Bloch in his History of Fishes, under the title of *C. aureus*, and la bandouliere dorée. This author acquaints us, that he found the drawing of this species amongst the designs of father Plumier, and that it inhabits the Antilles, but of its history he is entirely ignorant.

The body is of an oval form, golden-yellow colour, and covered with hard denticulated scales; the mouth is small, lips strong, and jaws furnished with setaceous teeth; gill-cover of a single piece; lateral line rather arched; fins yellow, green at the end; pectoral and tail fin rounded, the others falcated; in the dorsal fin twelve rays.—It is specifically distinguished by being of a golden colour, and having a spine near the cheek bone. Gmelin, Bloch, &c.

AUREUS, in *Natural History*, a species of *LIMAX*, that inhabits trees in Denmark and Norway, and described by Müll. as being yellow, and without spots. This creature is an inch and a half in length; beneath white; feelers, and a line between them, black.

AUREUS, in *Ornithology*, a species of *ORIOIUS* in the Linnæan system, and Paradise bird in that of Latham. A bird that is supposed to inhabit New Guinea. General colour tawny yellow, with the frontlet, chin, edges of the wings, and tail black.—*Of.* The length of this bird is eight inches; bill an inch long, and rather bent; shafts of the tail feathers, and fringe, near the tip yellow. This is the golden paradise bird of Latham; le troupiale des Indes de Buffon; and le rolhier de paradis of Buffon.

AUREUS, a species of *PSITTACUS*, that inhabits Brasil, and is called by English naturalists the golden-crowned parakeet. This kind is green, with the cere and orbits blueish-flesh colour; crown golden; an oblique blue band on the wing-coverts. Gmelin. Briss. calls it *psittaca Brasiliensis*; and Buff. *perruche couronnée d'or*.

AUREUS, in *Zoology*, the species of *CANIS* usually called the JACKAL; an animal about the size of a middling dog, and specifically distinguished by having a straight tail, and body pale fulvous. Schreber Sæugth.—Gmel. &c. Kæmpfer calls it *lupus aureus*; Valent. *vulpes Indiæ Orientalis*; Briss. *adil*; Buffon, *chacal*, *adive*; Vossmaer, *chien sauvage Indien*; and Gmel. and Penn. *schakall*, &c.

This animal inhabits the warmer parts of Asia and Africa, lurking among the woods and mountains in the day time, and venturing out in search of prey only during the night; when they assemble together in herds to the amount of two or three hundred, and indiscriminately attack and devour the lesser kinds of animals and birds; and will occasionally eat also certain kinds of vegetables. The voice of the jackal is described as peculiarly hideous, consisting of a kind of howl-

ing and indistinct barking; and when they hunt in troops, by their dreadful yellings alarm and put to flight deer, antelopes, and other timid quadrupeds; while the lion, instinctively attending to the clamour, is said to follow till the jackals have hunted down the prey, and having fatiated himself, leaves only the mangled remains to be devoured by the jackals. It is for this reason, Dr. Shaw observes, that the jackal is popularly termed the lion's provider. When pressed by hunger, jackals have been frequently known to enter towns, and devour indiscriminately whatever animal substance they can find. They commit ravages among the flocks, kill fowls, &c. and have been known to attack mankind.

There is great reason, according to Dr. Shaw, for supposing this animal to be the real origin of the dog, since almost all its manners and propensities are the same. When taken young, it is easily tamed; attaches itself to mankind, distinguishes its master, comes on being called by its name, shews an attachment to dogs instead of flying from them, and has all the other peculiarities of character by which the dog is distinguished; amongst others, the important observation of professor Guidentadt, who has given an accurate description of the jackal in the Petersburg Transactions, should by no means be omitted, viz. that the jackal and dog agree in the structure of the coecum or short intestine, and differ in that respect both from the wolf and the fox.

Dr. Pallas has favoured the world with an accurate description of this animal. In external figure, he remarks, the jackal resembles the wolf more than the fox. It is also larger and stands higher on its legs than the fox. The head is of a fox-red colour above, mixed with ash-grey hairs which have each a blackish ring and tip; the upper lip is white on each side of the nose, and the throat is of the same colour; the whiskers, the long hairs on the chin, and those above the eyes, which are five in number, are black; the ears are fox-red externally, and white internally; the neck and back are all over grey-yellow, and both, but especially the latter, are dashed with a shade of dusky, owing to the tips of the long hairs on those parts; the under part of the body, and the legs, are of a light reddish yellow, but the shoulders and thighs are externally of a fox-red; the claws are black; the thumb claw stands higher than that of the dog, and is crooked; the tail is straight, somewhat longer and more hairy than in the wolf, and is of a greyish-yellow, more inclining to fox-red towards the end; the long hairs have black tips, and consequently the tip of the tail appears black; the hair of the jackal is coarser and stronger than that of the wolf, and is longest on the shoulders and tail, where it measures four inches; on the neck and back it is shorter by an inch; between the hairs is situated a woolly fur of a grey colour; the four middle front teeth are of a truncated form, or, as if cut off, flat, not perceptibly notched or indented; the two exterior larger ones in the upper jaw are somewhat larger than the under; the grinders are six on each side, the first being the smallest, and of a conical shape; the next grinders, to the number of two in the upper, and three in the lower, are gradually larger, and divided into three points; the fourth of the upper jaw and the fifth of the under are the largest, and have two points; the remaining ones stand deeper in the jaw or more inwards, and are smaller than the preceding; the tongue has, on each side, a border or row of small verrucæ or warts.

Mr. Pennant describes the usual length of the jackal to be about two feet and a half; the female rather smaller than the male, and with from six to eight paps. Dr. Pallas counted in a young jackal three teats on one side, and four

on the other, of which the foremost one was situated near the side of the breast.

The more we consider the nature and manners of this animal, says Dr. Shaw, the more reason we shall find to coincide with professor Guldenstadt in opinion, that the jackal is the real origin of the dog (unless, indeed, we allow the wild dogs of Africa to be the dog in a state of nature). M. Guldenstadt very properly observes, that the natale solium of the wolf does not seem to fit it for the supposed origin of the dog, since it is generally confined to the frigid zone: its size is also against the supposition; for the natural size of any species of animal appears to be between that of the large and small varieties. The fox is still more unlike the dog, as to some particulars in the structure of the intestines; the native country of the jackal, which is properly Asia Minor, is the land where we should naturally suppose the primæval domestic dog to have originated. The jackal, according to M. Guldenstadt, has a natural propensity to follow mankind, instead of flying from him, like the wolf and the fox. The whelp, he adds, is very readily tamed, and when grown up, assumes all the habits of the domestic dog. That the jackal and dog readily intermix, appears from various testimonies, according to Buffon. M. Guldenstadt cannot consider the recurvate tail as a specific character of the dog, but thinks it may have originated from cicuration. The general colour of the jackals, which this author has seen, is a dirty fulvous, rather blacker on the back, and yellowish-white beneath; on each knee in general a black patch, and the tip of the tail of the same colour.

AUREUS, in *Antiquity*, the Roman gold coin, equivalent to 25 denarii, or 100 sesterces. Suet. in Oth. c. iv. Tacit. Hist. lib. i. Beverin. de Ponder. p. 33. seq.

In *Modern and Middle Age Writers*, it is called *solidus*, or *solidus aureus*.

The aureus, according to Arbutnot, generally weighed double the denarius; whence it must have been worth, according to the first proportion of coinage mentioned by Pliny, 11. 4s. 3½d. sterling.—According to the proportion that now obtains among us, 11. 0s. 9d. Plin. lib. xxxiii. c. 3. Arbut. tab. 25.—Ainsworth, however, makes the aurei (denarii) of the higher empire, weigh only five penny-weights; and under the lower empire, little more than half so much.

The weight of the aureus was gradually diminished by the emperors. The consular aureus weighed at a mean 126 troy grains, 40 of them being contained in the Roman pound; the imperial aureus, being 45 to the pound, weighed 112 grains; and the solidus, being 72 to the pound, weighed 70 grains. Alexander Severus coined pieces of one-half and one-third of the aureus, called semisses and tremisses; whence the aureus came to be called solidus, as being their integer. Phil. Transf. vol. lxi. part ii. art. 42. See COIN, and DENARIUS.

AURIA, VINCENT, in *Biography*, an Italian historian, was born at Palermo in 1625, devoted himself to the profession of the law, and was admitted doctor of laws at Catania, in 1652. He afterwards relinquished this employment, and possessing a liberal fortune, dedicated his time to literature. His works were chiefly Italian, and partly Latin, on subjects of history and antiquities. Those in highest estimation are ‘An History of the Great Men in Sicily,’ 4to., Palermo, 1704; and ‘An History of the Viceroys of Sicily,’ fol. Palermo, 1697. Nouv. Dict. Hist.

AURICELLA, in *Entomology*, a species of PHALÆNA (*Tinea*) found in France. It is snowy-white, with testaceous streaks on the wings, and a projecting tuft of hairs on the first joint of the antennæ.

AURICII, in *Geography*, a town of Germany, in the circle of Westphalia, and county of East Friedland, ten miles north-east of Lubben. It is encompassed with forests that abound with game. N. lat. 53° 28'. E. long. 6° 50'.

AURICHALCEUS, in *Entomology*, a species of SCAPABEUS, of a brassy-opaque colour, wing-cases pointed and spotted with white. Fabricius. Inhabits the East Indies.

AURICHALCEUS, a species of CERAMBYX (*Callidium Fabr.*), of a small size. It is brassy-brown and shining; thorax depressed; antennæ and legs black. Degeer.

AURICHALCEUS, a species of CARABUS that inhabits Denmark. It is of a yellowish colour, and brassy above. Mull. Zool. Dan.

AURICHALCUM. See ORICHALCUM.

AURICLE, AURICULA, in *Anatomy*, the external ear, or that part of the ear which is prominent from the head. The word is a diminution of *auris, ears*; for the description of this part, see EAR.

AURICLI, is also applied, by the English anatomists, to denote those cavities of the heart into which the veins pour their blood; but foreign anatomists call these cavities *venous sinuses*, and apply the word *auricle* to those little processes of the general cavity which resemble an animal's ear in shape. See HEART.

AURICOLLIS, in *Ornithology*, a species of MOTACILLA. Colour above olive, beneath orange; belly yellowish; vent whitish; greater wing-coverts, and middle tail-feathers ash-colour; lateral ones white within, without and at the tips black. Inhabits Canada. Gmelin.

AURICOMA, in *Entomology*, a species of PHALÆNA (*Noctua*), with wings of a greyish-brown colour; upper pair marked with black, in streaks and characters; legs annulated with white at the tip. Gmel. &c.

AURICULA LEPORIS, in *Botany*. See BUPHTHALMUM, and BUPLEURUM.

AURICULA Maris. See ARNARIA, CERASTIUM, HIERACIUM, MYOSOTIS, and SILENE.

AURICULA Urvi. See ARCTIA, PRIMULA, DODECARTHEON, and VERBASCUM.

AURICULA, in *Coneology*, a species of CARDIUM, with a white and very pellucid shell, that is found on the shores of Arabia and Egypt. It is heart-shaped and sub-rhombic; ribs twenty-four on each side; the grooves very finely crenulated; beaks remote. Fork. About two inches and a quarter in length, and one inch and three quarters in breadth.

AURICULA, a species of PATELLA, with a subrotund shell, radiated with furrows and striae; apex recurved; internal cavity ear-shaped. Inhabits the shores of the islands of Borneo, Santa Cruz, and St. Thomas. This shell is snowy-white, with the crown sometimes encircled with violet; sometimes radiated with black; brown within; border white or yellow; and the vertex brown. Gmelin, &c.

AURICULA, in *Gardening*, a well-known beautiful plant of the flower kind. This is considered in the Linnæan system as a species of PRIMULA. See PRIMULA.

The varieties of this plant are extremely numerous, as every year produces a great number of flowers, different in shape, size, and colour; in the leaves also there is often great variety, so that the experienced florist is frequently capable of distinguishing the particular sorts by that means. The characters of a good auricula are, that the stems of the flowers be lofty and strong; the footstalks of the single flowers short, with the umbels regular and close; the neck of each flower short, and the flowers large, regular, and spreading, but not inclinable to cup; the colours very bright

and well mixed; the eye of the flower large, round, and of a good white or yellow, with the tube or neck not too wide. Such flowers as want any of these properties are constantly rejected by experienced florists; and as the varieties every year increase from seeds, the bad ones are turned out to make room for such as are good. The proper time for sowing the seed is commonly about August; but a month or two later will answer the purpose. The most proper soil for it is a good light, fresh, sandy mould, mixed with very rotten farm-yard dung, or well rotted dung from the bottom of old hot beds. The manner of propagating these flowers, when thus obtained, is by offsets or slips, taken from the old roots in April, when the flowers are in full blow. As these plants which have strong single heads always produce the largest clusters of flowers, the curious should pull off the offsets, as soon as it can be done with safety to the plant, in order to encourage them to flower stronger. But in order to have them to flower in the greatest perfection, they should be preserved from too much wet in winter, and have free air, and not too much sun. And in the beginning of February, if the weather be mild, the earth in the auricula pots should be taken off as far as it can be without disturbing the roots, and such as is new and fresh laid in its place. The pots must then be well covered with mats in the night to defend them from frosts while the plants are budding. When the stalks begin to become long, they should be defended from heavy rains, but not kept too much under cover, as it is apt to draw up the stalks too long, and make them weak. They should likewise be watered frequently, a little at a time, care being taken that none of the water falls on the plant. When the flowers begin to open, the pots should be removed to stages, formed with shelves, one above another, placed under cover, but open to the morning sun, and sheltered from the mid-day sun. They may remain in this situation till their flowering is over, and then be set out to have the benefit of the rains and free air, for the ripening of their seeds, which should be carefully preserved and spread on paper to dry before they are put up.

AURICULA, in *Natural History*, a species of LUCERNARIA, of a shape resembling a flask, with a round neck; the lower part is very large, and encircled with eight tufts of tentacles or feelers. Fabr. Groen. Müll. calls this species *holothuria lagenam referens tentaculis octonis fasciculatis*. It inhabits the Greenland seas, adheres firmly to the leaves of the largest ulvæ, and rarely moves; feeds on marine insects, particularly on onisci, and is about an inch and a half in length. The body is black or reddish, and sometimes, though rarely, chestnut, glossed with gold; the mouth is white; the tufts of tentacles on the body black, with white tips.

AURICULA *Judeæ*, or *Jew's ear*, a kind of fungus or mushroom, somewhat resembling, in figure, a human ear.

It grows on old elder-trees, the tree on which, as some pretend, Judas hanged himself; and hence, they think, the name is derived.

This fungus steeped in water, and applied to the eyes, is said to free them of inflammations; but its chief use is under the form of a gargle in decoctions, against inflammations of the throat, or swelling of the tonsils.

AURICULÆ *Alvearium*. See ALVEARIUM.

AURICULÆ, *primus musculus*, in *Anatomy*, the name given by Fallopius to the *attolens auriculam*. He also calls the *extrahens auriculam* the *secundus musculus*.

AURICULAM *Retrahens*. See RETRAHENS.

AURICULAR, something that relates to the ears.

Thus we say, an auricular witness, *auritis testis*, a witness by hearing.

AURICULAR *Confession*, is that made in the ear privately.

AURICULAR *Medicines*, are such as are suited to the cure of distempers of the ear.

AURICULARIA, in *Botany*. See HEDYOTIS.

AURICULARIA, in *Conchology*, a species of HELIX, or fresh-water snail, found in stagnant waters in Europe. This shell is imperforate, obtusely-ovate, with a short and acute spire, and capacious aperture. Linn. Faun. Succ. Müll. Zool. Dan. Donov. Brit. Shells, &c. It is a very thin and brittle shell, rather pellucid, and of a horny or whitish colour; length from half an inch to an inch and a quarter, and easily known by the very ventricose appearance of the first whorl.

AURICULARIA, in *Entomology*, a species of FORFICULA, that is perfectly known in England by the name of common ear-wig, or ear-piercer, from an opinion generally prevalent that it creeps into the ears, and thence into the brain, of people who inadvertently lie down to sleep in fields, gardens, and other places which those creatures inhabit. It is specifically distinguished from other insects of the same genus by having the wing-cases white, and fourteen joints in the antennæ. Lister calls it *scarabæus subrufus cauda furcata*; and Frisch *vermis auricularius*.

The ear-wig is a very destructive creature; both in the orchard and flower-garden, and especially to wall-fruit, carnations, and roses. In order to prevent the mischief attending them, it is usual to erect stands supporting basins of water, or to hang the hollow claws of crabs or lobsters, tobacco-pipes, &c. on sticks in different parts of the garden, for them to creep into in the day-time, in order to catch and destroy them. Reeds open at both ends, and placed among the branches of fruit-trees, are also a good trap for them, as they crowd into their open channels, and may be easily collected, and thrown into a tub of water.

That the ear-wig or ear-piercer will creep into the ears of such as sleep in the open air, in those places where they inhabit, cannot be denied; but those who are acquainted with the anatomy of the head, assert that it is impossible it can ever enter the brain, because, say they, there is no open communication between the ear and the brain, and the jaws of the insect are too weak to effect one. In France the same prejudice prevails against this creature, among the lower orders of people, as in England; and, as with us, it is called from that circumstance the ear-piercer (*perce-oreille*). Its most formidable weapon, in their opinion, is the pair of forceps at the extremity of the body, a character peculiar to the genus, and not to this particular species. "C'est cette armure," says Degeer, "qui a fait donner a ces insectes le nom de forficula, et en françois le nom redoutable de perce-oreille, parce qu'on s'est imaginé que cet insecte l'intrusoit dans les oreilles, que de là il pénétrait dans le cerveau & faisoit périr. Ceux qui savent l'anatomie, connoissent l'impossibilité d'une pareille introduction dans l'intérieur du crâne, attendu qu'il n'y a point d'ouverture qui y communique; mais la frayeur de quelqu'un, a qui un de ces insectes fera par hasard entré dans la conduit de l'oreille, aura pu donner lieu a cette fable, &c."

The use of the forceps, with which the ear-wig is furnished, is to defend itself against other small insects, and when touched it never fails to display them in a threatening posture, by turning up the extremity of its abdomen. The larva differs very little from the complete insect, and runs with great agility.

AURICULARIS *Abductor*, in *Anatomy*. See ABDUCTOR.

The finger next the little finger is also called auricularis, by the Greeks *αυρις*, because used in picking the ear.

AURICU-

AURICULATA, in *Natural History*, a species of *Vorticella* that inhabits the fresh waters of Denmark. It is naked, with two small bristles at the tail. Mill. Hist. Verr. This kind is pellucid, cylindrical; the aperture dilated into a small ear on each side.

AURICULATA, a species of *Doris*, of a white colour, with dorsal fasciculate papillæ of a red colour tipped with white. This kind inhabits the North seas. Gmelin.

AURICULATED Leaf, in *Botany*, is a leaf which has a lobe on each side towards the base.

AURIENSIS, in *Ancient Geography*, an episcopal city of Africa, in Mauritania.

AURIFER, in *Entomology*, a species of *Circulio*, with a ferruginous body spotted with gold. Fabricius, Sp. Inf. Inhabits America, and has the front legs long.

AURIFER, a beautiful species of *Buprestis* that inhabits Cayenne. The wing-cases are green, with numerous impressed golden dots, and each terminating in two teeth; legs azure. Fabricius. Olivier.

AURIFLAMMA, in the *French History*, properly denotes a flag or standard, belonging to the abbey of St. Dennis, suspended over the tomb of that faint, which the religious, on occasion of any war in defence of their lands or rights, took down, with great ceremony, and gave to their protector or advocate, to be borne at the head of their forces. Du-Cange.

AURIFLAMMA is also sometimes used to denote the chief flag or standard, in any army.

AURIFLUA, in *Entomology*, a species of *Phalena* (*Bombyx*), that infests the apple-trees in Germany, and bears a strong resemblance to *phalena chrysothæa*. The wings are white, with a brown rib on the underside of the anterior pair; tail bearded and yellow. The larva is hairy, black, with red lines, and white dots on the sides; a protuberance on the neck, and another near the tail. Gmelin.

AURIGA, in *Astronomy*, the *Waggoner*; a constellation of stars in the northern hemisphere: whose stars, in Ptolemy's catalogue, at 14; in Tycho's, 27; in Hevelius's, 40; in the Britannic catalogue, 66. This is one of the 48 asterisms, mentioned by all the ancient astronomers; and represented by the figure of an old man in a kind of sitting posture, with a goat and her kids in his left hand, and a bridle in his right. Besides the Hoedi, this constellation includes another of the stars which the ancients distinguished by peculiar names, that is, Capella, the goat Capra, and Amalthea Capra, which is the bright one near the shoulder, and supposed to be the mother of the Hoedi, and the nurse of Jupiter. The Hoedi, or the two stars in the arm of Auriga, were regarded by the ancients as affording prefaces of the weather: and they were so much dreaded on account of the storms and tempests that succeeded their rising, that they are said to shut up the navigation of the sea at this season. When the day of their peculiar influence was passed, they celebrated a festival with sports and games, under the denomination of "Natalis Navigationis." Germanicus calls them unfriendly stars to mariners; and Virgil joins them with Arcturus, mentioning their setting and rising as circumstances of the most important preface. To the same purpose all the ancient critics represent a part of the constellation Auriga, if not the whole of it, as deserving particular attention, and as much an object of terror as the blazing Arcturus.

AURIGA, in *Ichthyology*, a species of *Chætodon*, found in the Arabian seas. It is whitish, obliquely fasciated with brown; and the fifth ray of the dorsal fin, filiform. Forsk. Fn. Arab.

The length of this fish is five inches; form nearly rhombic; whitish colour tinged with blue; the brown oblique

bands sixteen in number, and disposed nearly parallel to each other. The scales are rhombic: head lined above flat, scaly, of a reddish white colour, with four transverse fulvous stripes; iris black; mouth conic and compressed; lip retrolateral and equal; posterior margin of the dorsal fin black; anal fin varied with black and yellowish-white; tail truncated and fulvous; lateral line bent.

AURIGNAC, in *Geography*, a town of France, in the department of the Upper Garonne, and chief place of a canton in the district of St. Gaudens, 23 miles south-west of Toulouse, and 10 north-east of St. Gaudens.

AVRIGNY, *HYACINTH ROSTRATUS*, in *Botany*, a French historian, was born at Courtenay in 1715, became a member of the society of Jesus in 1761, and died in 1779. His works, comprised in four volumes, 12mo, printed at Paris in 1725 and in 1757, are "Memoires chronologiques et dogmatiques, for Ecclesiastical History, from 1700 to 1716," with critical remarks; a d. s. Memoires for the Universal History of Europe, for the same period. They are much valued for variety of materials, accuracy of dates, and elegance of style; but are not deemed impartial. New. Dict. Hist.

AURIGRAPHUS, from *aurum*, gold, and *grapho*, I write, in *Middle Age Writers*, a copyist, or calligrapher, who wrote in gold letters.

AURILLAC, in *Geography*, a town of France, and principal place of a district in the department of Cantal, and, before the revolution, the capital of Lower Auvergne. It is situated on the river Jordan, in a fertile valley; and the castle, which is high, commands the town. N. lat. 44° 55'. E. long. 2° 27'.

AVRILLE, a town of France, in the department of the Mayne and Loire, and chief place of a canton in the district of Angers, one league north of Angers.

AURINIA, in *Ancient Geography*, a town of Italy, in Etruria.

AURIOL, in *Geography*, a town of France, in the department of the Mouths of the Rhone, and chief place of a canton in the district of Aix, four leagues south-east of Aix, and four N. N. E. of Marseilles.

AURIPIGMENT, called also *Orpiment*. See *ARSENIC*, *Oriz.* sp. 3. var. 2.

AURIS, the ear. See *EAR*.

AURIS DIASPER, in *Conchology*, a species of *Strombus*, adapted by Linnæus and Gmelin, after Argenville. The lip projects into a sharp point; back mucronated; tail erect and pointed. Linn. Inhabits the southern coasts of Africa; is about three inches long; thick; ribbon of one colour, but variegated; on the back are generally three, and sometimes four, rows of tubercles, with the interstices transversely ribbed; and the outer whorl cancellated; mouth black-colour; pillar white. Gmelin, &c.

AURIS HIASUTA, a name given by Rumphius to the shell, first called *marx anus* by Linn. and Gmel, and given by Argenville.

AURIS JENEA, a species of *Voluta*, with a contracted oblong shell, having a smooth spine, and tridentated pillar-lip. Linn. Mus. Lud.—MILL. describes it as *hela tista cylindrica subgranulata. apertura lineolata. labro ad axim tridentato*. This shell inhabits the seas in India, and resembles *voluta auris mææ*, but is smaller, and narrower. The colour is brown, or white with brown waved spots; whorls of six spires, the first and exterior ones very nicely striated. Gmelin.

AURIS MARCHI, a species of *Voluta*, about three inches in length, and is a native of New Caledonia. The shell is fusiform, granulated, with an ovate aperture; pillar-lip cut and much spread. This is called *hela auris mææ* by

by Mill; verm. fluvi. et terr. Chemnitz figures it, and two varieties of the same species, tab. 121. Conch.

AURIS MINZ, a species of VOLUTA, found in India, where it inhabits marshy woods and swamps, and in its manner resembles an helix. The shell is contracted, oval-oblong, spire rugose, pillar-lip bifurcated. This is *Helix testis fuliformi granulata*, apertura lanceolata, labro ad axin bifidato of Müll. verm. fluvi. et terr.—*Auris nuda* of Rumpfius; and *auricula nuda* of Argenville. Lister figures one variety of this species in pl. 577. Conch. and Chemnitz another, tab. 149. f. 1395, 1396.

The length of this kind is four inches; it is brown, solid, rugose, or striated; spire large; whorls from six to nine, each terminating in a granulated band; the outer ones cancellated; aperture long, and widell beneath.

AURIS PORCI, a name synonymous with *Crilla galli*, &c. and given by Argenville to the species of *Mytilus* called by Gmelin, *M. crilla galli*.

AURIS SILENI, a species of VOLUTA, about two inches in length; of a ventricose form, and short; colour brown, with longitudinal undulated striae of a chestnut colour; aperture ovate, and spire obtuse. It is specifically described as being an oval, gibbous, umbilicated shell, with a single thick and flexuous plait on the pillar-lip. Bern. Mus. This is called in England Silenus's ear-shell. Its country is unknown.

AURIS MARINA, or sea ear-shell, a vague term for several shells of the HALIOTIS genus, but chiefly for the species *tal-reulata*, which is common in the Mediterranean, and is found, though rarely, on the western coasts of England. Duvoy. Brit. Shells, &c.

AURISCALPIUM, a species of TURBO, that inhabits the Mediterranean sea. This shell is white, and very smooth; aperture with an advanced flatish, concave, obtuse lip. Gmel. &c. This kind is milky-white and tubulate; whorls of the spire seven or eight; aperture dilated, and resembling an ear-picker; with a margin.

AURISCALPIUM, an instrument wherewith to pick and cleanse the ear from wax; and also serving for some other operations relating to that part.

The word is compounded of *auris*, ear, and *scalpo*, I scratch, or pick.

AURISPA, JOHN, in *Biography*, was born in 1369, at Noto, in Sicily. He studied the Greek language at Constantinople; and on his return to Italy, brought with him more than 100 Greek MSS. chiefly of pagan writers, which were more easily obtained than the writings of Christians; after a second visit to Constantinople in the train of the emperor John Palæologus, he taught the Greek and Latin languages at Bologna, Florence, and Ferrara. He was secretary to pope Eugenius IV. and Nicholas V. and enjoyed benefices in Sicily. After the death of the latter, who was his patron, he returned to Ferrara, and continued to teach and write till the time of his death in 1460. He translated some of the writings of Archimedes, and the commentaries of Hierocles on the golden verses of Pythagoras; and published poems and letters. His version of Hierocles was printed at Biele in 1543. Nouv. Dict. Hist. Gen. Biog.

AURIST, in *Medicine and Surgery*, one whose profession it is to cure discaes of the ear.

AURITA, in *Conchology*, a species of BALANUS, that inhabits the North Seas, and is described by Ellis. This shell is membranaceous, ventricose, seated on a tube, and eared; mouth with eight valves, and dentated. Gmelin, &c.—Ellis calls this *lepas nuda comosa aurita*.

AURITA, a species of ANONIA, with a shell of a somewhat ovate form, striated, and slightly eared; beak perforated. Gualt. Inhabits the seas about Norway, and

bears some affinity to another species of the same genus, called by Linn. and Gmel. *caput serp. ulmis*.

AURITA, a species of MYA, that inhabits New Zealand. The shell is ovate, compressed, and closed; hinge with two lateral teeth. Chemnitz. Colour ferrid ochraceous.

AURITA, in *Entomology*, a species of PIMELIA, with the thorax margined, dilated in front; each side on the wing-cases bicarinated. Inhabits Siberia, and is entirely of a black colour. Pallas, &c.

AURITA, a species of PHALÆNA (*Noctua*) that inhabits Spain. The wings are shining-brown, with a cinereous band in the middle; two denticles of stiff hairs on the head, and four others on the thorax. Fabricius, &c.

AURITA, a species of CICADA that inhabits Europe. The thorax is dilated into the form of two ears; shield of the head spreading, and rounded. Geoffroy calls this cicada thorace obtuse bicorni. It feeds on the oak and nut trees, and is entirely of a cinereous colour. Gmel. &c.

AURITA, in *Natural History*, a species of MEDUSA, having four cavities beneath. Linn. Fn. Succ. This kind inhabits the Baltic and other seas; is of a hemispherical form; hyaline; from two to four inches in diameter; and when floating on the sea in sunshine, reflects a beautiful splendor. The margins are fringed and yellow. Aldrovandus calls this *urtho festo*.

AURITA, in *Zoology*, a species of LACERTA that inhabits the sandy parts of Siberia about Naryn, and the desert of Comani. It is described by Pallas as having a tail of a moderate size, round, with callous dots on each side, dilated into a semiorbicular, soft, scabrous, dentated crest. This animal is rather larger than *lacerta gecko*; the colour above is cinereous and yellowish, clouded, and thickly speckled with brown; beneath whitish; spot on the chest, and tip of the tail beneath, black. The head is retuse; crest of the animal, when alive, turgid with blood; body ventricose and depressed, and with the legs and tail rough, with acute prominent dots; toes five, each furnished with a claw, and the three middle-most ones serrated, the inner one having a single notch, and the others two notches each. Gmelin, &c.

AURITÆ, called also HYKSOS, and SHEPHERDS, in *Ancient History*, the denomination of a large body of adventurers who migrated into Egypt at a very early period. Ancient and modern writers have not agreed in their conjectures concerning these enterprising and fortunate people. Manetho supposes the Aurite to have been Arabians; but the learned Bryant maintains that they were Arkites, who had been expelled from Babylon by the sons of Schem, at the second dispersion. Unwilling to remain at home indigent and inactive, or unable to resist the shock of some powerful foe, they abandoned a region which they could no longer possess in tranquillity, precipitated themselves into Egypt, drove the disunited tribes of Ham from the most fertile part of their territories at the upper end of the Delta, and settled there. This invasion happened soon after the Syrians had become formidable by the conquests of Ninus; for we are told that the Aurite fortified the eastern borders of their new settlements towards Arabia and Chaldaea. About this time, as all the ancient historians assert, the Delta had acquired the confidence of a morass. Drained by the shepherds, it soon became a temperate and beautiful, as it was naturally a fertile, region. For the space of two centuries and a half, this bold and enterprising race kept possession of Middle and Lower Egypt. In the course of this period they discovered, we are told, many useful arts and inventions, and from time to time sent out colonies in quest of new settlements. Two hundred and sixty years after their arrival in Egypt, the posterity of the original nations, not

finding

finding sufficient accommodation in Upper Egypt, to which they had been hitherto confined, or giving the succets of their fortunate invaders, commenced hostilities against them. After a long, doubtful, and bloody contest, the Auræ were obliged to retire. They separated into several bodies, and migrated into Phœnicia, Syria, Greece, and other regions, carrying their inventions and improvements along with them. This memorable revolution happened not long before the descent of Jacob. Playfair's *Chronology*, p. 64. See DISPERSION of MANKIND, and SHEPHERDS.

AURITINA, in *Ancient Geography*, a town of Africa, in the Pentapolis. Ptolemy.

AURITUS, in *Entomology*, a species of CANCER that inhabits Iceland; and is distinguished by having a single spine on both sides of the thorax, and flanks of the legs yellow; back grooved, and softish. Fab. Gmel. &c.

AURITUS, a species of CRYPTOCEPHALUS, found on the oak, in Saxony. It is black, with a yellow spot on both sides of the thorax, and flanks of the legs yellow. Fabricius.—*Olf.* This is *chrysomela aurita* of Linnæus. Syst. Nat.

AURITUS, in *Natural History*, a species of ECHINUS that inhabits the Persian seas. The colour is yellowish-grey, with the upper margin chestnut; base flat; punctured and marked with radiated streaks; anus oblong and situated near the mouth. It is specifically described by *Leslie apud Klein echinod.* as having a waved margin, the lower one rounded, upper one nearly square, and twice divided, and a gaping pore between every two avenues.—*Geoorde itoniphart.* Phelf. Zee-eg, &c.

AURITUS, in *Ornithology*, a species of TURDUS that inhabits Cayenne, and is called *fourmilier à oreilles blanches* by Buffon; and white-eared thrush by Latham. Above, it is varied with rufous and olive; beneath white; crown and pectoral band reddish-brown; chin and throat black; streak behind the eye descending on the neck, and consisting of elongated, white, glossy feathers. Gmelin. &c. Length four inches and three quarters.

AURITUS, a species of COLYMBUS, with a black head, and ears crested with a tuft of ferruginous feathers. Linn. Fn. Suec.

"The length of this species is twelve inches. In England, they inhabit the fens near Spalding, where they breed; they are found in the northern parts of Europe, and in the temperate parts of Siberia and Iceland. It is said by Bougainville to be met with in the Falkland Islands, where it is called the *diver with spectacles*.

"The nest, like those of most other birds in this genus, is composed of twigs, roots, and stalks of aquatic-plants, and is usually found floating among the reeds and flags nearly filled with water. The female lays four or five small white eggs, which are hatched in the nest while it remains thus immersed in water." *Donov. Brit. Birds, &c.* C. auritus, eared grebe.

Gesner calls this species *merguli genus alterum*; and Buffon *le petit grèbe huppé*. Gmelin speaks of a variety of this species *colymbus cornutus minor* of Brisson; and *colymbus seu podiceps minor* of Will. Orn. Ray, and Albin.

AURITUS, a species of TROCHILUS, of a green-gold colour above, and white beneath, below the eyes a band of black; and in the male two tufts of feathers of a violet colour on each side of the head under the ears; legs downy. This is *mellisuga Cayenensis* of Brisson; and *l'oiseau-mouche à oreilles* of Buff. Latham describes it under the name of violet-eared humming-bird. There is a variety of this bird with a purple stripe below the eyes; near the ears a black spot, and beneath it another of blue. This species in-

habits Cayenne, and is about four inches and a half in length.

AURIUM ARSCISSIO, in *Antiquity*, cutting off the ears, was a punishment inflicted by the Saxons law on those who robbed churches; and afterwards on every thief: and at length on divers other criminals.

AUROIZMUNSTER, in *Geography*, a town of Germany, in the circle of Bavaria, 16 miles south of Pilsna.

AUROCAPILLA, in *Ornithology*, a species of MONTICILLA, found in St. Domingo, Jamaica, and other islands in the American seas. It is olive, beneath white; crown golden; eye-brows black; breast spotted with black. Gmelin. This is *fecunda Pennsylvanica auricapilla* of B. Ill. *griseolata* de S. Domingus of Buff. and golden-crowned thrush of the Arctic Zoology.

AUROGALLUS, MATTHEW, in *Biography*, a grammarian of the 16th century, was a native of Bohemia; and became professor of languages in the university of Wittenberg. Besides the assistance he gave to Luther in translating the Bible, he wrote in Latin a "Compendium of Hebrew and Chaldean Grammar," printed at Wittenberg, in 1525, and at Basil, in 1539; and a treatise on the geography of the Holy Land, intitled "De Hebrais Urbium, Regionum, Populorum, &c. Nominibus," printed at Wittenberg, in 1526, and at Basil, in 1529. 8vo. He died in 1543. Gen. Diet.

AUROIR, in *Geography*, a town of France, in the department of the Cher, 21 leagues north-west of Sarcoins.

AURON, a river of France which runs into the Eure, near Bourges.

AURONITENS, in *Entomology*, a species of CARAPUS of the apterous kind. The shells are green and rough, with raised lines; legs rufous. Inhabits Saxony. An intermediate species between *corvus auratus*, and *nitens*.

AURONZA, in *Geography*, a town of Italy, belonging to the state of Venice, in the Cadore, seven miles north of Pieve di Cadore.

AURORA, in *Astronomy*, the morning twilight; or that faint light which begins to appear in a morning, when the sun is within eighteen degrees of the horizon.

AURORA, in *Conchology*, a very rare species of CYPREÆ, discovered on the coast of Otahete by captain Cook. It is rather ovate; margin whitish; back fine orange, and without spots. Among collectors of exotic shells, it is known by the name of *cyprea aurora*, or *morning-lawn covey*.

AURORA, in *Entomology*, a species of PHALÆNA, in Abbot's *Insects of Georgia*. The upper wings are yellow; base and margin speckled with red. Smith.

AURORA, the specific name under which PAPILO CARDAMINES is described by Linn. in Fn. Suec. i. n. 801.

AURORA, a species of PAPILO (*Dan. Cuvl.*) found in Siberia. The wings are fulvous; beneath, an ocellar dot on the anterior wings, and a silvery dot, with a contiguous one still smaller in the middle of the posterior pair. Fabricius, Gmelin, &c.

AURORA, a species of LAMPYRIS (*Pyrobroca* Fab.), given by Herbil. as a native of Pomerania. It is black; thorax red and cancellated; wing-cases chestnut, with four elevated lines, and the intermediate spaces dotted in rows.

AURORA, in *Geography*, an island belonging to the Archipelago of the New Hebrides, in the South Pacific ocean, discovered by Bougainville, in 1768. It is about twenty leagues long, and two broad, and lies nearly north and south. Its eastern shore is steep, but it has a small bay on the north-west coast. It abounds with wood and fresh water; and is inhabited. The vegetation of this island is luxuriant. The middle of it lies in S. lat. 15° 8'. E. long. 168° 17'.

AURORA.

AURORA, in *Mythology*, the goddess of the morning, was, according to Hesiod, the daughter of Thea and Hyperion, and sister of Sol and Luna; but according to others, the daughter of Titan and Terra. Under this title the ancients deified the light which precedes the rising of the sun above our hemisphere. The poets represent her as rising out of the ocean in a chariot, drawn by two rose-coloured horses, called by Homer, Lampus and Phæton, with rosy fingers dropping gentle dew. The large veil on her head was folded backwards, to denote that the brightness of day was already advanced, so as to disperse the darkness of the night. Virgil describes her as ascending in a flame-coloured chariot with four horses.

AURORA, in *Ornithology*, a species of *PSITTACUS* that inhabits Brazil. It is yellow; arm-pits, margins of the wings, and outer great quill-feathers in the middle, red. This is *psittacus luteus* of Briss. *parrot of Saturn*. Orn. *amazon jume* Buffon, and *arara-parrot* of Latham.

The length of this bird is twelve inches; bill, cere, legs and claws white; eye-brows and irides red; tail rounded, the four exterior feathers red within from the base to the middle. Gmelin.

AURORA, in *Zoology*, a species of *COLUMBER* with 170 abdominal plates, and thirty-seven subcaudal scales. This is a native of America, and is of a livid colour, with the back yellow. Gmelin. Dr. Shaw describes it as an orange-coloured snake, with yellow dorsal band and abdomen. Length about two feet and a half, and moderately thick in proportion; head rather large, and covered with very large scales; tail short, and tapering to an obtuse point.

AURORA Borealis, or **AURORA Septentrionalis**, in *Physiology*, the northern dawn or light, sometimes called *streamers*, is an extraordinary meteor, or luminous appearance, showing itself in the night-time, in the northern part of the heavens; and most usually in frosty weather.

It is usually of a reddish colour, inclining to yellow, and sends out frequent coruscations of pale light, which seem to rise from the horizon in a pyramidal undulating form, and shoot, with great velocity, up to the zenith. This light sometimes appears remarkably red, as it happened Dec. 5, 1737, of which we have very full accounts from divers parts of Europe, in the Phil. Trans. N^o. 459. sect. 7. p. 583—606.

The aurora borealis appears frequently in form of an arch; chiefly in the spring and autumn; after a dry year.—The arch is partly bright, partly dark; but generally transparent. And the matter of which it consists is also found to have no effect on the rays of light which pass through it. Dr. Hamilton observes, that he could plainly discern the smallest speck in the Pleiades through the density of those clouds which formed the aurora borealis in 1763, without the least diminution of its splendor, or increase of twinkling. Phil. Essays, B^o. iii. p. 136.

Sometimes it produces an iris.—M. Godin judges, that most of the extraordinary meteors and appearances in the skies, related as prodigies by historians, e. gr. battles, and the like, may be probably enough reduced to the class of aurora borealis. Vide H. A. Acad. R. Scienc. an. 1762. p. 465.

This kind of meteor, which is more uncommon as we approach towards the equator, is almost constant during the long winter, and appears with the greatest lustre, in the polar regions.

In the ice-land isles, the "merry dancers," as the northern lights are there called, are the constant attendants of clear evenings, and afford great relief amidst the gloom of the long winter-nights. They commonly appear at twilight, near the horizon, of a dun colour, approaching to yellow; they some-

times continue in that state for several hours, without any perceptible motion; and afterwards they break out into streams of stronger light, spreading into columns, and altering slowly into 10,000 different shapes, and varying their colours from all the tints of yellow to the most obscure russet. They often cover the whole hemisphere, and then exhibit the most brilliant appearance. Their motions at this time are most amazingly quick; and they astound the spectator with the rapid change of their form. They break out in places where none were seen before, skimming briskly along the heavens, are suddenly extinguished, and are succeeded by an uniform dusky tract. This again is brilliantly illuminated in the same manner, and as suddenly left a dark space. In some nights, they assume the appearance of large columns, on one side of the deepest yellow, and on the other, gradually changing till it becomes undistinguished from the sky. They move generally a strong tremulous motion from one end to the other, and this continues till the whole vanishes. As for us, who see only the extremities of these northern phenomena, we can have but a faint idea of their splendor and motions. According to the state of the atmosphere, they differ in colour; and sometimes assuming the colour of blood, they make a dreadful appearance. The rustic peasants, who observe them, become prophetic, and terrify the spectators with alarms of war, pestilence, and famine; nor, indeed, were these superstitious presages peculiar to the northern islands: appearances of a similar nature are of ancient date; and they were distinguished by the appellations of "plafinata," "traber," and "bolides," according to their forms and colours. In old times they were either more rare, or less frequently noticed; but when they occurred, they were supposed to portend great events, and the timid imagination formed of them aerial conflicts.

In the northern latitudes of Sweden and Lapland, the aurora borealis are not only singularly beautiful in their appearance, but afford travellers by their almost constant effulgence a very beautiful light during the whole night. In Hudson's bay, the aurora borealis diffuses a variegated splendor, which is said to equal that of the full moon. In the north-eastern parts of Siberia, according to the description of Gmelin (*Reise durch Siberien*, vol. iii. p. 135.), cited and translated by Dr. Blagden (*Phil. Trans.* vol. lxxiv. p. 228.), these northern lights are observed to "begin with single bright pillars, rising in the north, and almost at the same time in the north-east, which gradually increasing comprehend a large space of the heavens, rush about from place to place with incredible velocity, and finally almost cover the whole sky up to the zenith, and produce an appearance as if a vast tent was expanded in the heavens, glittering with gold, rubies, and sapphire. A more beautiful spectacle cannot be painted; but whoever should see such a northern light for the first time, could not behold it without terror. For however fine the illumination may be, it is attended, as I have learned from the relation of many persons, with such a hissing, cracking, and rushing noise through the air, as if the largest fire-works were playing off. To describe what they then hear, they make use of the expression "spekchi chodjat," that is, the raging host is passing. The hunters, who pursue the white and blue foxes in the confines of the ice sea, are often overtaken in their course by these northern lights. Their dogs are then so much frightened, that they will not move, but lie obstinately on the ground till the noise has passed. Commonly clear and calm weather follows this kind of northern lights. I have heard this account, not from one person only, but confirmed by the uniform testimony of many who have spent part of several years in these very northern regions, and inhabited

different countries from the Yenisei to the Lena; so that no doubt of its truth can remain. This seems indeed to be the real birth-place of the aurora borealis." This account of the noises attending the aurora borealis, allowing for some degree of exaggeration, has been corroborated by other testimonies. A person, who resided seven years at Hudson's Bay, confirms M. Gmelin's relation of the fine appearance and brilliant colours of the northern lights, and particularly of their rushing noise, which he affirms he has frequently heard, and compares it to the sound produced by whirling round a stick swiftly at the end of a string. A similar noise has also been heard in Sweden. Mr. Nairne also, being in Northampton, at a time when the northern lights were remarkably bright, is confident he perceived a hissing or whizzing sound. Mr. Belknap, of Dover, in New Hampshire, North America, testifies to this fact. American Transf. vol. ii. p. 196. M. Cavallo says that the crackling noise is distinctly audible, and that he has heard it more than once. Elem. of Nat. and Exper. Philos. vol. iii. p. 449. See also Musschenbroek Introd. Philos. vol. ii. p. 1056. § 2495. Beccaria dell' Eletticismo Artif. et Nat. p. 221.

Similar lights, called *auroræ australes*, have been long since observed towards the south pole (see Phil. Transf. N° 461. § 23, 24, and 25. and vol. liv. N° 53.); and their existence has been more lately ascertained by Mr. Forster, who assures us, that, in his voyage round the world with captain Cook, he observed them in high southern latitudes, though attended with phenomena somewhat different from those which are seen here. On Feb. 17, 1773, in south lat. 58°, "a beautiful phenomenon (he says) was observed during the preceding night, which appeared again this and several following nights. It consisted of long columns of a clear white light, shooting up from the horizon to the eastward, almost to the zenith, and gradually spreading on the whole southern part of the sky. These columns were sometimes bent sideways at their upper extremities; and though in most respects similar to the northern lights (*aurora borealis*) of our hemisphere, yet differed from them in being always of a whitish colour, whereas ours assume various tints, especially those of a fiery and purple hue. The sky was generally clear when they appeared, and the air sharp and cold, the thermometer standing at the freezing point."

The periods of the appearance of these northern lights are very inconstant. In some years they occur very frequently, and in others they are more rare; and it has been observed that they are more common about the time of the equinoxes than at other seasons of the year.

Dr. Halley (see Philos. Transf. N° 347. p. 406. or Abr. vol. iv. p. 138.) has collected together several observations, which form a kind of history of this phenomenon. After having particularly described the various circumstances which attended that observed by himself and many others in March 1716, and which was singularly brilliant, he proceeds with informing us, that the first account of similar phenomena recorded in the English annals, is that of the appearance which was noticed Jan. 30, 1560, and called "burning spears" by the author of a book intitled "A Description of Meteors," by W. F. D. D. reprinted at London, in 1654. The next appearance of a like kind, recorded by Stow, occurred on October 7, 1564. In 1574, as Camden and Stow inform us, an aurora borealis was seen for two successive nights, viz. 14th and 15th of November, with appearances similar to those observed in 1716, and which are now commonly noticed. The same phenomenon was twice seen in Brabant in 1575, viz. on the 13th of February and the 28th of September; and the circumstances attending it

were described by Cornelius Gemma, who compares them to spears, fortified cities, and armies fighting in the air. In the year 1580, M. Matlin observed these phasmata, as he calls them, at Bakwang, in the county of Wirtemberg, in Germany, no less than seven times in the space of twelve months; and again, at several different times, in 1581. On September 2d, 1621, the same phenomenon was seen over all France; and it was particularly described by Gassendus, in his "Physics," who gave it the name of "aurora borealis." Another was seen all over Germany, in Nov. 1623, and was described by Kepler. Since that time, for more than eighty years, we have no account of any such phenomenon either at home or abroad. In 1707, Mr. Neve observed one of small continuance in Ireland; and in the same year, a similar appearance was seen by Romer at Copenhagen; and during an interval of eighteen months, in the years 1707 and 1708, this sort of light had been seen no less than five times. Hence it should seem, says Dr. Halley, that the air, or earth, or both, are not at all times disposed to produce this phenomenon, though it is possible it may happen in the day time, in bright moon-shine, or in cloudy weather, and so pass unobserved. Dr. Halley further observes, that the aurora borealis of 1716, which he described, was visible from the west of Ireland to the confines of Russia, and to the east of Poland; extending at least near 30° of longitude, and from about the 50th degree of north latitude, over almost all the north of Europe; and in all places at the same time, it exhibited appearances similar to those which he observed at London. He regrets, however, that he was unable to determine its height for want of contemporary observations at different places. Father Boscovich has determined the height of an aurora borealis, observed on the 16th of December 1737, by the marquis of Poleni, to have been 825 miles; and Mr. Bergman, from a mean of thirty computations, makes the average height of the aurora borealis to be 72 Swedish, or (supposing a Swedish mile to be about 6½ English miles) 468 English miles. Euler supposes the height to be several thousands of miles; and Mairan also assigns to these phenomena a very elevated region, the far greater number of them being, according to him, about 200 leagues above the surface of the earth. Dr. Blagden, speaking of the height of some fiery meteors (Phil. Transf. vol. lxxiv. p. 227.), says, that "the aurora borealis appears to occupy as high, if not a higher region, above the surface of the earth, as may be judged from the very distant countries to which it has been visible at the same time;" he adds, that "the great accumulation of electric matter seems to lie beyond the verge of our atmosphere, as estimated by the cessation of twilight." However the height of these meteors, none of which appear to have ascended so high as 100 miles, is trivial, compared with the elevations above ascribed to the aurora borealis. But as it is difficult to make such observations on this phenomenon as are sufficient to afford a just estimate of its altitude, they must be subject to considerable variation and to material error. It is not improbable, that the highest regions of the aurora borealis are the same with those in which fire-balls move; more especially as Dr. Blagden informs us, that instances are recorded, in which the northern lights have been seen to join, and form luminous balls, darting about with great velocity, and even leaving a train behind like the common fire-balls. This ingenious author, however, conjecturing that distinct regions are allotted to the electrical phenomena of our atmosphere, assigns the appearance of fire-balls to that region which lies beyond the limits of our crepuscular atmosphere; and a greater elevation above the earth to that

accumulation of electricity in a lighter and less condensed form, which produces the wonderfully diversified streams and convulsions of the aurora borealis.

Many attempts have been made to assign the cause of this phenomenon. Dr. Halley first imagined that the watery vapours, or effluvia, raised exceedingly by subterraneous fire, and tinged with sulphureous streams, which many naturalists have supposed to be the cause of earthquakes, might have also been the cause of this appearance. But this hypothesis was not sufficient to account for the immense extent of these phenomena over the surface of the earth, and for their being always seen on the north side of the horizon, and never to the south. Abandoning this hypothesis, he conceived that the aurora borealis is produced by a kind of subtle matter, or magnetic effluvia, freely pervading the pores of the earth, and which, entering into it near its southern pole, passes out again with a like force into the æther at the same distance from the northern; the obliquity of its direction being proportioned to its distance from the pole. This subtle matter, by becoming some way or other more dense, or having its velocity increased, may be capable of producing a small degree of light, after the manner of effluvia from electric bodies, which, by a strong and quick friction, emit light in the dark: to which sort of light this seems to have a great affinity. If Dr. Halley had known, that an electrical stroke would give polarity to a needle destitute of it, and reverse the poles of one previously endued with it, he would have been led of course to conclude the electric and magnetic effluvia to be the same, and that the aurora borealis was this fluid performing its circulation from one pole of the earth to another; and he would thus have anticipated the hypothesis of Sign. Beccaria. See Mr. Cotes's description of this phenomenon, and method of explaining it, by streams emitted from the heterogeneous and fermenting vapours of the atmosphere, in *Smith's Optics*, p. 69, &c. or *Phil. Trans. Abr.* vol. vi. part ii.

The celebrated M. de Mairan, in an express treatise on the aurora borealis, published in 1731, assigns its cause to be the *Zodiacal light*, which, according to him, is no other than the sun's atmosphere: this light happening, on some occasions, to meet the upper parts of our air, on the side of the limits where universal gravity begins to act more forcibly towards the earth than towards the sun, falls into our atmosphere, to a greater or less depth, as its specific gravity is greater or less, compared with the air through which it passes. Although the whole atmosphere of the earth be involved in the solar atmosphere, it is thrown off both ways from the equatorial to the polar regions. This projection is owing partly to the centrifugal force arising from the diurnal motion of the earth, which, being greatest at the equator, and decreasing towards the poles, turns aside the zodiacal matter towards each pole; so that by his hypothesis he anticipates the discovery of aurora australes: and partly to the progressive motion of the earth in its annual orbit. In this case the light should dart from the equator to the poles, and not, as it really does, from the poles to the equator. Vide *Tract. Phys. & Hist. del' Aurora Boreale. Suites des Mem. de l'Acad. R. des Scienc. ann. 1731. p. 3. seq.* There is an abstract of Mr. Mairan's Physical and Historical Treatise of the aurora borealis, in the *Phil. Trans.* N. 453. or *Abridg.* vol. viii. p. 450.

M. Euler thinks the cause of the aurora borealis not owing to the zodiacal light, as Mr. de Mairan supposes; but to particles of our atmosphere, driven beyond its limits by the impulse of the light of the sun. On this supposition he endeavours to account for the phenomena observed concerning this light. He supposes the zodiacal light,

and the tails of comets, to be owing to a similar cause. See *TAIL of Comets*, and *ZODIACAL Light*.

Ever since the identity of lightning and of the electric matter has been ascertained, philosophers have been naturally led to seek the explication of aerial meteors in the principles of electricity; and there is now no doubt but most of them, and especially the aurora borealis, are electrical phenomena. Beside the more obvious and known appearances which constitute a resemblance between this meteor and the electric matter whereby lightning is produced, it has been observed, that the aurora occasions a very sensible fluctuation in the magnetic needle; that the atmosphere yields, at the time of its occurrence, a quantity of electric fire; and that, when it has extended lower than usual into the atmosphere, the flashes have been attended with various sounds of rumbling and hissing, already mentioned, and attributed by Dr. Blagden (*ubi supra*) to small streams of electric matter running off to the earth from the great masses, or accumulations, of electricity, by which he supposes both meteors and the northern lights to be produced. Besides, the aurora borealis may be partly imitated by means of artificial electricity. Dr. Hamilton, of Dublin, (*Phil. Ess. ess. iii.*) seems to have been the first person who attempted to discover any positive evidence of the electrical quality of the aurora borealis; but the only proof he produces is an experiment of Mr. Hawkbee, by which the electrical fluid is shewn to assume appearances resembling the aurora borealis, when it passes through a vacuum. He observed, that when the air was most perfectly exhausted, the streams of electric matter were then quite white; but when a small quantity of air was let in, the light assumed more of a purple colour. The flashing of this light, therefore, from the dense regions of the atmosphere into such as are more rare, and the transitions through mediums of different densities, he considers as the cause of the aurora borealis, and of the different colours it assumes. Mr. Canton, soon after he had obtained electricity from the clouds, offered a conjecture, that the aurora borealis is occasioned by the flashing of electric fire from positive towards negative clouds at a great distance, through the upper part of the atmosphere where the resistance is least. And he supposes, that the aurora, which happens at the time when the magnetic needle is disturbed by the heat of the earth, is the electricity of the heated air above it; and this appears chiefly in the northern regions, as the alteration in the heat of the air in those parts will be the greatest; nor is this hypothesis, he says, improbable, when it is considered, that electricity is the known cause of thunder and lightning; that it has been extracted from the air at the time of an aurora borealis (see *COUPESSUS*); that the inhabitants of the northern countries observe it to be remarkably strong when a sudden thaw succeeds severe cold weather; and that the tourmalin is known to emit and absorb the electric fluid only by the increase or diminution of its heat. Positive and negative electricity in the air, with a proper quantity of moisture to serve as a conductor, will, he conceives, account for this and other meteors sometimes seen in a serene sky. Mr. Canton afterwards contrived to exhibit this meteor by means of the *Torrucellian* vacuum, in a glass tube about three feet long, and sealed hermetically. When one end of the tube is held in the hand, and the other applied to the conductor, the whole tube will be illuminated from end to end; and will continue luminous without interruption for a considerable time after it has been removed from the conductor. If, after this, it be drawn through the hand either way, the light will be uncommonly intense, and without the least interruption, from one hand to the other, even to its whole length. And though

though a great part of the electricity is discharged by this operation, it will flash at intervals, when held only at one extremity, and kept quite still; but if it be grasped by the other hand at the same time in a different place, strong flashes of light will hardly ever fail to dart from one end to the other, and these will continue twenty-four hours and longer, without any fresh excitation. An arch'd double barometer of a considerable height is an improvement of this contrivance, for exhibiting the appearance of an aurora borealis, by means of the electric fire. To Mr. Canton's hypothesis it has been objected, that the electrical fire would flash in every direction, according to the position of the clouds, as well as from north to south; and that upon his hypothesis, illustrated by the tourmalin, the aurora borealis ought to be most frequent in summer, when the air is most heated, whereas it is found to be the reverse. Signior Beccaria, who pursued his observations on atmospheric electricity farther than any of his associates in these inquiries, conjectures that there is a constant and regular circulation of the electric fluid from north to south, which may be the original course of magnetism in general; and he thinks, that the aurora borealis may be this electric matter performing its circulation in such a state of the atmosphere as renders it visible, or approaching nearer the earth than usual. Against this supposed circulation it has been alleged that it ought to dart from the horizon towards the zenith in the northern hemisphere, and from the zenith towards the horizon in the southern one; whereas Mr. Forster, as we have already mentioned, informs us, that the column shot up from the horizon towards the zenith as well in the southern hemisphere as in the northern; so that if the aurora borealis is to be regarded as the flashings of electric matter, its course is plainly directed from both poles towards the equator, and not from one pole to the other. Why the electricity of the atmosphere should be constantly found to direct its course from the poles towards the equator, and not from the equator to the poles, suggests a difficulty which an anonymous writer (*Encycl. Brit.*) has attempted to solve in the following manner.—Assuming three axioms; viz. that all electric bodies, when considerably heated, become conductors of electricity; that, *et converso*, non-conductors when subjected to violent degrees of cold, ought to become electric; and that cold mists also increase the electric powers of such substances as are already electric; it is easy (says this writer) to deduce from these principles the cause of the aurora borealis. “The air, all round the globe, at a certain height above its surface, is found to be exceedingly cold, and as far as experiments have yet determined, exceedingly electrical also. The inferior parts of the atmosphere between the tropics, are violently heated during the day-time by the reflection of the sun's rays from the earth. Such air will therefore be a kind of conductor, and much more readily part with its electricity to the clouds and vapours floating in it, than the colder air towards the north and south poles. Hence the prodigious appearances of electricity in these regions, shewing itself in thunder and other tempests of the most terrible kind. Immense quantities of the electric fluid are thus communicated to the earth; and the inferior warm atmosphere having once exhausted itself, must necessarily be recruited from the upper and colder region. This becomes very probable from what the French mathematicians observed when on the top of one of the Andes. They were often involved in clouds, which, sinking down into the warmer air, appeared there to be highly electrified, and discharged themselves in violent tempests of thunder and lightning; while in the mean time, on the top of the mountain, they enjoyed a calm and serene

sky. In the temperate and frigid zones, the inferior parts of the atmosphere, never being so strongly heated, do not part with their electricity so easily as in the torrid zone, and consequently do not require fresh recruits from the upper regions; but notwithstanding the difference to be observed in different parts of the earth near its surface, it is very probable that at considerable heights the degrees of cold are nearly equal all round it. Were there a like equality in the heat of the under parts, there could never be any considerable loss of equilibrium in the electricity of the atmosphere; but as the hot air of the torrid zone is perpetually bringing down vast quantities of electric matter from the cold air that lies directly above it; and as the colder parts of the atmosphere lying towards the north and south poles do not conduct in any great degree; it thence follows, that the upper parts of the atmosphere lying over the torrid zone will continually require a supply from the northern and southern regions. This easily shews the necessity of an electric current in the upper parts of the atmosphere from each pole towards the equator; and thus we are also furnished with a reason why the aurora borealis appears more frequently in winter than in summer; namely, because at that time the electric power of the inferior atmosphere is greater on account of the cold than in summer; and consequently the abundant electricity of the upper regions must go almost wholly off to the equatorial parts, it being impossible for it to get down to the earth; hence also the aurora borealis appears very frequent and bright in the frigid zones, the degree of cold in the upper and under regions of the atmosphere being much more nearly equal in these parts than in any other. In some parts of Siberia particularly, this meteor appears constantly from October to Christmas, and its convulsions are said to be very terrifying. Travellers agree, that here the aurora borealis appears in greatest perfection; and it is to be remarked, that Siberia is the coldest country on earth. In confirmation of this, it may also be observed, that, from the experiments hitherto made with the electrical kite, the air appears considerably more electrical in winter than in summer, though the clouds are known to be often most violently electrified in the summer-time; a proof, that the electricity naturally belonging to the air is in summer much more powerfully drawn off by the clouds than in the winter, owing to the excess of heat in summer, as already observed.

“A considerable difficulty, however, still remains from the upright position which the streams of the aurora borealis are generally supposed to have; whereas, according to the hypothesis above mentioned, they ought rather to run directly from north to south. This difficulty occurred to Dr. Halley; but he answers it by supposing his magnetic effluvia to pass from one pole to another in arches of great circles, arising to a vast height above the earth, and consequently darting from the places whence they arose almost like the radii of a circle; in which case, being set off in a direction nearly perpendicular to the surface of the earth, they must necessarily appear erect to those who see them from any part of the surface, as is demonstrated by mathematicians. It is also reasonable to think that they will take this direction rather than any other, on account of their meeting with less resistance in the very high regions of the air than in such as are lower.

“But the greatest difficulty still remains; for we have supposed the equilibrium of the atmosphere to be broken in the day-time, and restored only in the night; whereas, considering the immense velocity with which the electric fluid moves, the equilibrium ought to be restored in all parts almost instantaneously; yet the aurora borealis never appears

except in the night, although its brightness is such as must sometimes make it visible to us did it really exist in the daytime.

“In answer to this it must be observed, that though the passage of electricity through a good conductor is instantaneous, yet through a bad conductor it is observed to take some time in passing. As our atmosphere therefore, unless very violently heated, is but a bad conductor of electricity; though the equilibrium in it is broken, it can by no means be instantaneously restored. Add to this, that as it is the action of the sun which breaks the equilibrium, so the same action, extending over half the globe, prevents almost any attempt to restore it till night, when flashes arise from various parts of the atmosphere, gradually extending themselves with a variety of undulations towards the equator.”

It has been observed, that the streams of the aurora borealis do not always move with rapidity; but they sometimes appear for a considerable time quite stationary, and they are sometimes carried in different directions with a slow motion. In order to account for these circumstances, it should be considered, that weak electric lights have been sometimes observed to exhibit the same appearance at the surface of the earth, and we may therefore suppose them much more capable of doing so at great heights above it, where the conductors are fewer in number, and much more imperfect. From instances that might be adduced, we may reasonably conclude, that small portions of our atmosphere may by various causes be so much electrified as to shine, and likewise be moved from one place to another, without parting with the electricity they have received for a considerable time. In this manner we may account for the corona, or circle, which is often formed near the zenith by the aurora borealis, when any of its parallel streams of light that shoot upwards, and by the laws of perspective, appear to converge towards a point, are over our heads, and actually come to a point. As this corona is commonly stationary for some time, it would serve as a mark by which to determine the distance of the object; e. g. let two persons, one at London, and the other at Edinburgh, observe an aurora borealis; then by noting the stars among which the corona was observed at each place, its true altitude from the surface of the earth may easily be determined by trigonometry. Although the true height of the aurora borealis has never yet been determined, there is no sufficient reason for supposing that it is higher than a meteor, seventy miles above the surface of the earth, which meteor, both by its splendor and figure, seems to prove that the air possesses a considerable degree of density at that distance from the earth. Besides, if its streams resemble the passage of electric light through a vacuum, it cannot be hence inferred, that the air is in a state similar to the vacuum of an air pump in those places where the aurora borealis is produced; because we have instances of similar appearances that are produced in very dense air. “The plate of an electrophorus is often so highly electrified, as to throw out flashes from different parts as soon as it is lifted up, and by proper management, it may be always made to emit long and broad flashes, which shall scarcely be felt by the finger; instead of small, dense, and pungent sparks; so that, though long flashes may be produced in rarefied air, it by no means follows, that the same may not also be produced in denser air. As little can we infer any thing from the colours, for we observe the electric spark sometimes white, sometimes blue, and sometimes purple, in the very same state of the atmosphere, and from the same substance.” Mr. Little, the inventor of an air-pump of a new construction, stating the boundaries of the atmo-

sphere within which the aurora borealis, considered as an electrical phenomenon, is visible, conceives that it cannot appear in air less rarefied than near 4000 times, and consequently that its nearest distance from the earth is about 45 miles, according to Dr. Halley’s table of the air’s refraction at different altitudes; and that in air rarefied more than 26000 times, it would not be visible, and therefore its greatest distance is about fifty miles, by the same table. He is also of opinion, that it is air burnt and exploded in its passage, which makes the electric matter visible, and that without air, if it could pass at all, it would not be luminous. Upon the whole he concludes, that the aurora borealis is confined within our atmosphere. Irish Transf. vol. vi. p. 387.

Dr. Franklin supposes, that the electrical fire discharged into the polar regions from many leagues of vaporized air raised from the ocean between the tropics, accounts for the aurora borealis; and that it appears first, where it is first in motion, i. e. in the most northern part, and the appearance proceeds southward, though the fire really moves northward. Franklin’s Exper. and Obs. 1769, p. 49. Phil. Transf. vol. xlviii. part i. p. 358, part ii. p. 784. Ib. vol. li. part i. p. 403. Ib. vol. lxxii. p. 15. Lettere dell’Ellettricismo, p. 269.; or Priestley’s Hist. of Electricity, vol. i.

Mr. Kirwan (Irish Transf. 1788, p. 70, &c.) supposes, that the rarefaction of the atmosphere in the polar regions proceeds from the aurora borealis and australis, and that these are produced by a combustion of inflammable air, caused by electricity. This inflammable air is generated, particularly between the tropics, by many natural operations, such as the putrefaction of animal and vegetable substances, volcanoes, &c.; and being lighter than any other, occupies of course the highest regions of the atmosphere. Consequently, this kind of air is chiefly thrown off towards the poles, and occasions the northern lights, which are the highest of all meteors, though they sometimes extend pretty low into the atmosphere. Mr. Kirwan further adds, that after the appearance of an aurora borealis, the barometer commonly falls, and that it is generally followed by high winds, proceeding usually from the south; all which facts strongly prove a rarefaction in the northern regions. To the same purpose, it is observed by Mr. Winn (Phil. Transf. vol. 73.), that the appearance of an aurora borealis is a certain sign of an hard gale of wind from the south or south-west. This occurred, without fail, in twenty-three instances; and he thinks that the splendor of meteors will enable the observer to form some judgment concerning the ensuing tempest. If the aurora is bright, the gale will come on within twenty-four hours, but will be of no long duration; if the light is faint and dull, the gale will be less violent, and longer in coming on, but will last longer. His observations were made in the English Channel, where such winds are very dangerous; and by attending to the aurora, he says, that he often escaped, when others were nearly wrecked. Observations of this kind would serve to lessen the dangers of navigation.

“That the aurora borealis ought to be succeeded by winds, may be easily deduced from the hypothesis above-mentioned. If this phenomenon is occasioned by the vast quantity of electric matter conveyed to the equatorial parts of the earth, it is certain that the earth cannot receive any great quantity of this matter at one place without emitting it at another. The electricity, therefore, which is constantly received at the equator, must be emitted nearer the poles, in order to perform its course; otherwise there would not be a constant supply of it for the common operations of nature. It is to be observed, that electrified bodies are

always

always furrounded by a blast of air, which is sent forth from them in all directions; hence, if the electric matter find a more ready passage through one part of the earth than another, a wind will be found to blow from that quarter. If, therefore, one of these places happens to be in the Atlantic ocean, near the coast of France, or in the bay of Biscay, the electric matter which has been received at the equator during an aurora borealis, will be discharged there some time after, and consequently a wind will blow from that quarter, which will be from the south-west to those ships which are in the English channel. It cannot be imagined, however, that all the matter can be discharged from one place; and therefore, according to the different situations of those electrical vents, winds may blow in different directions; and thus the same aurora borealis may produce a south-west wind in the English channel, and a north-west one in Scotland."

AURORA Surgens, a phrase used by *Alchemists*, to express the multiplicative virtue of the philosopher's stone.

AUROREA, in *Ornithology*, a species of *MOTACILLA*, called by Latham the *Daurian warbler*. This bird is fulvous beneath; crown and upper part of the neck hoary; front whitish; throat black; back and wings black, with a white triangular spot on the latter; tail-feathers fulvous, two middle feathers black. Pallas. This bird is the size of the red-start, and inhabits Siberia to the confines of China; most common in the vicinity of the river Selinga, among willows.

AUROS, in *Geography*, a town of France, in the department of the Gironde, and chief place of a canton in the district of Bazas, five miles north-east of Bazas.

AUROTA, in *Entomology*, a species of *PAPILIO* (*Dan. Candl.*) that inhabits the coast of Coromandel. The wings are entire and white; margin black, spotted with white; posterior ones yellow beneath. Cramer.

AUROTUS, a species of *PHALENA*, of the larger kind of *Bombyces*, with falcated wings; above and beneath of the same yellowish colour; with a white band, and transparent lunar spot in the disk of each. This kind inhabits America, and was described by Fabricius from a specimen in the Museum of the late Dr. Hunter.

AUROUX, in *Geography*, a town of France, in the department of the Lozere, and chief place of a canton in the district of Langogne, seventeen miles north of Merde.

AURULENTA, in *Entomology*, a species of *BUPRESTIS*, of a somewhat oblong or rather narrow form, that inhabits Carolina. The wing-veins are fastigate, bidentated at the end, and green with a golden margin; body golden; thorax slightly dotted. Fabricius.

AURULENTA, a species of *CICADA* (*Ranatra* Sec.), of the size and shape of *cimex obtusa*. The head and thorax are rufous; wing-veins brown, cinereous at the tip. A native of Cayenne. Fabricius.

AURULENTA, a species of *SPHEX*, the head and thorax of which are covered with golden coloured down; the abdomen black, with the margin of the segments ash-colour, and the legs rufous. This insect is of the middle size, and inhabits China. Fabricius.—*Obs.* Both Fabricius and Gmelin have evidently described this insect twice, once under the specific name *aurulenta*, and afterwards under that of *aurata*; or at least the only difference in the description is, that the legs are not mentioned in the specific character of the latter, but we are told in the general description, that they are of a ferruginous colour, which approaches pretty nearly to that of rufous; and as both kinds are said to be natives of Asia, the one of China, and the other of India, we have no doubt that Fabricius has inadvertently described the same insect in both

instances; and that Gmelin, without inquiry, has implicitly relied on his authority. See *AURULENTA*, Fabr. Mant. Inf. 1. p. 274. n. 10. and Fabr. Mant. Inf. 1. p. 276. n. 45.

AURUM, in *Natural History*, denotes gold. See *GOLD*. The word is chiefly used among us as applied to certain chemical preparations, whereof gold is the basis, or principal ingredient.—Such are the *aurum potable*, *aurum fulminans*, &c.

AURUM Fulminans, in *Chemistry*. See *GOLD*, *Salts of*.

AURUM Mosaicum, *musicum*, or *musivum*. See *TIN*.

AURUM Potabile, potable gold, a liquid preparation of this metal formerly much used in medicine, but now entirely obsolete.

The discovery of an universal medicine was a favourite speculation of the ancient alchemists, and they eagerly indulged the hope of finding it in the precious metal which alone was the object of all their attention. Hence we meet with a number of vaunted preparations of gold, most of them kept secret, but some revealed by the inventors, all of which had a certain reputation for a time, but are now sunk into deserved neglect.

Two methods were practised for the preparation of this metal as a medicine; the one was to grind gold leaves to a most impalpable powder, by a trituration of several days or even weeks; the other was to dissolve the metal in its proper menstruum, the nitro-muriatic acid, and to mix it with ether or any essential oil, which by operating a reduction of the metal in a very divided state, has the power of separating it from its acid solvent. As this fact is important in the chemical history of this metal, we shall mention it more particularly under the article *GOLD*.

The potable gold of Helvetius, retained till within these few years in the Paris pharmacopœia, is thus prepared. "Dissolve half a dram of pure gold in two ounces of aqua regia, employing a gentle heat; to the solution add one ounce of oil of rosemary, shake the mixture, and immediately the gold will quit the acid, and unite with the essential oil, giving it a beautiful yellow colour; this is to be decanted from off the acid which remains at the bottom, and mixed with fifteen ounces of rectified spirit of wine, which forms the potable gold."

The dose is from six to twenty drops.

The powers of this medicine are supposed to be in a high degree cordial, stimulating, and tonic.

In such a preparation as this, when the quantity of gold in each dose is so extremely minute (though still sufficient to give it somewhat of a yellow colour), it requires little discernment to see that all the medicinal powers, whatever they may be, depend altogether on the ethereal oil and the ardent spirit with which the gold is united; and accordingly it is now entirely rejected in every pharmacopœia.

A fairer trial, however, has been made of the virtues of gold in medicine. We read that some of the crafty alchemical empirics had the address to persuade several of their noble patrons that the royal metal was peculiarly well calculated to cure the diseases of persons of exalted rank; and under this circumstance this precious metal has been swallowed in larger doses. These, however, are not the follies of the present day, public credulity being diverted into other channels.

From all that we know concerning the properties of gold, it appears, that its inertness when taken into the human body, depends on the ease with which it is reduced to the reguline state, and when in this state, its absolute insolubility in any of the animal juices. As the nitro-muriatic acid of gold possesses the power, in a very high degree, of staining almost every animal matter, it is probable that it would act

as a topical stimulant with equal energy as the lunar caustic, or nitrate of silver, but it does not appear that gold would in any case be preferable to the other metals. It is now, therefore, entirely rejected from the *Materia Medica*.

AURUM, *Præblematicum*, *Paradoxum*, and *Graphicum*, in *Mineralogy*. See **COLD**, *Ores of*; and **TITANIUM**, *Ores of*.

AURUM, *Reginæ*, in *Antiquity*. See **QUEEN GOLD**.

AURUM Coronarium. See **CORONARY GOLD**.

AURUM Sophisticum, *minic gold*, in *Chemistry*, a preparation made as follows: take one distilled verdigris, eight ounces; crude Alexandrian tutty, four ounces; borax, twelve ounces; salt-petre, one ounce and a half; pulverize and mix them all together, tempering them with oil to the consistence of a plaster; then put a German crucible into a wind-furnace, heat it red-hot, and putting your mass into it, let it be covered, and the furnace filled with coals over the crucible. When the mass is melted, let it cool of itself, then break the crucible, and you will find at the bottom a fine regulus, like gold, weighing about four ounces, which being malleable, may be wrought into any form.

AURUM Vegetabile, a name given to saffron.

AURUNCI, in *Ancient Geography*, a people of Italy, in Latium. They have been often confounded with the Ausones; though Pliny distinguishes them. They appeared in a war against the Romans, in the year of Rome 258; but were entirely defeated in 408.

AURUNGABAD, **AURINGABAD**, or **AURENGBAD**, in *Geography*, a modern city of India, owing its rise from a small town to the capital of the province of Dowlatabad, in the Deccan, to Aureng-Zebe; from whom also it had its name. When the Deccan became a province of the Mogul empire, this city became the provincial capital, and continued to retain its rank after the Nizams became independent of Delhi; and until the encroachments of the Poonah Mah-rattas, of late years, made it an uncomfortable residence to the Nizam. It is situated on a plain, almost surrounded with mountains; it is large and populous; and was encompassed, by Aureng-Zebe, with walls and bastions. His palace, in which he resided, was also surrounded by walls and gates of entrance. The country about is fertile, and produces millet, wheat, and other provisions, but not sufficient for the immense number of its inhabitants, as it is one of the largest and most populous cities of India. N. lat. $19^{\circ} 45'$. E. long. $76^{\circ} 2' 30''$.

AURUNGZEBED. See **AURENGZEBED**.

AURUSPI, in *Ancient Geography*, a people of Africa, in Ethiopia, whose capital, according to Pliny, was not far from the Nile.

AURUSULIANA, an episcopal city of Africa, in Numidia.

AUSA, in the middle ages called *Aufona*, a town of Hispania Citerior or Tarræconensis, south-west of the Indigetes, between Gerunda and Maadrefa. The inhabitants were called Aufetani and Authatani. It is now *Tic* or *Tich d' Ojnas*, in Catalonia. N. lat. $41^{\circ} 50'$. E. long. 2° .

AUSANA, a village of Belgic Gaul, where the twelfth legion had its winter quarters.—Also, an episcopal see of Africa, in the præconsular province.

AUSANCALI, a town of Italy, in Liburnia. Ptolemy.

AUSARA, a town of Arabia Felix, in the country of the Sachalites, near the sea.—Also, a town in the interior part of Arabia Felix. Ptolemy.

AUSCHE, in *Geography*, a town of Bohemia, in the circle of Leitmeritz, eight miles E. N. E. of Leitmeritz.

AUSCHISÆ, in *Ancient Geography*, a people of Africa,

in Libya, to the west of the Asbystæ, and east of the Nasa-mons. Herodotus.

AUSCH, a people of Europe, in that part of Gaul called Aquitania. Their capital was Climberis, which afterwards assumed the name of the people. They occupied the country corresponding to the territory of Auch, west of the Tolosates. See **AUCH**.

AUSCULTARE, in *Ancient Customs*.—Because the reading of prayers with a graceful tone or accent, makes some impression on the hearers; there was anciently a person appointed, in monasteries, to hear the monks read and sing, who instructed them how to perform, before they were admitted to read or chant publicly in the church, or before the people.—This was called *auscultare*, q. d. *to hear*, or *listen*.

AUSER, or **AUSAR**, in *Ancient Geography*, now *Serchio*, a small river of Italy, in Etruria, which discharges itself into the sea, about six miles north of the mouth of the Arnus.

AUSI, a people of Africa, on the sea-coast of Libya, encompassing the lake of Tritonis, and separated by the river Triton from the Mæchlyes. Herodotus relates, that these savage people celebrated a feast in honour of Minerva, at which the young women separated into two companies, and fought against one another with clubs and stones; those who fell in the combat, or died of their wounds, were deemed not to have been virgins. They paid no respect to marriage, but possessed their women in common. Their children were nursed by their mothers till they were able to walk; and they were then introduced to an assembly of the men, who met every three months, and the man to whom any child first spoke, was acknowledged as its father.

AUSIGDA, a town of Africa, in the Pentapolis, watered by the river Cinydhius. An island of the same name is mentioned by Stephanus.

AUSULINDUM, a place of Africa, in the province of Tripoli, on the road from Tacapé to the greater Leptis.

AUSIMUM, or **AUXIMUM**, an ancient Roman colony, in the Picenum; now *Osino*, or *OSIMO*.

AUSINZA, a town of Asia, in Persia Propria. Ptolemy.

AUSITÆ. See **ÆSITÆ**.

AUSONA, a town of the Ausones, reckoned among the most ancient people of Italy, who occupied that part of Italy, which extends from the promontory of Circæum to the straits of Sicily; but they were afterwards reduced to a more limited territory between the montes Circæi and Maf-fici. They were extirpated before the time of Pliny. Virgil represents them as a colony of Trojans.

AUSONIA, a name first restricted to the territory of the Ausones, and afterwards applied to the whole of Italy.

AUSONIUM MARE, denotes that part of the Mediterranean now called the sea of Sicily. It was formerly a part of the sea called Ionian, extending southwards from the promontory of Japygium to Sicily, which it washes on the east, as it does the Brutii and Magna Græcia on the south and east. It is separated from the Tuscan sea by the strait of Messina.

AUSONIUS, **DECIVS**, or **DECIVS MAGNUS**, in *Biography*, a Roman poet of the fourth century, was a native of Bourdeaux, where his father Julius Ausonius was an eminent physician. Having enjoyed the advantages of an excellent education, under his grandfather Arborius at Toulouse, and also under other eminent professors of grammar and rhetoric, he became himself professor in these departments of literature in his native city. Such was his reputa-tion,

tion, that he was called to court by the emperor Valentinian, and appointed preceptor to his son Gratian. By the latter he was advanced to the office of pratorian prefect of Gaul and Italy about the year 376, and to the consulship in 379. He was much esteemed by the emperor Theodosius, and as some say, created by him a patrician. The time of his death is not accurately ascertained; but he appears to have been alive in 392, and probably lived to an advanced age. Amongst the learned it has been a subject of dispute, whether Ausonius was a Christian or a Pagan. If he was not a Christian, the poems on Christian topics ascribed to him must have been supposititious; and the insensibility of several of his pieces suggests a presumption, that he had not embraced Christianity.

His poems manifest learning and ingenuity; but they cannot bear the test of comparison with the productions of the Augustan age, as they are generally insipid, harsh and inelegant, and bear obvious marks of the declining genius and taste of the period in which they were written. The "Centio Nuptialis" is altogether formed of lines and hemistichs from Virgil, and the latter part of it is highly censurable for its obscenity. The epigrams are generally flat and insipid. The best editions of Ausonius are the "Variorum" of 1671, and the "Delphin" of 1730. Gen. Dict. Fabr. Bib. Lat. t. ii. p. 87, &c.

AUSPEX, in *Roman Antiquity*, a name originally given to those who were afterwards denominated *augurs*. In which sense the word is supposed to be formed from *avis*, *bird*, and *inspicer*, *to inspect*; *auspices*, q. d. *avispicias*, or inspectors of birds.

At first the auspices were properly those who presaged future events by inspection of the flight of birds; as the *auspices* predicted them by the inspection of victims, and *augurs* by the singing of the same birds. But Plutarch informs us (*Quæst. Rom.* 72.), that in process of time these distinctions were disregarded; and that the name of *augurs* was given to those who had been originally called *auspices*.

AUSPICIUM, AUSPICY, the same with AUGURY.

Servius, indeed, distinguishes between *auspicy* and *augury*; making *auspicy* comprehend the consideration merely of birds, and of their flight; *augury*, of the notes of birds, and of all sensible objects; he adds, that the former was allowed a man any where abroad, whereas the latter might only be performed in his native place. And it is certain, that consuls, generals, and others, who took omens out of Rome, were properly said *auspicy*: nevertheless, custom appears to have over-ruled this distinction.

The auspices were consulted on a variety of occasions, so that nothing was done respecting the public, either at home or abroad, in peace or war, without this ceremony; and at first in important affairs of a private nature they were scrupulously regarded. The auspices were referred to before any battle; they assisted at marriage (*Juvenal.* x. 256); and they were consulted on the choice of plebeian and patrician magistrates; and on the first day of every year, in order to determine whether the progress of it would be happy or otherwise. To this purpose Ovid, in his *Fasti* (l. 107.), says:

"Tempora commisi nascencia rebus arrendis;
Totus ab auspicio ne foret annus iners.
Quisque suas artes ob idem delibat agendo,
Nec plus quam solitum testificatur opus."

And in case of war he observes (*Trist.* ii. 173.):

"Per quem bella geris, cuius nunc corpore pugnas;
Auspicium cui das grande, deoque tuos."

AUSPITZ, in *Geography*, a town of Moravia, in the

circle of Brunn, forty-two miles S. S. W. of Olmutz, and 114 S. E. of Prague.

AUSSEE, New, a town of Germany, in the duchy of Stiria, forty-eight miles W. N. W. of Judenburg.

AUSSIG, or AUSTI, a town of Bohemia, in the circle of Leitmeritz, on the Elbe; ten miles N. W. of Leitmeritz.

AUST, a very small village of England, in the county of Gloucester, on the side of the Severn; whence is a passage-boat or ferry to the opposite shore in Gloucestershire, and thence across the Wye to Chepstow; 12 miles north of Bristol, and 6 south of Chepstow.

AUSTLER, in *Mythology*, was like each of the other winds, one of the sons of Atlas and Aurora: and it denoted the south wind. See *WIND*.

AUSTERE, is in general applied to a rough astringent taste, united with that of founels. It is really synonymous with *acrid*.

AUSTERITY, among *Moral Writers*, sometimes denotes rigour in the inflicting of punishments. We say also, austerity of manners; the austerities of the monastic life. The austerity of the Roman censors kept the people in their duty. The greatest austerity of the Carthusians is perpetual solitude.

AUSTERLITZ, or SLAWKOW, in *Geography*, a town of Moravia, in the circle of Brunn, which was almost destroyed by the Swedes, in the seventeenth century: twelve miles E. S. E. of Brunn, and 112 E. S. E. of Prague.

AUSTIL, or ST. AUSTIN, is a market and flannery town of Cornwall, in England. It is built on the eastern side of a hill, and has greatly increased during the last century in the number of its houses and inhabitants. This augmentation may be attributed to the prosperous tin mine; that are in the immediate vicinity, to the privilege of having one of the flannery courts held here, and in consequence of having a turnpike road carried through the town from Plymouth to the land's end. The church is a large ancient pile of building dedicated to St. Austin; and the town is ornamented with several statues in canopied niches. The seats of the church, and the external walls, are carved with various devices emblematical of the crucifixion. The original charter for holding a weekly market was granted by queen Elizabeth, who directed that the tiths should be applied to the relief and maintenance of the poor. The principal part of the inhabitants are employed in the mining concerns, in the pitchard fishery, and in a small manufactory of coarse woollens. At the west end of the town are three blowing-houses, where the tin is separated from the ore by means of fire. This process was formerly effected by smelting-furnaces, but the present method seems to be more economical, and far preferable. The old smelting-hoaks (some of which are still used in common), are supplied with coals, and are reverberatory: but in the blowing-houses, the fire is made with charcoal, and ignited by air impelled through cylindrical tubes. Beauties of England and Wales, vol. ii. p. 422, &c. See *BLOWING HOUSES, MINES, STANNARY*.

AUSTIN, ST. See AUGUSTIN.

AUSTIN Friars. See AUGUSTINES, and HERMITES.

AUSTRAL, derived from *auster*, *south wind*, the same with *southern*.

Thus *austral signs* are the six last signs of the zodiac; so called, because they are on the south side of the equinoctial.

AUSTRAL Earth, in *Minerology*. See *TERRA AUSTRALIS AUSTRALIS*.

AUSTRALASIA, in *Geography*, a name given, about half a century ago, by the learned president De Bouffes (*Histoire des Navigations aux Terres Australes*, Paris, 1756,

2 vols. 4to.), to those countries that lie to the south of Asia, namely, New Holland, New Guinea, New Zealand, &c.; whilst he distinguished the numerous isles in the Pacific by the appellation POLYNESIA. These regions constitute, by discoveries already made, about a fifth part of the world, and include, under the name of "Austral Lands," "Southern Indies," and other denominations, New Holland, New Guinea, New Britain, New Ireland, New Caledonia, New Zealand, the Friendly isles, Society isles, the Marquesas, and even the Sandwich islands in the north. But as these regions are of wide extent and distinct nature, consisting of almost a new continent in the south of Asia, and scattered groups of isles in the Pacific, many of which are nearer to South America, than to Asia, whilst most of them are not above twenty degrees to the south of the equator, the denomination of "Austral Lands," has been thought to be very objectionable, and that of the "Southern Indies," ridiculous. Since, therefore, they cannot well be blended under one common appellation, De Brosse adopted the above-mentioned distribution. Some recent German geographers have considered Australasia and Polynesia as synonymous terms, in contradiction to the first inventor of these appellations. This fifth part of the world, as the Germans call it, would not even then exceed the wide extent of Asia or America; but it has been thought preferable, for several reasons, to consider Australasia and Polynesia, as two great and distinct maritime divisions of the globe. The name of Australasia is the more proper, because it not only implies a continent but the reminiscence that this region supplies the place of the ideal Terra Australis, after which geographers and navigators have so long inquired in vain. Mr. Dalrymple (Introd. to Collect. of Voyages), whose judgment in these matters cannot be disputed, approves of the two divisions assigned by De Brosse. But if these should be rejected as divisions of the globe, they must of course be arranged among the "Asiatic islands;" and in this case the appellation may be still retained. The length of Australasia may be computed from 95° of E. longitude to 185°, that is 90° in lat. 30°, or nearly 5000 geographical miles; while the breadth, N. lat. 3° to S. lat. 50°, will be 3180 geographical miles. "The western boundary of Australasia may be taken in the meridian from the south of Sumatra, or extended to 100°, or even 90°, east from Greenwich; but as few or no isles of consequence have yet been discovered in that direction, the strict demarcation may be discovered by future circumstances. A like observation may be applied to the southern boundary of Australasia, which, as including New Zealand, and some isles not far distant, must be extended to the southern latitude of 50°, or even of 60°, where the islands of ice begin to appear. The most difficult boundaries are those on the north and east. A wide and vacant channel seems to divide the north-west part of Notasia, or New Holland, from the isles of Sunda, or Sumatran chain. From the north cape of Van Diemen, E. long. 131° from Greenwich, a line ascends to the north between the Indian and Pacific oceans, leaving in the former the isles of Banda, Ceram, Mysol, and Gilolo; while in the Pacific, and belonging to Australasia, are Timorlaut, Wajoo, and other isles immediately connected with Papua. This line being extended in the same direction about two degrees to the north of the equator, turns east into a wide channel of separation between the Carolines, &c. and New Ireland, and other isles belonging to Australasia. Bending south-east, fir Joseph Banks's isles and the New Hebrides are left in Australasia, while a considerable interval leaves the Feejee islands in Polynesia. Thence a wide and open sea gives the line of demarcation an ample sweep, about six or seven degrees, to

the east of New Zealand, when bending S. W. it joins the southern boundary."

"From these indications it will be perceived, that Australasia contains the following countries: 1. The central and chief land of Notasia, or New Holland, with any isles which may be discovered in the adjacent Indian ocean, twenty degrees to the W., and between twenty and thirty degrees to the E., including particularly all the large islands that follow. 2. Papua, or New Guinea. 3. New Britain, and New Ireland, with the Solomon isles. 4. New Caledonia, and the New Hebrides. 5. New Zealand. 6. The large island called Van Diemen's land, recently discovered to be separated from New Holland by a strait, or rather channel, called Bass's strait." See the several articles. Pinkerton's Mod. Geog. vol. ii. p. 431—464, &c.

AUSTRALASIÆ, in *Entomology*, a species of BLATTA, very frequently found in ships that have visited the islands in the South seas. It is of a ferruginous colour, with a white ring on the thorax; and a little white line at the base of the wing-cases. Fabricius, &c.

AUSTRALASIÆ, one of the New Holland species of PHALÆNA, described by Fabricius in his Spec. Inf. The wings reddish-orange; base of the lower ones beneath ferruginous. Mus. fir J. Banks.

AUSTRALASIÆ, a species of SCORPIO, described by Forster as a native of the islands in the Southern ocean. It is distinguished by having combs with six teeth, and the hands, or hand-claws being smooth. The body is rather depressed; brown above, paler beneath; extreme joint of the tail and legs pale.

AUSTRALASIAN SNAKE, in *Zoology*, a trivial name assigned by Dr. Shaw to a species of COLUBER that is figured in White's Journal of a Voyage to New South Wales; and which he describes as a blackish-brown snake, speckled with yellow, with very narrow scuta, and abdomen clouded with brown and yellow. This is a large snake, measuring nine or ten feet, and is rather slender in proportion to its length. The number of abdominal scuta, and subcaudal scales, from the imperfect manner in which the dried skins of this kind have been preserved, has not yet been ascertained.

AUSTRALE, in *Conchology*, a species of BUCCINUM, found in rivers in New Zealand. The shell is oblong, smooth, thin, fasciated; aperture ovate and entire. *Obs.* This appears to be an intermediate species between the Buccinum, Bulla, and Helix genera. Gmelin.

AUSTRALIS CORONA, in *Astronomy*. See CORONA Australis.

AUSTRALIS PISCIS, is a constellation of the southern hemisphere, being one of the forty-eight constellations mentioned by the ancients, not visible in our latitude. The stars in Ptolemy's catalogue are 18; and in the Britannic catalogue 24. The star Fomalhaut, of the first magnitude, is in the mouth of this fish.

AUSTRALIS, in *Conchology*, a species of HALIOTIS, rather exceeding three inches in length, and two inches in breadth. This shell is varied with grey, blueish, and red; form ovate, convex, and cancellated; spire prominent and inflated. Found adhering to the rocks upon the coast of New Zealand. Within, this kind is very pearly, and finely glossed with red and yellow.

AUSTRALIS, a species of MUREX that is found in the South Seas. The shell is ovate, with longitudinal striae; lip undulated; whorls of the spire guttered; first whorl turgid with four plaits; second with three plaits. Gmel. Spengl. This shell bears affinity to Murex stramineus; is about an inch and a half in length; of a straw colour, with a yellow pillar; and lip pure white.

AUSTRALIS, a species of **VENUS**, of a heart-shape, white, and glossy, with brownish characters, and entire margin. Chemn. Conch. A native of the South Seas.

AUSTRALIS, in *Entomology*, a species of **CANCER** (*Scyllarus*, Fabr.), described by Fabricius from a specimen in the collection of Sir Joseph Banks, that was brought from the South Seas. The plates of the antennæ are smooth and rounded. This kind bears some resemblance to *Cancer Arctus*; but it is of a narrower shape; the plates of two joints; thorax unequal, with a crenated margin; legs ten; claws simple.

AUSTRALIS, a species of **SCORPIO** that inhabits Africa, and, according to Degeer and Fabricius, has thirty-two teeth in the combs, and the hand-claws smooth.

AUSTRALIS, a species of **MUSCA** (*Stratiomy*) that inhabits South America. It is large and glabrous, with black eyes, and is specifically described as being testaceous, with a bidentated scutell; and the first segment of the abdomen brownish. Fabricius.

AUSTRALIS, a species of **FORMICA** found in New Holland. It is black, with the thorax unarmed; and petiole feak armed with two spines. Fabricius.

AUSTRALIS, a species of **SPHÆX** that inhabits New Holland. The colour is blackish blue; thorax lobed, fulvous in front. Fabr. Gmel. &c.

AUSTRALIS, a species of **MYRMELEON** that inhabits the south of Europe. The wings are white, with a black spot on the margin; and the body variegated. Fabricius.

AUSTRALIS, a species of **LYGÆUS** (Fabr.) that inhabits Otaheite. It is black; thorax slightly spinous, with a red anterior band; shanks of the posterior legs membranaceous.

AUSTRALIS, a species of **CIMEX**, with the upper-wing rufous, marked with a waved black streak; under-wings black, with a white dot in the middle. Inhabits New Holland; and called by Fabricius *lygæus 2-guttatus*.

AUSTRALIS, a species of **GRYLLUS** that inhabits Amsterdam island. It is greenish; thorax rotundate; wings and wing-cafes equal; legs anteriorly very spinous; is larger, but bears some affinity to the Brazilian species *spinipes*.

AUSTRALIS, a species of **LAMPYRIS** that inhabits New Holland. It is of a yellowish colour, with the head and wing-cafes brown. Fabricius.

AUSTRALIS, a species of **CERAMBYX** (*Callidium* Fabr.) On the thorax two white lines; on the wing-cafes four; the two middle ones united and abbreviated. Inhabits New Zealand. Fabricius.

AUSTRALIS, a species of **CRYPTOCEPHALUS** (*Crioceris*) that inhabits New Holland. The colour is rufous; thorax cylindrical; and two stripes of white on the wing-cafes. Fabricius.

AUSTRALIS, a species of **CYRINUS**, found in the fresh waters in New Holland. It is slightly striated; greenish; wing-cafes short; and furnished with a single tooth. Fabricius.

AUSTRALIS, in *Ornithology*, a species of **TRINGA** that inhabits Cayenne, and is about eleven inches in length. It is grey above, spotted with brown; beneath reddish; belly and rump whitish; tail and wings dusky; bill and legs black. Gmelin, &c. The crown is striated with brown.

AUSTRALIS, a species of **STERNA** or Tern, that inhabits Nativity island, in the South Seas. It is grey; bill and legs black; front fordid yellow; quill feathers white; connecting membrane of the feet tawny; length from seven inches and a half to nine inches; and called by Latham the southern Tern.

VOL. III.

AUSTRALIS, a species of **COCCUS**, about eleven inches in length, that inhabits Cayenne. It is black above, and cinereous; bill red; wing-coverts spotted with white; tail rounded. Gmelin. This is the Cayenne red-billed cock of Latham. *Cf.* Gmelin has another bird under the same name, *coccus australis*, which he describes as being black; feathers on the chin lax; quill-feather black. This is the South Sea Tern of Latham, and inhabits the Friendly Islands in the South Sea. Length thirteen inches.

AUSTRALIS, a species of **PARTRIDGE**, of a green colour; crown blue, and crested with long feathers; chin and middle of the abdomen red; thighs purple. A native of the Sandwich island, and described by Latham under the name of the blue-crested parakeet. The length of this bird is six inches and a half; beak orange; front pale-green; two middle tail-feather green, and yellow at the extremity; the others yellowish-edged, and tipped with green; legs dusky; claws black. Gmelin.

AUSTRALIS, a species of **FALCO** that inhabits Statenland. It is brown; cere yellow; tail black, dotted at the end with fordid white; size of the plaintive eagle; voice like a hen. Gmelin.

AUSTRIA, ARCHDUCHY OF, in *Geography*, one of the principal provinces of Germany, derives its name from its situation towards the east: *Ost-ryak*, or *Offerieb*, signifying in German the *eastern kingdom*. This name was softened into Austria by the Italian and French enunciation; and this division, which may be considered as partly belonging to ancient Pannonia, arose after Charlemagne had established the western empire; being a remnant of the sovereignty of what was called Eastern France, established by that conqueror. It was also styled "Marchia Orientalis," the eastern march, or boundary; and after the failure of the Francon line, became a marquisate feudatory to the dukes of Bavaria, till the emperor Frederic Barbarossa, in 1156, constituted it a duchy held immediately of the empire. See ARCHDUKE.

The archduchy of Austria is bounded on the north by Bohemia and Moravia, on the east by Hungary, on the south by Stiria, and on the west by Bavaria. It is divided by the river Ens into Upper and Lower Austria; the capital of the latter is Vienna, besides which it contains 35 other cities, and 256 market towns; and that of the former is Lintz, besides which it has 13 other cities, and 88 market-towns. The population of this archduchy has been usually computed at 1,685,000 persons; and more lately by Hoeck. in his "Statistical View of the States of Germany," at 1,820,000.

The Austrian dominions, or hereditary states of the house of Austria, comprehended, before the late war, besides the archduchy of Lower Austria, containing the country on this side the river Ens, sometimes called Lower Austria, and the country beyond the Ens, denominated Upper Austria, and also the country called the Inn-Viertel, or the part taken from Bavaria, of which the capital is Braunau, the following territories; viz. Interior Austria, including the duchies of Stiria, Carinthia, Carniola, Austrian Friuli, and Trieste; Upper Austria, or the Tyrolese; Anterior Austria, comprising the Brisgaw, Austrian territories in Swabia, Hohenembs, Falkenlaur, Langerargen, and Tettnang; the kingdom of Bohemia; the margraviate of Moravia; Austrian Silesia; Austrian Netherlands, now in possession of the French; Lombardy, including the duchies of Milan and of Mantua, now in possession of the French; the kingdom of Hungary, and bannate of Temes-

war; Illyrium, including Dalmatia, Croatia, and Slavonia; Transylvania; the province of Bukovina, annexed to the Austrian territory in 1777; and the provinces of Gallicia and Lodomia, being that part of Poland acquired by Austria in the partition of 1772. From the frontiers of Switzerland to the utmost limits of Transylvania, the length of the Austrian dominions may be reckoned at about 760 British miles, and the breadth about 520, from the river Bug, which forms a boundary between Austria and Prussia Poland, to the Save, which divides the Austrian from the Turkish sovereignty. The contents may be about 184,000 square miles; and Boetticher estimates the inhabitants at 108 to a square mile. Since he wrote, the populous region of the Netherlands has been withdrawn; however the population of the Venetian territories is little inferior. Towards the east, the Austrian dominions border on those of Russia and Turkey; to the north, on those of Prussia, Upper Saxony, Bavaria, from which it is separated by the river Inn, and Swabia; and on the utmost west are Switzerland and the Italian states.

The original population of these extensive regions is various; but chiefly Gothic and Slavonic. The native ancient Germans, a Gothic race, form the ruling, most industrious, and most important part of the inhabitants. The present population of the Austrian dominions is computed at more than 20,000,000; that of Hungary, Transylvania, and the Bukovina, being estimated at $4\frac{1}{2}$ millions. Some authors, however, have computed the population of Hungary alone, at 7,000,000; and a late German author (see Townson. ch. v.) has consequently swelled the general population of the Austrian dominions to 25,000,000; and a modern geographer (see Pinkerton's Mod. Geog. vol. i. p. 345.) thinks it reasonable to allow 23,000,000 as a medial computation of the numbers subject to the Austrian sceptre. Of the other chief provinces, Bohemia is supposed to hold $2\frac{1}{2}$ millions; Moravia $1\frac{1}{2}$ million; the acquisitions in Poland, more than 3 millions; and the archduchy of Austria, as we have already stated, 1,685,000.

Hoeck (ubi supra) has exhibited the hereditary states of Austria, with their respective population, in three tables; from which it appears, that Bohemia contains 2,806,493 persons; Moravia, 1,256,240; the duchy of Austrian Silesia, 250,000; Lower Austria, 1,820,000; Interior Austria or Stiria, &c. 1,645,000; Superior Austria, or the Tyrolse, 610,000; Anterior Austria, 293,433; Roverit and the Vorarlberg, 77,971; Hungary and Illyria, 7,350,000; Transylvania, 1,443,364; Bukovina, 130,000; Eastern Gallicia, 2,797,119; and Western Gallicia, 1,106,178; amounting in the whole to 21,585,798 persons. The army is computed by Boetticher at 365,455 men, in 136 regiments, of which 46 are German, and only 11 Hungarian. But in the sanguinary contest with France, this army has been greatly diminished; and, at present, it is supposed not to be equal to that of Prussia, estimated at about 200,000; and far less than that of Russia, which is supposed to double this number. The revenue is computed at more than ten millions sterling; to which Austria contributes about three millions; and Hungary a little more than a million and a half. This revenue used to exceed the expences; but the public debt is now supposed to surpass 40,000,000 l. sterling, and the recent wars have occasioned great defalcations.

Austria, before the acquisition of Venice, might have been regarded as an inland power; as the small harbour of Trieste had no commercial importance. Since the Austrian dominions have acquired their present extent and power, de-

termined rivalry has subsisted between them and France. There are also causes of confirmed jealousy between Austria and Prussia, and of irreconcilable hatred between the Austrians and Turks. As Austria is also jealous of Russian power, it is not easy to select any state on the continent with which it could enter into a strict and permanent alliance.

The aspect of the Austrian dominions is rather mountainous than level, and presents in this respect a striking contrast to that of Russia and Prussia. Of the elevated chains which diversify the Austrian territories, the first that deserves mention is the Rætian or Tyrolse Alps, called the Brenner mountains (see ALPS, and BRENNER), among which are several glaciers; and there are also considerable hills, which branch from the Swiss and Tyrolse Alps, in the northern parts of the territory that was formerly Venetian, such as mount Baldo, mount Bolca, and the Euganean hills near Padua. The provinces of Carinthia and Carniola present many chains of mountains, as that of Lobel, which separates these countries, and the Julian or Carnic Alps, now called Birnbaumer Wald, which divide Carinthia from Italy. The summits of the Carniolan mountains are covered with permanent snow; of these, the most memorable are the Kalenberg near the river Save, and the Runberg, and the Karst to the south of Idria. Here also terminates the vast chain which proceeds by the north of Dalmatia towards the Hæmus, and is known by many local appellations, as mount Promina near Gnin, mount Prologh, mount Clobu, &c. &c. but better distinguished by the Dalmatian chain. The latter mountains are chiefly calcareous. Towards the north in the south of Stiria, there first occurs the chain of Bacher; mount Grafau on the east of Judenburg; and the chief mountains in this province, or those of Grinin, in its western extremity towards Salzburg. On the east towards Hungary, this country is more plain and fertile. On the south of Austria is a chain of inconsiderable elevation. (See CETIUS, and KALENBERG.) Upper Austria, or the western part of this province, contains many considerable mountains, the highest of which is in the maps called Priel, but the proper name is Gressenberg. Towards the north, Austria is divided from Bohemia by a ridge of considerable elevation, which passes to the north-east of Bavaria. On the north-west, Bohemia is parted from Saxony by a chain of metallic mountains called the Erzgebirg, a word that denotes hills containing mines. On the west of the river Eger, near its junction with the Elbe, stands the mountainous group of Mileffou, supposed to be the highest in the province. On the north-east the Sudetic chain, which branching from the Carpathian, divides Bohemia and Moravia from Silesia and the Prussian dominions. The Carpathian mountains, bounding Hungary on the north-east, deserve particular notice. See CARPATHIAN.

Of the rivers which pervade the Austrian dominions, the principal is the DANUBE. Next to this in importance is the THESS; and there are also the SAVE, the DRAVE, the INN, the MULDA, the ELBE, the MORAU, the ADIGE, and several others of less note. The lakes are numerous, and some are of considerable size. In Austria proper, are the lake Traun, the Ebensee, and others. Carinthia contains a large central lake not far from Clagenfurt, and Carniola another, called the Cirknitz see. Tyrol has no lake of any consequence, except a part of the Lago di Garda; but its glaciers are numerous. For the morasses and lakes of Hungary, see HUNGARY. See NEUSIDLER and PALITZER. In Transylvania is the Tefege To; and many small lakes are situated amidst the Carpathian mountains.

The soil of the Austrian dominions is upon the whole extremely fertile and productive, in spite of the neglect of industry, which has permitted many parts of Hungary, and of the Polish provinces, to pass into wide forests and marshes. In Austria Proper, Mr. Marshal observes (Travels, vol. iii. p. 102.) that oats were little cultivated; the other products were such as those of England, particularly abundance of cabbages and potatoes; but the cultivation was not neat, small waste spots being left by the plough, which harboured weeds to the great detriment of the field. The vineyards and fields of saffron were numerous; cattle appeared in abundance; and large herds of swine, which fed all the summer in the woods. At a more recent period, Mr. Coxe (Travels in Poland, &c. vol. i. p. 153, &c.) gives a deplorable picture of the want of cultivation in the southern provinces of Poland, now subject to Austria; the country being chiefly overpread with vast tracts of gloomy forests, and exhibiting few symptoms of an inhabited, and still less of a civilized country. In travelling the high road from Cracow to Warsaw, in the course of 258 miles, he met with only two carriages and a dozen carts. The country was equally thin of human habitations; a few wooden villages succeeded one another at long intervals, whose miserable appearance corresponded with the wretchedness of the surrounding country. The darkness of the night, during which he travelled for want of decent accommodation, deprived him of nothing but the light of indifferent crops of corn, gloomy forests, and objects of human misery. The natives were poorer, humbler, and more miserable, than any he had observed in the course of his travels; wherever he stopped, they flocked around him in crowds, and demanded charity with the most abject gestures. The whole country is for the most part sandy or marshy. According to this description, Austria seems to have made no great acquisition in the Polish provinces.

The domestic animals in the Austrian dominions are commonly excellent, particularly the cattle. The mineralogy of these territories is the most various and interesting of any in Europe. There is scarcely a province from the frontiers of Switzerland to those of Turkey, which cannot boast of its minerals, and the acquisitions made by the house of Austria in Poland, contain one of the most remarkable mines in Europe, the saline excavations of Wilizka. See SALT, and WILIZKA. See also BOHEMIA, and MORAVIA.

The fertile archduchy of Austria furnishes few minerals; though mines of gold are found near the abbey Goettwig, and those of alum near Krems; salt-petre, however, is prepared in abundance; and at a little distance from St. Annaberg, near the frontiers of Stiria, a rich mine of silver was opened in 1754. The southern provinces of Stiria, Carinthia, and Carniola, afford many important minerals. See these articles. The northern parts of Italy, now subject to Austria, have been remarkable for mineralogy; but on passing into the Tyrol, several mines occur of ancient reputation, such as that of silver and lead near Lermos; and in the same quarter, those of Naseriat, in the Vermer mountains, about 30 miles north-west of Inspruck, which are rich in silver, copper, lead, and iron; nor is the southern region of Trent wholly destitute of mines. But the principal mines in the Austrian dominions are situated in the eastern provinces of HUNGARY and TRANSYLVANIA. See also CHEMNITZ, and SHERNITZ.

The climate of Austria Proper is commonly mild and salubrious, though occasionally exposed to violent winds; and the southern provinces in general enjoy a delightful temperature, excepting merely the severities of Alpine win-

ter in the mountainous parts. The more northern regions of Bohemia and Moravia, with the late acquisitions in Poland, can likewise boast of the maturity of the grape, and of gentle and favourable weather. The numerous lakes and morasses of Hungary, and the prodigious plains resembling deserts, are supposed to render the air damp and unwholesome, the cold of the night rivalling the heat of the day; but the keen blasts from the Carpathian mountains seem in some measure to remedy these evils, the inhabitants being remarkable for health and vigour.

The manufactures seem not to have been cultivated to any great extent in any part of the Austrian dominions. Those of Vienna are the most considerable. (See VIENNA, and also BOHEMIA.) The commerce of these dominions depends principally on their native opulence; Austria Proper, and the southern provinces, producing abundance of horses and cattle, corn, flax, saffron, and various wines, with several metals, particularly quick-silver from the mines of Idria. Bohemia and Moravia are also rich in oxen and sheep, corn, flax, and hemp; in which they are rivalled by the dismembered provinces of Poland. The linen manufactures of Bohemia, according to Hoeck, amount annually to 16,000,000 florins, besides some in wool and in cotton. The woollen manufacture at Lintz employs 30,000 persons; and in the whole archduchy of Austria there are seven great manufactures of cotton cloth, which occupy 140,000 individuals. The wide and marshy plains of Hungary, afford excellent pasturage for numerous herds of cattle; and other parts of the same country produce corn, rice, the rich wines of Tokay, and tobacco of an excellent flavour, with extensive mines of various metals and minerals. Upon the whole, the Austrian territories in general abound to such a degree with the various necessaries and luxuries of life, which are found either in the north or south of Europe, that the imports would seem to be few and inconsiderable; and before the acquisition of Venice, the chief exports were from the port of Trieste, consisting of quick-silver and other metals, with wines and other native products. From a table of the exports of Hungary for one year, given by Dr. Townson, it appears, that they consisted chiefly of cattle, hogs, sheep, flour, wheat, rye, wool, and wine, carried to other Austrian provinces; and only about one-seventh part sent to foreign countries.

The prevailing religion of the Austrian dominions is the Roman Catholic. However, Protestants of various sects are found in Bohemia and Moravia; nor are Lutherans unknown at Vienna, though they chiefly abound in Transylvania; and in Hungary the Protestants are supposed to be equal in number to the catholics.

The form of government is an hereditary monarchy, approaching to absolute power. Hungary, indeed, retains its ancient states, or rather an aristocratical senate; but as the military force is lodged wholly with the sovereign, no distinct kingdom or state can withstand his will. Austria also has its states, consisting of four orders, clergy, peers, knights, and burgeses; the assembly for Lower Austria being held at Vienna, and that of the Upper at Lintz. But these local constitutions can little avail against the will of a powerful monarch, supported by a numerous army. The laws vary according to the different provinces; and almost every state has its peculiar code. (See HUNGARY.) Upon the whole, the laws may be regarded as mild and salutary; and the Austrians in particular are a well regulated and contented people, while the Hungarians are often dissatisfied, and retain much of their ancient animosity against the Germans.

The history of Austria properly so called, may be concisely delineated in the following epochs, collected and detailed by Mr. Pinkerton, in his "Modern Geography," vol. i. p. 337.

"1. The house of Austria, which, by successive fortunate marriages since the fifteenth century, has arisen to such a summit of power, is well known to have sprung from the humble count of Hapsburg. Those lords possessed a small territory in Switzerland, in the northern corner of the canton of Bern, near the river Aar, about three miles south of the town of Bruck, and the same distance to the north of Mellingen. On a lofty eminence, crowned with beech, stands an ancient tower, the first seat of the house of Austria. In the twelfth century Otho is designated count of Hapsburg, and even heraldry can scarcely ascend beyond his grandfere Radebot, brother of Werner, bishop of Strasburg. In 1273, Rodolph of Hapsburg was called to the imperial throne, after an inter-reign, during which the German potentates had increased, and secured their own power; and wisely preferred a nominal sovereign, whose humble extract, and small possessions, could afford no check to their ambition. Yet Rodolph was at this time lord of the greater part of Switzerland; after the extinction of the powerful house of Zaeringen, and that of the counts of Kyburg, whose joint inheritance devolving to Rodolph, became the basis of his power, and that of his successors. (See *Planta's Swis. i. 170.*)

"2. Another emperor of the house of Austria appeared in Albert, A. D. 1298; from whom the Swis made their signal revolt in 1307. His son Frederic was obliged to yield the empire to Louis of Bavaria. (See *ALBERT I.*)

"3. Albert II. duke of Austria, A. D. 1438, succeeded to three crowns, on the death of his father-in-law the emperor Sigismund, those of Hungary, and Bohemia, and that of the empire by unanimous election. This was the epoch of the lasting grandeur of the house of Austria. Yet his successors Frederic III. and Maximilian I. were feeble princes; and Charles V. first astonished Europe with a real display of Austrian power. (See *ALBERT II.*)

"4. Maximilian having married the heiress of Burgundy, the Netherlands became subject to the house of Austria in 1477; and his son Philip, in 1496, marrying the heiress of Aragon and Castile, the ample dominions of Spain fell afterwards under the Austrian sceptre. Charles V. inherited all these domains; but on his resignation, Spain and the Netherlands passed to his son Philip II. and the former crown continued in the Austrian line till the close of the 17th century. Austria, Bohemia, and Hungary, passed to Ferdinand, the brother of Charles V. who was also chosen emperor of Germany.

"5. The noted bigotry of the house of Austria was not confined to the Spanish branch, for though Maximilian II. about 1570, had granted liberty of conscience even to the Protestants of Austria, yet those of Bohemia, and other parts, were afterwards so much oppressed, that the Protestant princes of Germany called in Gustaf Adolf, the celebrated Swedish monarch, to their assistance, who shook the empire to its very foundation. Even France supported the Protestants, in the view of weakening the Austrian power; and the war continued till 1648, when the famous treaty of Westphalia was signed, which has served as a basis for other diplomatic transactions. (See *WESTPHALIA.*)

"6. The war with France was often rekindled during the long reign of Leopold I. 1658 to 1705; and in 1683, the Turks were so successful as to lay siege to Vienna.

"7. His son Joseph I. joined the allies against France, and shared in their success. He married the daughter of John Frederic, duke of Hanover.

"8. By the death of the emperor Charles VI., on the 20th of October 1740, without male issue, the house of Austria became extinct. The elector of Bavaria seized the kingdom of Bohemia, and was elected emperor in 1742, but died in 1745.

"9. Francis of Lorraine, son of Leopold duke of Lorraine, having married Maria Theresa, daughter of the emperor Charles VI. succeeded to the Austrian dominions, which continue to be held by his descendants. In 1745 he was elected emperor, and his successors have enjoyed the imperial crown, as if hereditary. The powerful house of Lorraine is of great antiquity, descending from Gerard count of Alsace, in the 11th century, whose origin is referred to a collateral branch of the house of Austria.

"10. The reign of the emperor Joseph II. a beneficent but impetuous prince, whose grand designs of reformation were frustrated by his ignorance of the inveteracy of habits and prejudices, which must ever be considered in a due estimate of human affairs.

"11. The obdurate and sanguinary contest with France, the events of which are known to all."

For an abridged detail of the history of the other Austrian dominions; see *BOHEMIA, HUNGARY, VENICE, &c.*

AUSTRIACA SYDRA, in *Astronomy*, a name given by Maupertuis to the spots in the sun, as supposing them to be small stars between the sun and us.

AUSTRIACA, in *Entomology*, a species of *SPHEX* found in Austria, and described by Schranck. It is of a black colour, with a sulphur-coloured band, and two dots of the same at the base of the abdomen; legs sulphur-colour, with the thighs of the posterior ones thick.

AUSTRIACA, a species of *CICADA* (*Ranatra* Sec.), of a small size, that inhabits Austria. It is black, with pale legs; white at the base of the eyes; wings transparent, with three faint bands of black. Schranck, &c.

AUSTRIACA, a species of *BUPRESTIS*, with brassy, striated, and bidentated wing-cases; head and thorax greenish; abdomen violet. Gmelin. This kind inhabits Idria, is about the size of *buprestis rustica*, and is called *mordella gigantea* by Scopoli.

AUSTRIACA, a species of *CICINDELA* found in Austria. This insect is green, with the breast and belly golden red; wing-cases with a thin golden margin, and a few white spots. Schranck, Beytr.

AUSTRIACUS, in *Entomology*, a species of *CIMEX* that inhabits Austria. This insect is ferruginous, and has the feutel divided by a black band. Schranck.

AUSTRIACUS, a species of *CURCULIO* found in Austria. It is apterous, cinereous; wing-cases lineated with whitish, and dotted with black. Fabricius.

AUSTRIACUS, a species of *SCARABÆUS* (*Melolontha*) found in Austria. This kind is glabrous; wing-cases brown, with an exterior elevated margin, and four spots on the feutel. Herbst, &c. It is uncertain whether this is a distinct species or a variety only of *scarabæus agricola*.

AUSTRIACUS, in *Ornithology*, a species of *FALCO*, named by Latham the *Austrian kite*. Cere and legs rather woolly and yellow; body above chestnut; beneath testaceous, spotted with brown; tail forked. Inhabits the woods in Germany, and feeds on small birds and bats. Gmelin.

AUSTRIACUS, in *Zoology*, a species of *COLUBER* that is found in the environs of Vienna, and is so very analogous to coluber

coluber natrix, or common snake, as to be formerly confounded with it. Laurenti, in his work on the Amphibia, appears to be the first writer who distinguished them; the principal difference seems to consist in the perfect smoothness of the scales in aultriacus, while those of natrix are slightly carinated. It is of a blueish-ash, inclining to rufous on the sides and abdomen, with a double row of alternate rufous spots along the back. This kind lives in moist meadows, hedges, and watery places, and is of a fierce disposition, but incapable of producing injury, being unprovided with poisonous fangs. It occasionally varies a little in colour. Gmelin, Shaw, &c.

AUSTRO AFRICUS, in *Metecorology*, the south-fourth-west point, or wind.

AUSTROMANCY, in *Mythology*, properly denotes soothsaying, or a vain method of predicting futurity, from observations of the winds.

AUSUFAL, in *Ancient Geography*, the name of a place in Africa, on the road from Carthage to Alexandria, thirty-four miles from this latter city. Anton. Itin.

AUSUM, a town of Africa, in Mauritania Cesariensis. Ptolemy.

AUTARIATES, a people of Illyria, mentioned by Arrian, in his account of Alexander's expedition into this country; and probably the same with those placed by Strabo in Thrace, to the north of mount Rhodopus.

AUTARIS, a place in Arabia Felix. Pliny.

AUTEFAGE, in *Geography*, a town of France, in the department of the Lot and Garonne, and chief place of a canton in the district of Villeneuve d'Agen, nine miles N. N. E. of Agen.

AUTENIQUA, an extensive and beautiful country of Africa, lying to the east of the cape of Good Hope, and partly inhabited by Dutch colonists. The term "Auteniqua," in the language of the Hottentots, denotes, "loaded with honey," and is strictly applicable to this country, as you cannot advance a step in it, proceeding from the Cape, without seeing innumerable swarms of bees. M. Vaillant, who visited this country in 1782, calls it the most delightful region in the universe. It is interspersed with hills and vallies, enamelled meads and beautiful pastures; and it abounds with small rivulets, which contribute both to the scenery and fertility of it. The whole of Auteniqua, from the chain of mountains which divides it from the race of Hottentots called "Gonaquas," to the sea, is inhabited by planters, who rear cattle, make butter, cut down timber, and collect honey, with all which they supply the Cape. But though they employ wood in commerce, they use none of it for building houses. Their habitations are wretched hovels, constructed of wicker work, daubed over with clay; the skin of a buffalo, fixed at the four corners to as many stakes, serves them for a bed; and the door, which serves also for a window, is shut by a mat. The furniture is mean and scanty, as the dwelling is incommodious. With this appearance of poverty and wretchedness, the people live well; they have plenty of game and salt-water fish, and vegetables of every kind in their gardens through the year. For these they are indebted to the fertility of the soil, and the rivulets flowing in various directions from the mountains, by which it is watered. In the mountainous regions of this district, there are multitudes of elephants, buffaloes, panthers, hyenas, and antelopes of every species, which are hunted and killed by the natives, partly for food, and partly with a view to the preservation of their herds and flocks. The kites and vultures of this country are singularly fierce and voracious. Beyond the limits of the country

called "Auteniqua," is a spacious bay, with sufficient depth of water for the largest vessels, and safe anchoring ground, known to navigators by the name of the bay of "Agoa," but called by the colonists "Blutenberg's" bay, from the name of a governor who visited it. In advancing about a league along the coast, there is a considerable river called "Quear-Boom," which would afford an ample supply of water. The Hottentots, who are scattered "kraals" inhabit this delightful country, are described by Vaillant as a faithful, gentle, and rather timid race. He affirms, but probably without sufficient evidence, that they have not any notion of superior powers who govern the world. He also says that, totally free from jealousy, they lend their wives to travellers who visit them. In Vaillant's map, Auteniqua lies between 32° 30' and 34° 50' S. lat. and between 20° and 23° 40' E. long.

AUTENOW, a town of Poland, in the palatinate of Kiof, eighteen miles W. S. W. of Bialacerkiew.

AUTENTUM, in *Ancient Geography*, a town of Africa, in the route from Thene to Thersita, thirty miles from Suffetula, and twenty-five miles from Amudarsa. Anton. Itin.

AUTER Droit, in *Law*, is where persons sue or are sued, in another's right; as executors, administrators, &c.

AUTER Vie; a person who holds an estate by the life of another, is usually called tenant *per auter vie*. Litt. sect. 56.

AUTERFOITS Acquit, a plea by a criminal, that he was heretofore acquitted of the same treason or felony. For one shall not be brought in danger of his life, for the same offence, more than once. 3 Inst. 213. But by stat. 3 Hen VII. c. 1. this plea shall be no bar to the prosecution of any appeal. See **ACQUITTALE**.

AUTERFOITS Attain, a plea of former attainder, which is a good plea in bar, whether it be for the same or any other felony, under some exceptions; so that this plea is never good but when a second trial would be quite superfluous. See **ATTAINDER**.

AUTERFOITS Convict, a plea upon a former conviction for the same identical crime, though no judgment was or ever will be given; and this is a good plea in bar to an indictment.

AUTE RIVE, in *Geography*, a town of France, in the department of the Upper Garonne, and chief place of a canton in the district of Muret on the Arriege, fifteen miles south of Toulouse.

AUTHENTIC, something of received authority. It also signifies something solemn, and celebrated; clothed in all its formalities; and attested by proper persons, to whom credit has been regularly given.

Biblical writers have differed in opinion about the meaning of the phrase "Authentic letters," used by Tertullian, De Præscrip. c. 36. p. 245. B. Some by authentic letters have understood the originals themselves, in the apostle's hand-writing, or that of his amanuensis, and signed at the conclusion by himself. Others are of opinion, that Tertullian means letters in their original language. But Dr. Lardner, rejecting these two interpretations, maintains that this ancient father means by authentic letters such as were certain and well attested. In this sense the word authentic is used by Cicero Ad. Attic. l. x. ep. 9. Accordingly, by "Authenticæ literæ" we are not to understand "Authentic letters, or epistles," but "Scriptures;" and so the word should have been rendered. Hence it may be inferred, agreeably to the argument used by Tertullian, that the scriptures

scriptures received by the apostolical churches were authentic; the testimony given by those churches being, according to this father, an authentic, original, and certain testimony. Lardner's Works, vol. ii. p. 266, &c.

AUTHENTIC, in *Musick*, a term used in speaking of the ecclesiastical modes of *canto fermo*, or plain-song. An authentic tone or mode is that, when the octave is harmonically divided in this proportion, 6:4:3. that is to say, when the

fifth is at the bottom, and the fourth at top, as A. When the octave is divided arithmetically, as 4:3:1. where the fifth is above the fourth, as D, then the mode is termed

plagal. Of the eight ancient ecclesiastical modes, four are authentic; namely, the first, third, fifth, and seventh. The rest, that is, the second, fourth, sixth, and eighth, are plagal. See **MODES**.

AUTHENTICATING, the punishing an adulteress, by public whipping, and shutting her up in a convent for two years; after which, if the husband be not willing to take her back, she is shaven, veiled, and shut up for life. It is so called, as being the punishment prescribed in the Authentics. If the husband die within the two years, she seems to have a right to petition the court for her liberty; at least, another man, willing to marry her, may petition, and probably obtain it.

AUTHENTICITY of the *Old and New Testament*. See **BIBLE**, and **TESTAMENT**.

AUTHENTICS, **AUTHENTICÆ**, in the *Civil Law*, is a name given to the Novels of Justinian. See **NOVEL**.

The reason of the denomination is not well known.—Alciat will have it to have been first given them by Accursius. The Novels were originally composed in Greek, and afterwards translated into Latin by the patrician Julian, who also reduced them into fewer words, and less compass. And in the time of Bulgarius, there was a second version made, more exact and literal, though not quite so elegant as the former.

This translation, says the author just cited, being preferred by Accursius, he called it *authentica*, by way of preference to that of Julian, as being more conformable to the original. They are hereby distinguished from some other publications of later imperial constitutions, which are not regarded as of much authority.

AUTHIE, in *Geography*, a river of France, which runs into the sea, eight miles north from the mouth of the Somme, and separates the department of the Straits of Calais from the department of the Somme, through almost its whole course.

AUTHION, a river of France, which runs into the Loire, two miles south of Angers.

AUTHON, a town of France, in the department of the Eure and Loire, and chief place of a canton in the district of Nogent le Rotrou; six leagues west-north-west of Chateaudun.

AUTHOR, formed of *avros*, *ipse*, or rather from the Latin participle *actus*, or *augeo*, *I increase*; properly denotes one who created or produced any thing; and is applied, by way of eminence, to the first cause; viz. God. Thus we say, the author of nature; author of the universe, &c.

The term author is sometimes used in the same sense with inventor or inventor. Polydore Virgil has wrote eight books of the authors or inventors of things, &c. See **INVENTION**.

AUTHOR, in matters of *Literature*, denotes a person who has wrote or composed some book or writing. Accordingly we say, the sacred authors, anonymous authors, ancient and modern authors, &c. An original author is he who first treated of any point or subject; who did not follow any other person, or imitate any model either in the matter or the manner of what he has wrote.

AUTHORITY, in a general sense, denotes a right or power to command, and make one's self obeyed. In this sense we say, the supreme or sovereign authority; absolute or despotic authority; the royal authority; the episcopal authority; the authority of the church, of a father, &c. the authority of scripture, of a creed, confession, or the like.

AUTHORITY is also used for the testimony of an author or writing.

The word is also particularly understood of an apothegm, or sentence of some great or eminent person, quoted in a discourse, either by way of proof, or embellishment.

Authority also includes rules, laws, canons, decrees, decisions, &c. alleged in confirmation of a matter in dispute. Passages quoted from Aristotle were of great authority in the schools: texts of scripture are of decisive authority.

Authorities make a species of arguments called by rhetoricians inartificial or extrinsic arguments. See **ARGUMENTS**.

For the use and effect of authorities, see **EVIDENCE**, **FAITH**, **PREJUDICE**, **PROBABILITY**, **REASON**, **REVELATION**, &c.

AUTHORITY, in *Law*, is a power to do something, conveyed by word or writing; as also by writ, warrant, commission, letter of attorney, &c.; and sometimes by law.

AUTHORITY, or **AUTHORITIES**, likewise denote the treatises of ancient authors, such as Glanvil, Bracton, Britton, the author of the book Fleta, Hengham, Littleton, Statham, Brooke, Fitzherbert, Staundforde, and some others of ancient date, which are cited as authority; and furnish evidence that cases have formerly happened in which particular points were determined, which are now become settled and first principles.

One of the last of these methodical writers, in point of time, whose works are of any intrinsic authority in the courts of justice, and do not entirely depend on the strength of their quotations from older authors, is sir Edward Coke, who hath written four volumes of Institutes, as he is pleased to call them, though, says judge Blackstone, they have little of the institutional method to warrant such a title.

AUTIRE, in *Geography*, a river of France, which runs into the Sevre, a little below Maillerais.

AUTO Da Fe. See **ACT of Faith**.

AUTOCABDALI, in *Antiquity*, an order of musicians, who wore an ivy crown, or garland.

Scaliger seems to rank them in the number of *mimi*.

AUTOCEPHALUS, compounded of *avros*, *ipse*, and *κεφαλη*, *caput*, *head*, a person who is his own ruler or master, and who has no other over him.

This denomination was given, by the Greeks, to certain archbishops, who were exempted from the jurisdiction of patriarchs.—Such were the archbishop of Cyprus, by a general decree of the council of Ephesus, which freed him from the jurisdiction of the patriarch of Antioch.

There were several other bishops in the East, who were autocephali; and in the West, those of Ravenna pretended to the same right.—The sixth council, canon 39, says, that the autocephali have the same authority with patriarchs;

but

but this is not to be understood in the full latitude of the words; but only as intimating, that the autocephali have the same authority over their bishops, that patriarchs had over their archbishops: in which sense, only, they are equal to patriarchs.

AUTOCHTHONES, from *αὐτός*, *ipse*, and *χώρα*, *terra*; an appellation assumed by some nations, importing, that they sprung, or were produced, from the same soil which they still inhabited. In this sense, autochthonos amounts to the same with **ABORIGINES**. In this sense it was that the Greeks, and especially the Athenians, pretended to be *autochthonos*, and, as a badge thereof, wore a golden grasshopper woven in their hair, an insect supposed to have the same origin.

This favourite epithet of the Athenians, which gave denomination to one of the tribes of Athens, signifies only, "people born in the country where they live," in opposition to strangers. The common people of Athens perverted this to signify people sprung from the earth. See what Plato makes Socrates say on this matter, in *Menexen*, p. 518. See also *Isocr.* in *Paneg.* p. 65. *Cicero Orat. pro L. Flacc.* 26. *Isocrates* says, that people of sense at Athens understood by this epithet, that Athens was the most ancient of the Greek cities, and that it had been built by those who, from time immemorial, had been established in the country known by the name of Attica. See *Herod.* l. vii. § 161. *Suid.* voc. *Αὐτοχθόνες*, t. i. p. 389. History, however, destroys this last pretension; as few circumstances are better known than the time of the building of Athens.

AUTOCRATOR, from *αὐτός*, and *κράτος*, *power*; a person vested with an absolute independent power, by which he is rendered unaccountable to any other for his actions. The power of the Athenian generals, or commanders, was usually limited; so that, at the expiration of their office, they were liable to render an account of their administration. But, on some extraordinary occasions, they were exempted from this restraint, and sent with a full and uncontrollable authority: in which case they were styled *αὐτοκράτορες*.

The same people also applied the name to some of their ambassadors, who were vested with a full power of determining matters according to their own discretion, and resembled our *plenipotentaries*.

AUTOCRATOR was also a title given to the Roman emperors, first to *Julus*, and afterwards to his successors, like that of *Cæsar*, or *Augustus*.

AUTODIDACTUS, from *αὐτός*, and *διδάσκω*, *I teach*; a person self-taught.

It is used in divers senses, sometimes to denote a person who received his knowledge immediately from heaven without any help or study. In which sense the word occurs in *Homer*, and *Clemens Alexandrinus*.—Sometimes for him who acquires his knowledge without instruction, either by word of mouth, or reading of books. Such were the inventors of sciences and laws.—Sometimes, and that most usually, for him who arrives at learning by the use of books alone, without the assistance of any master, or instruction *viâ voce*.

AUTOGLYPHUS *Lapis*, a stone, mentioned by *Plutarch*, and some other of the ancients, as having naturally impressed on it the figure of *Cybele*. It is said to have been found in *Sagaris*, a river of *Perſia*. Doubtless, if any such stone ever existed, the priests had got it made to deceive the people.

AUTOGRAPHUM, formed of *αὐτός*, and *γράφω*, *serillo*, the very hand writing of any person; or the original of a

treatise, or discourse.—The word is used in opposition to a *copy*.

Autographa, or original MSS. of the New Testament, are the first copies of each book, which were written either by the apostles themselves or by amanuenses under their immediate inspection. *St. Paul* usually adopted the latter mode; but to prevent the circulation of spurious epistles, he wrote the concluding benediction with his own hand. See *Rom.* xvi. 22. *Gal.* vi. 11. and *2 Theſſ.* iii. 17, 18. compared with *eb.* ii. 2. and *1. Cor.* xvi. 21. None of these original MSS. are now remaining, nor could they have been preserved, without the interposition of a miracle, during the space of eighteen centuries. "But what benefit (says *Michaelis*, *Introductio to the N. T.* by *Marsh*, vol. i. p. 247.) should we derive from the possession of these MSS.; what inconvenience do we sustain from their loss? No critic in classical literature inquires after the original of a profane author, or doubts of the authenticity of *Cicero's Offices*, because the copy is no longer extant which *Cicero* wrote with his own hand. An antiquarian, or collector of ancient records, will hardly maintain, that the probability of these books being genuine, is inferior to the probability that a record in his possession of the twelfth century is an authentic document of that period; for though his record is only 600 years old, and the works of *Cicero* are thrice as ancient, we are more exposed to imposition in the former instance, as the forgery of antiquities is often practised by those, whose business and profit are to lead the curious into error. But supposing that the original MSS. of *Cicero*, *Cæsar*, *Paul*, and *Peter*, were now extant, it would be impossible to decide whether they were spurious, or whether they were actually written by the hands of these authors. The case is different with respect to persons, who have lived in the two last centuries, whose hand-writing is known, with which a copy in question may be compared and determined; but we have no criterion, that can be applied to MSS. so old as the Christian æra. Yet admitting that these original writings were extant, that we had positive proofs of their authenticity, and, what is still more, that the long period of seventeen centuries had left the colour of the letters unfaded, still they would be no infallible guide in regard to the various readings."

Knittel, in his edition of a fragment of *Ulphilas*, p. 129. accounts for the loss of the original MSS. of the N. T. by supposing that the original gospels and epistles, as soon as the different communities, for whose use they were written had taken a copy, were returned to the authors; and he says, that it was the general practice among the Christians of that age, and in support of the assertion appeals to a passage in *Polycarp*, and another in *Jerom*. But his arguments, in the opinion of *Michaelis*, are very unsatisfactory; and he thinks it reasonable to suppose, that the very same accidents, which have robbed us of other ancient documents, have deprived us likewise of these originals. From a passage of *Ignatius*, in the eighth chapter of his epistle to the *Philadelphians*, it has been inferred, that some of the first Christians appealed to the original MSS. at that time extant, and held them in great veneration; for which they were ridiculed, as the same passage is thought to suggest, by the early fathers, and those who had the greatest authority in the church. But the passage to which appeal is made, in order to prove the existence of the original MSS. in the time of *Ignatius*, is found to relate to a different subject. See **AUTHENTIC**.

The early loss of the autographa of the N. T. affords just matter of surprise, when we reflect that the original MSS.

MSS. of Luther and other eminent men who lived at the time of the reformation, whose writings are of much less importance than those of the apostles, are still subsisting. Various causes may have contributed to this circumstance, of which several have been alleged in Griesbach's "Historia Textus Epistolæ Pauli," sect. ii. § 7, 8. Michaelis has given the following account of it. The several books of the N. T. were circulated among the Christians in numerous copies; "these were soon collected into a volume, and formed the edition in general use; and as no disputes had then arisen on the subject of various reading, they felt not the necessity of preserving in a common archive the MSS. of the apostles. The situation of the Christian churches was at that time extremely different from the present: the most eminent, which were those of Rome, and Corinth, consisted of a number of small societies, that assembled separately in private houses, having no public building as a common receptacle for the whole community; and even in those private houses a moderate number only could meet together, as it was their custom not merely to pray and to teach, but likewise to celebrate their feasts of love. The epistle, which they had received from St. Paul, was not the property of any one society in particular, but belonged to the community at large, and that which was sent to the Corinthians was addressed to the communities throughout all Achaia. Each society copied the epistle in its turn, and beside the general copies, many individuals probably took copies for themselves, whence the original MS. of the apostle, in passing through so many hands, where perhaps not always the greatest care was taken, must unavoidably have suffered. The Christian communities in Rome and Corinth had no common archive, or public library, in which the MS. of the apostle might have been afterwards deposited, for want of which, the original, as soon as a sufficient number of copies had been made, was forgotten and lost. In other cities, the number of single societies, among which the epistle was divided, was inferior indeed to that in Rome, Corinth, or Ephesus, but the same causes contributed in each to the loss of the original epistle."

The same learned author adds, "the late or early loss of the autographa has no influence on the grounds of our faith; for the credibility of a book, which during the life of the author has been made known to the world, depends not on the preservation of the author's manuscript. No reader of the present work will inquire after the copy, which I send to the printer, to determine whether the work itself be spurious or authentic; nor was it necessary, for determining the authenticity of the New Testament, to preserve the originals; for each book, during the lives of the apostles, was circulated throughout the Christian world, in numberless copies, though they were not collected during that period into a single volume." As the autographa of the N. T. fell so early into oblivion, it seems reasonable, in certain cases, to make use of critical conjecture for settling the true reading of disputed passages in the N. T., as well as in other books. On this subject, see Michaelis *Introd.* vol. i. §. 2. p. 253, &c.

For the purpose of multiplying autographs, or original copies of the same writing, several machines have been invented. See *Writing Machine*.

AUTOISON, in *Geography*, a town of France, in the department of the Upper Saône, and chief place of a canton, in the district of Vesoul; five leagues south of Besançon.

AUTOL, a town of Spain, in Old Castile, one league from Calahorra.

AUTOLYTIOTOMUS, he who cuts himself for the stone. See *LITHOTOMY*.

Of this we have a very extraordinary instance given by Reifelius, in the *Ephemerides* of the *Academy Naturæ Curiosorum*, an. 3. Oct. 190.

AUTOLOALA, in *Ancient Geography*, a town of Gætulia, in Libya Interior, which stood betwixt the Sabus and the Salathus, the only two rivers of note, except the Gir and Niger, that watered Gætulia. Nothing is now known of this ancient city, but that it gave name to the Autololes, a powerful tribe of Gætulia Proper, that spread themselves over that part of Tingitania which bordered on the coast of the Atlantic ocean.

AUTOLYCUS, in *Biography*, a Greek mathematician and astronomer of Pitane, in Æolia, flourished about 320 years before Christ. He was preceptor in mathematics to Arcefilaus, who was also a disciple of Theophrastus, the successor of Aristotle. That he was an eminent mathematician appears from two of his works that are extant; viz. a treatise "On the moveable Sphere," published by Dasypodius in Greek and Latin, 8vo., at Strasburg, in 1572; and in a Latin translation in the "Synopsis Mathematica" of Merfennus, published in 4to., at Paris, in 1644; and also a treatise "On the rising and setting of the Stars," edited with the former work by Dasypodius. *Diog. Laert. Vit. Arcefil. Fabr. Bib. Græc. tom. ii. p. 89. Montucla Hist. Mathem. t. i. p. 192.*

AUTOMATON, or AUTOMATUM, compounded of *αὐτός, ipse,* and *μαρμαίω, I am excited or ready,* whence *αὐτοματός, spontaneous;* a self-moving engine; or a machine which has the principle of motion within itself. Such were Archytas's flying dove, mentioned by Aulus Gellius, *Noct. At. lib. x. c. 12.* (see *AFROSTATION*); and Regiomontanus's wooden eagle, which, as historians relate, flew forth from the city of Nuremberg, met the emperor Maximilian on his arrival, June 7, 1470, saluted him, and returned; as also his iron fly, which, at a feast, flew out of his hands and taking a round, returned thither again; and also Dr. Hooke's flying chariot, capable of supporting itself in the air. *Hakew. Apol. c. x. sect. 1.* None of the contemporary writers, though they often mention Regiomontanus, take any notice of those pieces of mechanism that have been ascribed to him; and it is probable, says Beckmann (*Hist. Invent. vol. iii. p. 325.*) that the whole tale originated from Peter Ramus (*Schol. Mathem. l. ii. p. 65.*), who never was at Nuremberg till the year 1571. Charles V., it is said, after his abdication, amused himself during the latter period of his life, with automata of various kinds.

Among automata are also reckoned all mechanical engines which go by springs, weights, &c. included within them: such are clocks, watches, &c. *Vide Bapt. Port. Mag. Nat. c. 19. Scalig. Su. til. 326.*

When clocks were brought to perfection, some artists added to them figures, which, at the time of striking, performed certain movements; and as they succeeded in these, some of them attempted to construct single figures, detached from clocks, which either moved certain limbs, or advanced forward and ran. In the middle of the sixteenth century, when Hans Bullman, of Nuremberg, constructed figures of men and women, which moved backwards and forwards by clockwork, beat a drum, and played on the lute, according to musical time, they excited universal astonishment. The most ancient automata, of which we have any record, are the tripods constructed by Vulcan (see *Iliad, xviii. 373. Philostrat. Opic. ed. Olearii, p. 117 and 240.*), which being furnished with wheels, advanced forwards to be used, and again

again returned to their places. These tripods, which are mentioned also by Aristotle (Polit. i. 3.) were probably only a kind of small tables, or dumb waiters, with wheels so contrived that they could be put in motion, and driven to a distance, on the smallest impulse.

Automata that represent human figures are called Androïdes. (See ANDROIDES, under which article an account has been given of several figures of this kind.) From a letter addressed by Thomas Collinson, esq. to Dr. Hutton, we learn, that the secret of the chess-playing figure exhibited in various places by M. Kempelen (baron Kempell), was discovered by a gentleman of rank and talents named Joseph Frederick Freyhere, who published, at Dresden, in 1789, a treatise explaining its principles. A well-taught boy, very thin and small of his age, so that he might be concealed in a drawer almost immediately under the chess-board, agitated the whole machine. M. Droz of La Chaux de Fonds, in the province of Neuchâtel, has also executed some very curious pieces of mechanism. One of these was a clock, presented to the king of Spain, to which pertained, among other curious contrivances, a sheep that imitated the bleating of this animal, and a dog, watching a basket of fruit, that barked and snarled when any one offered to take it away, and a variety of moving human figures. Mr. Collinson informs us, that when he was at Geneva, Droz, the son of the former, shewed him an oval gold snuff-box, about $4\frac{1}{2}$ inches long, 3 broad, and $1\frac{1}{2}$ thick, which was double, with an horizontal partition; one of the partitions contained snuff, and in the other, upon opening the lid, there sprung up a very small bird, of green enamelled gold, perching on a gold stand. This minute curiosity, being only three quarters of an inch from the beak to the extremity of the tail, wagged its tail, shook its wings, opened its bill of white enamelled gold, and poured forth such a clear melodious song as would have filled a room of twenty or thirty feet square with its harmony. Another automaton of Droz's was the figure of a man, about the natural size, which held in its hand a metal style; and by touching a spring that released the internal clock-work from its stop, the figure began to draw on a card of Dutch vellum hid under the style. Having finished its drawings on the first card, the figure rested. It then proceeded to draw different subjects on five or six other cards, which number limited its delineating powers. The first card exhibited elegant portraits and likenesses of the king and queen facing each other; and the figure was observed with the most surprising precision to lift its pencil, in the transition from one point of the draft to the other; as, e. g. from the forehead to the eye, nose, and chin, and from the waving curls of the hair to the ear, &c. without making the least slur.

AUTOMEDON, in *Entomology*, a species of PAPILO (*Heliconius*), with broad angulated wings of a brown colour above, and livid beneath; an ocellar spot in the anal angle. Fabricius, &c. Native place unknown.

AUTONINE, BERNARD, in *Biography*, a French lawyer and advocate to the parliament of Bourdeaux, was born at Agenois, in 1587, and died in 1666. The principal of the law treatises which he wrote are in French, "A Comparison of the French with the Roman Law," published in 2 vols. fol. in 1644; and "A Commentary upon the Provincial Law, or 'La Coutume,' of Bourdeaux," the best edition of which is that of Dupin, 1728, fol. with notes. He also wrote in Latin "Censura Gallica in Jus Civile Romanum," Paris, 8vo. 1615; and he published at Paris, in 1607, in two volumes, 8vo., an edition of Juvenal and Perilius, with ample notes. He has been deemed

an industrious rather than a judicious author. Nouv. Dict. Hist.

AUTONNE, in *Geography*, a river of France, which runs into the Oise near Verberie.

AUTONOMI, in *Ancient Geography*, so called because they were their own law-givers, a people who inhabited the most rocky and barren parts of Thrace, separated from Macedonia by mount Hæmus. In their engagement with Alexander, they behaved with extraordinary valour; but their whole army was cut in pieces, and their baggage taken, together with their wives and children. After this defeat, they submitted to the conqueror, who, in order to prevent their revolt during his absence, took with him into Asia all the chief men of their nation. They afterwards turned under Perses against the Romans; but were allowed to live according to their own laws till the reign of Vespasian, who made their country part of the province of Thrace. Thueyd. l.ii. Arrian. l.i.

AUTONOMIA, from *αυτος*, *self*; and *νομος*, *law*, a power of living or being governed by our own laws and magistrates. The liberty of the cities which lived under the faith and protection of the Romans, consisted in their autonomy, i. e. they were allowed to make their own laws, and elect their own magistrates, by whom justice was to be administered, and not by Roman presidents or judges, as was done in other places which were not indulged the autonomy.

AUTOPRACTI, from *αυτος*, and *πραξις*, *I exad*, in the *Civil Law*; those indulged this privilege, that they should not be summoned or compelled to pay taxes or tributes by the collectors, but should be left to their own free will. Du-Cange.

Of this number were men of distinguished dignity, and those eminent for their probity and honour.

AUTOPSY, compounded of *αυτος*, *one's self*, and *οραω*, *fight*, ocular inspection, or the seeing a thing with one's own eyes.

AUTOPYROS, from *αυτος*, and *σπυρος*, *wheat*, in the *Ancient Diet*, an epithet given to a species of bread, wherein the whole substance of the wheat was retained, without retrenching any part of the bran.

Galen describes it otherwise, viz. as bread where only the coarser bran was taken out.—And thus, it was a medium between the finest bread, called *similagineus*, and the coarsest, called *surfuraceus*.

This was also called *autopyrites*, and *syncomistus*.

AUTOUR, in *Ornithology*, the name under which Buffon describes the goshawk, or *falco palumbarius* of Linnæus.

AUTOURE, in *Natural History*, a sort of bark which resembles cinnamon, but is paler and thicker; it is of the colour of a broken nutmeg, and full of spangles. It comes from the Levant, and is an ingredient in the carmine dye.

AUTREAU, JAMES D', in *Biography*, a painter and a poet, was born at Paris, in 1656; but being of a singular and misanthropic disposition, secluded himself from the world, lived in obscurity, and died in a hospital. As a painter, though not eminent, he produced some pieces that were esteemed. With a view of doing honour to the character of cardinal Fleury, he adopted the device of exhibiting Diogenes with a lantern searching for an honest man, and pointing him out in a portrait of the cardinal. Having nearly attained the age of sixty, he began to write for the stage; and the species of composition which he first adopted, notwithstanding his contrary disposition and habits, was light and humorous comedy. He wrote both for the Italian and French theatres. His "Port a l'Anglois" was

his first piece, and another of his works was the "Amans Ignorans." He also composed some tragedies and serious pieces for the French theatre; and wrote Lyric compositions for the opera. The plots of his pieces are simple and inartificial; but the dialogue is easy and natural; and some of his scenes contain genuine comedy. Notwithstanding all his exertions, Autreau died in extreme poverty, at the hospital of the Incurables in Paris, in 1745. His works were collected and published, with a preface, by Pesselier, in four volumes, 12mo. in 1749. *Nouv. Dict. Histor.*

AUTRECOURT, in *Geography*, a town of France, in the department of the Meuse, and chief place of a canton in the district of Clermont; four miles S. S. E. of Clermont, and eleven south-west of Verdun.

AUTREY, a town of France, in the department of the Upper Saone, and chief place of a canton in the district of Champlitte; one league north-west of Gray.

AUTRICOURT, a town of France, in the department of the Coté d'Or, and chief place of a canton in the district of Chatillon sur Seine, eight miles north of Chatillon.

AUTRICUM, in *Ancient Geography*, now *Chartres*, a town of Gaul, the capital of the Carnutes, and called *Civitas Carnotum*, and *Carnotena*. It was seated on an eminence, and seems to have derived its first name from the river *Autura*. It was celebrated in Gaul, as the principal residence of the Druids, who held their assemblies among the woods in its vicinity. The name of Carnotum was probably derived from the Celtic *Kar* or *Ker*, denoting a city, and expressing its peculiar excellence.

AUTRIGANES, a people of Hispania Citerior, in Cantabria, who dwelt near the foot of the Pyrenées, towards the south-west. The only town they had on the coast was *Flaviobriga*.

AUTRUCHE, in *Ornithology*. See **STRUTHIO CAMELUS**.

AUTRY, in *Geography*, a town of France, in the department of the Ardennes, and chief place of a canton in the district of Grandpré; three leagues west of Varennes.

AUTUMN, the third season of the year; being that in which the harvest and the fruits of the summer are gathered. It begins on the day when the sun's meridian distance from the zenith, being on the decrease, is a mean between the greatest and the least; which in these countries is supposed to happen when the sun enters Libra, or about the twenty-second day of September. Its end coincides with the beginning of winter.

Divers nations have computed the year by autumns; the English Saxons, by winters.—Tacitus tells us, the ancient Germans were acquainted with all the other seasons of the year, but had no notion of autumn.

Autumn has always been reputed an unhealthy season. Tertullian calls it "tentator valetudinum;" and the satirist speaks of it in the same light:

"Autumnus Libitine quæslus acerbæ."

Autumn is commonly represented by painters under the figure of a female crowned with vine branches, and bunches of grapes; naked in that part which respects summer, and clothed in that which corresponds to winter. Its garment is covered with flowers, like that of Bacchus.

AUTUMNAL, something peculiar to autumn. Thus,

AUTUMNAL Point, is one of the equinoctial points; being that from which the sun begins to descend towards the south pole.

AUTUMNAL Equinox, is the time when the sun enters the autumnal point. See **EQUINOX**.

AUTUMNAL Flowers. See **FLOWER**.

AUTUMNAL Plants, in *Gardening*, all such as attain perfection in autumn, either in their growth, or in their flowering, &c.

AUTUMNAL Season, that period, which, in regard to the numerous operations to be performed in it, is commonly considered to be, from about the beginning or middle of August to the latter end of November; and in which the different works of sowing, planting, and propagation, &c. are most successfully accomplished; as, for instance, the putting in various sorts of esculent plants to stand the winter for the ensuing spring and summer, such as cabbages, cauliflowers, carrots, lettuces, spinach, onions, &c. in the more early part; and in the latter, beans, peas, coleworts, and early cabbage plants; likewise cauliflowers, some to remain under hand and bell glasses, others in frames, to stand till spring; also lettuces on warm borders, and in frames, to stand the winter; and celery in shallow trenches, for spring use; and the making and spawning of mushroom-beds, for winter and spring. Different sorts of fibrous-rooted flower-plants are also increased at this season, by dividing or parting their roots, particularly in the months of September, October, and November, when the flower-stems decay; the slipped or divided parts mostly flowering the following year: and from the middle of September to the middle or end of November, is the time for transplanting from one place to another different kinds of hardy fibrous-rooted perennials, as directed under their proper genera. Most sorts of bulbous flower-roots, that were taken up in summer, are now planted in order to exhibit an early spring and summer bloom, in the following year. The seeds of many sorts of flowers are likewise at this time to be sown, which do not grow so freely when sown at other seasons, as is shown under their proper heads. In the latter part of this season it is necessary to plant cuttings, and make layers, for the propagation of various trees and shrubs of the hardy kind. The seeds of many sorts of hardy trees and shrubs may also be sown. Besides these, many other parts of garden culture are particularly necessary at this season.

AUTUMNAL Signs, are those through which the sun passes during the season of autumn, Libra, Scorpio, and Sagittarius.

AUTUMNALIS, in *Ornithology*, a species of **PSITTACUS**, called by Brisson *psittacus americanus*; crick à tête bleue by Buffon; lesser green parrot by Edwards, Av. and autumnal parrot by Latham. It is distinguished by being of a green colour, with the front and spot on the quill feathers scarlet; crown and primary quill feathers blue. Gmelin.

Of this kind there are two distinct varieties; one with the front and chin blue, and the other with the head varied with red and white. The first is var. (β) *psittacus fronte gulaque cæruleis* of Gmel.; crick à tête bleue of Buffon; blue-faced green parrot of Edwards; and blue-headed creature of Bancroft. Gujan. The latter is called Cocho in Fernandez. Hist. Nov. Hisp. Inhabits Guiana.

This species is about the size of a pigeon; region of the eyes blue; primary wing-coverts blue, and red at the base; tail feathers green above, and tipped with yellowish, outer one blue at the exterior edge: beneath yellowish, reddish at the base, with a green spot in the middle.

AUTUMNALIS, a species of **ANAS** or duck, that inhabits South America. It is greyish; wings, tail, and belly black; spot on the wing tawny and white. Jacquin Beytr. This is the red-billed whistling duck of Edwards; *anas situ-*

laris americana of Briss.; and siffleur à bec rouge et narines jaunes of Buffon.

This bird is represented to be of a very quarrelsome disposition, but may be tamed; sits on trees, and measures in length twenty-one inches. The bill is red, black at the tip; crown, back, and scapulars chestnut; breast yellowish ash; legs yellow.

AUTUMNALIS, a species of *FRINGILLA*, called by Latham the autumnal finch. It inhabits Surinam; is of a greenish colour, with a ferruginous cap, and vent testaceous. Linnæus. The tail is even at the end.

AUTUMNUS, in *Entomology*, the name given by Admiral to the moth, or phalæna, called by Gmelin *P. jagana*; which see.

AUTUN, in *Geography*, an ancient city of France, and chief place of a district in the department of the Saone and Loire; and, before the revolution, the capital of a district called *Autunois*, with a bishop's see. It is situated near the river Arroux, at the foot of three mountains, in which are three springs, that supply the city with water. The city itself is small, being about $\frac{1}{2}$ of a mile in length, and about the same breadth; it has now few good buildings, but its ruins indicate its former magnificence; and those of its walls in particular, seem, by the firm union of the stones that compose them, as if they had been cut out of the solid rock. Here are the remains of three ancient temples, one dedicated to Janus, and another to Diana; and also of a theatre, and a pyramid, the last probably having been a tomb. It has also two beautiful antique gates; the field in which it stands is called "the field of urns," because several urns have been dug in it. Autun was made a Roman colony by Augustus, and after him called "Augustodunum;" and as early as the reign of Claudius, it ventured of itself, and without assistance, to declare against the legions of Gaul. After a siege of seven months, they stormed and plundered this unfortunate city, already wasted by famine; nor was it restored till the reign of Diocletian. The country from Chalons to Autun is very rich in vineyards and cornfields, and presents, by its lofty hills and swelling outline, a picturesque scene. The approach to it is by a road which winds over hills, that is covered with an underwood of broom, and crowned with a forest of birch and fir-trees. The cathedral is a handsome building. N. lat. $46^{\circ} 56', 48''$. E. long. $4^{\circ} 17', 44''$.

AUTURA, in *Ancient Geography*, a river of Gallia Celta, now the *Eure*, which falls into the Seine on the south side.

AUTZ, in *Geography*, a town of the duchy of Courland, thirty-six miles S. S. E. of Goldingen.

AUVE, a town of France, in the department of the Marne, and chief place of a canton in the district of St. Menehould, thirteen miles E. N. E. of Chalons.

AUVERGNE, a province of France, before the revolution, but now forming the two departments of Puy de Dôme, and Cantal, bounded on the east by Forez, on the north by Bourbonnois, on the west by Limosin, Quercy, and La Manche, and on the south by Rouergue, and the Cevennes. Its extent from south to north is about forty French leagues, and from west to east thirty. It is divided into Upper and Lower Auvergne. The former is cold and mountainous, and yet has excellent pastures, and supplies many large cattle; the latter, to which belongs the valley of Limagne, and by which appellation it has sometimes been distinguished, is a fertile and pleasant country, abounding in wine, grain, fruit, and hemp. Auvergne supplies Lyons and Paris with fat cattle; a large quantity of cheese is

made in this province; and it has several manufactures. It has mines of silver, iron, lead, and coals. Its principal rivers are the Allier, the Dordogne, and the Allagnon; which see. The capital of the whole province is Clermont. The basaltic mountains of this ancient province are famous; and have been ascribed by some eminent naturalists to volcanoes; but as they consist chiefly of basaltic columns and elevations, others, among whom may be reckoned the best judges, allege that they have no claim to a volcanic origin. Those of Auvergne are too extensive to have been produced by a single volcano, and it would be too bold a conjecture to attribute them to a chain of volcanoes. "The northern part of the chain is styled the Puy de Dôme, while the southern is called that of Cantal. The Monts d'Or form the centre, and are the highest mountains in France. The chief elevation is that of the Puy de Sausi, which rises about 6,500 feet above the level of the sea, while the Puy de Dôme is about 5000, and the Plomb du Cantal, the highest of that part, is about 6,200 feet. Near the Puy de Sausi is l'Ango, that gigantic mountain, and Ecorchade, a shattered and wrecked elevation. The Plomb du Cantal is also accompanied by bold rivals, as the Puy de Griou, le Col-de-Calre, le Puy Mari, and the Violent. This enormous assemblage of rocks covers an extent of about 120 miles, and according to the French authors, is chiefly basaltic. The Puy de Sausi is capped with almost perpetual snow, followed in the descent by naked rocks and ancient pines; from its side issues, from two sources, the river Dordogne, and many picturesque cascades develope amidst basaltic columns. On the 23d of June, 1727, Pradines, a village on the slope of one of these mountains, was totally overwhelmed by its fall; the whole mountain with its basaltic columns rolling into the valley. The inhabitants were fortunately engaged in the celebration of Midsummer eve, round a bonfire at some distance. These mountains are in winter exposed to dreadful snowy hurricanes, called *Aéirs*, which in a few hours obliterate the ravines, and even the precipices, and descending to the paths and streets, confine the inhabitants to their dwellings, till a communication can be opened with their neighbours, sometimes in the form of an arch under the vast mass of snow. Wretched the traveller who is thus overtaken: his path disappears, the precipice cannot be distinguished from the level; if he stand he is chilled, and buried if he proceed: his eye-sight fails amidst the snowy darkness; his respiration is impeded; his head becomes giddy; he falls and perishes. In summer, thunder storms are frequent and terrible, and accompanied with torrents of large hail, which destroy the fruits and flocks, which for six months pasture on the mountains, guarded by shepherds, who have temporary cabins of turf and reed, styled *burons*." Pinkerton's Mod. Geog. vol. i. p. 274.

Auvergne, in the revolutions of France, formerly maintained a just pre-eminence among the independent states and cities of Gaul. The brave and numerous inhabitants displayed a singular trophy, which was the sword of Cæsar himself, which he had lost when he was repulsed before the walls of Gergovia. As the common offspring of Troy, they maintained a paternal alliance with the Romans; and if each province had imitated the courage and loyalty of Auvergne, the fall of the western empire might have been prevented or delayed. They firmly maintained the fidelity which they had reluctantly sworn to the Visigoths; but when their bravest nobles had fallen in the battle of Poitiers, they accepted, without resistance, a victorious and catholic sovereign. This easy and valuable conquest was achieved, and possessed by Theoderic, the

eldest son of Clovis. At length, however, Childebert, the king of Paris was tempted by the neighbourhood and beauty of Auvergne; and on the false report that their lawful sovereign was slain in Germany, the city and diocese were betrayed by the grandson of Sidonius Apollinarius. Childebert enjoyed this clandestine victory. Theodoric having promised to the Franks of Austrasia the possession of this rich and productive country, forfeited the allegiance of the inhabitants, and devoted them to destruction. His troops, reinforced by the fiercest barbarians of Germany, spread desolation over the fruitful face of Auvergne, and two places only, the strong castle of Merolac, and the holy shrine of St. Julian at Brivas or Brioude, were saved or redeemed from their licentious fury. Before the Austrasian army retreated from Auvergne, Theodoric exacted some pledges of the future loyalty of a people, whose just hatred could only be restrained by their fear. A select band of noble youths, the sons of the principal senators, were delivered to the conqueror, as the hostages of the faith of Childebert and of their countrymen; and, on the first rumour of war, or conspiracy, these guiltless youths were reduced to a state of servitude; and one of them only, whose name was Attalus, escaped by a singular adventure. See Gibbon's Hist. vol. vi. p. 362—369.

AUVERGNIE, a town of Switzerland, one league south of Neuchâtel.

AUVERNAS, a very deep-coloured heady wine, made of black raisins so called, which comes from Orleans. It is not fit to drink before it is above a year old; but if kept two or three years, it becomes excellent.

AUVIGNY, N. CASTRES D', in *Biography*, a French historian, was born at Hainault in 1712, and in his youth resided with La Fontaine. But engaging in the military profession, he entered into a company of life-guards, and was killed in the battle of Dettingen, in 1743. In the province of literature, he distinguished himself by several works, the principal of which was "The Lives of Illustrious Men of France, from the commencement of the Monarchy to the present time." Of this work, 8 volumes in 12mo appeared in the author's life-time; two posthumous volumes were published by his brother; and the publication has been since continued by the abbé Pereaue and M. Turpin. The biographical sketches of Auvigny are written with animation and elegance, but they approach so much to fiction that they cannot be implicitly relied on as historical truth. An abridged history, written by Auvigny, and published in two volumes 12mo. is intitled "An Abridgment of the History of France, and of the Roman History, in question and answer." In 1735, he published, in five volumes 12mo. "An History of the City of Paris;" but part of the fourth and the whole of the fifth, were written by M. de la Barre. The principal of Auvigny's works of imagination is "Memoirs of Madame de Barneveldt." Nouv. Dict. Hist.

AUVILLARD, in *Geography*, a town of France, in the department of the Lot and Garonne, and chief place of a canton, in the district of Valence; 13 miles south-east of Agen, and two south of Valence. N. lat. 44° 3'. E. long. 0° 48'.

AUVILLERS-LES-FORGES, a town of France, in the department of the Ardennes, and chief place of a canton in the district of Rocroi, ten miles W. N. W. of Mezieres.

AVUS, in *Ancient Geography*, a river of Spain, in the territory of the Callaici, whose course lay from east to

west, and which discharged itself into the sea towards the north.

AUW, in *Geography*, a town of Germany, in the archduchy of Austria, seated on the Danube; ten miles W. S. W. of Grein.

AUWAWA, in *Ichthyology*. See BALISTES KLEINII.

AUX, in *Astronomy*. See AUGES.

Some use *aux* to denote the arch of the ecliptic, intercepted between the first point of Aries, and the point wherein the sun, or a planet, is at its greatest distance from the earth. Wolf. Lex. Math. p. 222.

AUXACIA, in *Ancient Geography*, a town of Asia, in Scythia, beyond mount Imaus, and to the west of Issodon Scythica.

AUXENTIUS, in *Biography*, an Arian divine, was a native of Cappadocia, and flourished in the fourth century. In the contest between the Arians and Catholics, he was advanced by the emperor Constantius to the see of Milan. By Hilary, bishop of Poitiers, he was accused to the emperor Valentinian, as an enemy of Christ, and a blasphemer; and in order to silence his enemies, he made a declaration of his faith, with which the emperor was satisfied. But the Catholics proceeded against him, and a council, which was held at Rome by pope Damasus, in 368, excommunicated him. He was also condemned by Athanasius, and the prelates of Gaul at the same time. However, he retained the see of Milan to the time of his death in 374, and was succeeded by Ambrose. Cave, H. L. tom. i. p. 214.

AUXERRE, in *Geography*, a city of France, and capital of the department of the Yonne, seated advantageously for trade, on the side of a hill, near the Yonne, which washes its walls. Before the revolution, it was the see of a bishop, and capital of a country called Auxerrois. The episcopal palace was one of the most beautiful in France. N. lat. 47° 47' 57". E. long. 3° 34' 6".

AUXERROIS, a name given before the revolution to a country of France, in the northern part of Burgundy; bounded on the east and north by Champagne, north-west by Nivernois, and on the south by the rest of Burgundy, about nine leagues long and five broad. Its capital was Auxerre.

AUXESIS, in *Mythology*, a goddess worshipped by the inhabitants of Egina, and mentioned by Herodotus and Pausanias.

AUXESIS, αυξηση, *increase*, in *Rhetoric*, a figure whereby any thing is magnified too much. See AMPLIFICATION, and INCREMENT.

AUXILIARY, any thing that is helping or assisting to another. For an account of the auxiliary troops of the Romans, see ALLIANCE.

AUXILIARY Verbs, in *Grammar*, are such as help to ascertain or limit the sense of others; that is, are prefixed to them to form or denote their moods or tenses.

Such, in English, are *have*, *am*, or *be*; in French, *être* and *avoir*; in Italian, *ho*, and *sono*, &c.—The auxiliary *am* supplies the want of PASSIVES in our language.

All the modern languages we know of make use of auxiliary verbs. The reason is, that the verbs thereof do not change their terminations or endings, as those of the Latin and Greek, to denote the different tenses or times of being, doing, or suffering; nor the different moods or manners of their suffering, &c.: so that, to supply this defect, recourse is had to different auxiliary verbs.

Besides the perfect auxiliary verbs, we have several defective ones; as *do*, *will*, *shall*, *may*, *can*, and *have*; which, by changing the terminations, save the necessity of changing those of the verbs to which they are added. Thus, instead

of *ego uro, tu uris, ille urit, &c.* we say, *I do burn, thou dost burn, he doth burn, &c.*

The verbs *have, be, will, and do*, when they are unconnected with a principal verb, expressed or understood, are not auxiliaries, but principal verbs; as, we *have* enough; I *am* grateful; he *wills* it to be so; they *do* as they please; and in this view, they also have their auxiliaries; as, I *shall have* enough; I *will be* grateful, &c. Murray's Eng. Gram. p. 76.

AUXILIUM, in *Law*. See AID.

AUXILIUM *curiæ*, signifies an order of court, for the summoning of one party at the suit of another.

AUXILIUM *ad filium militem faciendum, vel filiam maritandam*, was a writ directed to the sheriff of every county, where the king or other lord had any tenants, to levy of them reasonable aid, towards the knighting of his eldest son, or the marriage of his eldest daughter.

AUXIMA, in *Ancient Geography*, a town of Spain, mentioned by Florus.

AUXIMIS, a town of Africa, in Mauritania Cæsariensis. Ptolemy.

AUXIMUM, or AUXUMUM, OSIMO, a town of Italy, in the Picenum, south of Ancona. It was a Roman colony.

AUXO, in *Mythology*, the name of one of two graces worshipped by the Athenians. See HEGEMONE.

AUXORS, in *Geography*, a name given before the late division, to a territory of France, of which Semuren-Auxois was the capital.

AUXON, a town of France, in the department of the Aube, and chief place of a canton in the district of Ervy; $4\frac{1}{2}$ leagues south of Troyes, and $1\frac{1}{2}$ north of Ervy.

AUXONNE, a town of France, in the department of the Coté d'Or, and chief place of a canton, and seat of a tribunal, in the district of St. Jean de Losne, seated in a plain near the east side of the Saone. It is surrounded by a double wall built in the 17th century, and has a bridge of 23 arches over the Saone, serving for the passage of the waters when the river overflows; and at the end of the bridge is a causeway of 2250 paces in length; $5\frac{1}{2}$ leagues E. S. E. of Dijon. N. lat. $47^{\circ} 11' 24''$. E. long. $5^{\circ} 23' 35''$.

AUXY, a town of France, in the department of the straits of Calais, and chief place of a canton, in the district of Montreuil; three leagues S. S. E. of Hesdin.

AUXY, in the *French Manufactures*, a name given to that sort of wool which is spun in the neighbourhood of Abbeville, by those workmen who are called *boupiers*. It is a very fine and beautiful wool, which is commonly used to make the finest stockings.

AUZAGUREL, or AUSSAGUREL, in *Geography*, a town of Africa, in the kingdom of Adel, reckoned by some the capital, and situated on an eminence near the Hawah. See ADEL.

AUZANCE, a town of France, in the department of the Creuse, and chief place of a canton, in the district of Eaux, seated on a hill, surrounded with ponds; 25 miles E. S. E. of Gueret, and nine south of Eaux.

AUZARA, OSARA, in *Ancient Geography*, a town of Asia, in Syria; or according to Ptolemy, in Arabia Deserta, S. S. E. of Circesium; situated on the western bank of the Euphrates.

AUZATA, AUZA, or AUZIA, a town of Libya, built according to Josephus, in his "Antiquities," by Ithobaal, king of the Tyrians; situated, according to Ptolemy, in the interior of Mauritania Cæsariensis, to the east of a lake from which flowed the river Cæmalaph. It was the capital

of the Aufes, who were situated to the west of the river Triton. Tacitus informs us, that it was built in a small plain, surrounded on all sides with barren forests of immense extent. The ruins of this city were called by the neighbouring Arabs "Sur Gullan," or "the walls of the Antelopes," a great part of which, ranked at proper distances with little square towers, is still remaining.

AUZILS, in *Geography*, a town of France, in the department of the Aveyron, and chief place of a canton in the district of Albin; 15 miles north-west of Rhodéz.

AUZON, a town of France, in the department of the Upper Loire, and chief place of a canton, in the district of Brioude, on the Allier, six miles north of Brioude.

AUZOUT, ADRIAN, in *Biography*, a French mathematician of the 17th century, and one of the first members of the Academy of Sciences at Paris, was born at Rouen, and died in 1693. Some have ascribed to him the honour of having invented the Micrometer; but he is more justly entitled to the praise of having contributed to the improvement of it, in pursuance of the ideas suggested by M. Huygens, and the marquis of Malvasia. (See MICROMETER.) *Auzout's* treatise on this subject was published in 1667, and may be found in the Memoirs of the Academy for 1693, tom. vii. *Auzout* was also concerned with M. Picard in the important discovery of the method of applying the telescope to the quadrant, which has been highly useful to astronomers. It has been said, particularly by M. de la Hire, that M. *Auzout* had a principal part in this discovery; but from the description given of it by M. Picard, in his "Figure de la Terre," the reader cannot hesitate in pronouncing M. Picard himself to have been the original and sole author. It appears, however, from several fragments of letters in a correspondence between our ingenious but unfortunate countryman Mr. Gascoigne, who was killed in the battle of Marston-Moor, and Messrs. Horrox and Crabtree, and which are recorded by Derham, in the Phil. Transf. for 1723 (vol. 48. p. 190.), that the method of constructing a micrometer, and also of applying telescopic sights to quadrants, was known to him before the time of the civil wars. But as these two important discoveries were not published even in England, and were not likely to be made known on the continent at this early period; it is not improbable that *Auzout* and Picard might also have a just claim to the honour of being original, though not the first inventors. The honour of having discovered the method of applying the telescope to astronomical instruments in the year 1665, was also claimed by Dr. Hooke. M. *Auzout* published "An Ephemeris of the Comet of 1665;" "A Letter to the Abbe Charles on the Observations of Campani," in 1665; his "Treatise on the Micrometer," in 1667; and some "Remarks on the Machine of Hooke." These three last pieces were contained in the 6th volume of the Memoirs of the Academy. Montucla, Hist. Mathem. t. ii. p. 569—572.

AW, in *Geography*, a town of Germany, in the county of Bregentz, 25 miles S. E. of Bregentz.

AWA, a town of Japan, in a province of the same name.—Also, a town of Persia, in the province of Irak; 28 leagues south of Casbin.

AWAIT, in our old *Statutes*, is used to signify what we now call *waylaying*, or lying in wait, to execute some mischief. In stat. 13 R. II. c. 1. it is ordained, that no character of pardon shall be allowed before any justice, for the death of any man slain by *await*, or malice prepensed, &c.

AWARD, in *Law*, the judgment of some person who

is neither assigned by law, nor appointed by the judge, for ending a matter in controversy; but is chosen by the parties themselves that are at variance. See **ARBITRATIONS**.

AWATCHLA, in *Ornithology*, a species of **MOTACILLA**, that inhabits Kuntshatka. It is of a brown colour; chin and breast white, spotted with black; middle of the belly and lower white; primary quill-feathers bordered with white; tail-feathers orange at the base. *Arch. Zool.*—Gmelin.

AWATSKA, in *Geography*. See **AVATSCHA**.

AWCHAR, a town of Persia, in the province of Adirbeizan, 50 leagues S. W. of Tauris.

AWEL, a river of Scotland, in the Highlands. See **LOCH-AWE**.

A-WEIGH, in *Sea-Language*, the same as *A-trip*, when applied to the anchor.

AWENYDHION, in *British Antiquity*, a name that was given to certain persons in Wales, and derived from *Awen*, was, of course, expressive of poetical raptures. These persons, when consulted about any thing doubtful, appeared to be inflamed with a high degree of enthusiasm, and even to be possessed by an invisible spirit. They were neither hasty, nor very direct and explicit in their answers, or in the solution of the difficulties that were proposed to them; but in the course of a long and wild circumlocution, the required answer or solution would be obtained by means of some turn or digression in the speech, which was thought to imply or express it. These persons were at length roused from their seeming extacy as from a deep sleep, and they were compelled as it were, by violence, to return to their natural condition. When persons of this description recovered their reason, after an apparent and temporary alienation of mind, they did not recollect any of those circumstances that had occurred, or of the words which they had uttered during their extacy. If they were, therefore, again consulted about the same subject, they would express themselves in very different words. The gift, which they possessed, was conferred upon them, as they imagined, in their sleep, and the mode of communication seemed, says Giraldus, as if new milk or honey was poured into their mouths; to others, as if a written scroll had been put into their mouths; and when they awoke, they knew and declared that they had been endowed with this extraordinary spirit of divination. Some gift, resembling that to which the Awenydhion of Wales pretended, has been long known in Scotland, under the denomination of **SECOND SIGHT**. Warrington's *Hist. Wales*, p. 102, &c.

AWERRI, in *Geography*, a town of Africa, and capital of a kingdom of the same name, about 20 leagues from Benin to the south.

AWIN-EA, a river of Ireland, which rises in lake Ea, in the province of Donegal, and runs into the sea, seven miles north of Killebegs.

AWK. See **ACK**.

AWL, or **AUL**, a shoemaker's implement, wherewith holes are bored in leather, to facilitate the stitching or sewing the same.—The blade of the awl is usually a little flat, and bending; and the point ground to an acute angle.

AWME, or **AUME**, a Dutch measure of capacity for liquids; containing eight *schekels*, or twenty *verges*, or *vertels*: answering to what in England is called a tierce, or one-sixth of a ton of France, or one-seventh of an English ton. *Arbuth. Tab.* 33.

AWN, **ARISTA**, in *Botany*, the needle-like bristles which form beards of different sorts of grass or grain, as wheat, barley, &c. The word is, in some districts, pronounced

Ails. It is sometimes used to signify a sharp point terminating a leaf. See **ARISTA**.

AWNING, on board a ship, is when a sail, a tarpaulin, or the like, is hung over any part of the ship, above the decks, to keep off the sun, rain, or wind.

Awnings are made of canvas. The length of the main deck awning is from the centre of the fore-mast to the centre of the main-mast; the width corresponds to the breadth of the ship, taken at the main-mast, foremast, and at the midway between. The length of the quarter deck awning is from the centre of the main-mast to the centre of the mizen-mast; and the width answers to the breadth of the ship, at the main-mast, mizen-mast, and at the midway between. The length of the poop, or after-awning, is from the centre of the mizen-mast to the ensign-staff, about seven feet above the deck; and the width is formed agreeably to the breadth of the ship, taken at the mizen-mast, the taffarel, and at the midway between. The canvas is cut to the given breadths of the awning, allowing about nine inches to hang down on each side, which is sometimes scolloped and bound with green baize, and is sewed together with an inch seam, and tabled all round with a two or three inch tabling. Half the diameter of the masts is cut out in the middle at each end, and lacing-holes are made across the ends to connect one awning to another. On the upper part, along the middle and sides, is sewed a one inch and half or two inch rope, to which the trucks are sewed at about three quarters of a yard asunder. A thimble is spliced in each end of the rope. Sometimes curtains are made to hang to the sides of the awnings, of the same length as the awnings. Their depth is taken from the sides of the awning to the gun-wale, supposing the awning to be in its place. The seams and tablings are the same as those of the awnings, and lacing-holes are made along the upper tabling of the curtain, and the side tabling of the awning. *Clerke's Elem. and Practice of Rigging*, vol. i. p. 140. 230.

In the long-boat they make an awning, by bringing the sail over the yard and stay, and booming it out with the boat-hook.

AX, a carpenter's instrument, serving to hew wood.—The ax differs from the joiner's hatchet, in that it is much larger, and heavier, as serving to hew large stuff; and its edge tapering into the middle of its blade.—It is furnished with a long handle or helve, as being to be used with both hands.

AX, in *Geography*, a town of France, in the department of the Arriege, and chief place of a canton in the district of Tarascon, on the Arriege; 9 leagues west of Prades, and 4½ S. E. of Tarascon.

AX. See **AXBRIDGE**, and **AXMINSTER**.

AX, *Battle*. See **CELT**.

AXAMENTA, in *Antiquity*, a denomination given to the verses, or songs, of the *salii*, which they sung in honour of all men.

The word is formed according to some, from *axare* q. d. *nominare*. Others will have the *carmina saliarum* to have been denominated *axamenta*, on account of their being written in *axibus*, or on wooden tables.

The *axamenta* were not composed, as some have asserted, but only sung by the *salii*. The author of them was Numa Pompilius; and, as the style might not be altered, they grew in time so obscure, that the *salii* themselves did not understand them. Varro says they were seven hundred years old. *Quint. Inst. Or. lib. i. c. 11*.

AXAMENTA, or *Affamenta*, in *Ancient Music*, hymns or songs performed wholly with human voices.

AXAS, in *Geography*, a town of America, in the interior part of New Albion. N. lat. $39^{\circ} 5'$. W. long. $114^{\circ} 30'$.

AXAT, or AZAT, a town of France, in the department of the Aude, and chief place of a canton, in the district of Quillan, on the Aude: twenty-five miles south of Carcassonne, and five S. S. E. of Quillan.

AXBERG, a town of Sweden, in the province of Nerica.

AXBRIDGE, a town of England, in the county of Somerset, about eight miles north of Wells, and 131 west of London. The river Ax divides the bridge from Over-Weare, and gives the place its appellation. This town is pleasantly situated at the south-western roots of the dark Mendip hills. It has a corporation consisting of a mayor, bailiff, eight capital burgessees, and twenty-two common councilmen; and sent members to parliament, till excused at the request of the inhabitants, in the reign of Edward the third. Its market for corn, sheep, pigs, &c. is on Saturday, and two fairs are held here annually for the sale of cattle and cheese. Its only manufacture is knit-hose, in which a great number of families is employed. The church is particularly noted for its beautiful and uniform architecture, and for the stately monuments which it contains. Most of them are erected to the memory of the Prowle family, many of whom were interred within the walls. This town contains 190 houses, and 1000 inhabitants. About two miles east of Axbridge is the village of Cheddar which is celebrated for its fine cheese; and extraordinary rocks or cliffs. The village is situated under Mendip hills, having the flat moors which extend to Glastonbury on the south side, and a high ridge of hills on the north. The Cheddar cliffs seem to have been the effect of some great convulsion of nature, which rent the hill asunder and formed an opening or chasm completely through it. This chasm is now appropriated to a road, which leads from the bottom to the top of the hill, having its sides formed by the high craggy rocks. The length of this gap is nearly two miles, in a winding direction. In many parts the cliffs rise to the height of full 300 feet, quite perpendicularly, some terminating in bold pinnacles, others in irregular fragments like shattered battlements, and others impending over head in an awful manner. Yews project out of several of the fissures, forming lofty canopies, and many of the rocks wear long mantles of ivy, which produce a picturesque appearance, and form a pleasing contrast to the craggy nakedness of others. The romantic and grand appearance of these rocks attracts the notice of many travellers. Mendip hills, which are often called the alps of Somersetshire, abound with lead and calamine, and like the similar hills of Derbyshire, contain many vast caverns and subterraneous vaults. Various coralloid relics are found in this limestone. Several curious plants are also obtained here, among which the following are the most rare; *Dianthus cæsius* (Cheddar Pink) *d. arenarius*, and *thalidrum minus*. Maton's Observations on the Western Counties, and Collinson's History of Somersetshire.

AXEL, a strongly fortified town of Flanders; it was taken from the Spaniards by Maurice, prince of Nassau, in 1586; nine leagues W. of Antwerp. N. lat. $51^{\circ} 15'$. E. long. $3^{\circ} 45'$.

AXENS, a town of Germany, in the county of Tyrol; nine miles S. W. of Insprack.

AXHOLM, an island of England, in the N. W. part of Lincolnshire, formed by the rivers Trent, Idel and Dan, about ten miles long and five broad; the lower part is marshy; the middle part fertile, and produces flax in abun-

dance. The chief town, or rather village, thinly inhabited, is called *Axy*.

AXIA, in *Ancient Geography*, a town of Greece, in the country of the Locrian Ozolians.—Also, a town of Italy, in Etruria; and the inhabitants were called *Asiatæ*.

AXIACA, a town of Sarmatia, to the left of the river Sagaris, and north of Odesius (Oczakow).

AXIACES, a river of European Sarmatia, a little above Dacia; and the people who inhabited the district to the right of this river were called *Asiæi*.

AXICA, or AZICA, an ancient town of India, on this side of the Ganges. *Ptolemy*.

AXILLA, in *Anatomy*, or ALA, the cavity under the upper-part of the arm; commonly called the arm-pit.

The word is a diminutive of *axis*, *n. d. hule vis*.

Abscesses in the axilla are usually dangerous on account of the many blood-vessels, lymphatics, nerves &c. thereabout, which form several large plexus.—By the ancient laws, criminals were to be hanged by the axilla if they were under the age of puberty.

AXILLA, in *Botany*, is the space comprehended between the stems of plants and their leaves.

Hence we say, those flowers grow in the axilla of the leaves; i. e. at the base of the leaves or just within the angles of their pedicles.

AXILLARY, in *Anatomy*, something that belongs to the *axilla*, or lies near them.

AXILLARY Artery, a certain portion of the great artery which supplies the upper part of the trunk, and upper extremity. See ARTERY, *Distribution of those Vessels*.

AXILLARY Vein, a certain extent of the vein corresponding to the above-mentioned artery. See the account of the *Distribution of the VEINS*.

AXILLARY Nerves, are branches of the four lower cervical and first dorsal, which form a plexus in the axilla. See NERVE, *Distribution of*.

AXILLARY Glands, the glands belonging to the absorbing vessels which are situated in the axilla. See ABSORBING VESSELS, *Distribution of*.

AXILLARY Leaves, in *Botany*. See LEAF.

AXIM, in *Geography*, a small district or canton of Africa, on the Gold Coast, between cape Apollonia, and Tree Puntas. The climate is unhealthy, being so moist, that, according to the proverb of the country, it rains eleven months and twenty-nine days in the year. The maize, on account of the humidity of the soil, is neither plentiful nor excellent; but it produces a great quantity of rice, which is exported to all the kingdoms of the Coast, in exchange for millet, yams, potatoes, and palm-oil; and it yields also water-melons, ananas, bananas, cocoas, oranges, two kinds of lemons, and all sorts of fruits and vegetables. Axim also produces great numbers of black cattle, sheep, goats, and tame pigeons, as well as other fowls. The whole country is filled with populous villages; some on the sea-side, others farther up the country; and all of them rich and beautiful. The intermediate lands are well cultivated, and the soil is so fertile as richly to compensate the labour of the husbandman: besides which the natives are wealthy, from a constant traffic they maintain in gold with the Europeans. The capital of this district is Axim, or ACHOMBENE, standing under a Dutch fort, and screened behind by a thick wood, that covers the whole declivity of a neighbouring hill. The river Axim runs through the town, and the coast is defended by a number of small-pointed rocks, which project from the shore, and render all access to it dangerous. The European settlements are, 1. The Dutch fort of St. Anthony, standing

standing on a high rock, which projects into the sea in the form of a peninsula, and so environed by dangerous shoals and unperceived rocks, as to be inaccessible to an enemy except by land, on which side it is fortified by a parapet, draw-bridge, and battery of heavy cannon. The Portuguese were the first founders of this settlement; but they were driven from it by the Dutch, in 1642. Its form is triangular; and it has three batteries; one towards the sea, and two towards the land. The situation of the fort is east of the river Axim, called by the Portuguese Rio Manco, which is navigable only by canoes; but it is rich in gold dust, washed down by the stream from the inland countries. 2. Mount Manfore, three leagues distant from fort St. Anthony; near which is the large and populous town of Pockesso. Mount Manfore is well situated for a fort, being the first point of cape Tres Puntas. Here the Brandenburgers or Prussians had one principal factory, called FREDERICKSBURGH: but it was taken by the Dutch, and remained in their possession. 3. Cape TRES PUNTAS, so called from its being composed of three points or eminences, projecting into the sea; on which are the three villages, Akora, Akron, and De Jussamma or DICKSCOVE. See the several articles.

The government of Axim is composed of two bodies of the natives: the caboceros, or chief men; and the manceros, or young men. To the former belongs the cognizance of civil affairs; but whatever is of general concern, and may properly be called national, appertains equally to both members of the state. The caboceros are less wealthy in gold and slaves, and of course less regarded by the people, and they are often impeached before the bar of the manceros: whereas no manceros can be tried for crimes of a public nature, but by his own assembly. In the distribution of justice, there is a great degree of partiality and corruption: presents of gold or brandy, conveyed to the caboceros, ensure a favourable verdict; and justice is frequently delayed as well as perverted by the influence of bribes. The defendant, in defect of sufficient testimony on either side, by witnesses or probable circumstances, clears himself by oath: and the oath of purgation is always preferred to that of accusation. As to penalties in criminal cases, murder is punished either by death or a pecuniary mulct. However, the fine for murdering a slave is very trifling in comparison to that exacted for the life of a free man; and execution seldom takes place, unless the criminal be poor, and unable to answer the demands of his judge. The only punishment for thefts is restitution, or a fine proportioned to the quality of the offender: and the creditor may seize on the property of the debtor to the amount of twice the value of what is due to him: but the usual method is to settle the account by arbitration, or restitution of the goods and chattels bought. Mod. Un. Hist. vol. xiii. p. 391—401.

AXIMA, in *Ancient Geography*, a town of Asia, in Persia Proper, or Persis.—Also, a town of Italy, in the Alps, belonging to the Centrones. Ptolemy.

AXINAEÆ, AXINÆÆ, in *Natural History*, a genus of the MOLLUSCA tribe (*Yellaceæ*), established by Poli, in his history of the shells of the two Sicilies. The character is taken from the form of the animal; the shell it inhabits belongs in the Linnæan arrangement to the ARCA genus.

AXINCES, in *Ancient Geography*, the *Bog* or *Akfeu*, a large river which traversed Sarmatia, separated the Callipides Axiaci, to whom it gave name, and discharged itself into the Borythenes.

AXINIA, the ancient name of a mountain of Peloponnesus, in Arcadia.

AXINIUM, the name given by Appian to an ancient city of Spain.

AXINOMANCY, AXINOMANTIA, from *αξιον*, *securis*, and *μαντις*, *divinatio*, an ancient species of divination, or a method of foretelling future events by means of an ax or hatchet.

This art was in considerable repute among the ancients; and was performed, according to some, by laying an agate-stone on a red-hot hatchet; and also by fixing a hatchet on a round stake, so as to be exactly poised; then certain formula of devotion were pronounced, and the names of suspected persons were repeated, and he at whose name the hatchet moved was pronounced guilty.

AXIOM, ΑΧΙΟΜΑ, from *αξιον*, *I am worthy*, a self-evident truth, or a proposition whose truth every person receives at first sight; and to which the term *dignity* is applied, on account of its importance in a process of reasoning. These axioms are self-evident truths that are necessary, and not limited to time and place, but must be true at all times and in all places.

Thus, that the whole is greater than a part; that a thing cannot be and not be at the same time; and that from nothing, nothing can arise, are axioms.

By axioms, called also *maxims*, are understood all common notions of the mind, whose evidence is so clear and forcible, that a man cannot deny them without renouncing common sense, and natural reason.

Self-evident propositions furnish the first principles of reasoning; and it is certain, that if in our researches we merely employ such principles as these, and apply them properly, we shall be in no danger in advancing from one discovery to another. For this we may appeal to the writings of mathematicians, which being conducted agreeably to this standard, incontestibly prove the stability of human knowledge, when it is made to rest on so sure a foundation. The propositions of this kind of science have not only stood the test of ages; but they are found to be attended with that invincible evidence, which constrains the assent of all who consider the proofs by means of which they are established.

Lord Bacon proposes a new science, to consist of general axioms, under the denomination of *philosophia prima*. For an account of the origin and evidence of those truths called axioms, as well as of their importance and utility in the pursuit of knowledge and truth, see INTUITION, PRINCIPLES, and COMMON SENSE.

AXIOM is also an established principle in some art or science. Thus, it is an axiom in *Physics*, that nature does nothing in vain; that effects are proportional to their causes, &c. So it is an axiom in *Geometry*, that things equal to the same third are also equal to one another; that if to equal things you add equals, the sums will be equal, &c. It is an axiom in *Optics*, that the angle of incidence is equal to the angle of reflection, &c. In this sense the general laws of motion are called axioms; as that all motion is rectilinear, that action and reaction are equal, &c. See LAWS of Motion.

These particular axioms, it may be observed, do not immediately arise from any first notions or ideas, but are deduced from certain hypotheses; this is particularly observable in physical matters, wherein, as several experiments contribute to make one hypothesis, so several hypotheses contribute to one axiom.

The axioms of Euclid are very general propositions, and so are the axioms of the Newtonian philosophy; but these two kinds of axioms have very different origins. The former appear true upon a bare contemplation of our ideas; whereas the latter are the result of the most laborious induction.

Lord

Lord Bacon, therefore, strenuously contends, that they should never be admitted upon conjecture, or even upon the authority of the learned; but, as they are the general principles and grounds of all learning, they should be canvassed and examined with the most scrupulous attention, "ut axiomatum corrigatur iniquitas, quæ plerumque in exemplis vulgatis fundamentum habent." De Augm. Sc. l. ii. c. 2. "Atque illa ipsa putativa principia ad rationes reddendas compellere decrevimus, quousque plane constant. Distrib. Operis.

A late writer (see Tatham's Chart, and Scale of Truth) distinguishes between axioms *intuitive*, and *self-evident*. The former, he says, pass through the first inlets of knowledge, and flash direct conviction on the minds, as external objects do on the senses, of all men; in the formation of the latter, reason judges by single comparisons, without the aid of a third idea or middle term; so that they have their evidence in themselves, and though inductively framed, they cannot be syllogistically proved. If we admit this distinction, and its reasonableness must be allowed, the character of intuitive axioms will be restricted to particular truths. See INDUCTION, REASONING, and SYLLOGISM.

AXIOM, in *Rhetoric*, is used by Hermogenes to denote grandeur, dignity, and sublimity of style.

AXIOPOLIS, in *Ancient Geography*, a town of Lower Mæsia, according to Ptolemy, situated near the spot where the Danube assumed the name of Ister; north-east of Durostorus. It is now a town of European Turkey, in Bulgaria, called *Axiopoli*, on the right bank of the Danube. N. lat. 45° 40'. E. long. 34°.

AXIOS, a form of acclamation, anciently used by the people in the election of bishops. When they were all unanimous, they cried out $\alpha\chi\iota\sigma$, *he is worthy*, or $\alpha\omega\chi\iota\sigma$, *unworthy*.

AXIOSIS, in *Rhetoric*, denotes a third part of an exordium; sometimes also called $\alpha\pi\omega\delta\delta\omega\tau\iota\varsigma$, and containing some new proposition more nearly relating to the matter in hand, than the $\pi\rho\delta\lambda\omega\tau\iota\varsigma$.

Thus, in Cicero's oration pro Milone, the protasis is, "Non possum non timere, judices, visa hæc nova judicii forma;" the $\alpha\lambda\lambda\alpha\sigma\iota\omega\nu\eta$, "Nec enim ea corona confessus vester cinctus est qua solebat;" the $\alpha\chi\iota\omega\tau\iota\varsigma$, "Sed me recreat Pompei fratrilium, cuius sapientie non fuerit, quem sententis iudicium tradidit, telis militum dedere;" the basis, $\beta\alpha\sigma\iota\varsigma$, "Quamobrem adesse animis, judices, & timorem, si quem habetis, deponite."

AXIOTHEA, in *Biography*, a female philosopher of Greece, who lived in the time of Plato. Such was her thirst for knowledge, that she disguised herself in man's clothes, in order to attend the lectures of that philosopher. Menag. in Diog. Laert. l. iii. c. 43.

AXIS properly signifies a line, or long piece of iron or wood passing through the centre of a sphere, which is moveable upon the same. In this sense we say, the axis of a sphere or globe; the axis, or axle-tree of a wheel, &c.

AXIS, in *Anatomy*, is the second vertebra of the neck, reckoning from the skull.

It is thus called, because the first vertebra, with the head, move thereon, as an axis. See SKELETON.

AXIS, *Spiral*, in *Architecture*, is the axis of a twisted column drawn spirally, in order to trace the circumvolutions without. See COLUMN, *Twisted*.

AXIS of the Ionic capital is a line passing perpendicularly through the middle of the eye of the volute.

AXIS of the world, in *Astronomy*, is an imaginary right line, which is conceived to pass through the centre of the

earth, and to terminate at each end in the surface of the mundane sphere.

About this line as an axis, the sphere in the Ptolemaic system, is supposed daily to revolve.

This axis is represented by the line PQ, *Plate II. Astr.* fig. 18.—The two extreme points in the surface of the sphere, viz. P and Q, are called its poles.

AXIS of the earth, is a right line upon which the earth performs its diurnal rotation from west to east.

Such is the line PQ, *fig. 19*.—The two extreme points are also called poles.

The axis of the earth is a part of the axis of the world.—It always remains parallel to itself, and at right angles with the equator. See ANGLE, INCLINATION, and PARALLELISM.

AXIS of a planet, is a line drawn through its centre, about which the planet revolves.

The Sun, Earth, Moon, Jupiter, Mars, and Venus, are known, by observation, to move about their several axes; and the like motion is easily inferred of Mercury, Saturn, and the Georgian planet.

AXIS of the horizon, equator, ecliptic, zodiac, &c. are right lines drawn through the centres of those circles, perpendicular to their planes.

AXIS, in *Botany*, a taper column placed in the centre of some flowers or katkins, about which the other parts are disposed. It is synonymous with *columella*.

AXIS, in *Geometry*.—AXIS of rotation or circumolator, is an imaginary right line, about which any plane figure is conceived to revolve, in order to generate a solid.

Thus a sphere is conceived to be formed by the rotation of a semicircle about its diameter or axis, and a right cone by that of a right angled triangle about its perpendicular leg, which is here its axis.

AXIS is yet more generally used for a right line proceeding from the vertex of a figure to the middle of its base.

AXIS of a circle or sphere, is a line passing through the centre of the circle or sphere, and terminating at each end in its circumference.

The axis of a circle, &c. is otherwise called its diameter.

AXIS of a right or rectangular cylinder, is properly that quietest right line, about which the rectangular parallelogram turns, by whose revolution the cylinder is formed.

In general, the right line which joins the centres of the opposite bases of cylinders, whether they be right or oblique, is denominated their axis.

AXIS of a right cone, is the right line or side upon which the right-angled triangle forming the cone makes its motion. Hence it follows, that only a right cone can properly have an axis; because an oblique one cannot be generated by any motion of a plane figure about a right line at rest. But because the axis of a right cone is a right line drawn from the centre of its base to the vertex; the writers of conics, by way of analogy, likewise call the like line, drawn from the centre of the base of an oblique cone to the vertex, its axis.

AXIS of a conic section, is a right line passing through the middle of the figure, and bisecting all the ordinates at right angles.

Thus if AP (*Plate Conics, fig. 31*.) be drawn perpendicularly to FF, so as to divide the section into two equal parts, it is called the axis of the section.

Or, the axis of a conic section is a line drawn from the principal vertex, or vertices, perpendicular to the tangent at that point.

AXIS, *transverse*, called also the *first* or *principal axis* of an ellipse,

ellipse, is the axis AP, last defined; being thus called in contradistinction to the *conjugate* or *secondary axis*.

Or, in the ellipse and hyperbola, it is the diameter that passes through the two foci, and the two principal vertices of the figure.

The transverse axis in the ellipse is the longest; and in the hyperbola it cuts the curve in the points A and P (fig. 32.) and is the shortest diameter.

Axis, *conjugate*, or *second axis*, of the ellipse and hyperbola, is the diameter passing through the centre and perpendicular to the transverse axis. Such is the line FF (fig. 31.) drawn through the centre of the ellipse C, parallel to the ordinate MN, and perpendicular to the transverse axis AP; being terminated at each extreme by the curve. And such, in the hyperbola, is the right line FE (fig. 22.) drawn through the centre parallel to the ordinates MN, MN, perpendicularly to the transverse axis AP. In the ellipse and hyperbola, the conjugate axis is the shortest of all the conjugate diameters. The axis of a parabola is of an indeterminate length; that is, is infinite. The axis of the ellipse is determinate. The parabola has only one axis; the ellipse and hyperbola have two.

Axis of a *Curve Line*, in general, denotes that diameter which has its ordinates at right angles to it, when that is possible. For, as in the conic sections, any diameter bisects all its parallel ordinates, making the two parts of them on both sides of it equal, and the diameter which is perpendicular to such ordinates is an axis; so in curves of the second order, if any two parallel lines meet with the curve in three points, the right line which cuts these two parallels so that the sum of the two parts on one side of the intersecting line, between it and the curve, is equal to the third part terminated by the curve on the other side, then the said line will in like manner cut all other parallels to the former two lines, so that with respect to every one of them, the sum of the two parts, or ordinates, on one side, will be equal to the third part, or ordinate, on the other side. Such intersecting line is then a diameter; and that diameter, whose parallel ordinates are at right angles to it, when that is possible, is an axis. The case is the same with regard to other curves of still higher orders. Newton, *Enumeratio Linearum Tertii Ordinis*, § 2. art. 1.

Axis of a *Magnet*, or *Magnetical Axis*, is a line passing through the middle of a magnet lengthwise; in such manner, as that however the magnet be divided, provided the division be made according to a plane, in which such line is found, the magnet will be cut or separated into two loadstones; and the extremes of such lines are called the poles of the stone. See *MAGNET*.

Axis, in *Mechanics*. The axis of a balance is the line upon which it moves or turns. See *BALANCE*.

Axis of *Oscillation*, is a right line parallel to the horizon, passing through the centre, about which a pendulum vibrates; and perpendicular to the plane in which it oscillates. See *OSCILLATION*, and *PENDULUM*.

Axis in *Peritrochio*, or *Wheel and Axle*, is one of the five mechanical powers, or simple machines, contrived chiefly for the raising of weights to a considerable height. It consists of a circle, represented AB (*Plate I. Mechanics*, fig. 5.) concentric with the base of a cylinder, and moveable together with it, about its axis EF. This cylinder is called the *axis*; and the circle, the *peritrochium*; and the radii, or spokes, which are sometimes fitted immediately into the cylinder, without any circle, the *scytale*. Round the axis winds a rope, or chain, by means of which the weights, &c. are to be raised, upon turning the wheel.

The axis in peritrochio takes place in the motion of every

machine, where a circle may be conceived as described about a fixed axis, concentric to the plane of a cylinder, about which it is placed; as in crane-wheels, mill-wheels, capstans, &c.; a gimblet and an augre to bore with may also be referred to the wheel and axis.

Axis in *Peritrochio*, *properties of the*. 1. If the power applied to the axis in peritrochio, in the direction AL (fig. 6.), being a tangent to the periphery of the wheel, or perpendicular to the scytala or spoke, be to a weight W, as the radius of the axis CE is to the radius of the wheel CA, or the length of the spoke; the power will just sustain the weight, i. e. the weight and the power will be in equilibrio.

Dem. The same power is required to support W, whatever be the point of the axis to which it is applied, because the distance from the corresponding centre of motion is the same, and the wheel and axis may be reduced to a bent lever; and consequently there will be an equilibrium, when $P : W :: W's \text{ distance from the centre of motion, or radius of the axis,} : \text{radius of the wheel}$. Or, since the directions of P and W are perpendicular to their respective distances from their centres of motion, they are wholly efficient; and P's velocity is to W's velocity, as the periphery of the wheel to the periphery of the axis; and consequently, when there is an equilibrium, $P : W :: \text{periphery of the axis} : \text{periphery of the wheel} :: \text{radius of the axis} : \text{radius of the wheel}$.

If the thickness of the rope, to which W is appended, be not inconsiderable, it ought not to be neglected; for when one or more coils or spires of the rope are folded about the axis, the distance of W's direction from the centre of motion is increased, and becomes equal to the sum of the semidiameters of the axis and ropes; and there is an equilibrium when $P : W :: \text{the whole distance of W's direction from the centre of motion} : \text{semidiameter of the wheel}$.

2. If a power applied in F, pull down the wheel according to the line of direction FD, which is oblique to the radius of the wheel, though parallel to the perpendicular direction; it will have the same proportion to a power which acts according to the perpendicular direction AL, which the whole line has to the sine of the angle of direction DFC. For, since FD is perpendicular to AC, DC will be the distance of the power applied at F from the centre of motion; consequently the power at F : W :: EC : CD; and the power at A : W :: EC : CA; consequently the power at F : power at A :: CA : CD. But if CA or FC be taken for the whole sine or radius, CD will be the sine of the angle DIC; and the power at F will be to the power at A :: the whole sine is to the sine of the angle of direction DFC, in case of an equilibrium between the power and weight.

Hence, since the distance of the power in A is the radius CA, the angle of direction DFC being given, the distance DC is easily found.

3. Powers applied to the wheel in several points, F and K, according to the directions FD and KI, parallel to the perpendicular one AL, are to each other as the distances from the centre of motion CD and CI, reciprocally. For the power at F : W :: EC : CD; and the power at K : W :: EC : IC; consequently the power at F : power at K :: IC : CD.

Hence, as the distance from the centre of motion increases, the power decreases, and *vice versa*, the weight being the same. Hence also, since the radius AC is the greatest distance, and corresponds to the power acting according to the line of direction; the perpendicular power will

will be the smallest of all those able to sustain the weight *W*, according to the several parallel lines of direction.

4. If a power acting according to the perpendicular *AL*, raise the weight *W*, the space passed through by the power will be to the space passed through by the weight, as the weight to the power which is able to sustain it.

For, in each revolution of the wheel, the power passes through its whole periphery; and in the same time the weight is raised through an interval equal to the periphery of the axis; the space of the power therefore is to the space of the weight, as the periphery of the wheel to that of the axis; but the power is to the weight, as the radius of the axis to that of the wheel. Therefore, &c.

5. A power and a weight being given, to construct an axis in peritrochio, by which the weight shall be sustained and raised by the given power. Let the axis be large enough to support the weight without breaking. Then, as the weight is to the power, so make the radius of the wheel, or the length of the spoke, to the radius of the axis.

Hence, if the power be but a small part of the weight, the radius of the wheel must be vastly great.—E. gr. Suppose the weight 4050 and the power 50, the radius of the wheel will be to that of the axis as 81 to 1. But such a machine would be of an inconvenient size; and it may therefore be provided against by increasing the number of the wheels and axes; and making one to turn round another by means of teeth or pinions.

To find the effect of a number of wheels and axes, thus turning one another, multiply together all the radii of the axes, and all the radii of the wheels, and then it will be, as the product of the former is to the product of the latter, so is the power to the weight. Thus, if there be four wheels and axes, the radius of each axis being one foot, and the radius of each wheel being three feet; then the continual product of all the radii of the wheels is $3 \times 3 \times 3 \times 3$, or 81 feet, and that of the radii of the axes only 1; consequently the effect is as 81 to 1, or the weight may be 81 times the power. On the contrary, if it be required to find the diameter of each of four equal wheels, by which a weight of 4050 lb. shall be balanced by a power of 50 lb. the diameter of each axis being one foot; divide 4050 by 50, and the quotient is 81; extract the fourth root of 81, or twice the square root, and it will be 3, for the diameter of each of the four wheels sought. See *WHEELS*. See also *MECHANICAL POWERS*.

6. If *P* and *W* act in the same plane, and in the directions *PD* and *WD* (fig. 7. and 8.), meeting in *D*, and be in equilibrio, they are equivalent to a third force, or pressure upon the axis at *A*, whose direction meets *PD* and *WD* in *D* (see *MORION*); and producing *PD*, *WD*, these three forces are to each other, as the sides *DF*, *DE*, and diagonal *DG*, of the parallelogram *EF*; consequently $P : W :: DF : DE$, or drawing *AN*, *AM*, perpendicular to *WD* and *FDP* respectively, $P : W :: AN : AM$. See *LEVER*.

7. The pressure upon the axis at *A* (i. e. *Pr*) : $P :: DG : DF :: \sin. \angle DFG$ or $PDW : \sin. \angle FGD$ or ADW ; $Pr : W :: DG : DE :: \sin. \angle DEG$ or $PDW : \sin. \angle DGE$ or ADP ; and $P : W :: \sin. \angle ADW : \sin. \angle ADP$. When the angle *PDW* is infinitely small, or *PD* and *WD* are parallel, the perpendiculars *AN*, *AM* are to each other as *AW : PA*. Parkinson's System of Mechanics, &c. p. 137.

Axis of a Vessel, is that quiescent right line passing through the middle thereof, perpendicularly to its base, and equally distant from its sides.

Axis, in *Optics*. *Optic axis*, or *visual axis*, is a ray pas-

sing through the centre of the eye; or it is that ray, which, proceeding through the middle of the humours cone, falls perpendicularly on the crystalline humour, and consequently passes through the centre of the eye.

Axis, *Common*, or *Mean*, is a right line drawn from the point of concurrence of the two optic nerves, through the middle of the right line which joins the extremity of the same optic nerves.

Axis of a Lens, or *Glass*, is a right line passing along the axis of that solid, of which the lens is a segment.

Thus, a spherical convex lens being a segment of some sphere, the axis of the lens is the same with the axis of the sphere; or it is a right line passing through the centre thereof. Or, the axis of a glass is a right line joining the middle points of the two opposite surfaces of the glass. See *LENS*.

Axis of Incidence, in *Dioptrics*, is a right line drawn through the point of incidence, perpendicularly to the refracting surface. See *INCIDENCE*.

Axis of Refraction, is a right line continued from the point of incidence or refraction perpendicularly to the refracting surface, along the farther medium. Or, it is that made by the incident ray, perpendicularly prolonged on the side of the second medium. See *REFRACTION*.

Axis, in *Zoology*, a species of the *Cervus*, or *Stag* genus, with branched, round, erect horns, that are built at the summit; and the body spotted with white. Erxleb. Mamm. p. 312. Schröber, &c.

The axis, according to Sonnini and others, is an animal almost peculiar to the colder parts of Asia; it inhabits the wooded mountains of the Celebes, Java, and Ceylon, in great numbers, but it is still more abundant on the banks of the river Ganges, and for that reason is not unfrequently called the *Ganges stag*. The axis multiplies fast in the parks and menageries of England, France, and other parts of Europe; and being a most graceful animal, is no small ornament to the grounds of the nobility and gentry. It is said to propagate with the female of the common stag; and it is equally probable, that the female axis would produce with the male of the other kind.

This animal was known to the ancients by the name of axis. Pliny speaks of it as a native of India, and informs us likewise that it was consecrated to Bacchus. Its size is nearly that of the fallow deer; colour above pale rufous brown, elegantly spotted with white, beneath white; tail like that of the fallow deer, and rufous above, and white beneath. The axis is easily tamed; its smell is exquisite; and flesh very good when salted.

Gmelin, on the authority of Pennant, speaks of two varieties of this creature; the first, with a body uniformly of one colour, with the extremity of the horns trifurcated; and the other with horns that are also trifurcated, but larger, and whitish. These are the *middle axis* and *spotted axis* of Dr. Shaw; and are thus noticed in the Gen. Zool. of that author. "*Middle axis*. Whether this be a variety of the former (*spotted axis*), or specifically distinct, does not appear perfectly clear. It is, according to Mr. Pennant, of a middle size between the *spotted axis* and the *great axis* or following kind. In the colour of its hair, it resembles the first sort; but is never spotted. It, however, is said to vary into white, in which state it is considered as a great rarity. It inhabits dry hilly forests in Ceylon, Borneo, Celebes, and Java, where it is found in very numerous herds. Its flesh is much esteemed by the natives, and is dried and salted for use."—" *Great Axis*. The existence of this species, or variety, is ascertained from a pair of horns in the British Museum, resembling the former kinds in shape, but of a larger size ;

they measure two feet nine inches in length, are of a whitish colour, and are very strong, thick, and rugged. Mr. Pennant conjectures that they were brought from Ceylon or Borneo, having been informed by Mr. Loten, who had long resided in the former of these islands, that a very large kind of flag, as tall as a horse, of a reddish colour, and with trifurcated horns, existed there as well as at Borneo. In Borneo, they are said to frequent low marshy tracts, and to be called by the name of water flags."

AXIUS, now VARDARI, in *Ancient Geography*, the largest river in Macedonia, springing from two fountains in the Scardian mountains, and after a course of eighty miles, spread itself into an extensive lake below the city of Edessa. There receiving the Erigon, it fell into the bay of Thessalonica, almost opposite to that city.—Also, a river of Syria, which passed Apamea.

AXLE-TREE. See AXIS.

AXMINSTER, spelt in old writings AXMYSTER, in *Geography*, is the name of a market town in Devonshire, situated on the great leading road from London to the West of England. It is said to derive its name from the river Axe, on which it is seated, and a minster, founded here by king Athelstan, for seven priests, who were appointed to pray for the souls of some of his army that were slain in a dreadful conflict with the Danes. A place in the neighbourhood is still called *Kings-field*, and another place bears the name of Kilmington, from *Kil-maen-ton*. A castle was formerly standing in the town; and the market, held on Saturday, is kept in a place still bearing that name. Whatever size or character the minster might originally possess, it has been nearly destroyed; and the parish church, though large, has scarcely any appearance of antiquity. A small Saxon arch, with zigzag mouldings and appropriate capitals, is preserved in the east end of the south aisle. Axminster is a healthy, clean town, pleasantly situated on rising ground, which slopes on the western side to the river. A considerable manufactory of carpets is carried on here, the peculiar make and character of which have obtained them the name of Axminster carpets. They are woven in one entire piece, and several persons are employed at the same time in working the coloured patterns. The manufactory was first established here in 1755, by the grandfather of the present proprietor. Since that time the trade has much increased, and now above one hundred hands are constantly employed in the different processes of making a carpet. (See CARPET.) Beside the persons engaged in this manufactory, Axminster is inhabited by several others, who carry on the making of broad and narrow cloths, cotton tapes, druggets, leather breeches, and gloves. Here are two meeting-houses, one for Independents, and the other for Methodists; also a Roman Catholic chapel. Axminster has the advantage of a Sunday school, and also a free school. The neighbourhood is adorned with several respectable and handsome mansions, of which *Shute House* and *Ford Abbey* are the most considerable. The first belongs to the De La Pole family, and the second to Francis Gwynn, esq. This is a large respectable structure, many parts of which are the same as originally belonged to the ancient abbey. Polwhele's *History of Devon*, vol. ii. p. 288.; and *Beauties of England and Wales*, vol. iv.

AXOLOTI, in *Ichthyology*, a singular fish found in the lake of Mexico. It has four feet like the lizard, no scales, a matrix like a woman, and the menstrual flux. It has the taste of an eel.

AXON, in *Ancient Geography*, a river of Asia Minor, in Caria, formed by the re-union of two small streams, and running south from the town of Calydna, discharged itself

into the north-west part of the gulf of Glaucus, to the north-west of the promontory of Pedalum.

AXONA, a river of Belgic Gaul, now the Aisne.

AXUM, in *Geography*, once the large and populous capital of Abyssinia, in the province of Tarré, existed in a flourishing state so lately as about the beginning of the 16th century, but was ruined in that century by the Turkish invasion. It is now a village, or at least an inconsiderable town, exhibiting in its ruins traces of its ancient magnificence and importance. The ancient city of Axum was built, according to Mr. Bruce, by a colony of Cushites, and he cites an Abyssinian tradition, which says, that it was built by them early in the days of Abraham. See ABYSSINIA. As the Abyssinians never built any city, and no ruins of any exist at this day in the whole country, this traveller conceives, that Axum was the magnificent metropolis of the trading people, or Troglodyte Ethiopians, called Cushites, who constructed, in many places, buildings of great strength, magnitude, and expence, especially at Azab, suitable to the magnificence and riches of a state, which was from the first ages the emporium of the Indian and African trade. As Axum is situated about midway between Azab and Meroe, it points out the road taken by the caravans that carried on the intercourse between the Ganges and the Mediterranean. The ruins of Axum are very extensive; but like those of the cities of ancient times, they consist altogether of public buildings. In one square, supposed by Mr. Bruce to have been the centre of the town, there are forty obelisks, none of which have any hieroglyphics upon them. One of these, which is still standing, is larger than the rest; and there are two of a larger size that are fallen. They consist of one piece of granite; and on the top of that which is standing, there is a patera exceedingly well carved in the Greek taste. The structure of this obelisk, and of the two larger that are fallen, is ascribed by Mr. Bruce to Ptolemy Euergetes. Upon the face of the obelisk, there is a great deal of carving in the Gothic taste, somewhat like metopes, triglyphs, and guttæ, disposed rudely and without order; but there are no characters or figures. The face of this pyramid, of which Mr. Bruce has given a geometrical elevation, looks due south; it has been placed with great exactness, and has preserved its perpendicular position to the present time. On the face, fronting the south, is the representation of a door, with a lock and bolt, such as are used at this day in Egypt and Palestine. This obelisk is supposed to have been erected by Ptolemy Euergetes, who conquered this city and the neighbouring kingdom, and who was the patron of Eratosthenes, for the use of this astronomer in ascertaining the latitude. Its top was first cut into a narrow neck, then spread out like a fan in a semicircular form, with a pavement curiously levelled to receive the shade, and to mark the separation of the true shadow from the penumbra as distinctly as possible. The edifice, thus constructed, was probably intended for verifying the experiments of Eratosthenes with a larger radius, and not for observing the obliquity of the ecliptic at Axum. For though Axum, by its situation, was a very proper place, the sun passing over that city and obelisk twice a year; yet he could not make use of the sun's being twice vertical to this city, because it is vertical about the 25th of April and about the 20th of August; and at both these seasons, the heavens are so overcast with clouds, and the rain so continual, especially at noon, that it must have been very extraordinary if Ptolemy had once seen the sun during the months of his residence in this place. Beyond the convent of Abba Pantaleon, and a small obelisk situated on a rock

above,

above, there is to the south a road cut in a mountain of red marble, having on the left a parapet wall about five feet high, solid, and of the same materials. In this wall, at equal distances, are hewn solid pedestals, bearing on their tops the marks where stood the colossal statues of Sirius, the Iatrator anubis, or dog-star. Of these pedestals, with the marks of the statues just mentioned, there are 133 still in their places; but there remained only two figures of the dog, which were much mutilated, and evidently in the Egyptian taste. These are composed of granite; but some of them appeared to Mr. Bruce to have been metal. There are also pedestals, on which the figures of the sphinx have been placed. Two magnificent flights of steps several hundred feet long, all of granite, exceedingly well fashioned, and still in their places, are the only remains of a magnificent temple. In the angle of this platform, where the temple stood, is the present small church of Axum, substituted for one destroyed by Mahomet Gragné in the reign of king David III., and which was probably the remains of a temple built by Ptolemy Energetes, if not the work of more remote times. The church is, a mean, small building, and very negligently kept. Mr. Bruce apprehends, that some ancient copy of the O. T. was deposited here, probably that from which the first version was made; but whatever it might be, it was destroyed, together with the church itself, by Mahomet Gragné; though the superstitious people have a tradition that it still subsists there. Another relic, preserved in this place, is a picture of Christ's head crowned with thorns, said to have been painted by St. Luke, which, upon occasions of singular importance, is brought out and carried with the army, especially in a war with Mahometans and Pagans. Within the outer gate of the church are three small square inclosures, all of granite, with small octagon pillars in the angles, apparently Egyptian; on the top of which were formerly small images of the dog-star, probably of metal. Upon a stone, in the middle of one of these, the king sits and is crowned, and this ceremony has always subsisted since the days of Paganism; and below it, where he places his feet, is a large oblong slab of free-stone; bearing the following inscription, much defaced.

“ΙΙΤΟΑΕΜΑΙΟΥ ΕΥΕΡΓΕΤΟΥ ΒΑΣΙΛΕΟΥ.”

Adjoining to Axum is a road, formed by large stones standing edgewise, or heaped upon one another, which is apparently the remains of an old causeway, part of the magnificent works about this city.

The present town of Axum stands at the foot of a hill, and contains about 600 houses. It is watered by a small stream, which flows constantly from a fountain in the narrow valley, where the rows of obelisks stand. The spring is received into a magnificent basin, 150 feet square, and thence it is carried, at pleasure, to water the neighbouring gardens, where there is little fruit, except pomegranates, which are not very excellent. In the town are several manufactures of coarse cotton cloth; and here also the best parchment is made of goats' skins, which is the ordinary employment of the monks. Every kind of vegetation seemed later at Axum, and its vicinity, than at Adowa. N. lat. $14^{\circ} 6'$ $36''$. E. long. $38^{\circ} 39'$. Bruce's Travels, vol. iii. p. 128, &c.

AXUNGIA, a kind of fat, the hardest and driest of any in the bodies of animals.

The word is supposed to be formed *ab axe rotarum quæ unguntur*, from its being used as the grease of wheels.

The Latins distinguish fat into *pinguedo*, and *adips*, or *sebum*; which last, when old, is particularly called *axungia*; but many of our modern writers confound them. *Phy-*

stians make use of the *axungia* of the goose, the dog, the viper, and some others, which is held by some to be of extraordinary service in the drawing and ripening of tumours, &c.

AXUNGIA of glass, called also the *gall*, and *salt of glass*, is a steam taken from the top of the matter of glass before it be thoroughly vitrified. It is used in cleaning the teeth, and by farriers for clearing the eyes of horses.

AXYLON, in *Ancient Geography*, a country of Asia, towards Bithynia and Cappadocia. Livy.

AXYRIS, in *Botany*. Lin. g. 1047. Schreb. 1409. Juss. 86. Gertn. t. 128. Class. *monocotyledonaria*. Nat. Order. *Liliaceæ*. — *Liliifera*, Juss. Gen. Char. * Male flowers in an anther. Cal. perianth three-parted, spreading, obtuse. Cor. none. Stam. filaments three, capillary, spreading. Anthers roundish. * Female flowers feathery. Cal. perianth five-leaved (two-leaved, *Syl.*), concave, obtuse, converging, permanent; the two outer leaflets shorter. Cor. none. Pyl. germ roundish; styles two, capillary; stigmas acuminate. Per. none. Calyx, closely involving the seed with its three leaflets. Seed one, ovate, compressed, obtuse.

Ess. Gen. Char. *Mul.* Calyx three parted. Cor. none. Fem. Cal. two-leaved. Cor. none. Styles two. Seed one.

Species, 1. *A. amarantoides*, simple spiked axyris. Gmel. lih. 3. 21. t. 2. f. 2. and t. 3. “Leaves ovate, stem erect, spikes simple.” Leaves rough, with stellate hairs; fruit-bearing branches, naked at the base; spike very small, subsessile, quite simple, terminal. It is observed by Gmelin, that the calyx of the female flower is two or three-leaved. Cultivated by Miller in 1758. 2. *A. hybrida*. Gmel. l. c. “Leaves ovate; stem erect; spikes conglomerate.” This differs from the first, in the spike of flowers being on long peduncles, conglomerate, or directed the same way, twisted, with the fruit-bearing-branches crowded close to the stem, and the leaves more rough. Pallas supposes this to be only a variety of the former plant. According to Gmelin, the calyx is three-leaved, and there is but one style in the female flower. 3. *A. prostrata*. Gmel. l. c. “Leaves obovate; stem subdivided; flowers headed.” Stem much branched, six or seven inches high; leaves on stalks; flowers at the ends of the branches, conglomerate, with numerous leaflets among them. The female calyx has also three leaflets according to Gmelin. All these are annual plants, and natives of Siberia.

AXYRIS *Ceratoides* now constitutes a new genus, under the name DIORIS; which see.

AY, in *Geography*, a town of France, in the department of the Marne, and chief place of a canton in the district of Epernay, seated on the Marne; famous for its good wines; four leagues south of Rheims, and one N. E. of Epernay. N. lat. $49^{\circ} 4'$. E. long. $2^{\circ} 15'$.

AY, PULO, one of the Banda islands, in the Indian sea, about three leagues in circumference, where the Dutch have erected a fort.

AYAG, or KAYACHU, one of the Andreanofskie islands, in the Eastern or Pacific Ocean, about 150 versts in circumference, and consisting of several high and rocky mountains, the intervals of which are bare heath and moor ground; but in the whole island, there is not one forest tree. The vegetables resemble those of Kamtschatka. It furnishes small quantities of crow or crane-berries, and the larger sort of bilberries; but of the roots of burnet and all kinds of snakeroot, such abundance as to afford, in case of necessity, a plentiful provision for the inhabitants. There is one small rivulet; and there are many good bays and anchoring places. The population cannot be precisely ascertained, as the natives are continually emigrating from island to island in their baidars.

AYAMONTE,

AYAMONTE, a sea-port town of Spain, situate at the mouth of the Guadiana, on the frontiers of Portugal, with a good haven in the gulf of Cadiz; small, but well fortified, and defended by a castle on a rock; 3½ miles W. S. W. of Seville. The adjacent vineyards are fruitful, and the wine excellent. N. lat. 37° 13'. W. long. 8° 5'. See **AIMONTE**.

AYAMS, derived from an Arabic word which signifies *eyes*, a name given to a class of officers in the provinces of the Ottoman empire, whose business it is to watch over the safety and the fortune of individuals, and also over the good order and defence of a town; to restrain the unjust enterprises of the pachas, and the exactions of the military, and to concur in the just assessment of the taxes.—Appointed by the people, those who undertake this honourable function, are generally men reputed the most virtuous; there are several of them in the great towns, and a single person superintends several villages in the plains. They receive no other reward for their trouble and zeal, than the respect with which they are treated, and the satisfaction of being useful. The Ayams call to their divan the notables of the town and the lawyers, in order to discuss the more important subjects, to digest the remonstrances that are proper to be made to the pacha, and to establish the grounds of those complaints which they judge necessary to be presented against him to the Porte. Olivier's Trav. in the Ottom. Emp. p. 200.

AYBAR, in *Geography*, a town of Spain, in Navarre, on the river Arragon; one league from Sanguesa.

AYBED, a place of Egypt, on the gulf of the Red Sea, where the merchandises of Asia were landed.

AYBLENG, a town of Germany, in Upper Bavaria, twenty-six miles S. E. of Munich.

AYCHA, a town of Bohemia, in the circle of Boleslaw; sixteen miles north of Jung-Bantzel.

AYDHAB, a place of Africa, in Egypt, on the coast of the Red Sea. N. lat. 21° 53'. E. long. 36° 26'. See **AIDHAB**.

AYE, a town of Norway, in the island of Shierney.

AYE-AYE, in *Zoology*, a singular quadruped discovered by Sonnerat, in the island of Madagascar; and described in his voyage to the East Indies (tom. ii. p. 137). The name appears to have no precise meaning; it is an exclamation of the people in Madagascar, and which M. Sonnerat applied to this animal. It is found chiefly, if not exclusively, on the western side of the island.

In size the creature is equal to a rabbit, measuring in a right line from the muzzle to the origin of the tail, fourteen or fifteen inches, and the tail being rather longer than the body. The head is formed like that of a squirrel; the incisive teeth are very contiguous, and so placed as to resemble in some manner, the beak of a parrot; but the two in the lower jaw are much stronger than those in the upper one. The ears are naked, large, and rounded at the tip, as in several of the bat tribe. The toes on each foot are five in number; and the first or innermost one, which serves as a thumb to the hind feet, has a large and flat nail as in the *makis* tribe (*macaoco*, or *lemur*). A very distinguished character of this animal is the length of the toes on the fore-feet; the two last joints of the middle toe above all are very long, slender, and destitute of hair, and the nails are hooked. The fur is as coarse as horse-hair; and is of a purplish, or musky-brown colour, intermixed with black and griseous ash; upon the head, and back, about the eyes, legs, and thighs, is a deep musk-colour; on the eyelids, and several parts of the body and limbs, black however predominates, and the tail is of this latter colour; that of the face, throat, and

belly is greyish white, or slightly tinged with rufous in some places; it does not carry the tail elevated like a squirrel. The female has two teats on the lower part of the belly.

M. Sonnerat, who saw both the male and female, speaks of them as being very stoulish and gentle animals; and which, like the owls, are scarcely able to discern objects in the day time. They live chiefly under ground, feeding on worms and insects which they find in the earth, crinerevices in the trunks of trees, from whence they extract them with the greatest facility, by means of their long slender toe before mentioned. Those which Sonnerat kept alive, were served with rice, and he observed that they fed themselves with the two long toes of their forefeet, in the same manner as the Chinese do with their chop-sticks when eating rice at their meals.

Sonnini forms a new genus of this animal, under the name of **CHIEROMYS** (or *rat à main*), observing that it is the only species of its genus known. The generic character, according to this author, consists in the toes being very long, and the thumb of the hinder pair being bent aside, or turning rather backwards. He censures Gmelin for calling it *sciurus Madagascariensis* or Madagascar squirrel, because a quadruped of that genus really exists in Madagascar.—Gmelin thus specifically describes his *S. Madagascariensis*; middle toe of the fore-feet naked, and very long; thumb nail of the hind-pair rounded.

AYEL, Fr. or **AYLE**, in *Lacep.* a writ which lies where the grandfather was seized in his demeine on the day he died, a stranger enters the same day and dispossesses the heir. See *ASSISE de Mort, &c.*

AYEN, in *Geography*, a town of France, in the department of the Correze, and chief place of a canton in the district of Brive; fourteen miles S. S. W. of Uzerches.

AYENIA, in *Botany*, (named in honour of the duke D'Ayen, duke and marechalle de Noailles). Lin. g. 1020. Schreb. 367. Gærtn. 79. Juss. 278. Class, *gyandria pentandria*; or according to Schreber, *pentandria monogynia*. Nat. Order of *colunniferae*.—*Malvaceae*, Juss. Gen. Char. *Cal.* perianth one-leafed, five parted; parts ovate, oblong, acute, coloured in the middle, reflex, withering. *Cor.* five-leaved, united at the top to the nectary into a flat star; claws of the petals capillary, very long, bowed outwardly; borders obcordate, reflex, with clubbed tips turned upward; nectary bell-shaped, sitting on a cylindrical, erect column, shorter than the calyx; border five-lobed, lobes elevated, above flattish, with a longitudinal furrow, excavated underneath, sharp. *Stam.* filaments five, very short, inserted into the margin of the nectary, on the top of the ribs, between the divisions of the border, each bent downwards through a notch at the end of each petal; anthers roundish, under the borders of the petals. *Pysl.* germ roundish, five-cornered, at the bottom of the nectary; style cylindrical; stigma obtuse, five-lobed. *Per.* capsule five-angled, roundish, muricate, five-celled, ten-valved, clastic. *Seeds* solitary, rather oblong, gibbous on one side, angular on the other.

Ess. Gen. Char. Monogynous. *Cal.* five-leaved. *Pct.* united into a star, with long claws; anthers five, under the star; caps. five-celled.

Species, 1. *A. pusilla*; smooth ayenia. Mill. Dict. fig. t. 18. "Leaves cordate, smooth." Stem weak, woody, from nine inches to a foot high; leaves alternate, indented, pointed, stalked; flowers at the base of the petioles, two, three, or four, from the same point, on separate peduncles; corolla purple, tubulous, spreading at the top into five segments, each terminated by a slender tail. A native of Peru. Cultivated by Miller, in 1756. Its flowers appear in succession from July till winter. 2. *A. tomentosa*. "Leaves ovate,

ovate,

ovate, roundish, tomentose." Leaflets of the calyx lanceolate, acute, permanent; corolla without petals, but composed of a one-leafed bell-shaped nectary, with a five-cleft margin; filaments on the outside of the nectary, longer than the calyx, bowed, bent in, and fixed by a broad membranous tip, to the edge of the nectary; anthers three. A native of South America. 3. *A. magna*. Jacq. Amer. Piët. p. 112. "Leaves cordate pubescent; germ of the flowers sessile." An upright shrub, five feet high; leaves acuminate, serrate, alternate, on tomentose footstalks; peduncles short, axillary, mostly in fours; three-flowered; flowers small, herbaceous, not gynandrous. A native of Carthage and other places of South America. 4. *A. leucigata*. Swartz. Prod. 97. "Leaves ovate, entire, very smooth, germ pedicelled, nectary ten-cleft, radiated." A native of Jamaica.

Propagation and Culture. These plants are to be propagated by seeds sown on a temperate hot-bed, early in the spring, and when they have four leaves, they should be transplanted in another hot-bed to bring them forward, or in pots, and plunged into a hot-bed of tanner's bark. They must be shaded till they have taken new root, and afterwards have free air admitted to them every day in proportion to the warmth of the season; they also require frequent watering. In winter they may be preserved in a moderate stove, but as they perfect their seeds the first year, it is not necessary to continue the old plants. See Martyn's Miller's Dict.

AYENNIS, in *Geography*, the name of an Indian tribe of America, in Florida.

AYERBA, a town of Spain, in Arragon, on the Gallego, between Saragosa and Jaca.

AYERBENGAI, a town of the island of Sumatra.

AYERSTOWN. See AYSTOWNS.

AYESHA, in *Biography*, the favourite wife of Mahomet, was the daughter of Abubeker, and the only one of Mahomet's numerous wives who was a virgin when she came to his bed. With this view, he married her at seven years of age, and cohabited with her at nine. He had no children by her; but so affectionate and constant was his attachment to her, that in his last illness he was conveyed to her house, and expired in her arms. Her enemies charged her with adultery on a particular occasion; and though the prophet had suspicions of her infidelity, he thought it most prudent, for preserving the dignity of his own character, to produce a seasonable revelation from heaven, attesting her innocence; and he punished her accusers as calumniators. After the death of Mahomet, Ayesha was held in great veneration by the Mussulmans, denominated "the mother of the faithful," and consulted on important occasions. Against the caliph Othman she conceived, for some reason that is not known, an invincible prejudice, and formed a plot for dethroning him. When Othman was assassinated by another enemy, she vigorously opposed the succession of Ali, because he had concurred in the accusation of her infidelity. Uniting with her favourites Telha and Zobeir at Mecca, and under a pretence of avenging the murder of Othman, she marched in a litter borne by a very strong camel, at the head of an army, towards Bassora, and on approaching the town, after some ineffectual resistance on the part of the inhabitants, she was met by a deputation sent to know her intentions, whom she harangued with great passion, and in a loud shrill voice, in a long speech. To her speech, one of the Arabs replied, "O mother of the faithful, the murder of Othman was a circumstance of less moment than thy leaving home upon this cursed camel. God has bestowed on thee a veil and a protection; but thou hast rent the veil,

and set at nought the protection." After some contest, the troops of Ayesha gained possession of Bassora. But Ali advanced, and as Ayesha obstinately rejected all pacific counsels, a fierce battle ensued at a place called Horata, in which both Telha and Zobeir were slain. The combat closed with hamstringing the camel on which Ayesha was carried, and taking her prisoner. After some mutual reproaches between her and Ali, she was civilly dismissed, and sent to Medina with an injunction to live peaceably at home, and to concern herself no more in affairs of state. This restriction she afterwards resented by refusing to suffer Hasan, the son of Ali, to be buried near the tomb of the prophet, which was her property. Having regained some degree of influence in the reign of the caliph Moawiyah, she was consulted by him concerning the succession of his son Yezid. Soon after, she died, in the 58th year of the Hegira, A. D. 677, at the age of 67 years. Mod. Un. Hist. vol. i. Herbelot Bib. Or. p. 75.

AYGULA, in *Zoology*, a species of SIMIA, characterised by Linnæus as the long-tailed, beardless, grey monkey, with a rising longitudinal tuft on the crown; the simia nigra magnitudinis medicæ of Edwards; egrette of Buffon; and egret monkey of Pennant. Linnæus mentions an animal, apprehended to be a variety, with a roundish head, the face less black, and the colour of the body less ferruginous. Mr. Pennant describes the egret as having a long face, and an upright pointed tuft of hair on the top of the head, hair on the forehead black; colour of the upper part of the body olivaceous; of the lower, cinereous; eyebrows large; beard very small; size of a small cat. It is said to inhabit India, and particularly the island of Java, and to be a very sportive and lively species; gamboling on the trees, and making a continual noise during the night. M. Cèpede surmises, that the bonneted monkey may perhaps be a variety of this species. Shaw.

AYGULUS, in *Entomology*, a species of SCARABÆUS, that inhabits India. Thorax with four dots; head tuberculated; wing-cases testaceous; and no fore-tarsi. Fabricius.

AYLAH. See AILAH.

AYLESBURY, in *Geography*, is a large market and borough town in Buckinghamshire, in England; and may be considered the most considerable town in the county. It consists of several streets and lanes, which are irregularly disposed over an extensive surface of ground that rises in the midst of the rich vale of Aylesbury. Leland describes the town as being principally built with timber when he visited it, but since that time it has been considerably enlarged and improved, and most of the houses constructed with brick. The improvements originated with Sir John Baldwin, who erected some considerable buildings, and raised a causeway three miles in length to facilitate the approach to the town through a road that was often miry and dangerous. This gentleman, in the time of Henry the eighth, also procured the assizes to be held here which had before been kept at Buckingham. In consequence of this, a county gaol, and also a handsome county hall, were erected. About the year 660, Aylesbury became famous as the burial place of St. Olyth, who was born at Quarendon in this neighbourhood, and beleaded in Essex by the Pagans. The burial place of a saint, in the dark ages of superstition, caused it to be much more frequented by sanctified enthusiasts, and Aylesbury became highly celebrated from this circumstance. Besides, the sisters Editha and Eadburga became possessed of the manor, which after the conquest was given by the king to some of his favourites. The singular tenure, by which it was now held, serves to explain the customs of the times. This enjoined the lord of the manor to provide straw for the king's

king's bed and chamber, three eels for his use in winter; and in summer, straw, rushes, and two green geese, thrice every year, if he visited Aylesbury so many times. The church is a spacious and ancient structure, built in the shape of a cross, with a low tower rising at the intersection of the nave and transepts. It contains a few ancient monuments and on the south side is a room appropriated for a free-school. The church-yard is large, and disposed into several walks, which are planted with double rows of trees. This town was made a borough by charter, and empowered to send members to parliament on the 14th of January, 1553-4. The right of voting is veiled in all the householders who do not receive alms, and these commonly amount to about 350. Here are six annual fairs, and a market held on Saturday: at the latter, great numbers of calves and ducks are sold to dealers from London. Many people in this town and its neighbourhood derive support from their peculiar skill in breeding and rearing of ducks. To gratify fashionable luxury they contrive to prevent the ducks laying till the months of October and November; when by heating and stimulating food, they are induced to drop their eggs; these are collected and put under different hens, which are also impelled to sit at an unseasonable time, and often made to continue in the nest for two or three broods. By this treatment the poor bird is often exhausted, and dies under her compulsive duty. When the young ducks are hatched, they are placed near the fire and nursed with particular care. By these methods, many ducklings are sent to the metropolis, at Christmas, and have been known to sell at fifteen shillings and a guinea per couple. The parish of Aylesbury, including the hamlet of Walton, occupies a large space of ground, and comprehends 697 houses and about 3082 inhabitants, the lower class of whom are usually employed in making of lace.

The *vale of Aylesbury* is particularly celebrated among agriculturists, for its richness and fertility of soil. It extends for many miles east and west, nearly from Tame in Oxfordshire to Leighton-Buzzard in Bedfordshire, and is mostly appropriated to the grazing and fattening of cattle and sheep. About five miles from Aylesbury, is Eythorpe, a feat of the Earl of Chesterfield; and at ten miles distance is Wotton-under-Bernwood, an ancient feat of the Grenville family, and now occupied by the earl of Temple. Britton and Brayley's *Beauties of England and Wales*, vol. i. p. 343, &c.

AYLESFORD, a considerable village of England, in the county of Kent, seated on the northern bank of the river Medway, over which there is a handsome stone bridge of six arches. It is four miles from Maidstone, and thirty from London. The ancient name of this place is found to have been Saillenag-habail; but in consequence of a bloody battle which was fought here between the Britons and Saxons in 455, the name was changed to Angles-ford, and that afterwards contracted to Aylesford. This battle is rendered memorable in the annals of English history, as being the first great conflict between the invading Saxons under Hengist, and the harassed Britons under Gwrtheyrn. Concerning the issue of this battle our historians are very contradictory: some have described the Britons as completely victorious; but the learned Mr. Turner observes, that as Hengist and his son Elesa possessed Kent after this event, we may presume that the engagement was unfavourable to the natives. In this sharp battle, Horfa, brother to Hengist, and Catigern, brother to Vortimer, are said to have fought hand to hand, and were both killed on the spot. The former was interred on the eastern side of the Medway, at a place which still retains the name of Horsted; and Catigern was buried at a place nearer the scene of battle, where it

is stated a large Cromlech was erected to his memory. This monument is still existing at the place, and consists of three large upright stones, about eight feet high, with another lying on the top, measuring eleven feet by eight, and two feet in thickness. It is called Kitfeoty-house. (See CROMLECH.) At the distance of about two fields are other stones erect and some lying down in a circular arrangement. In the reign of Henry the Third, a monastery of Carmelites was founded at Aylesford, by lord Grey of Codnor. It was granted by Henry the eighth to sir Thomas Wyatt, and has at length devolved to the earl of Aylesford. Here is an hospital for six poor people, each of whom is allowed ten pounds a year. Hailes's *History of Kent*, 8vo. edition. Turner's *History of the Anglo-Saxons*.

AYLETS, or SEA-SWALLOWS. In *Heraldry*, they are often called *Cornish Coughs*, and are painted sable beaked, and legged gules.

AYLMER, or ÆLMEER, *John*, in *Biography*, an English divine and bishop, was descended from an ancient family at Aylmer-hall, in the county of Norfolk, and born in the year 1521. Being a younger son, he was educated at Cambridge under the patronage and at the charge of Henry Grey, marquis of Dorset, and afterwards duke of Suffolk; who, when his studies were finished, took him into his house, as preceptor to his children, one of whom was lady Jane Grey. Under his tuition, this lady became an excellent proficient in the Latin and Greek languages, so that she could not only read them with ease, but write them with elegance. Aylmer, as a preacher, zealously inculcated the principles of the reformers; and having, in consequence of his preferment to the archdeaconry of Stow, in the diocese of Lincoln, a feat in the convocation, held in the first year of queen Mary, he resolutely opposed that return to popery to which the clergy in general seemed to be inclined; and he was one of six persons who offered to debate all the controverted points of religion with the most learned champions of the Papists. His zeal for the reformation rendered him obnoxious to the government, so that he found it necessary to withdraw from the country; and as he was of a diminutive size, he made his escape by being concealed in a pipe of wine which had a false bottom, the wine being drawn from the lower half, whilst Aylmer lay hid in the upper. During the time of his exile, he resided first at Straßburgh, and afterwards at Zurich in Switzerland, pursuing his studies, and improving himself by travelling, in the course of which he visited most of the universities in Italy and Germany. Towards the close of his exile, he wrote an answer to John Knox's book against the government of women, intitled, "The first Blast against the monstrous Regiment and Empire of Women." His piece was intitled, "An Harborow for faithful and trewe Subjects against the late blowne Blaste, &c." printed at Straßburgh, in 1559. This book was written with vivacity and learning; but it contained some passages which seemed to indicate a tendency towards puritanism, and particularly one in which he exhorted the bishops to content themselves with moderate incomes, and with a portion "priest-like, and not prince-like." However, when this passage was afterwards objected to him by his enemies, he vindicated himself by saying, "When I was a child, I spoke as a child, and thought like a child, &c." After the accession of queen Elizabeth, Aylmer returned home, and was one of the eight divines appointed to dispute with as many popish bishops at Weilmaster, in the presence of a great assembly. In 1562, he obtained the archdeaconry of Lincoln, and in right of this dignity, he sat in the famous synod held this year for examining and settling the doctrine and discipline of the reformed

reformed church. In this situation he continued for several years, attending to his duties as a justice of the peace, and one of the ecclesiastical commissioners, and entering very little into those disputes that would have subjected him to the notice of either of the two parties by whom he was suspected. In 1573, he accumulated the degrees of bachelor and doctor in divinity, in the university of Oxford; and in 1576, he succeeded his intimate friend and fellow exile in the see of London; but he incurred censure by commencing, and prosecuting for some years, a suit against him for dilapidations. Indeed, a prudent attention to his own interest was a discriminating feature in the bishop's character. In his clerical and episcopal capacity, he was assiduous in public preaching, occasionally rousing, as it is said, the languid attention of his audience by reciting Hebrew verses from a pocket bible; and in his efforts for guarding the church against the attacks both of papists and puritans. Persons of both these descriptions, and particularly the latter, were treated by him with a degree of severity, which was not only unwarrantable in itself, but which incurred occasional admonition from the ruling powers. His virulent abuse of some puritan ministers exposed him to the no less acrimonious assault of their sarcastic writers, so that he became the hero of the celebrated Martin Mar-prelate. See Fuller's Church History, b. ix. p. 223, 224. He was involved in a variety of disputes with respect both to the temporalities of his see, and his exercise of its spiritual jurisdiction; so that his life was far from being tranquil, though his spirit was bold and resolute, and enabled him to surmount the difficulties with which he had to encounter. Of his resolution and personal courage the two following instances are recorded: one was his submitting to the extraction of a tooth, in order to encourage queen Elizabeth to undergo the same operation; and the other was his cudgelling his son-in-law for misconduct towards his wife, who was a favourite daughter. Bishop Aylmer died at Fulham, in 1594, at the age of 73 years, and was buried in St. Paul's cathedral. He left seven sons and two or three daughters, to all of whom he left large legacies, which he was enabled to do by his economy and avarice. The character of Aylmer deservedly ranks high with respect to talents and learning, but his temper was irritable and violent; he was immoderately fond both of power and money; and he undoubtedly possessed an arbitrary and persecuting spirit. Biog. Brit. Andrews's Hist. of Gr. Brit. vol. i. p. 524.

AYLSHAM, or ALESHAM, in *Geography*, is a respectable market town in Norfolk, in England, situated in a flat and fertile country on the banks of the river Bure. In 1773, an act of parliament was obtained for making this river navigable hence to Coltishall in its course to Yarmouth, a distance of about ten miles, in which space there are five locks: the undertaking was completed in 1779. This town is the capital of the manor of the duchy of Lancaster, in consequence of which the duchy court is always held here. The manor was granted by Edward III. to the famous John of Gaunt, duke of Lancaster, who built a handsome church in the town, and dedicated it to St. Michael. A free-school was founded here in 1577, by Robert Janays, who was then mayor of Norwich. Aylsham is about eleven miles from Norwich, and 120 from London. It has two annual fairs, and a weekly market on Tuesday: this was formerly held on Saturdays, but has been altered to the former day. History and Antiquities of Norfolk, 10 vols. 8vo.

AYMARAES, a jurisdiction of South America, in the diocese of Cusco, about 40 leagues south-west from Cusco. This territory abounds in figar, cattle, and grain, and also in mines of gold and silver, which formerly produced large

quantities of these valuable metals; but at present few of them are wrought, the country being too thinly inhabited.

AYMARGUES. See AIMARGUES.

AYMOUTH, See EYMOUTH.

AYNAC, a town of France, in the department of the Lot, and chief place of a cañon in the district of Figeac, twelve miles N. N. W. of Figeac.

AYOQUANTOTOTL, or AVIS AYOQUANTOTOTL, in *Ornithology*, the name under which the *Oriolus Naebhorus* of Gmelin is described by some old writers. Vide Heron. Mex. Seba, &c.

AYORA, in *Geography*, a small place of Spain, in the province of Valencia, upon the river Xucar, at the foot of a mountain, one league from the frontiers of New Castile; the inhabitants of which are said to speak Castilian in its purity.

AYOTECOS, high mountains of America, in Mexico, in the province of Tlascala, towards the coast of the South sea.

AYRSHIRE, a county in the south-western part of Scotland, bounded on the north by the county of Renfrew, on the east by the shires of Lanark and Dumfries, on the south by Galloway, and on the west by the frith of Clyde. Its extent is about sixty-five miles in length by thirty-six in breadth, and it is divided into three great bailiages or stewardries, which bear the names of Kyle, Cunningham, and Carrick. These districts are extremely different from each other in appearance, as Carrick and the interior parts of Kyle are mountainous, and only fitted for pasture; while the coast of Kyle, and the greater part of Cunningham, present a fine, level, cultivated country, interspersed with numerous towns and villages. Its rivers are the Tweed, the Ayr, the Esk, the Annan, the Urr, the Guran, the Doon, and the Lugar. This county includes two royal burghs, Ayr and Irvine, and several towns, among which are Bath, Baillantrae, Girvan, Kilmarnock, Kilwilling, Largs, and Salcoats. Ayrshire possesses many valuable veins of coal, also some quarries of freestone, limestone, ironstone, and several rich lodes of lead and copper ore. A few curious specimens of agates, porphyries, and calcareous petrifications are often found in the hills of Carrick; and a species of whetstone, known by the name of *Ayr-stone*, is obtained from this county. The population of it, as returned to the house of commons in 1800, was 84,306, of which 39,666 were males, and 44,640 females.

AYR, the principal town in the above county, is a royal borough of considerable antiquity, and the seat of a judicary court. It was nominated a royal borough by William the Lion, in 1180, and the privileges by charter then granted are still enjoyed by the town. It is pleasantly seated on a point of land which projects into the sea, between the influx of the rivers Doon and Ayr, and the principal street is broad and ornamented with a row of good houses on each side. Ayr has been a town of considerable trade, but the rising opulence of Glasgow has attracted the merchants from this place. The inconvenient entrance to the harbour proved detrimental to the commerce of the town, but the inhabitants are carrying on extensive works to remove all obstructions at the mouth of the river, and render it more commodious for trading vessels; and two new reflecting light-houses are now erecting near the entrance to the harbour. The salmon fishery of the two rivers furnishes employ for many of the inhabitants, and the sand banks of the coast abound with all kinds of white fish. Its population is 5,992, and it has 735 houses.

AYR, *New Town of*, is the name of another town, seated on the north side of the river Ayr. It has baronial jurisdiction, and a distinct magistracy from the other town. This place seems to have arisen under the influence of Robert Bruce, who

retired here upon being attacked with a leprosy, established a lazaret-house, and conferred considerable favours on the town, and the neighbouring village of Priestwich. Its population is 1724.

AYR, a river of Scotland, rises in the parish of Muirkirk, in the above county, and after a course of about eighteen miles due west, falls into the frith of Clyde, at the town just described. Its banks are steep and romantic in some places, but in others it often overflows its shores, and does considerable damage.—Also, a river of France, which runs into the Aisne near Grandpré.

AYRAINES, a town of France, in the department of the Somme, and chief place of a canton in the district of Amiens, nine miles S. S. E. of Abbeville.

AYRSTOWN, or AYRSTOWNS, a town of America, in Burlington county, New Jersey, situate on the middle branch of Aucocus creek, sixteen miles from the mouth of the creek in the Delaware, and thirteen south-east from Burlington.

AYRY. See AERY.

AYSCUE, AYS COUGH, or ASKEW, *Sir George*, in *Biography*, an eminent English admiral of the seventeenth century, was descended from a good family in Lincolnshire; and entering into the sea-service in his youth, acquired the reputation of an able and experienced officer, and obtained the honour of knighthood from king Charles I. Adhering, however, to the parliament in the civil war, he was constituted admiral of the Irish seas, where he is said to have rendered great service to the protestant interest, and to have contributed much to the reduction of the whole island. In 1651, he reduced the islands of Scilly, and also Barbadoes and Virginia, to the obedience of the parliament; and he afterwards behaved with great honour in the war with the Dutch. In 1666, whilst he was engaged with the Dutch fleet, his ship was driven upon the Galloper sand; and being surrounded with enemies, and despairing of help from friends, he was obliged to surrender. After this disaster, he went no more to sea; but spent the remainder of his days in retirement. *Biog. Brit.*

AYSIA MENTA, or AYZIA MENTA. See EASEMENT.

AYSLINGEN, in *Geography*, a market town of Germany, in a prefecture of the same name, in the diocese of Augsborg, situate on the Danube.

AYST, a river of Aultria, in the Blach quarter, on which is seated the market town of Waldhausen.

AYTON, or AITON, a small town of Greece, in Livadia, five leagues north of the Dardanelles of Lepanto. This is thought to be the ancient town of *Ætolia*, called *Calydon Aquile*.

AYUD, AUDIN, or HAWD, a province of Hindostan, containing the most northern countries belonging to the Moguls, such as Kakares, Bankish, Nagarkat, Siba, and others. It is situated to the north-west of the Ganges, and watered by rivers which fall into it; so that, notwithstanding its mountains, it is exceedingly fertile; and its trade with the countries to the north-east renders it very rich. In this province there are many independent rajahs, and two remarkable pagodas, one at Nagarkat, dedicated to the idol Matta, and the other at Kalamak, which is venerated, because the Indians regard it as miraculous, that the water of the town should be very cold, and yet spring from a rock that continually throws out flames.

AZA, in *Ancient Geography*, a town of Asia, in Syria, seated on an eminence to the west of one of the branches of the river Chalus, south-west of Chaonia.—Also, an ancient town of the Lesser Armenia, placed by the Antonine Itinerary in the route from Casarea to Sangala, 26 miles from the latter place.—Also, a name given in the time of Steph.

Byz. to the town of Gaza.—Also, a town of Palestine, in the tribe of Ephraim.

AZAB, USSAB, or SABA, in *Geography*, a territory on the Abyssinian coast of the Arabian gulf, near the straits of Babelmandeb, which has been, from time immemorial, the mart of frankincense, myrrh, and balsam. Behind Saba, upon the Indian ocean, is the “*Regio Cinnamonifera*,” where a considerable quantity of that wild cinnamon grows, which the Italian druggists call “*canella*.” Azab, or Saba, was formerly a principal station of the caravans, which traded to Arabia. It lies in N. lat. 13° 5'. E. long. 43° 5'. and though it is not a port, it affords a very tolerable road, where is very safe riding, under the shelter of a low desert island, called “*Crab Island*,” with a few rocks at the end of it. The people, however, says Mr. Bruce, are Galla, the most treacherous and villainous wretches upon the earth. They are “*Shepherds*,” who sometimes resort to the coasts in great numbers, and sometimes traverse the hinder part of the hills that run close along the shore, and occupy miserable villages composed of huts, that run nearly in an east and west direction from Azab to Raheeta, the largest of all their villages. At Azab may be had plenty of water, sheep, and goats, and also some myrrh and incense at the proper season. But no confidence is to be had in the people. Those of Mocha, who are absolutely necessary to them in their commercial transactions, cannot trust them without surety or hostages. Near Azab there are large ruins, which seem to indicate its former magnitude and importance. There is especially an aqueduct, which, in remote times, furnished a very considerable supply of water from a fountain in the mountains, which must have greatly contributed to the beauty, health, and pleasure of the place. This is constructed with large massy blocks of marble, brought from the neighbouring mountains, placed upon one another without lime or cement, but joined with thick cramps, or bars of brass. There is likewise a number of wells, not six feet wide, composed of pieces of marble hewn to parts of a circle, and joined with similar bars of brass. This circumstance is somewhat surprising, as we are informed by Agatharcides (p. 60.), that the Alileans and Cassandrians, in the southern parts of Arabia, just opposite to Azab, had among them gold in such plenty, that they would give double the weight of gold for iron, triple its weight for brass, and ten times its weight for silver; and that in digging the earth, pieces of gold were found as big as olive-stones, and some much larger. However this be, the inhabitants of the continent, and of the peninsula of Arabia opposite to it, agree, that this was the royal seat of the queen of Saba, famous in ecclesiastical history for her journey to Jerusalem; that these works belonged to her, and were erected at the place of her residence; and that all the gold, silver, and perfumes came from her kingdom of Sofala, which was Ophir, and which reached from thence to Azab, upon the borders of the Red Sea, along the coast of the Indian ocean. See *ABYSSINIA*.

The ruins at Azab, as well as those at Axum (See *AXUM*), appear to be those of public buildings, and not of private dwellings; and from this circumstance it has been inferred, that these were not cities of constant residence, but rather places of resort, where the adventurous traders and their attendants lived, as usual, in their tents, but where their religious rites were celebrated with the greatest solemnity, and in a manner becoming the dispositions of men, who ventured in expeditions across the deserts, far more difficult and dangerous than across the Atlantic; whence, we may also imagine, was derived the great influence, or rather power, of the order of priests, who perhaps were the only constant inhabitants of these spots, which they wished

wished to be considered as the favourite abodes of their divinities. It appears, however, from the best authorities, that Meröe, Axum, and Azab, were places that had a common origin, and were most probably, as we have already observed, the principal stations of the caravans that traded to Arabia, while Thebes and Ammonium continued the communication toward Carthage. Whether from Azab there was an intercourse with the Ethiopians of the more southern parts of Africa, toward cape Gardafan, and the present Zaquebar, is a question that deserves particular investigation. On this subject, see professor Heeren's "Ideen über die Politik, &c." or "Ideas on the Policy, Intercourse, and Commerce, of the principal Nations of Antiquity." Gottingen, 1793.

AZAB, in the *Military Order of the Turks*, signifies a particular body of the soldiery taken in, or added first to the janizaries, but now become a separate body from them.

The word, in the Oriental languages, signifies an unmarried person, and the original order of these was, that they should be single men.

The azabs in Egypt have been great rivals to the janizaries, and sometimes they have got the better. Their institution and officers are the same with those of the janizaries; but with this difference, that from odobashees they are made serbajees, and from that office ejas, and come into the divan. On the contrary, among the janizaries, when any one is made a serbajee, it is laying him aside, and he is no farther advanced. Pococke's Egypt.

AZABE-KABERI, from *kaber*, *sepulchre*, and *azab*, *torment*, denotes a temporary punishment, which, as the Mahometans say, the wicked must suffer after death. Their crimes are hereby expiated, and Mahomet opens the gate of paradise to all who believe in him.

AZADARICHTA, in *Botany*. See MELIA.

AZADKAR, in *Geography*, a large town of Persia, called also *Teuin*, and placed by Tavernier in an extensive plain, watered by 400 subterranean canals.

AZAGARIUM, in *Ancient Geography*, a town of the European Sarmatia, in the vicinity of the Borysthenes. Ptolemy.

AZAGRA, in *Geography*, a town of Spain, in Navarre, on the Ebro; two leagues from Calahorra.

AZAIZY, a poor and inconsiderable tribe of Arabs, inhabiting a village of Egypt, called Bir Ambar, between the Nile and the Red Sea, about N. lat. 26°, and E. long. 33°; who subsist by letting out their cattle for hire to the caravans that go to Cossair. The village probably derived its name Bir Ambar, or the well of spices, from its having been formerly a station of the caravans from the Red Sea, loaded with this kind of merchandise from India. The habitations of the Azaizy are constructed of potter's clay, in one piece, in shape of a bee-hive: the largest not above ten feet high, and the greatest diameter six. Bruce's Trav. vol. i. p. 170.

AZALEA, in *Botany*, (*ἄζαλον*, *dry*; from its growing in a dry soil.) Lin. g. 212. Schreb. 277. Gaertn. 63. Juss. 158. Class, *pentandria monogynia*. Nat. Order, *Licnides* — *Rhododendria*, Juss. Gen. Char. Cal. perianth five-parted, acute, erect, small, coloured, permanent. Cor. monopetalous, bell-shaped, semiquadrifid; the files of the divisions bent in. Stam. filaments five, filiform, inserted into the receptacle, free; anthers simple. Pyl. germ roundish; style filiform, the length of the corolla, permanent; stigma obtuse. Per. capsule roundish, five-celled, five-valved. Seds many, roundish. Obs. In some species the corolla is funnel-shaped.

Ess. Gen. Char. Cor. bell-shaped; stamina inserted into the receptacle; capsule five-celled.

Species, 1. *A. pontica*, Pontic azalea. "Leaves shining, lanceolate, smooth on both sides, racemes terminal." This species much resembles rhododendron ponticum; but its flowers are yellow, its leaves smaller, ovate and ciliate. A native of Pontus. 2. *A. indica*, Indian Azalea. Thunb. Jap. 84. "Flowers sub-solitary; calyxes hairy." A shrub, three feet high, with a rough cinereous-brown bark. Branches short, twisted, irregular. Leaves stiff, villose, close, ever-green. Flowers cover the whole upper part of the shrub, and are of a beautiful bright red colour. A native of the East Indies. It is much cultivated in Japan for the elegance of its flowers, and variety in their size and colours. 3. *A. nudiflora*, naked-flowered azalea. The varieties are as follow: *A. coccinea*, deep scarlet azalea, Curt. Mag. 180. *A. rutilans*, deep red azalea. "Calyxes minute." *A. carnea*, pale red azalea. "Tube red at the base, calyxes leafy." *A. alba*, early white azalea. "Calyxes of a middling length." *A. bicolor*, red and white azalea. "Limb of the corolla pale; tube red; calyx small; branchlets hairy." *A. papilionacea*, variegated azalea. "Corolla red, the lowest segment white; calyxes leafy." *A. partita*, downy azalea. "Corolla pale red, divided to the base into five parts." Sp. Char. "Leaves ovate, corollas hairy, stamens very long." In its native country this frequently exceeds fourteen feet in height, but in England, we never see it half this height. Several stems arise from the root. Leaves oblong, smooth, alternate, stalked. Peduncles axillary, long, naked, supporting a cluster of red flowers, which are tubulous, and swelling at the base, like those of the hyacinth, and contracted at the neck; they are divided at the top into five unequal segments, which spread open. The filaments and styles are much longer than the petals, and stand erect. A native of North America; and introduced here by Peter Collinson, esquire, in 1734. 4. *A. viscosa*, viscid azalea. "Leaves scabrous at the edge; corollas with glutinous hairs." Its varieties are, *A. odorata*, common white azalea. "Branches diffusid; leaves deep green, shining." *A. vittata*, white-striped flowered azalea. "Corolla white, with pale red keels; styles elongated; red at the end; leaves pale, ovate, oblong." *A. fissa*, narrow-petalled white azalea. "Corolla divided to the very base; leaves deep green, shining." *A. floribunda*, cluster-flowered white azalea. "Styles longer than the corolla; leaves glaucous underneath." *A. glauca*, glaucous azalea. "Corolla white; leaves glaucous on both sides, the younger with feathered hairs on the upper surface." This shrub rises with several stems near four feet high. Leaves spear-shaped, narrow at the base, beset at the edges with short rough teeth, and stand in clusters at the ends of the shoots. Flowers in clusters at the extremities of the branches, white, with a mixture of dirty yellow on the outside; tube an inch long; the two upper segments at the top reflex; the two side ones bent inwards; and the lower one turned downwards. These flowers have the appearance of those of honey-suckle, and are as agreeably scented; they appear in July. This is nearly allied to the foregoing; but does not flower till after the leaves are expanded. It is a native of North America, and was introduced here by P. Collinson, esquire. 5. *A. japonica*, Lapland azalea. "Leaves with excavated dots sprinkled over them." A shrub six or seven inches high. It is to be distinguished from rhododendron dauricum only by its having five stamens, whereas that has ten. 6. *A. procumbens*, trailing azalea. Flor. Lapp. ed. 2. 60. t. 6. Eng. Bot. vol. 13. Hudf. 88. With. 230. Lightf. 139. Flor. Pan. t. 9. "Branches procumbent, diffuse; leaves opposite, revolute, very smooth." Stem woody, much branched; branches leafy, round, smooth; leaves opposite, stalked, spread much, elliptic, obtuse, revolute, entire, smooth; petals

tiolcs channelled, ciliate; peduncles in pairs, commonly one-flowered, reddish, with bractes at the base; flowers erect, of a deep rose colour, bell-shaped, regular; capsule subrotund-ovate, acute, five-celled, margins of the valves inflex. It grows on most of the high mountains of Scotland. 7. *A. punctata*, dotted azalea. Lour. Cochin. 113. "Leaves rugged about the edge; flowers dotted, heaped." Five feet high, erect, branched; leaves lanceolate, entire, smooth, alternate; corolla white; calyx whitish, dotted with red, as are also the corollas, anthers, and germ. A native of the woods of Cochinchina.

Propagation and Culture. 1, 2. the Pontic and Indian species have not yet been cultivated in Europe. 3, 4. grow naturally in shade, and in moist ground; many of the plants have been sent of late years from North America to England, and produced beautiful flowers in this country. They must have a moist soil and shady situation; and can only be propagated by shoots from their roots, or by laying down their branches, for they do not produce seeds here. When any of them are laid down, it should be only the young shoots of the same year, for the old branches will not put out roots. The best time for this is at Michaelmas, and if they are covered with some old tan, to keep out the frost, it will be of use to them. The autumn is the best time to remove the plants, but the ground about the roots should be covered in winter; a practice necessary for the old plants to preserve them in vigour, and cause them to flower well. 5, 6. are low plants, of little beauty, and will only thrive on boggy ground upon mountains. See Martyn's Miller's Dict.

AZAMA, in *Ancient Geography*, a town of Africa, placed by Ptolemy fifteen days journey distant from Carthage bay; south-east of Cirta. It is supposed to be the present *Zamora*.

AZAMBUJA, in *Geography*, a small town of Portugal, containing from seven to eight hundred houses, seated in a well-cultivated plain, on the banks of the Tagus, not far from Lisbon.

AZAMOGLANS. See AGENOGLANS.

AZAMOR, in *Geography*, a small sea-port town of Africa, in the kingdom of Morocco, and province of Duquella. It is seated on the river Morbeya, at some distance from its mouth. This town is not adapted to maritime commerce, because the entrance of the river is dangerous. It was unsuccessfully besieged by the Portuguese in 1508; but taken in 1513 by the duke of Braganza, and abandoned about the end of the sixteenth century. At a little distance from Azamor, facing a spacious bay, are the ruins of the ancient city of Titus, supposed by Chenier (Present State, &c. of Morocco, vol. i. p. 37.) to have been one of the cities founded by order of the senate of Carthage. Near the same place are the ruins of Almedina, a town built by the Moors. The cape of Azamor stretches out to the west. See MAZAGAN. N. lat. 33° 20'. W. long. 8° 20'.

AZAMORA, in *Ancient Geography*, a strong place of the Lesser Armenia, in Cataonia. Strabo.

AZANAGHIS, in *Geography*, a people on the coast of Africa, near cape Blanco. They inhabit the adjacent deserts, and are not far from the Arabs of Hoden. Their food is dates, barley, and the milk of their camels. They acknowledge no master, but the more wealthy among them are treated with some tokens of respect. Their general character is that of being perfidious and fraudulent; they are poor and wretched, and live in hordes dispersed in several places along the coast.

AZANI, in *Ancient Geography*, a people of Asia, in Phrygia, to which they were annexed. Strabo.

AZANIA, one of the three grand divisions of Arcadia,

according to Strabo. Steph. Byz. says, that it contained seventeen towns.—Also, a part of the maritime coast of Ethiopia, Pliny.

AZANITIS, a country of Asia Minor, in Phrygia, in which was the source of the river Rhyndacus. Strabo.

AZAOTON, or AZOAL, a sandy desert of Africa, in Libya, almost destitute of water, and which is traversed by the compass, like the sea.

AZAPES. See ASAPPES.

AZAR, in *Ancient Geography*, a mountain in Egypt. Ptolemy.

AZAR, in *Geography*, a town of Arabia, seventy-six miles south-east of Amanzimifdin.

AZARA, in *Ancient Geography*, a town of Asia, in Armenia Major, seated on the river Araxes. Strabo.—Also, an ancient town of Asiatic Sarmatia. Ptolemy.—Also, a temple of Diana, in Assyria. Strabo.

AZARABA, a town of Asia, in Sarmatia. Ptolemy.

AZARECAH, or AZARAKITES, in *History*, the denomination of a sect of heretical Mussulmans, so called from Nafe Ebn al Azarak their founder, who acknowledged no power or government, temporal or spiritual. They consisted of a combination or assemblage of all who rejected and opposed the Mahometan faith; they were sworn enemies of the house of Ommyyah; and committed dreadful ravages in all the Moslem territories through which they passed. In the sixty-eighth year of the Hegira, they made an irruption into Irak, and carried their barbarous excesses to such a height, that they murdered all persons whom they met with, ripped open women with child, and committed every species of cruelty that could be invented on people of every description, without discrimination. During this period their founder died, and was succeeded by Katri Ebn al Fojat, under whose conduct they continued their depredations. Musab, the governor of Mosul and Mesopotamia, sent a body of troops against them, commanded by Omar Ebn Abdallah Tenimi, who completely routed them at Naisiabor, in Chorasan, slew many of them, and pursued the rest as far as Ispahan and the province of Kerman. See MAHOMETANS.

AZAREDO, in *Geography*, a sea-port town of South America, in the bay of Spinto Santo, on the coast of Brasil. This is a famous port for sugar. S. lat. 20° 18' W. long. 40° 10'.

AZARIAH, or UZZIAH, in *Biography*, one of the kings of Judah, succeeded his father Amaziah in the year 809 before Christ. The early part of his reign, in which he was pious and virtuous, was prosperous and happy; and he obtained great advantages over the Philistines, Ammonites, and Arabians. He was devoted to agriculture, though he had a standing army of 307,500 men, with large magazines, well furnished with arms both offensive and defensive; he employed many husbandmen in the plains, vine-dressers in the mountains, and shepherds in the vallies. Towards the close of his life, and of his reign, which lasted fifty-two years, he became an idolater, died of a leprosy, and was buried, not in the royal sepulchre, but in an adjacent field. 2 Kings, xv. 2 Chron. xxvi. There are many high-priests and others, mentioned in scripture, and in the Jewish history, who bore the name of Azariah.

AZARIAS, a learned Italian rabbi, lived in the sixteenth century, and published at Mantua, in 1574, a Hebrew treatise, intitled, "Meor en Ajim," or "The light of the eyes;" in which are discussed, with considerable learning and knowledge of the Christian scriptures, several points of chronology and criticism. The work contains a Hebrew translation of the book of Aristotle on the LXX. Nouv. Dict. Histor.

AZAROLUS, or AZAROLE, in *Botany*. See CRATÆGUS. AZARUM,

AZARUM, a small, dry, blackish, stringy, medicinal root, much used in France as a specific for the frenzy in horses. The azarum, called also *radix sylvestris*, grows in the Levant, Canada, and about Lyons in France. The first is reputed the best. It is given in powder, from the quantity of an ounce to two.

AZATA, in *Ancient Geography*, a town of Asia, in Media. Ptolemy.

AZATHA, a town of Asia, in Armenia Major. Ptol.

AZAY LE FERON, in *Geography*, a town of France, in the department of the Indre, and chief place of a canton in the district of Châtillon sur Indre; nine miles S. S. E. of Châtillon.

AZAY le Richau, a town of France, in the department of the Indre and Loire, and chief place of a canton in the district of Chinon, four leagues south-west of Tours, and four north-east of Chinon.

AZAZEL, in *Jeruzsb Antiquity*. See SCAPT-GOAT.

AZED, in the *Materia Medica*, a name given by the Arabian writers to a kind of camphor, which they make the third in value, placing it after the *alcajzari* and *abrizgi*. The first of these was the finest of all the kinds of camphor, and was collected tolerably pure from the tree, as it grew in Causur, the place whence it was named. The *abrizgi* was the same camphor, rendered yet more pure by sublimation; this was a discovery of one of the kings of that country, and the camphor was named from him. The third kind, or *azed*, was the same with what we now receive from the Indies, under the name of crude or rough camphor. The word *azed* signifies only *large*, and was used to express the camphor formed into such large cakes, as it is also at this time. Avicenna says, this camphor was gross, of a dusky colour, and much less bright and pellucid than the other kinds. See CAMPHOR.

AZEDARACH, in *Botany*. See MELIA.

AZEKAH, or **AZECHA**, in *Ancient Geography*, a city of Judæa, strong both by situation and its walls; in the tribe of Judah, and seated in the same north-west corner with Iebna and Makkedah, in the valley of Terbinth, where David slew Goliath. Josh. xv. 35. 1 Sam. xvii. 1. Eusebius and St. Jerom inform us, that, in their time, there was a city of this name between Jerusalem and Eleutheropolis.

AZELFOGE, in *Astronomy*, a fixed star of the second magnitude, in the tail of Cygnus.

AZEM, in *Geography*. See ASAM, and ASSEN.

AZARAILLES, a town of France, in the department of the Meurte, and chief place of a canton in the district of Luneville, three leagues south-east of Luneville.

AZETENE, sometimes called *Anzitené*, in *Ancient Geography*, a country of Asia, in Armenia Major, between the sources of the Tigris and Euphrates, to the south of Saphena. Ptolemy.

AZEVEDO, **IGNATIUS**, in *Biography*, a Portuguese Jesuit, was born at Oporto, in 1527, and resigning an ample fortune of which he was heir to a younger brother, he devoted himself to religion in the society of the Jesuits at Coimbra. In process of time he became a missionary, and was deputed as such to the Indies and Brazil, under the title of procurator-general for those countries. Having given an account of his first voyage to the general at Rome, he set out on a second mission with a great number of attendants; but whilst the ship was sailing, in 1570, towards the island of Palma, it was taken by corsairs, and all the missionaries were put to death. On this account, Azevedo and his thirty-nine companions have been honoured as martyrs in the church of Rome; and the history of their mission and martyrdom was published by Beauvais, a Jesuit, in 1744. Moreri.

AZEYTAO, in *Geography*, a small town of Portugal, in

Elremadura, consisting of 552 houses, and 2242 inhabitants. It has a manufactory of cottons, and is one of a considerable trade in wine, &c. of, for which its situation, between the two harbours of Lagos and St. Ube, is convenient.

AZIALCOULLER, a town of Spain, in the country of Seville, about an indistinct west of Seville.

AZIBINTA, in *Ancient Geography*, an island of the Mediterranean. Ptolemy.

AZILAR, in *Geography*, a town of Africæ Turkey, in the road between Constantople and Tebrat.

AZILLIS, a town of France, in the department of the Aude, and chief place of a canton in the district of Carcassonne; thirty miles E. N. E. of Carcassonne. N. lat. 43° 15'. E. long. 2° 33'.

AZINGUR, a town of Hindostan, in the country of Aihahind; 108 miles W. N. W. of Panna, and 50 north of Benares.

AZIMUS, or **AZIMUNTUM**, in *Ancient Geography*, a small city of Thrace, on the Thracian borders. This city, scarcely mentioned by geographers, has been distinguished in the annals of history by the moral spirit of its citizens, and their daring exploits against the innumerable host of the northern barbarians. Instead of tamely expecting their approach, the Azimuntines attacked, in frequent and successful sallies, the troops of the Huns, rescued from their hands the spoil of the captives, and recruited their combat force by the voluntary affluence of fugitives and deserters. After the treaty of peace between Attila and the eastern empire, A. D. 446, the Barbarian conqueror still menaced the empire with implacable war, unless the Azimuntines were persuaded, or compelled, to comply with the humiliating conditions which their sovereign had accepted. Theodosius, demanding authority over a society of men who so bravely asserted their natural independence, the king of the Huns consented to negotiate an exchange with the citizens of Azim.

They demanded the restitution of some shepherds, who, with their cattle, had been accidentally surprised. After diligent, but fruitless inquiry, the Huns were obliged to swear, that they did not detain any prisoner belonging to the city, before they could recover two surviving countrymen, whom the Azimuntines had detained as pledges for the safety of their lost companions. Attila was satisfied, and deceived by their solemn asseveration, that the rest of the captives had been put to the sword; and that it was their constant practice immediately to dismiss the Romans and the deserters, who had obtained the security of the public faith. If the race of the Azimuntines, whether this dissimulation on their part be excused or condemned by political casuists, had been encouraged and multiplied, the Barbarians would have ceased to trample on the majesty of the empire. At a subsequent period, in the war of the emperor Maurice against the Avars, A. D. 595—602, the Azimuntines manifested a considerable degree of the invincible spirit of their ancestors. See Gibbon's Hist. vol. vi. p. 63, &c. vol. viii. p. 201, &c.

AZIMUTH, in *Astronomy. The azimuth of the sun, or of a star, is an arc of the horizon, comprehended between the meridian of the place, and any vertical circle passing through the sun or star; and it is equal to the angle at the zenith formed by the said meridian and vertical circle, which is measured by the fore-mentioned arc.*

The word is pure Arabic, which signifies the same thing. The azimuth is reckoned eastward in the morning, and westward in the afternoon; and it is usually estimated from the south, or from the north, as it is nearer to the one or to the other of those points. Thus if it be found by observation, that the vertical circle which passes through the zenith and a star intersects the horizon just in the midway between the

the east and the fourth, then the star's azimuth is said to be 45° eastward of the fourth. It is the complement of the eastern or western amplitude to a quadrant.

The azimuth is found trigonometrically, by this proportion; as radius is to the tangent of the latitude, so is the tangent of the sun's altitude to the cosine of the azimuth from the fourth at the time of the equinox. Otherwise, — suppose the latitude of the place, and the sun's declination to be given, and let it be required to find the sun's altitude and azimuth at 6 o'clock. E. G. Let London be the place in N. lat. 51° 32', and let his declination be 23° 28', as it is on the longest day; then to find his altitude and azimuth at 6 o'clock in the morning and evening, construct a figure in the following manner. Describe the meridian (Plate II. *Astronomy*, fig. 20.), draw the horizon HR, and prime vertical ZN; make RP = latitude 51° 32' N.; draw the 6 o'clock semicircle PS, the equator EQ, the 23° 28' N. parallel of declination *nm*, intersecting the 6 o'clock semicircle PS in \odot ; and through Z, \odot , N, describe the azimuth circle Z \odot N, intersecting the horizon in A; then the triangles Z \odot P and φ \odot A are supplemental triangles to one another. In the spherical triangle Z \odot P, right-angled at P, we have

Given the co-lat. ZP = 38° 28'
 the co-declin. \odot P = 66° 32'
 Required the co-altitude Z \odot
 the azimuth \angle Z \odot P.

Or, in the spherical triangle φ A \odot , right-angled at A,

Given the lat. A φ \odot = 51° 32'
 the declin. φ \odot = 23° 28'

Required the altitude A \odot
 the co-azimuth φ A
 To find the altitude A \odot .

As Radius	-	-	-	10.00000
To sin. declin. = 23° 28'	-	-	-	9.60012
So sin. lat. = 51° 32'	-	-	-	<u>9.89375</u>
To sin. alt. = 18° 10'	-	-	-	<u>9.49387</u>

To find the azimuth AR.

As Radius	-	-	-	10.00000
To Cot. lat. = 51° 32'	-	-	-	9.79383
So tang. declin. = 23° 28'	-	-	-	<u>9.63761</u>
To co. tang. azimuth = 74° 53'	-	-	-	<u>9.43144</u>

For the arc AR measures the \angle RZA, the azimuth.

On the shortest day at London the parallel of south declination cuts the 6 o'clock hour-circle below the horizon; and as the triangles φ A \odot and φ a \odot are congruous, the depression below the horizon, on the shortest day at 6 o'clock, will be equal to the altitude at the same hour on the longest day; and the azimuth will also be equal, if estimated from the fourth. Thus, on the 21st of June, the sun will bear N. 74° 53' E. at 6 o'clock in the morning, and N. 74° 53' W. at 6 in the evening; but on the 21st of December, at the same hours, it will bear S. 74° 53' E., and S. 74° 53' W. From this problem, it appears, that as the declination increases, the altitude increases and the azimuth lessens, and the contrary happens while the declination is decreasing; so that on the days of the equinoxes, when the sun has no declination, the altitude at 6 o'clock will be nothing, or the sun will be in the horizon; and the azimuth being then 90°, the sun will be due east in the morning, and west in the evening; that is, on the days of the equinoxes, the sun rises and sets at six, in the east and west points of the horizon.

Again, Given the latitude of a place, the sun's declina-

tion and altitude; required the hour from noon, and the sun's azimuth. E. G. In the latitude of 51° 32' N. the sun's altitude was observed to be 46° 20', when his declination was 23° 28' N.; what was the sun's azimuth, and the hour when the observation was made?

Let the primitive circle ZRNH (fig. 21.) represent the meridian of London, HR the horizon, and ZN the prime vertical; make RP = 51° 32' the height of the pole at London; draw the axis PS, and the equator EQ; lay off the declination En, Qm, 23° 28' N. the altitude Hr, Rr, 46° 20'; and describe the parallel of declination *nm*, and the parallel of altitude *rs*, intersecting one another in \odot , the place of the sun at that time; through Z, \odot , N, describe an azimuth circle Z \odot N, and through P, \odot , S, describe an hour circle P \odot S; then the angles \odot ZP, \odot PZ, being measured, will give the azimuth and hour from noon required; or, they may be computed in the following manner.

In the oblique-angled spherical triangle P \odot Z,
 Given the co-lat. ZP = 38° 28'
 the co-alt. or zenith distance Z \odot = 43° 40'
 the co-declin. or polar distance \odot P = 66° 32'
 Required the azimuth, \angle Z \odot P.
 and the hour from noon \angle \odot PZ.

To find the azimuth, or angle \odot ZP.

Here Z \odot = 43° 40'
 ZP = 38° 28'

\odot Z — ZP = 5° 12' = D.
 P \odot = 66° 32'

2)	71° 44'	35° 52'
	61° 20'	30° 40'

Then co-arith. sin. co-lat. = 38° 28'	-	0.20617
co-arith. sin. co-alt. = 43° 40'	-	0.16086
sin. $\frac{1}{2}$ sum. co-declin. and D = 35° 52'	-	9.76782
sin. $\frac{1}{2}$ diff. co-declin. and D = 30° 40'	-	<u>9.70761</u>

The sum of the four logs. - - - 19.84246

The $\frac{1}{2}$ sum gives 56° 31 $\frac{1}{2}$ ' - - - 9.92123
 And 56° 31 $\frac{1}{2}$ ' doubled gives 113° 3' for the azimuth sought, reckoning from the north.

To find the hour from noon, or \angle \odot PZ.

Here P \odot = 66° 32'
 PZ = 38° 28'

P \odot — PZ = 28° 4' = D
 \odot Z = 43° 40'

2)	71° 44'	35° 52'
	15° 36'	7° 48'

Then co-arith. sin. co-declin. = 66° 32'	-	0.03749
co-arith. sin. co-lat. = 38° 28'	-	0.20617
sin. $\frac{1}{2}$ sum. co-alt. and D = 35° 52'	-	1.76782
sin. $\frac{1}{2}$ diff. co-alt. and D = 7° 48'	-	<u>9.13263</u>

The sum of the four logs. - - - 19.14411

The $\frac{1}{2}$ sum gives 21° 55' - - - 9.57206

This 21° 55' doubled gives 43° 50' for the measure of the hour from noon, which is 2^h 55^m 20^s.

Hence it appears that the observation was made either at 9^h 4^m

5^h 4^m 40^s in the morning, or at 2^h 55^m 20^s in the afternoon.

The azimuth being first found, the hour from noon might have been found by the proportion between opposite sides and angles. If the declination and latitude had been of contrary names, the same kind of process would have served for finding the things required, except that the side $\odot P$ would have been obtuse; by adding the declination to 90° , instead of subtracting it, as in the case of the latitude and declination having like names.

To find the azimuth by the Globe, see **GLOBE**.

AZIMUTH, *Magnetical*, is an arc of the horizon contained between the azimuth circle of the celestial object, and the magnetical meridian; or it is the apparent distance of the object from the north or south point of the compass. This is found by observing the object with an azimuth compass, when it is about ten or fifteen degrees high, either in the forenoon or afternoon. See **COMPASS**.

AZIMUTH Compass, is an instrument used at sea for finding the sun's magnetical azimuth.

The description and use of the azimuth compass, see under *Azimuth* **COMPASS**.

AZIMUTH Dial, is a dial whose style or gnomon is at right angles to the plane of the horizon.

AZIMUTHS, called also *Vertical Circles*, are great circles of the sphere intersecting each other in the zenith and nadir, and cutting the horizon at right angles. The horizon being divided into 360° , there are usually reckoned 360 azimuths. The azimuths are represented by the rhombs on common sea-charts; and on the globe these circles are represented by the quadrant of altitude, when screwed in the zenith.

On these azimuths is reckoned the height of the stars, and of the sun, when he is not in the meridian; that is, the azimuths shew what distance these are from the horizon.

AZINCOURT, in *Geography*. See **AGINCOURT**.

AZIO, a town of European Turkey, in the province of Livadia, sixty-four miles north-east of Lepanto.

AZIRIS, in *Ancient Geography*, an ancient town of Armenia Minor. Ptol.—Also, a place of Africa, in Libya, where, as Herodotus says, the Cyrenæans established themselves.

AZIRISTUM, an agreeable place in Armenia Minor, over against Thera, surrounded by hills, and watered by a river. Herodotus.

AZIZUS, in *Mythology*, derived from the Syrian *aziz*, force, an epithet given to Mars, adored at Edessa. Bryant says (*Anal. Anc. Myth.* vol. i. p. 27.), that *Az* or *As* was one of the titles of the sun, and that *Azizus*, formed by a reduplication of the same term, denoted the deity of Edessa and Syria, and was the same as *Asis* and *Isis*, made feminine in Egypt, who was supposed to be the filer of *Osiris*, the sun.

AZMAVETH, **AZMOTH**, or **BETHESMOTH**, in *Ancient Geography*, a city probably in the tribe of Juda, adjacent to Jerusalem and Anathoth. Nehem. vii. 28. xii. 29.

AZMERE, in *Geography*. See **AGMERE**.

AZMON, in *Ancient Geography*. See **ASSEMEN**.

AZNALCAÇAR, in *Geography*, a town of Spain, in the province of Andalusia; seven leagues from Seville.

AZNOTH TAVOR, or **AZNOTH**, in *Ancient Geography*, is placed by Eusebius in the plain, not far from Damascus. Josh. xix. 34.

AZOCHIS, a town of Palestine, in Galilee. It was situated near Sephoris, and taken by Ptolemy.—Also, an ancient town of Asia, in Mesopotamia. Pliny.

AZOF, in *Geography*, a town and fortress on the Don, containing about 3800 inhabitants; distant from St. Petersburg 1998, and from Moscow 1268 versts. It is well known

that the Don is the Tanais of antiquity. Now, in this region, many ages ago, stood a town of the same name with the river, which had been built by the Greeks. Chardin pretends that Azof is situate fifteen Italian miles inland from the river; whereas the old town of Tanais is only three high miles distant from the river. What reason Chardin had for giving this statement, receiving one or the other, it is difficult to discover. Though we cannot absolutely prove that the town Tanais stood precisely on the site of the present Azof, yet it is manifest that it was in this district. The more ancient a town is, the more likely it is to have undergone considerable and frequent alterations; and the less reason there is for imagining that it stood exactly on the old primitive spot, of which Rome alone may afford an example. Concerning Tanais, however, Claudius Ptolemaeus affirms it to have been situate near the present Azof. For a hinting, as he does, the Don to be the boundary between Europe and Asia, he gives the town Tanais to the Asiatic division. Strabo likewise (p. 215, 340, ed. Casaub.), placing the town on the same side, at the same time informs us that it was built by the Bosphorians Greeks. Greece, in its earlier periods, was extremely populous; and some parts of it, from the nature of their soil, were not productive enough for the nourishment and support of their prolific inhabitants. Hence they were necessitated to construct numerous towns on the sea-coast and on several islands, in order to devise means for remedying so great a defect. The commerce, to which the sea gave them all necessary accommodations, furnished this people at the same time with other means of freeing themselves from poverty. For, at one time, particular towns, at another whole tribes, united to send colonies to different places out of Greece. These new settlers gradually formed colonies on the shores of Natolia, Sicily, the inferior parts of Italy, in France, and several other countries; so that the commerce of almost the whole world then known was imperceptibly drawn into their hands. In like manner they planted their colonies round the whole coast of the Euxine, where, on the coasts of the peninsula of the Crimea, Theodosia, Cherfon, Panticapæum, and other towns, became particularly famous.—At what time the town Tana, or the present Azof, fell into the possession of the Genoese, is not now to be ascertained. It may however be furnished, that they obtained it from the Polovtzes before the incursion of the Tartars, and therefore prior to the year 1237, as they would not have been able to cope with the Tartarian forces. The Genoese were still in possession of the Crimea, and at the same time of Tana or Azof, in 1474, though the Turks had conquered Constantinople in the year 1453. In 1637, Azof was captured from the Turks by the Kozaks; and in 1642, after being reduced to ashes, it was reconquered by the Turks. On the twenty-eighth of July 1696, it surrendered to the arms of tzar Peter the Great; who in 1711, in consequence of the unfortunate affair at the Pruth, restored it to the Turks at the treaty of Bender; from the Turks it was again captured by the Russians, in 1739; but by the treaty of Belgrade they were obliged to raise it to the foundations. It remained in an abandoned state during thirty years. But in the last war against the Turks, Catharine II. caused it to be re-edified, and it is now in the best state of defence. Coins of Azof have been found, bearing on them the name of khan Taktanysh.

Azof is situate in the government of Ekatarinoflav; which, belonging partly to Little Russia and partly to the Zaporogian Kozaks, till the year 1752, when it began to be occupied by colonists from all nations, was one continued waste steppe, entirely void of inhabitants, but has since proved a great acquisition to the industry and trade of the country, under the name of New Servia. The ecclesiastical affairs of the

the Russians are under the archbishop of Ekatarinoflaf and Chersonofotaurida; and in his absence under his vicar the bishop of Feodofia and Marupol. The other religious communions are governed by their own spiritual prefects.

AZOF. *Sea of,* called by the ancients Palus Mæotis, formerly by the Russians the Putrid sea, and in some maps Zabacke sea, is a gulf in the Euxine, to which it is joined by a strait. It is situate in the dominions of Russia. Long. 52° to 57° east Ferro; lat. 45° 20' to 47° 20' N. It is about 210 miles in length, and from 40 to 60 in breadth. It has six harbours: Taganrok, Mariupole, and the little fort of Petrosfk close to the shore, Azof. Nafhitshevan, and fort St. Dmitri near the mouth of the Don. Of all these, Taganrok has the greatest trade in exports; being next to that of Chersin in the Euxine. Azof at present is not by far of so much consequence as it formerly was, Russia having now so many harbours on the Turkish waters, and as that arm of the Don, on which Azof lies, is gradually filling with sand from year to year. The other harbours are for the most part of little significance as to foreign commerce. From Taganrok, in 1793, were exported bariron, tallow and tallow-candles, butter, wheat, and wheat-meal, linen, peltry, tow and cordage, wax and wax-candles, fish, caviar, leather, morsh bones and teeth, honey, soap, sailcloth, sheeps wool, &c. to the amount of 428,087 rubles. It is mostly inhabited by Armenians, who fled hither from the Crimea, in 1780; and at present contains several excellent manufactories of silk, cotton, &c. The amount of the exports from the other ports is not known; probably it is but small. The importation consists in raw and wrought silk and cotton, muslins, Turkish stuffs and carpets, wool and angora goats hair, Greek wines, oil, various kinds of fruit, tobacco and snuff, spices, saffron, opium, medicinal drugs, pearls, precious stones, gold and silver, &c. The whole northern coast of the sea of Azof, from the Don to Perekop, is laid out in fisheries, to which occupation these districts are extremely favourable. They fish with nets that have in the middle a conical bag, in which the fish assemble; and one single draught, which generally lasts only six hours, yields 60,000 fish; among which, however, are found but few sturgeons, shads, and other large kinds of fish. The salted and smoked mackerel, called by the Turks skumri, are an important article of trade in the Crimea, and are frequently sent from Feodofia and Balaklava to Constantinople, and to all the maritime towns of Natolia and Romelia. These fish are transported in barrels, and a thousand of them are sold on the spot for three and a half or four pialtres. Tooke's View of the Russian Empire, iii. 72.

AZOGA SHIPS, in *Commerce,* are those Spanish ships commonly called the *quick-silver ships,* from their carrying quicksilver to the Spanish West Indies, in order to extract the silver out of the mines in Peru and Mexico. But it is a great mistake to imagine that these ships are absolutely laded with quicksilver only; for though strictly speaking, they are to carry no goods unless on the king of Spain's account, they are usually full laden, notwithstanding this regulation, by reason that the merchants procure special licences of the king to load, upon paying a consideration for such licences.

AZONI, derived from the privative *α,* and *ζων,* *zone,* or *country,* in *Mythology,* a term anciently applied to such of the gods as were not the peculiar divinities of any particular country or people, but were acknowledged as gods in every country, and worshipped by every nation. See *God.*

These azoni were a degree above the visible and sensible gods, which were called *zoni,* who inhabited some particular part of the world, and never stirred out of the district or zone that was assigned them. Such in Egypt were Be-

rapis, Osiris, and Bacchus; and in Greece, the Sun, Mars, the Moon, and Pluto. They were called by the Romans *dii communes.*

AZOPHAGUS, from *α,* *ζων,* *animal,* and *φαγο,* *I eat,* in *Natural History,* a term used by authors to express such insects or animals as feed on herbs, never eating the flesh of any living creature.

AZOR, or *Azou,* in *Ancient Geography,* a town of the northern part of Palestine, to the south of Dan.

AZORES, in *Geography,* called also *Western Islands,* from their situation, and *Terceras* from the name of the principal island, are a group of islands lying in the Atlantic ocean, between 36° and 40° N. lat. and 25° and 33° W. long. Geographers have frequently classed them among the African islands; but they more properly belong to Europe, as they are about 13° distant from Cape St. Vincent, in Portugal, and about one degree more remote from the African shore. Besides, their latitude connects them more naturally with Europe than with Africa, and they were first peopled by Europeans. They are seven in number, viz. St. Michael, Sta. Maria, Tercera, Gratiofa, St. George, Pico, and Fayal, besides the smaller ones of Flores and Corvo, which lie at a considerable distance to the west, but as they all belong to the government of Portugal, they are all now included under the same general appellation. These isles were all discovered by the Portuguese, but the precise period is a subject of dispute. According to the account inscribed on his globe by the celebrated geographer Behaim, or Behem, they were discovered in 1431; but Murr says, that they were explored successively from 1432 to 1449. It is certain, however, that they were first discovered by the Portuguese, before the year 1449; and they are said to have given them the name of Azores, from *azor,* *a falcon,* on account of the number of goshawks, which were here remarkably tame, there being neither man nor quadruped to disturb them. In 1466, they were given by the king of Portugal to his sister the duchess of Burgundy. They were colonized by Flemings and Germans, among whom was Job de Huerter, the father-in-law of the geographer Behaim, and lord of Moikirchen, being driven from Flanders by war and famine. Huerter afterwards resided at Fayal, and appears to have had a grant of the arms from the duchess of Burgundy. Although the subsequent history of these islands is rather obscure, the Flemish inhabitants seem always to have acknowledged the king of Portugal. The Azores are discovered at a great distance from the sea, on account of a high mountain called the Pico, or Peak (see *Pico*), of a conical form, resembling the peak of Teneriffe. They are generally mountainous, and exposed to earthquakes and eruptions of volcanos, one of which occurred July 9th, 1757, when St. George's, Pico, and Fayal, which form a closer group than the others, being scarcely five leagues asunder, and Tercera, though at twice that distance from St. George's, were suddenly disturbed at the same instant, and shaken to their foundation by terrible convulsions of the earth. The first shock lasted two minutes. On this occasion the ocean overflowed, many persons lost their lives, and these islands were covered with ruins. The consequence of this dreadful convulsion of nature was the production of eighteen little islands, that rose insensibly from beneath the sea, at the distance of about ten yards from the north coast of St. George's. They disappeared in a few months, as those produced by the volcano of St. Michael had done before. It was observed, that Flores, Corvo, St. Michael, and St. Mary's, were not at all affected by this eruption of St. George's, and that Gratiofa suffered very little. They are subject also to violent winds, and the fury of the waves, which are frequently very injurious, by overflowing the low grounds, sweeping off whole fields

fields of grain and folds of cattle, breaking down their fences, and overwhelming their houses. Nevertheless they produce wheat, wine, fruits, and abundance of wood; and they have many quadrupeds both wild and tame. One of the latest accounts we have of these islands is that of Mr. Adanson, who visited them in 1753, on his return from Senegal; but it is to be regretted, that these interesting islands, like all the other Portuguese settlements, are almost unknown.

AZORIUM, or **AZORUS**, in *Ancient Geography*, a town of Greece, in Pelagonia Tripolitidis, according to Strabo and Livy. It was situated among the Perihæberians, at the confluence of two rivers which formed the river Curatius.

AZOT, in *Agriculture*, a substance which is only distinguishable in its different states of combination with other matters. Its effects on vegetation, when in the state of gas, are probably not yet fully ascertained. According to the observations of Humboldt and Scopoli, some sorts of plants when exposed in it soon droop and die, while others, as lichens, continue to increase and grow in a perfect manner.

AZOT, in *Chemistry*, is one of the most important of the substances hitherto considered as elementary, existing very abundantly in nature, forming the greater part of the atmosphere, the peculiar and almost characteristic ingredient of animal matter, the basis of the nitric acid, and one of the constituents of the volatile alkali.

Pure or uncombined azot is only known in the form of a gas; it is then synonymous with the *phlogificated air* of Scheele and Priestley, the *atmosphærical mephitic* of Lavoisier, and the *nitrogen gas* of Chaptal and some other French chemists.

It was by experiments on the various substances which alter, corrupt, and deteriorate common air, that the properties of azotic gas became first familiar to chemists. In all these, and in the direct *eulometrical* experiments, or such as decompose the air in order to ascertain its purity, it is the oxygen, together with the carbonic acid and other casual ingredients, which is subtracted by the chemical re-agents; whilst the azotic gas alone remains unaltered and unabsorbed. Hence, chemists had as first no other knowledge of azot than as a residue untouched in chemical operations, and its properties could only be described by negatives, till the important discoveries of the composition of nitric acid, of ammonia, and of animal matter, gave a new interest to azot as a chemical element.

Azotic gas may be obtained in various methods. In every eudiometric process, as we have just mentioned, the residue is azotic gas of greater or less purity. Thus, if phosphorus be burned in a confined quantity of common air, after the combustion has ceased, the residue is azotic gas in considerable purity, generally however holding some of the phosphorus in solution.

Another method of obtaining this gas, first employed by Scheele, is to moisten a quantity of iron filings and sulphur, inclose them in a glass vessel full of common air inverted over water, and in a few days by the absorption of all the oxygen of the air, the azotic gas will be left pure.

Another, and a very speedy method of procuring this gas in great purity, is by agitating common air in contact with a solution of sulphat of iron saturated with nitrous gas.

These methods, with the precautions to be observed, will be further noticed under the article **EUDIOMETRY**, in which it will be seen that the proportion of azotic gas in the atmosphere is, with little variation, about 73 per cent.

Azotic gas may also be readily procured in large quantities by the decomposition of animal matter by means of nitric acid.

If very dilute nitric acid be poured on any animal matter, particularly muscular flesh or the cornea of the eye, and a gentle heat be used, azotic gas is given out in great quantity. This experiment is one of a series of excellent observations on the vital MARRA made by Berthollet, which we have already noticed under that article. The azot in this case proceeds from the animal matter, and not from the acid.

In the decomposition of Ammonia by the cuprous salt acid, and in the reduction of ferrous metal oxides by this alkali, azotic gas is also given out in great purity.

In a single instance, as the gas may be said to be *generated*, for a very considerable quantity of the air rises up in bubbles through the springs of several of the natural fountains, such as those of Bath and Burton. The nature of the air thus obtained was first observed by Dr. Priestley.

Azotic gas is absolutely incapable of supporting combustion. When a lighted taper is dipped in a jar of this air, it becomes instantly extinguished without any noise or explosion. It is equally destructive to animal life (because its derivation, from z , and o , *deriving of life*); and the fatal effects to an animal immersed in it come on so speedily, that it has been thought by some to possess a positively noxious power independent of the mere absence of oxygen.

Azotic gas is somewhat lighter than common air. Its specific gravity, when obtained from common air by iron filings and sulphur, is stated by Kirwan to be 0.9712, or in the proportion of 975 : 1000 compared with atmospheric air. Lavoisier makes it only 0.95115, or to common air, as 942.6 : 1000.

With oxygen, azot forms a variety of combinations. That of atmospheric air has already been mentioned. A simple admixture of oxygen with a small proportion of azotic gas produces no particular effect, but when the combination is assisted by the electric spark, a true combustion of azot takes place, and the product is the **NITRIC ACID**. This beautiful discovery we owe to Mr. Cavendish.

When azot and hydrogen are mixed together, both in the gaseous form, no union appears to take place; but under different circumstances **AMMONIA** is produced.

Azotic gas, when heated with **CHARCOAL**, with **SULPHUR**, or with **PHOSPHORUS**, dissolves a small portion of these simple substances, and holds them in suspension for a considerable time.

Very little is known concerning the action of azot in its simple form upon metallic or saline substances; and in the state of gas, it appears to be more inactive and unwilling to enter into combination than any other substance in nature.

Azot has not hitherto been decomposed, so that it must be considered as a chemical element. Several attempts, however, have been made for this purpose, but none of them have proved satisfactory. The latest of these, which excited much attention in Germany, was that of Weigleb, a justly eminent chemist, an account of which he published in Crell's Annals for 1796. The chief experiment on which this philosopher grounds his theory of the composition of azot is the following: if an earthen tube of small diameter (the stem of a tobacco-pipe for instance), be heated quite red-hot, and the steam of water be sent through the tube in this state without any obvious connection with the external air, a considerable quantity of a gas is generated, which consists almost entirely of azotic gas, mixed with a small quantity of carbonic acid. Hence, this chemist would infer, that as nothing but water and heat are present, the azotic gas here produced is formed by the union of the vapour of water with caloric at a very high temperature. A second experiment is to pass the vapour of water over the oxyd of

manganese, enclosed in an earthen tube, and already heated for a considerable time, so as to expel all the oxygen which it will yield: in this case also, there will be a very considerable production of azotic gas. A third experiment is to pass the vapour of water through heated glass tubes, of no more than two lines in diameter, when azotic gas will be equally produced. The inference of the composition of azotic gas derived from these experiments, would be very legitimate, if no cause of error could be detected; but the society of Dutch chemists, who have enriched the science with so many valuable observations, on repeating the experiments, fully explained the reason of this singular phenomenon, in demonstrating the permeability of every kind of earthen-ware not glazed, when exposed to a considerable heat. Therefore in these experiments, the vapour of water in passing through the tube, is found partly to make its way through its pores into the surrounding coals; and at the same time the air circulating through the furnace, partly enters the tube, and is collected at the further extremity; and this air being vitiated by the burning fuel, is principally azotic gas, mixed with a certain portion of carbonic acid. This permeability of heated earthen-ware (which had been before observed by Dr. Priestley), should always be kept in mind by chemists; as many of the most important experiments of research are performed by the ingenious apparatus of a heated tube. With regard to the production of azotic gas, when the vapour of water was sent through a red-hot glass tube, it was fully ascertained by the above-mentioned chemists, that no gas of whatever kind appears whilst the tube remains perfect, but that the least crack or fissure is sufficient to give admittance to the air of the furnace with as much ease as the pores of the earthen tube. As an additional proof that the gas in these instances came from without, we may add, that on removing the fire from the earthen tube, and continuing the transmutation of the aqueous vapour, some gas still continued to be given out whilst it remained red-hot, and this latter portion was atmospheric air, or that which now surrounded the heated tube.

Several other circumstances relating to azotic gas, are connected with the theory of PHLOGISTON, to which we shall further refer the reader. Ann. de Chem. tom. 26 and 29.

AZOT, *Gaseous Oxid.* See NITROUS OXYD.

AZOTH, among the *Ancient Chemists*, signified the first matter of metals; or the mercury of the metal, more particularly that which they call the *mercury of the philosophers*, which they pretend to draw from all sorts of metallic bodies.

Paracelsus's azoth, which he boasted of as an universal remedy, is pretended to have been a preparation of gold, silver, and mercury: a quantity of this he is said to have always carried with him in the pommel of his sword.

AZOTUS, AZOTH, or ASHDOD, in *Ancient Geography*, one of the five Philistine satrapies, was a celebrated sea-port of Phœnicia, on the Mediterranean, situate about fourteen or fifteen miles south of Ekron or Accaron, between that and Ascalon, and about thirty miles distant from Gaza, towards Joppa. It fell at first to the lot of Judah, but continued for a considerable time in the hands of its ancient owners. It was in this city that the ark of God triumphed over the idol Dagon, which fell down and was crushed before it (1 Sam. v. 2); and it was to this place that Philip was conveyed, after he had baptized the Ethiopian eunuch. Acts, viii. 40. This place was fortified by the Egyptians as a barrier against the Assyrians; and it was so strong, if we may believe Herodotus, that it sustained a blockade and siege of twenty-nine years, under Psammethichus, king of Egypt, about 631 years before the Christian æra. It was

again re-established, but taken, and its fortresses and towers burned, by the Maccabees, in the year 137 B. C. Afterwards Gabinius, the Roman president of Syria, ordered it to be rebuilt. It was again captured by Vespasian, in the Jewish war, under the reign of Nero, A. D. 67. The ruins of that once famous city are now called "Ezdoud;" it is distinguished, says Volney (*Travels in Egypt and Syria*, vol. ii. p. 338.), at present by its scorpions, but exhibits no proofs of its ancient importance. Three leagues from Ezdoud, is the village of El-Majdal, where they spin the finest cottons in Palestine, which, however, are very coarse. This traveller reports, that the whole coast is daily accumulating sands, inasmuch, that many places which were known to be anciently sea-ports, are now 4 or 500 paces within land. Imperial Greek medals were struck at Azotus, in honour of Septimius Severus, and of Domitian.

AZPILCUETA, MARTIN, surnamed NAVARRE, in *Biography*, a Spanish lawyer, esteemed one of the most learned lawyers of his time, was born in 1494, at Verafoa near Pampeluna. He was successively professor of jurisprudence at Toulouse, Salamanca, and Coimbra, and consulted by persons from all parts as an oracle of law. When his friend Bartholomew Caranza, archbishop of Toledo, was summoned to Rome by the inquisition, on a charge of heresy, Aspilcueta, though eighty years of age, went thither to plead for him; and at this advanced age he retained his faculties in their full vigour. Such was his charity to the poor, that he seldom passed a beggar without giving him alms; and it is said, that the mule on which he usually rode would stop of its own accord when he saw a beggar. He died at Rome, in 1586, at the great age of ninety-two years. A collection of his works was printed at Lyons, in 6 volumes fol. in 1597; and at Venice, in 1602. Nouv. Dict. Histor.

AZRAIL, in the *Mahometan Theology*, the angel of death, whose office it is, according to the Mahometans (who relate many ridiculous stories concerning this angel), to separate the souls of men from their bodies.

AZTATL, in *Ornithology*, a name by which a kind of white heron is known in Mexico.

AZUA DE COMPOSTELLA, or AZUCA, in *Geography*, a sea-port town on the sea-coast of St. Domingo; twelve leagues S. S. E. of cape Salinas.

AZUAGA, a town of Spain, in the province of Estremadura; three leagues south-east of Llerana.

AZUIS, in *Ancient Geography*, an ancient town of Africa Propria. Ptolemy.

AZUMAR, in *Geography*, a town of Portugal, in the province of Alentejo.

AZUN, a valley in that part of the department of the Upper Pyrenées, formerly called Bigore, in France, distinguished by the number of its valuable mines, of silver, copper, iron, lead, and tin. Those that are already known amount to no fewer than twenty; but lead chiefly abounds throughout the whole of this mountainous country.

AZURE, the blue colour of the sky. See BLUE, CLOUD, and SKY.

AZURE, in *Heraldry*, signifies blue; in heraldic engravings it is expressed by horizontal lines.

AZURE. See ULTRAMARINE.

AZURE, or SMALT. See COBALT.

AZUREA, in *Entomology*, a species of PHRYGANEA, with black wings, violet behind. Linn. The lower wings are obliquely violet. It inhabits the north of Europe.

AZUREA, in *Zoology*, a species of LACERTA that inhabits Africa, and is distinguished by having the tail verticillated, short, with mucronated scales. Linn. Gmelin speaks of

two varieties of this creature; one, a native of Africa, is rather larger than the preceding, and is described under the name of *cordylus brasiliensis*; Laur. Amp.: the other has a deep chestnut coloured stripe on the shoulders.

The colour of this species in its natural state, Dr. Shaw imagines to be an elegant pale blue, fasciated on the body and tail with several transverse and somewhat alternate bands either of black, or very deep blue. The kind figured in the Gen. Zool. of that writer to illustrate the species, appears to be the second variety mentioned by Gmelin, having a dark band on the shoulders. Dr. Shaw observes that the head is rather obtuse; the body moderately thick, and covered as well as the limbs with very small smooth scales; and the tail on the contrary, which is of a moderate length, is very distinctly and strongly verticillated by rows of large carinated scales, the extremities of which project considerably so as to form so many shining points.

AZURENSIS, or AJURENSIS, in *Ancient Geography*, an episcopal see of Africa, in Numidia.

AZUREUS, in *Entomology*, a species of CARABUS, of an azure colour, with red legs and antennæ. Inhabits Leipsic. Fabricius.

AZUREUS, a species of CIMEX, of a middle size; dull green colour; and yellowish mouth and legs. This kind inhabits Guinea. *Olf.* The abdomen is yellowish, with black dots in the middle.

AZURIN, in *Ornithology*, a name assigned by Buffon Hist. Oif. to the species of TURDUS, since called specifically *cyanurus* by Gmelin, which see.

AZUROUX, a name given by Buffon to the *emberiza earulea* of Gmelin. See EMBERIZA CERULEA.

AZYGOS, in *Anatomy*, a vein arising out of the cava, otherwise called vena sine pari, because single, whence its name. See VEINS, *Description of the*.

AZYMITES, in *Ecclesiastical History*, Christians who communicate in bread not leavened or fermented. See AZYMUS. This appellation is given by Cœciliarius to those of the Latin church, upon his excommunicating them in the eleventh century. Du-Cange. The Armenians and Maronites also use azymus, or unleavened bread, in their office; on which account some Greeks call them azymites.

AZYMUS, composed of the privative α and ζυμω, *ferment*, something not fermented, or that is made without leaven.

The term azymus is much used in the disputes betwixt those of the Greek and Romish church; the latter of whom contend that the bread in the mass ought to be *azymus*, *unleavened*, in imitation of the paschal bread of the Jews, and of our Saviour, who instituted the sacrament on the day of

the passover; and the former strenuously maintaining the contrary, from tradition and the constant usage of the church. This dispute was not the occasion of the rupture between the Greek and Latin churches; Photius having broken with the popes 200 years before; though it is urged that before the time of Photius, A. D. 866, azymus was used in the Romish church; and that it was more generally used through the West, for which the authority of Alcuin, who died in 794, is alleged. St. Thomas, in 4 Sent. dist. 2. q. 11. art. 2. quæstion. 3. relates, that during the first ages of the church, none but unleavened bread was used in the eucharist, till such time as the Ebionites arose, who held that all the observances prescribed by Moses were still in force; upon which both the eastern and western churches took to the use of leavened bread; and, after the extinction of that heresy, the western church returned to the *azymus*; the eastern pertinaciously adhering to the former usage.

This account is controverted by father Sirmond, in a dissertation on the subject; wherein he shews, that the Latins had constantly communicated in leavened bread, till the tenth century, and cardinal Bona, *Rerum Liturgic. c. 23. p. 185.* greatly discredits what St. Thomas alleges.—In the council of Florence it was decreed, that the point lay at the discretion of the church; and that either leavened or unleavened bread might be used; the western church has preferred the latter.

AZZALUM, in the *Ancient Physiology*, a species of iron, reputed the most excellent of all, supposed to have been brought from India, whence it was called *Indicum*, but in reality, according to some, brought from China. Plin. Hist. Nat. lib. xxxiv. c. 14.

AZZO, PORTIUS, in *Biography*, an eminent Italian lawyer, who held the professorship of jurisprudence at Bologna, from the year 1190, till his death, which probably happened not long after 1220, and at this time the university was attended by 10,000 students. Such was his assiduity as a lecturer, that he said he never was ill but in the vacations. He was the author of a "Summary of the Code and the Institutes," which has passed through several editions. Of this work, Gravina says, (*De Orig. Jur. v. i. p. 93.*) that it is so ingenious and profound, that although written in a barbarous age, we cannot, with all our present erudition, be safely without it. One of his scholars collected the "Introduction to the Code" of this author, which has been printed; and several of his writings remain in manuscript. *Nouv. Dict. Histor.*

AZZOGLIO, in *Geography*, a town of Italy, in the principality of Masserano; six miles N. N. E. of Masserano.

B.

B

B A A

B, The second letter of our alphabet, and of most others.

This observation fails in the ancient Irish alphabet; where B is the first, and A the seventeenth; and in the Abyssinian, where A is the thirteenth.

B is the first consonant, and first mute, and in its pronunciation is supposed to resemble the bleating of a sheep; upon which account Pierius tells us, in his Hieroglyphics, that the Egyptians represented the sound of this letter by the figure of that animal.

B is also one of those letters which the eastern grammarians call *labial*, because the principal organs employed in its pronunciation are the lips. It has a near affinity with the other *labials* P and V, and is often used for P, both by the Armenians, and other orientals; as in *Betrus* for *Petrus*, *apfens* for *absens*, &c.; and by the Romans for V, as in *amabit* for *amarit*, *berna* for *verna*, &c. whence arose that jest of Aurelian on the emperor Bonofus, *Non ut vivat natus est, sed ut bibat*. See V.

The final B was also sometimes changed into L in the ancient languages, as *Beelzebul* for *Beelzebub*. Bochart (Hieroz. p. ii. l. iv. c. 9. p. 501.) and Grotius (in Matth. x. 25.), have given instances of such changes.

B and C, or the K of the Greeks, are often substituted for one another. Thus, the Greeks say, Βορβορυνη for Κορβορυνη; and the Latins *Bufo* for *Cufo*. B and D are also used interchangeably, as in *Bellum* and *Duellum*. See Quint. de Orat. c. 45.

Plutarch observes that the Macedonians changed Φ into B, and pronounced *Bilip*, *Berenice*, &c. for *Philip*, *Pbernice*, &c.; and that those of Delphos used B, instead of Π; as βεβαι for πειπει, βικρον for πικρον, &c. See P.—

The Æolians change the B into F, as Βαλαζον for Βαλαζον.

The modern Greeks call the *bea*, *vita*.

The Latins said *suppono*, *oppono*, for *subpono*, *obpono*, and pronounced *obtinuit*, though they wrote *obtinuit*, as Quintilian has observed. They also used B for F or Ph; thus in an ancient inscription mentioned by Gruter, OBRENDARIO is used for OFRENDARIO. See F, &c.

B requires an entire closure and pressure of the lips, and is pronounced by forcing them open with a strong breath. This letter also, if it pass through the nose, becomes an M; as appears by those who have the nostrils stopped by a cold or otherwise, when they endeavour to pronounce the letter M; for instance, *many men*, is by such a one sounded *bany ben*. See M.

With the ancients, B, as a numeral, stood for 300, as appears by this verse:

“Et B trecentum per se retinere videtur.”

When a line was drawn above it, \bar{B} , it stood for 3000: and with a kind of accent below it, for 200; but among the Greeks as well as Hebrews, this letter signified only 2.

B. F. in the preface to the Decrees, or Senatus-consulta of the old Romans, signified *bonum factum*. It is often found on medals, to mark the epocha or year.

B, in the chemical alphabet, denotes *mercury*, according to Raymond Lully.

B on some French coins denotes that they were struck at Rouen.

B is also used as a contraction for *Bachelor*; as B.A. *Bachelor of Arts*; B.L.L. and B.D. *bachelor of laws*, and *bachelor of divinity*.

B, in *Musick*, is a contraction of *B-mi*, the third sound of the Guido scale or gammut. B is the second line in the base; the third in the treble; and the note below the tenor or C clef, on whatever line it is placed. It likewise stands for basso, base, in vocal music; and in the instrumental tenor part, if C is placed before it in a score, thus, C. B. it implies *col basso*, meaning that the alto viola is to play with, or rather an octave above, the base. B. C. in old sonatas, implies *basso continuo*, or a constant accompaniment for the organ or harpsichord, figured for thorough-bass. *B-fa*, and *B-mi*, in the scale of Guido, imply B flat, and B natural.

B molle implies B b.

B quadro, B ♯.

If there are flats at the clef, they stand in the following order: $\bar{B}\bar{E}\bar{A}\bar{D}\bar{G}$. See GAMMUT, FLAT, SHARP, and NATURAL.

BA, in *Geography*, a town of Africa, in Ardrah, on the Slave coast. See ARDRAH.

BAADEN. See BADEN.

BAADSTED, BABSTED, or BATSTED, or BASTAD, a sea-port of Sweden, in South Gotland, with a bay, in which are several small ports; ten miles north of Engelholm. N. lat. 56° 28'. E. long. 12° 40'.

BAAI. BEL, or BELUS, denoting *Lord*, in *Ancient Mythology*, a divinity among several ancient nations, as the Canaanites, Phœnicians, Sidonians, Carthaginians, Babylonians, Chaldeans, and Assyrians.

The term *Baal*, which is itself an appellative, served at first to denote the true God, among those who adhered to the true religion. Accordingly the Phœnicians, being originally Canaanites, having once had, as well as the rest of their kindred, some notion of the true God, probably called him *Baal*, or *Lord*. But they, as well as other nations, gradually degenerating into idolatry, applied this appellation

pellation to their respective idols; and thus were introduced a variety of divinities under the denomination of Baal, called *Baalim*, or Baal, with some epithet annexed to it, as Baal-Berith, Baal-Gad, Baal-Moloch, Baal-Peor, Baal-Zebub, &c. Some have supposed that the descendants of Ham first worshipped the sun under the title of Baal (see 2 Kings, xxiii. 5. 11.), and that they afterwards ascribed it to the patriarch who was the head of their line; making the sun only an emblem of his influence or power. It is certain, however, that when the custom prevailed of deifying and worshipping those who were in any respect distinguished amongst mankind, the appellation of Baal was not restricted to the sun, but extended to those eminent persons who were deified, and who became objects of worship in different nations. The Phœnicians had several divinities of this kind, who were not intended to represent the sun. It is probable that Baal, Belus, or Bel, the great god of the Carthaginians, and also of the Sidonians, Babylonians, and Assyrians, who from the testimony of scripture appears to have been delighted with human sacrifices, was the Moloch of the Ammonites, the Chronus of the Greeks, who was the chief object of adoration in Italy, Crete, Cyprus, and Rhodes, and all other countries where divine honours were paid him, and the Saturn of the Latins. In process of time, many other deities, besides the principal or first mentioned, were distinguished by the title of Baal among the Phœnicians, particularly those of Tyre, and of course among the Carthaginians, and other nations. Such were Jupiter, Mars, Bacchus, and Apollo or the sun.

The term Baal, as we have already observed, denoted *God* or *Lord* among the orientals; and the *Zeus* of the Greeks had the same meaning. Servius (in *Æn.* l. i.) who is followed by Vossius (*Theol. Gent.* l. ii. c. 4.), observes, that Baal in the Punic language had two significations, either denoting Saturn, or being equivalent to the Latin *deus* or god. Accordingly, if Baal and Zeus, or Jupiter, be words of the same import in different languages, we may apply to the former what Varro, cited by Tertullian, says of the latter, that the number of those divinities who passed under this denomination amounted to 300. Some, however, are of opinion, that there were originally only two gods of the Phœnicians, and consequently of the Carthaginians; and that all the other deities were comprehended under two; viz. Baal and Ashtaroth, or Belus and Astarte. See Seld. de *Dicis Syr.* Synt. 2. c. 2. p. 145. Shuckford's *Connec.* b. v.

The temples and altars of Baal were generally placed on eminences; they were places inclosed with walls, wherein was maintained a perpetual fire; and some of them had statues or images, called in scripture "Chamanna." Naundrell, in his journey from Aleppo to Jerusalem, observed some remains of these inclosures in Syria. Baal had his prophets and his priests in great numbers; accordingly we read of 450 of them that were fed at the table of Jezebel only; and they conducted the worship of this deity, by offering sacrifices, by dancing round his altar with violent gesticulations and exclamations, by cutting their bodies with knives and lancets, and by raving and pretending to prophesy, as if they were possessed by some invisible power. Several of these practices, and particularly that of cutting the body, were, according to Mede (vol. ii. p. 774.), funeral rites, as appears from Lev. xxi. 5. xix. 28. Deut. xiv. 1. Jerem. xlviii. 37. xvi. 6.; and they were retained, says this learned author, in the funeral worship of those that were deified after their death. Hence, and from other circumstances, he infers, that Baal was a demon-god. See BAALIM, DÆMON, and IDOLATRY.

BAALBEC, in *Geography*. See BAUBEC.

BAAL-BERITH, in *Ancient Mythology*, derived from

baal, *sovereign*, and *berith*, *covenant*; a deity acknowledged under this title by the Carthaginians and Phœnicians in their alliances.

Jupiter was worshipped by these people under the denomination of Belus or Baal; to him they addressed their oaths, and they placed him at the head of their treaties. Hence some have not scrupled to affirm, that he was the Baal-Berith of the Phœnicians (see Banier, in *Mythol.* vol. i.); but Cumberland (see Saachoniatho's *Phœn. Hist.* p. 152.) supposes that Baal-Berith was Cronus, or Ham, worshipped anciently at Berytus. See *Judg.* viii. 33. ix. 4. According to Bryant (*Anal. Anc. Mythol.* vol. ii. p. 356.) the Baal-Berith of the Canaanites was no other than the Arkite god; with whose idolatry the Hæcrites in general were infected, soon after they were settled in the land of Canaan. (See BERYTUS.) The Greeks, however, had their *Zeu agæus*, or Jupiter, the witness and arbitrator of oaths; and the Latins their *Deus Fidus*, or Jupiter Pilius, whom they regarded as the god of honesty and integrity, and who presided at treaties and alliances.

BAAL-GAD, BAGAD, or BEGAD, an idol of the Syrians, whose name was composed of *baal*, *lord*, and *gad*, *chance* or *fortune*; the god of chance or fortune. After the god of thunder, the god of chance was one of the first worshipped by mankind. See *Phil. Trans.* vol. lvi. N^o. 2. an. 1766.

BAAL-GAD, in *Ancient Geography*, a city of Palestine, at the foot of mount Hermon, so called from the deity Baal-Gad, who was worshipped in this place. *Job.* xi. 17.

BAAL-HERMON. See BOWAT.

BAAL-HAZOR, a city of Ephraim, where Absalom kept his flocks; 2 *Sam.* xii. 23.

BAAL-HERMON, a town of Palestine, generally placed north of the tribe of Issachar. 1 *Chron.* v. 23.

The temple of Baal-Hermon in mount Libanus (*Judges*, iii. 1. 3.), was probably founded, says Bryant (*Anal. Anc. Mythol.* vol. ii. p. 163.), by the Cadmians, who formed one of the Hivite nations in these parts.

BAALIM, in *Ancient Mythology*, inferior deities among the Phœnicians.

The learned Joseph Mede (vol. ii. p. 776.) having suggested that Baal, or in the Chaldee dialect Bel, was the first king of Babel after Nimrod, and the first that was deified and reputed a god after his death, apprehends that this gave occasion for denominating all other demons Baalim. These Baalim, he conceives, were the deified souls of the dead. Bryant also (vol. ii. p. 529.) is of opinion that the most early defection to idolatry consisted in the worship of the sun, and that of demons, called Baalim. See DÆMON.

BAAL-MEON, in *Ancient Geography*, a city of Canaan, in the tribe of Reuben, taken by the Moabites, and possessed by them in the time of Ezekiel. *Numb.* xxxii. 38. 1 *Chron.* v. 8. *Ezek.* xxv. 9. Luthius and Jerem place it near Aïles from Eibus or Esbon, at the foot of mount Baara or Abarim.

BAAL-PEOR, or BAAI PEOR, in *Mythology*, an idol deity of the Moabites and Midianites, supposed by some to have been SATANUS, whose worship was conducted with great impurity; by others to have been ADONIS; and by others to have been SATURN, taken by this appellation in *Andr.* The learned Mede, supposing Peor to be the name of a mountain in Moab, upon which a temple of Baal was erected, concludes that Baal-Peor was only another name of Baal, derived from the situation of his temple; and to add no more, Seld. in (*De Dicis Syris*, Syntag. 1. c. 5.) foretells that Baal-Peor is Pluto, founding his conjecture on *Pl.* evi. 28. where it is said, "They joined themselves unto Baal-Peor, and ate the offerings of the dead." The sacrifices to which these words refer, says this author, were

offered to appease the manes of the dead. But these sacrifices or offerings of the dead may mean no more than the sacrifices or offerings made to idols, or false gods, who are properly called "The dead," in contradistinction to the true God, called in scripture "The living God."

BAAL-PERAZIM, in *Ancient Geography*, a place of Palestine, in the valley of Rephaim, not far from Jerusalem, where David put to flight the Philistines. 2 Sam. v. 20.

BAAL-SAMEN, or **BAAL-Shemaim**, according to the Hebrew mode of expression, q. d. *the Lord of heaven*, in *Mythology*, a deity of the Phœnicians, which was probably the sun, to whom they and the Carthaginians paid divine honours, addressing him with their arms extended. Belisama, or the queen of heaven, was the moon.

BAAL-TAMAR, in *Ancient Geography*, a place of Judæa, in the tribe of Benjamin, situate, according to Eusebius, near Gibeah, where the children of Israel engaged the tribe of Benjamin. Judg. xx. 33.

BAAL-TIS, in *Mythology*, a goddess among the Phœnicians, chiefly worshipped at Byblos; supposed by some to have been the same with the Diana of the Greeks.

BAAL-ZEBUB. See **BEELEZEBUB**.

BAAL-ZEPHON, or **BAAL-TSEPHON**, q. d. *the god or idol of the north*, in *Mythology*, a deity of the ancient Egyptians, so called, according to Dr. Shaw, (*Trav.* p. 309.) in contradistinction, perhaps, to others of the Lower Thebais, whose places of worship were to the south or east. But if Tzephon be derived from צפון, *to spy out, or observe*, then Baal-tzephon will probably signify the "god of the watch-tower," or "the guardian god," such as the Hermes or Terminus of the Romans, the Ερμης Οριος of the Greeks, &c. At the temple of this deity, according to the Jerusalem Targum, Pharaoh, when he was pursuing the Israelites in their exodus, offered sacrifice, waiting till the next day for an attack upon Israel, whom he believed his god had delivered into his hands; but, in the mean time, they passed the Red sea, and escaped.

BAAL-ZEPHON, in *Ancient Geography*, a place thought by some to be a city, opposite to Pihahiroth, where the Israelites encamped before they passed the Red sea. It was distinguished either by its northern situation, צפון, signifying the north, in Exod. xxvi. 20. Josh. viii. 11. and in other places of scripture; or by some watch-tower or idol temple that was erected upon it. Dr. Shaw supposes, that this place was at the eastern extremity of the mountains of Suez, or Attakah, the most conspicuous of these deserts; inasmuch as it overlooks a great part of the lower Thebais, as well as the wilderness that reaches towards, or which rather makes a part of, the land of the Philistines. Accordingly Migdol might lie to the south, and Baal-tzephon to the north of Pihahiroth. For the march of the Israelites from the edge of the wilderness being towards the sea, or the south-east, their encampment betwixt Migdol and the sea, or before Migdol, could not well have any other situation. See Exod. xiv. 2. xix. 2. 9. Numb. xxxiii. 7. Eusebius reports, from ancient traditions, that the Israelites passed at Clyfna, the Kolsoum of the Arabs, both of the terms signifying destruction, which was a very expressive appellation, if it was deduced from the destruction of the Egyptian army. The situation of Kolsoum, it has been said, is near Suez; and hence it has been thought, that Baal-tzephon was at Suez, though Pococke, Shaw, and Bruce, place it farther to the south. In support of this opinion it has been further alleged, that the appellation Baal-tzephon, the god of the north, implies, that the temple of this deity stood either on the northern extremity of the Red sea itself, or on the northern extremity of the gullet called Pihahiroth. "Baal-tzephon," says Bruce (*Travels*, vol. i. p. 233.) "was probably some

idol's temple, which served for a signal-house upon the cape which forms the north-entrance of the bay, opposite to Jibbel Attakah, where there is still a mosque, or saint's tomb. It was probably a light-house, for the direction of ships going to the bottom of the gulf, to prevent mistaking it for another foul bay, under the high land, where is also a tomb of a saint, called Abou Derage." See **PIHAHIROTH**.

BAAL'S RIVER, and **BAY**, in *Geography*, lie in West Greenland, between Bear Sound on the south-east, and Delft's Point on the north-west, and opposite to the mouth of Hudson's Strait.

BAAN, JOHN DE, in *Biography*, an eminent portrait-painter, was born at Haerlem, in 1633, and after receiving instructions in the art of painting from his uncle Pieman, pursued his studies with singular assiduity under Bakker, at Amsterdam. Having determined to form himself upon the model of Vandyck, his merit was soon universally known; and he was invited by Charles I. to London, where he painted the portraits of the king, queen, and chief nobility at court, and was much admired for the elegance of his attitudes, and also for his clean, natural, and lively tone of colouring. Upon his return to the Hague, he painted a noble portrait of the duke of Zell, for which he received a sum amounting nearly to 500l. The best of De Baan's performances is the portrait of prince Maurice of Nassau, in the execution of which he exerted the utmost efforts of his pencil. He died in 1702. Pilkington.

BAAN, Jacob de, the son of the former, was born at the Hague, in 1673; and having acquired eminence as a painter under the instruction and by the example of his father, he came over to England about the age of twenty, among the attendants of William III., where he was favourably received. From England, where he gained by his performances in portrait-painting distinguished reputation, he travelled through Tuscany to Rome, and he there devoted himself to the prosecution of his studies. However, though he gained a considerable sum of money by painting several portraits and conversations, during his residence at Rome, he squandered it away by various modes of profusion and expence. His premature death, at the age of twenty-seven, A. D. 1700, and the previous intermission of his assiduity, prevented his arriving at that excellence of which his talents were capable. Pilkington.

BAANITES, in *Ecclesiastical History*, the followers of Baanes, who adopted and diffused the Manichean notions in the ninth century, about the year 810.

BAAR, in *Geography*, a landgraviate of Germany, in the circle of Swabia, belonging to Furstenberg, situate to the east of Brisgau. The source of the Danube is in this territory.

BAARAS, **BAHARAS**, or **BACHARAS**, in *Botany*, an extraordinary kind of root, said to grow on mount Lebanon, in a valley called *Baaras*, whence the name, near the city Macheron.

By the account which Josephus gives of it, it seems to be a sort of vegetable phosphorus, for he represents it as of a flame colour, emitting rays of light in the night, and disappearing by day.

BAARIOU, in *Geography*, a river of Asia, in Kamtschatka, which runs in a valley between two mountains.

BAAT, in the language of the Siamese, answering to *ticul* in that of the Chinese, denotes a weight and coin current in those kingdoms. It weighs about half an ounce.

BABA, in *Biography*, a Turcoman impostor, and pretender to prophecy, who appeared among the Mahometans, in the city of Amasia in Natolia, in the year of the Hegira 638, A. D. 1240, and who seduced a great multitude of followers. One of his disciples, named Isaac, published his commission, and gained a number of adherents. Baba and Isaac concurred in commencing acts of hostility against all

all who would not adopt their profession of faith, viz. "There is but one God, and Baba is his apostle:" and they put several Mahometans and Christians, who resisted them, to death. At length, the Mahometans and Christians uniting together, raised an army, which entirely routed their followers, destroyed many of them, and took their two chiefs captives, who were afterwards beheaded; and thus their sect was totally annihilated. Herbelot. Bib. Orient. Sale's Koran. Introd. p. 187.

BABA, in *Geography*, a territory in the jurisdiction of Guayaquil, in South America, extending to the skirts of the Cordilleras, or the mountains of Anga Marca, belonging to the jurisdiction of Latacunga. Besides the principal town of the same name, at some distance from a river of the same appellation, there are two other places called San Lorenzo and Palenque, far from the capital, and near the Cordilleras, whose inhabitants are little civilized. The cacao-trees, which abound in this district, produce fruit twice in the year.

BABA, or *Temisvar*, a town of European Turkey, in Bulgaria, 64 miles east of Silitria.

BABA, *Cape*, a cape of Natolia, in Asia Minor, between the islands of Tenedos and Lesbos, and near the gulf of Adramytti, on the coast of the Archipelago. N. lat. 39° 33'. E. long. 26° 22'. It was formerly the promontory *Leucos*. A small town of the same name, situated to the east of the cape, on a sloping ground, has a small harbour for boats; and is famous in Turkey for the knife and sword blades which are manufactured there for the use of the orientals. It is peopled by Turks and Greeks; the adjacent soil is tolerably good, and furnishes the same productions as that of Troas. Olivier's Trav. vol. ii. p. 56.

BABA, in *Ornithology*, the Russian name of the PELICAN.

BABACHOKA, in *Geography*, one of the Bislagos islands.

BABAHYOY, a territory and town of the jurisdiction of Guayaquil, in South America. The town is the site of the grand custom-house, where account is taken of the various commodities that are conveyed to or from the Cordilleras and adjacent countries. Besides the principal town, this district contains Ujiba, Caracol, Quilea, and Mangaches; the two last border on the Cordilleras, and are at a considerable distance from Ujiba, where the priest resides during winter, and whence he removes to Babahoyo in the summer. The capital, besides its settled inhabitants, has always a great number of traders from other parts. This country, being level and low, is overflowed by the swellings of the rivers Caluma, Ujiba, and Caracol; so that at Babahoyo the water rises to the first story of the houses; and during winter it is entirely deserted. In this district cacao is abundant. It also produces cotton, rice, Guinea pepper, and a great variety of fruits. It has likewise large droves of black cattle, horses, and mules, which, in winter, are kept in the mountains, and in summer are removed to the low lands to feed on the gamalote, a plant so luxuriant as to cover the ground, and rising to the height of two and a half yards.

BABAIN, a town of Persia, in the province of Kerman, ninety miles south-east of Sergian.

BABAIN, a village or burgh of Egypt, built on the ruins of an ancient town, about six miles west of ACHMOUNAIN.

BAB-BAHA, one of the richest countries of Abyssinia, about twelve miles from the river Baha, and near the lake TZANA. This on the south, and Woggora on the north, are the two granaries that supply the rest of the kingdom. It contains a number of small villages; in which the queen and many of her relations have their houses and possessions. These villages are all surrounded with Kolquail trees, as large in the trunk as those of the province of Tigis, but

less beautiful, and furnished with fewer branches. Bruce's Travels, vol. iii. p. 504.

BABBI, GREGORIO, in *Biography*, a tenor singer in the Italian opera, with the sweetest, most flexible, and most powerful voice of its kind, that his country could boast at the time. He flourished from 1730 to 1740; never was in England; but we have seen the principal songs that were composed for him, and confessed with many good judges that heard him sing them, and have no doubt but that he was a dignified, splendid, and powerful performer.

BABBIN, in *Geography*, a town of Pomerania, in the island of Rugen, twelve miles north of Bergen.

BABBINI, MATTEO, in *Biography*, so named from being the scholar or imitator of Babbi, arrived in England in 1786, at the same time as Rubinelli. He had a tenor voice that was sweet, though not powerful, had an elegant and pleasing style of singing; but it was easy to imagine that his voice had been better; and not difficult to discover, though his taste was modern, and many of his *riffimenti* refined and judicious, that his graces were sometimes redundant, and his manner affected. His importance was very much diminished, when he sung with the Mara; and after the arrival of Rubinelli, he sunk into insignificance.

BABBUING, among *Hunters*, is when the hounds are too busy after they have found a good scent.

BABEL, WILLIAM, in *Biography*, organist of All-hallows, Bread-street, seems to have been the first, in this country at least, who thinned, simplified, and devised the music of keyed-instruments of the crowded and complicated harmony, with which, from the convenience of the clavier, and passion for full and elaborate music, it had been embarrassed from its earliest cultivation. This author acquired great celebrity by wire-drawing the favourite songs of the opera of Rinaldo, and others of the same period, into snowy and brilliant lessons, which, by mere rapidity of finger in playing single sounds, without the assistance of taste, expression, harmony, or modulation, enabled the performer to astonish ignorance, and acquire the reputation of a great player, at a small expence. There is no instrument so favourable to such frothy and unmeaning music as the harpsichord. Arpeggios, which lie under the fingers, and running up and down the scales of easy keys with velocity, are not difficult, on an instrument of which neither the tone nor tuning depends on the player; as neither his breath nor bow-hand is requisite to give existence or sweetness to its sounds. And Mr. Babel, by avoiding its chief difficulties of full harmony, and dissimilar motion of the parts, at once gratified idleness and vanity. We remember well, in the early part of our life, being duped to the glare and glitter of this kind ofinsel; this *pouffiere dans les yeux*, which Mr. Feiton continued, and other dealers in *notes*, et rien que des notes, till Jozzi, the singer, by his neat and elegant manner of executing the brilliant, graceful, and pleasing lessons of Alberti, rendered them the objects of imitation. At length, on the arrival of the late Mr. Bach, and construction of pianofortes in this country, the performers on keyed-instruments were obliged wholly to change their ground; and instead of surprising by the *seeming* labour and dexterity of execution, had the real and more useful difficulties of taste, expression, and light and shade, to encounter. Babel, who was one of his Majesty George the First's private music, died about the year 1722.

BABEL, in *Ancient Geography*, a city and tower built by Noah's posterity in the plain of Shinar, Gen. xi. 1—9. Its precise situation is not ascertained; nor is it of any great importance to determine it. It was within the province of Shinar, and probably the ancient Babylon was erected on or near its ruins. (See SHINAR, and BABYLON.) Some travellers

vellers, led by a tradition of the inhabitants, have judged a place about eight or nine miles to the west, or north-west of Bagdad, to be the tower of Babel. This is called the tower of Nimrod, and is conspicuous at a great distance, being insulated in an extensive plain between the Euphrates and Tigris, and resembling by its ruins a shapeless mountain more than a tower. Rauwolf supposes he found the ruins of Babylon upon the Euphrates, near Felusia, about 36 miles to the south-west of Bagdad; and Della Valle was directed, by another tradition, to seek it about two days journey lower, near an ancient city called Hella, seated on the same river. After all, there is no end of conjectures; the ruins described by many authors seeming to be rather the remains of some later structures raised by the Arabs, than those of the original tower of Babel. The time of this enterprise is generally allowed to have been before the birth of Peleg, about the year 2247 B.C. in the year of the flood 121 according to the Hebrew calculation; in the year 401, according to the Samaritan; and, according to the Septuagint, in 531. The persons concerned in this undertaking were, according to the history, the posterity of Noah; who journeying from the east, found the plain of Shinar, where they dwelt, and concurred in this enterprise. There is no reason, therefore, for excluding the family of Shem, as some have done, from any share in this memorable transaction. Bryant, however, maintains that Shem and his posterity had no concern in it; and that the chief agents were the sons of Chus, or Chuthites; and that they were the ancient Titans, or worshippers of fire. *Anc. Myth.* vol. iii. p. 31. 91. The motives which induced them all to unite and co-operate in the execution of this design have been differently assigned. Accordingly, the meaning of the passage which announces it, has been differently interpreted. It is as follows; "And they said, go to, let us build us a city and a tower, whose top may reach unto heaven; and let us make us a name, lest we be scattered abroad upon the face of the whole earth." Some have supposed, that they apprehended a second deluge, and in order to secure for themselves a refuge in case of danger, they determined to erect this lofty building. Others, who imagine, that if this had been their purpose, they should have selected an eminence, and not a plain, for the site of their proposed edifice, suppose that they engaged in this undertaking in order to prevent that separation and dispersion of which they had been previously admonished. The scripture, say these persons, expressly assigns the reason of their conduct, which was "to make for themselves a name," or establish a memorial of themselves, "lest they should be scattered;" or, as the words are otherwise rendered, "before they should be scattered abroad." Other interpreters allege, that the word *שֵׁן*, *shem*, should be translated "a sign," and not "a name;" and they render the passage "let us make us a sign, lest we be scattered;" and thus as Perizonius (*Orig. Babyl.* c. 10. p. 168. c. 11. p. 193. c. 12. p. 223.) explains it, the tower was to serve them as a beacon, or mark, by the sight of which, or of a signal from the top of it, they might avoid straying in the open plains with their flocks (the first men being shepherds), and be brought back again into the city, which they had built for a place of abode, as they were unwilling to be dispersed. As to the expression "of its top reaching unto heaven," it is a Hebrew phraseology, merely denoting its great height; and for this purpose we read of cities walled up to heaven. Some, however, have supposed, that the phrase was intended to denote the use to which this tower was to be appropriated, or that it was to be consecrated to the heavens, or to the worship of the sun, moon, and stars, of

the fire and air, and other natural powers, as deities; and as it indicated a tendency towards idolatry, the true God interposed to prevent a total and irreclaimable defection. Whatever was the design with which this edifice was constructed, Almighty God thought proper to restrain the execution of it (*Gen. xi. 6.*), by the confusion of language and dispersion which ensued. See *CONFUSION of Languages*, and *DISPERSION of Mankind*. From this confusion, the city and tower were denominated *Babel*. By altering in the word *Babel* the second *bel* into a *lamer*, the passage (*Gen. xi. 9.*) might be thus rendered, "the name of it was called Ballel, because there the Lord did *ballel*, that is, confound the lip of all the earth;" or thus, "the name of it was called *confusion*, because there did the Lord confound the lip of all the earth." Some have supposed, deviating indeed too far from the literal history (*viz.* Becharti *Oper.* t. i. p. 56.), that Moses did not mean any particular tower, but that he spoke in general of a turreted city, or a city with turrets on its walls. Such a city, compared with the caverns in which the first men unquestionably lodged, might well appear a tower with a heavenly or very elevated top, like the habitations of the Anakims: these being surmounted with natural rocks or peaks, and that with artificial elevations. See *Gen. xi. 4.* *Deut. i. 28.*

The materials of which this tower was constructed were, as the scripture informs us (*Gen. xi. 3.*), burnt bricks instead of stone, and slime instead of water. According to an eastern tradition, three years were employed in making and burning these bricks, and each of them was 13 cubits long, 10 broad, and 5 thick. The slime was of a pitchy substance, or bitumen, brought from a city in the neighbourhood of Babylon, called Is or Hit. Oriental writers, on whose report we can repose little confidence, pretend that the city was 313 fathoms in length, and 151 in breadth; that the walls were 5533 fathoms high, and 33 broad; and that the tower itself was no less than 10,000 fathoms or 12 miles high. St. Jerome affirms, from the testimony of eye-witnesses, who, as he says, had examined the remains of the tower, that it was four miles high. But it is needless to recant more of these fables. See *BABYLON*.

BABEL-MANDEB, sometimes called **BABEL-MANDEL**, in *Geography*, a narrow strait at the entrance into the Red sea, which connects it with the Indian ocean, lying between the south-western coast of Yemen or Arabia Felix, and the coast of Adal in Africa, and formed by the projecting land of Arabia on the east, and that of Abyssinia on the west. N. lat. 12° 5'. E. long. 43° 50'. The whole breadth of this strait is about 30 geographical miles; and within it, about a league from the coast of Yemen, is the small barren island of Perim, sometimes called Babel-mandel, which has a good port, but is without fresh water. This island is called by Arrian the isle of Diodorus. Near the African coast are several small islands, and on the continent is the town of Zeila, which is subject to the Imam of Yemen. Vessels that navigate this strait most commonly pass between the isle of Perim and Arabia, though the passage is narrow, on account of the number of small islands on the African coast. The currents are strong, and the swell high, so that it is difficult to pass without a fair wind; hence this navigation has been dreaded by the unskilful mariners of the adjoining countries. In ancient times the navigation of the Arabian gulf, which is even now slow and difficult, was considered by nations around it to be so extremely perilous, that it led them to give such names to several of its promontories, bays, and harbours, as convey a striking idea of the impression which the dread of this danger had made upon their imagination. Accordingly, the entry into the gulf, they called *Babel-mandeb*, which signifies *the gate or port* of

of *destruction*; to a harbour not far distant, they gave the name of *Mete*, or *death*; and an adjacent headland they called *Gardesfan*, or *the cape of Lurial*. Near this strait Ptolemy places a town, which he calls, in the Greek, *Mundath*, probably a corruption of *Mandeb*; and the same story on the south side of the strait, and the city upon a lake, which means the Hades, or Hell, by Ptolemy is *Red Sea*. A cluster of islands met with in the canal, after passing Mocha, is called *Jibbel Zakir*, or the islands of prayer for the remembrance of the dead. And in the same course up the gulf, others are called *Sebaat Gzier*, praise or glory be to God, as we may suppose, for the return from this dangerous navigation. Niebuhr and Bruce.

In the "Periplus of the Erythrean sea," by Dr. Vincent, the straits of *Babel-mandeb* are contracted to 23 miles, and divided into two channels, by the intervention of *Perim* and other isles; and they open in an easterly direction to *Cana* or *Cape Fartaque* on the Arabian side, and to *Aromata* or *Gardesfan* on the coast of Africa; which two promontories form the proper entrance to the straits from the Indian ocean, and are about 250 geographical miles asunder.

BABENHAUSEN, a town of Germany in the circle of Swabia, to which belongs a lordship of the counts of Fugger, seated on the *Gunz*; 26 miles W. S. W. of *Augsburgh*, and 16 S. E. of *Ulm*. N. lat. 48° 11'. E. long. 9° 16'.

BABENSKOI, a town of Russia, in the government of *Archangel*, 90 miles S. S. W. of *Kola*.

BABIA, a river of Russian Lapland, which runs into the *White sea*, six miles south of *Pialitza*.

BABIA, in *Mythology*, a goddess of Syria, worshipped particularly at *Damas*. She was supposed to be the goddess of youth, and to have been their *Venus*, who presided over love and marriage. Selden, de *Diis Syris*, Syntag. 11. c. 4.

BABIBA, in *Ancient Geography*, a town of Africa, in *Libya interior*, on the Western coast, between the rivers *Aradus* and *Stachir*.

BABJCA, in *Geography*, a town of Poland, in the Palatinate of *Minsk*, eight miles east of *Mozyr*.

BABIN, FRANCIS, in *Biography*, a theologian and canonist of France, was born at *Angers* in 1651, and elected professor of divinity, in the university of his native city. Here he read lectures to numerous classes for 20 years. In 1706, he was appointed by the bishop of *Angers* one of his grand vicars, and employed to collect and regulate the minutes of the conferences of the diocese. This work was published in 18 volumes 12mo, and is much esteemed for its method and style. In 1697, *Babin* published in 4to. a work, intitled, "A Narrative of what passed in the university of *Angers*, on the subject of *Jansenism* and *Cartesianism*." Louis XIV. allowed him a pension of 2000 livres, and appointed him to several lucrative and honourable offices, which he enjoyed till his death in 1734, at the age of 83. He retained his faculties to the last, and was often consulted on ecclesiastical questions and cases of conscience. *New. Dict. Hist.*

BABIN, in *Geography*, a town of Poland, in the palatinate of *Lublina*; eight miles South-west of *Lublina*.—Also, a town of Poland, in the palatinate of *Braclaw*; twenty-eight miles north-east of *Braclaw*.—Also, a town of Poland, in the palatinate of *Belz*, thirty-six miles east of *Belz*.

BALINGTON, GEORGE, in *Biography*, an English Bishop, was born about the middle of the sixteenth century, in *Northamptonshire*, as some say, but according to others, in *Devonshire*, and educated in *Trinity college*, *Cambridge*. While he was domestic chaplain to *Henry earl of Pembroke*,

president of the council in the marches of *Wales*, he is said to have married lady *Mary Sidney*, the daughter of *Pembroke*, by her English maternal version of the *Barons of Davil*. By the interest of his patron, he was appointed treasurer of the church of *Windsor*, and in 1590 became bishop of *Exeter*, from which he was translated first to *Exeter*, and afterwards to *Worcester*, where he remained for thirteen years till the time of his death in 1610. Notwithstanding his liberality in repairing the cathedral of the diocese, and bequeathing to it his library, no monument was erected on his grave. For learning and piety, and as a pious and popular preacher, Dr *Balington* has been highly extolled. He was also humble and discreet, and with the exception of having alienated from the bishopric of *Exeter* the rich manor of *Crediton* in *Devonshire*, he has been deemed innoxious to the charge of avarice. His works, published in 1615 and 1637, contain "Comfortable Notes on the Pentateuch;" an "Exposition of the Creed, Commandments, and Lord's Prayer;" a "Conference between Man's Frailty and Faith;" and three sermons. They are written in the quaint style of the times, and are distinguished by their piety more than by their literary merit. *Biog. Brit.*

BABINOVITCHI, in *Geography*, a district of the government of *Moldavia* in *Russia*, on the river *Lutchoffa*, falling into the *Duna*. N. lat. 54° 52'. E. long. 50° 14'.

BABIROSA, *BARBIROSSA*, and *BARBIROESSA*. See *BAEYROSSA*.

BABITZ, in *Geography*, a town of *Bohemia*, in the circle of *Czadau*; five miles W. N. W. of *Teatich Brod*.

BABOEUF, a town of France, in the department of the *Oise*, and chief place of a canton in the district of *Noyon*; two miles E. N. E. of *Noyon*.

BABOLZA, a town of Lower Hungary, in *Slavonia*, between *Posleg* and *Zigetli*, towards the *Drave*; supposed by some to have been the ancient *Manjutinum*, or *Por-Manjutinus*.

BABOON, in *Zoology*, the name of that tribe of *APES* (*Simia* Linn.) which have short tails;—cauda abbreviata; *papiones novæzædæ veterum*, Gmel. Linn. Syst. Nat.; and comprehending the species *nemestrina*, *apedia*, *spinx*, *mormon*, *maimon*, and *porcaria*. The baboons of Dr. Shaw are such of the *Simia* genus as have very muscular bodies, and whose tails are commonly short. *Baboon* in the English language has the same application as *habonia* in the French, and of which many accounts have been given by *Buffon*, *Sonnini*, and others. *Virey* observes, that the *baboons* are a ferocious and very lascivious kind of ape, found in many parts of the old world, and especially in Africa. Their muzzle, he remarks, is a little lengthened in the same manner as that of a dog, and on that account they have sometimes been called *ginges cyanocephals*, and also *magots*. They live on fruits, seeds, roots, leaves, insects, &c. like the other kind of apes; and are observed to be a mischievous and thievish race. In a state of captivity they are altogether untamable, are fond of wine and spirituous liquors; and the females, it is asserted, have an antipathy to the males, as the males have against men. See *Simia*.

BABOPAS, in *Geography*, a town in the interior part of *New Albion*, east of the lower range of mountains which extend northward from the head of the peninsula of *California*. N. lat. 37° 45'. W. long. 114° 25'.

BABORA, a town of Poland, in the palatinate of *Lemberg*; twelve miles south of *Lemberg*.

BABOUCARD, in *Ornithology*, the name given by *Buffon* to the Senegal variety of *Scops *Uguia* (S. Gmelin)*, or common King-bird; and which *Brisson* calls *Uguia Senegalensis*.

BABOUIN A MUSEAU DE CHIEN, in Sonnini (edit. Buffon), in *Zoology*, the *Simia hamadryas*, Linn.; and *dog-faced ape*, Penn. See *SIMIA HAMADRYAS*.

BABRA, in *Geography*, a town of North America, in the country of New Navarre; 205 miles south of Casa Grand.

BABUCO, a small town of Italy, in the Campagna of Rome.

BABUL, a town of the East Indies, in an island of the river Indus, supposed by some to be Cambaya, and by others Patan, stretching out towards the islands Formosa and Lequios.

BABUYANES, a cluster of six or seven small islands, about nineteen leagues north of the isle of Luzon, in the Pacific ocean; one of them contains about 500 inhabitants; and the chief produce is wax, ebony, bananas, cocoas, and plantains.

BABUYEA, a town of North America, in the province of Culiacan; 65 miles north-east of Culiacan.

BABYLAS, in *Biography*, a celebrated martyr of the Christian church, was chosen bishop of the see of Antioch, A. D. 238, under the emperor Gordian; and after governing this church for thirteen years, he either died in prison, or was put to death, in the persecution of Decius. Chrysofom applauds his courage for refusing admission into the church to an emperor who had killed the son of a king, whom he had received as an hostage; and this emperor is supposed to have been Philip, who put his colleague, the young Gordian, to death. This is said to have been the cause of the bishop's death. But there are several circumstances that invalidate the truth of this story. However this be, the remains of Babylas were transported about one hundred years after his death, by order of the Cæsar Gallus, into the midst of the grove of Daphne, where was a temple of Apollo; a magnificent church was erected over them; a portion of the sacred lands was appropriated to the maintenance of the clergy, and the burial of the Christians at Antioch; and the heathen oracle was silenced, as it was supposed, by the presence of the saint's dust, but more probably, as Van Dale suggests (*De Oraculis*, p. 392.), by an apprehension of the priests, that the Christians, who daily visited the tomb of the martyr, would detect their imposture. Julian soon after demolished this church; and the Christians removed the relics of St. Babylas, with acclamations of triumph, to their former habitation within the walls of Antioch. On this occasion, Julian exerted his pride to dissimble his resentment; but during the night which terminated this procession, the temple of Daphne was in flames, the statue of Apollo was consumed, and the walls of the edifice were left a naked and awful monument of ruin. The Christians of Antioch confidently asserted, that the powerful intercession of St. Babylas had pointed the lightnings of heaven against the devoted roof. Julian, however, could disguise and restrain his indignation no longer. Imputing the fire of Daphne to the revenge of the Christians, whom he opprobriously denominated Galileans, he ordered the doors of the cathedral at Antioch to be shut, and its wealth to be confiscated. For the purpose of discovering the criminals, several ecclesiastics were tortured, and a presbyter of the name of Theodoret was beheaded. Euseb. E. H. l. vi. c. 39. Julian in Misopogon, p. 361. Ammianus Marc. l. xxii. c. 13. Gen. Dict. Gibbon's Hist. vol. iv. p. 121, &c.

BABYLON, in *Ancient Geography*, the capital of the ancient Babylonia, or Chaldaea. supposed to have been situated in N. lat. 33°. E. long. 46° 30'; or according to the observations of M. Beauchamp (*Mém. Ac. Sc. Paris*,

1787), N. lat. 32° 34', and E. long. 44° 12' 30". This ancient city, reckoned for many ages one of the wonders of the world, was situated on the Euphrates; and its ruins, of which few vestiges now remain, are placed by geographical writers at a town called Hilla, or Elugo, about fifteen leagues to the south-west of Bagdad. It was seated on a plain, and surrounded by water; and hence appears the propriety of the scripture expression (Is. xxi. 1.) "the burden of the desert of the sea," or rather "of the plain of the sea;" and besides, the places about Babylon, as Abydenus informs us from Megasthenes (Euseb. Præp. Evang. l. ix. c. 41. p. 457.) are said from the beginning to have been overwhelmed with waters, and to have been called "the sea." Nevertheless, it is no less properly denominated "a mountain" (Jer. li. 25.) on account of the great height of its walls and towers, its palaces and temples; and accordingly Berofus cited by Josephus (*ubi infra*), says of some of the buildings, that they resembled mountains. It was founded, as some say, by Semiramis, and according to others, by Belus, who is thought by many to be the same with Nimrod. But whoever was the first founder of it, it was in process of time much improved; and Nebuchadnezzar, in particular, repaired, enlarged, and beautified it to such a degree, that he may be said to have built it, according to his own vain-glorious boast (Dan. iv. 30.); "Is not this great Babylon, that I have built for the house of the kingdom, by the might of my power, and for the honour of my majesty?" Nor is this asserted only in scripture, but it is likewise attested by heathen authors, Megasthenes, Berofus, and Abydenus, whose words are quoted by Josephus (*Antiq. l. x. c. 11. § 1. t. i. p. 536. ed. Haverc.*) and Eusebius (*Præp. Evangel. l. ix. c. 41. p. 457. ed. Vigeri*). By one means or other Babylon became a city so great and famous, that it gave name to a very large empire; and it is denominated by a variety of just and appropriate terms in scripture, such as "great Babylon" (Dan. iv. 40.); "the glory of kingdoms," and "the beauty of the Chaldees excellency" (Is. xiii. 19.); "the golden city" (Is. xiv. 4.); "the lady of kingdoms" (Is. xlvii. 5.); "abundant in treasures" (Jer. li. 13.); and "the praise of the whole earth" (Jer. li. 41.)

The most famous works in and about this ancient city, as they are enumerated and described by Prideaux from ancient authors, were the walls, the temple of Belus, the palace of Nebuchadnezzar, the hanging gardens, the banks of the river, the artificial lake, and the canals.

This city was surrounded with walls, which, according to the account of Herodotus (l. i.), the most ancient author who mentions them, and who himself had been at Babylon, were 87 feet thick, 350 feet high, and in compass 480 furlongs, or 60 miles. Other writers, who differ from Herodotus in some particulars, give nearly the same account of the dimensions of the walls. Diodorus Siculus indeed (l. ii.) has very considerably diminished the circumference of these walls, and somewhat reduced their height as stated by Herodotus, but he has enlarged their breadth by saying that six chariots might drive upon them abreast; whereas the former observes, that one chariot only might turn upon them: but then he places buildings on each side of the top of these walls, which, according to him, were only one story high; and thus these two writers may be tolerably reconciled. As for those who assign fifty cubits as the height of these walls, they represent them as they were after the time of Darius Hystaspes, who had caused them to be beaten down to that level. See Strabo, l. 16. p. 743. Pliny H. N. l. vi. c. 26. Philostrat. l. i. c. 18.

These walls formed an exact square, each side of which was

was 120 furlongs, or 15 miles long, built of large bricks cemented together with bitumen, a glutinous slime which issues out of the earth in that country, and in a short time becomes harder than the brick or stone cemented by it. Without the walls, the city was encompassed by a large ditch filled with water, and lined on both sides with bricks made of earth dug out of the site of the ditch, whose dimensions are indicated by those of the walls. In the compass of the walls there were 100 gates, or 25 in each of the four sides, all of which were formed of solid brass, referred to by the prophet Isaiah, ch. xlv. 2. Between every two of these gates were three towers, and four more at the four angles of this large square, and three between each angle and the next gate on either side; and each of these towers was ten feet higher than the walls. This, however, is to be understood merely of those parts of the walls where towers were necessary for defence; for as some parts were seated on a morass, and consequently inaccessible by an enemy, there the labour and expence were spared; and therefore the whole number of these towers amounted to no more than 250. From the 25 gates on each side of this square proceeded 25 streets, extending in straight lines to the corresponding gates in the opposite sides, so that the number of the streets was 50, each of them being about 15 miles long, and all crossing one another respectively at right angles. Besides these there were also four half streets, which were rows of houses, facing the four inner sides of the walls. These latter were properly the four sides of the city within the walls, and each of them was 200 feet broad; the whole streets being about 150 feet in breadth. By this intersection of the 50 streets, the city was divided into 676 squares, each of which was four furlongs and a half on each side, or two miles and a quarter in compass. Round these squares on every side toward the streets stood the houses, all of three or four stories in height, and beautified with every kind of ornaments; and the space within each of the squares was vacant, and occupied only by court-yards or gardens, adapted to convenience or pleasure.

A branch of the river Euphrates intersected the city, running through the middle of it from north to south; and over the river, in the central part of the city, was a bridge, a furlong, as some say, but according to others, much more, in length, and thirty feet broad; which bridge was ingeniously constructed in order to supply a defect in the bed of the river, which was composed of sand. At the two ends of this bridge were two palaces; the old palace on the east side, and the new one on the west side of the river; the former occupying four of the above mentioned squares, and the latter nine. The temple of Belus, which stood next to the old palace, took up another of these squares.

The whole city stood on a large plain, in a fat and deep soil; that part or half of it which lay on the east side of the river, was the old city; the other on the west was added by Nebuchadnezzar; and both were included within the square bounded by the walls already described. The form of the whole was seemingly borrowed from Nineveh, which was also 480 furlongs in compass, but its form was that of a parallelogram, whereas that of Babylon was an exact square. Nebuchadnezzar, who had destroyed that old seat of the Assyrian empire, is supposed to have designed that this new one should exceed it in size and in magnificence. It appears, however, that it was never wholly inhabited, though Nebuchadnezzar carried thither a great number of captives out of Judæa and other conquered countries; nor was time allowed for its arriving at that population and glory, which were the objects aimed at by Nebuchadnezzar; for Cyrus removing the seat of empire to Shushan, Babylon

gradually sunk into utter decay. When Alexander came to Babylon, we learn from Quintus Curtius, that no more than 8100 square furlongs were then occupied by building; but the whole space within the walls contained 14,400 square furlongs; and therefore there must have been 6760 square furlongs, which, as Curtius informs us, were ploughed and sown. Nor indeed were the houses contiguous, but a void space was left on each side between one house and another.

According to the observations of major Rennell (Geographical System of Herodotus examined and explained, &c. p. 341.), there seems to be no mode of invalidating the fact respecting the extent of the space inclosed by the walls of ancient Babylon: "nor (says he) can it in our idea be reduced to less than a square of about 8½ British miles, giving an area of 72 square miles. But that even 72 contiguous square miles should have been in any degree covered with buildings, is on every account too improbable for belief. The inhabitants of London, taken at a ninth part of the whole population of South Britain (say about 7,000,000, or for London 800,000), require for their supply of provisions and necessaries, a proportion of land equal to about 6000 square British miles, on a supposition that they were confined to its produce alone, and that it was taken as it generally runs throughout the kingdom."—"If there be allowed to Babylon an area of seventy-two miles, we conceive that it would then bear a proportion to the space which the buildings of London occupy, taking in all its suburbs and members, whether contiguous or otherwise, and allowing the man area of 15½ British miles, as 9 is to 2 nearly. But as most of the large Asiatic cities that we have seen or heard of, scarcely contain within the same space half the number of inhabitants that European cities do, we must reckon the proportion of population that Babylon would have contained to that of London, as 9 to 4. In this case, 15,000 square miles of such land as the common run of that in England would have been required for the support of the people of Babylon. But as the simpler manner of living among the lower classes of people in Asia requires a less quantity of land to support it, a considerable deduction may be made, and instead of 15,000 square miles, we may perhaps substitute 12,000. Now it will appear, that this reduced sum of square miles equals, within one-twelfth part, the whole area of Lower Mesopotamia; and even the whole tract properly denominated Babylonia and Chaldæa, including all the arable and pasture land, from whence Babylon could have been conveniently supplied by the inland navigations, was little more than double the above aggregate, taken at 15,000 square miles. And though it be true, that the quality of the Babylonish lands, in most places, was superior in fertility to those of England; yet, on the other hand, a prodigious delusion must be made for the marshes and lakes of Lower Mesopotamia and Chaldæa." Hence the author very judiciously infers, that the houses occupied only a part of the vast space inclosed by the walls, and he furnishes a modern instance, in the same region, of a city surrounded by a wall seven miles in circuit; and yet Bédoua contains only from 40 to 50,000 inhabitants; the wall inclosing date groves and corn fields. Besides, it should be remembered that the Euphrates flowed through the centre of Babylon, in which part of its course it is from 200 to 500 feet wide. The palace of the Babylonian kings, the temple of Belus, and other public buildings must also have occupied a considerable part of the space within the walls.

The next object particularly worthy of notice in the city of Babylon, was the temple of Belus. In the middle of this temple stood the ancient tower, supposed by Bochart

(Phaleg. p. 1. l. i. c. 9.) to have been the famous tower of Babel. This tower was at its base a square of a furlong on each side, or half a mile in compass, and consisted of eight towers, as they appeared to be, built one above the other; the height of each being 75 feet, and that of the whole 600 feet. The ascent to its top was by stairs on the outside, formed by a sloping line from the bottom to the top eight times round it, so as to exhibit the appearance of eight towers. As these compartments or stories had many rooms with arched roofs supported by pillars, they made parts of the temple, when the tower became consecrated to idolatrous purposes. The uppermost story was the most sacred, and the most appropriate to the uses of devotion. Over the whole of the top of the tower there was, it is said, an observatory (Diod. Sic. l. ii.), by the advantage of which the Babylonians extended their skill in astronomy beyond other nations. For when Alexander took Babylon, Callisthenes, the philosopher, who accompanied him thither, found they had astronomical observations for 1903 years from that time, which carried up the account as high as the 115th year after the flood, or within 15 years after the tower of Babel was built, or to the year B. C. 2334. Till the time of Nebuchadnezzar, the temple of Belus contained only this tower, the rooms of which served all the occasions of its idolatrous worship. But he enlarged it by erecting edifices round it in a square of two furlongs on every side, and a mile in circumference, exceeding the square at the temple of Jerusalem by 1800 feet. The whole of these buildings was inclosed by a wall, which is computed to have been two miles and a half in circumference. In this wall were several gates of solid brass, supposed to have been formed out of the brazen sea, brazen pillars, and other vessels and ornaments, which Nebuchadnezzar had brought to Babylon from Jerusalem; for he is said to have dedicated in this temple the spoils of that expedition. Dan. i. 2. 2 Chron. xxxvi. 7. In the same place were several images or idols of massy gold; one of them, which was a statue of Belus, in an erect posture, forty feet high, crowning the summit, and resting on a pedestal of fifty feet in height. As this is said to have weighed 1000 Babylonian talents, it is computed to have been worth three millions and a half of our money. According to Diodorus Siculus (*ubi supra*), the weight of the statues and decorations amounted to five thousand and odd talents in gold, and their value has been estimated at above twenty-one millions of our money; and the like sum is allowed for the treasure, utensils, and ornaments.

On the east side of the river stood the old palace of the kings of Babylon, four miles in circuit; and opposite to it, on the other side of the river, was the new palace built by Nebuchadnezzar, which was eight miles in circumference.

For an account of the hanging gardens of Babylon, see *PENSILES HORTI*. The other works ascribed to Nebuchadnezzar, by Berofus and Abydenus, were the banks of the river, the artificial canals, and the completion of the artificial lake, said to have been sunk by Semiramis. The canals were cut out on the east side of the Euphrates, in order to convey the waters of the river, when it overflowed its banks, into the Tigris, before they reached Babylon. The chief of these was the *NAARMALCHA*.

The lake was on the west side of Babylon, and, according to the lowest computation, 40 miles square, 160 in compass, and 35 feet deep as Herodotus says, and 75 according to Megasthenes. It was dug to receive the waters of the river, while the banks were building on each side of it; but the lake, and the canal that led to it, were afterwards preserved, and found useful to prevent inundations, and to serve as a reservoir, from which water was occasionally let out by

sluices for improving the land. The banks were constructed of bricks and bitumen, on both sides of the river, to keep it within its channel, and were extended through and beyond the city, occupying an interval of twenty miles. Opposite to each street, on either side of the river, was a brazen gate in the wall, with stairs leading down from it to the river; which gates were open in the day, and shut in the night.

All these works are attributed by Berofus, Megasthenes, and Abydenus, to Nebuchadnezzar; but Herodotus says, that the bridge, the banks, and the lake, were the work of a queen who reigned after him, called Nitocris, who probably finished what Nebuchadnezzar had begun and left imperfect.

Babylon subsisted with singular reputation, and was for a long time considered as one of the wonders of the east. At length Cyrus, having subdued the several nations that inhabited the great continent from the Ægean sea to the Euphrates, and likewise Syria and Arabia, entered Assyria, and directed his march towards Babylon. Nabonadius, Labynitus, or Belsazzar, who then reigned at Babylon, hearing that he was advancing to his metropolis, marched out to give him battle; but being put to flight, he returned into the city, where he was closely besieged by Cyrus. But the capture of a place so strong, and furnished with all kinds of provisions for twenty years, was no easy enterprise. Despairing of succeeding against it by storm, he drew round it a line of circumvallation, with a large and deep ditch, to intercept its communication with the country. He also divided his army into twelve bodies, each being appointed to guard the trenches for a month; but the besieged, triumphing in the height of their walls, and the amplitude of their stores, insulted Cyrus from the ramparts, and seemed to defy all his efforts. Cyrus, having spent two years before Babylon without making any impression, adopted the following stratagem, which proved successful. Informed that a great annual solemnity was to be kept in the city, and that the Babylonians were accustomed, on this occasion, to spend the whole night in drinking and debauchery, he thought this a proper time for surprising them. Accordingly he sent a strong detachment to the head of the canal leading to the great lake, already described, with orders, at an appointed time, to break down the bank which separated between the lake and the canal, and to turn the whole current of the river into the lake. At the same time he appointed one body of troops to occupy the place where the river entered into the city, and another to station themselves where it came out; and he ordered them to march in by the bed of the river, which was two stadia broad, as soon as they should find it fordable. Towards the evening, he opened the head of the trenches on both sides of the river above the city, that the water might discharge itself into them, and by these means, and the breaking down of the great dam, the river was soon drained. Then the two bodies of troops above-mentioned entered the channel, according to the instructions which they had received; and advancing towards the city, they found the gates left open, in consequence of the riot and disorder of the night, and penetrated into the city without opposition. Meeting at the palace, according to their previous agreement, they surprised the guards, and cut them in pieces. Those who were in the palace, opening the gates to know the cause of the confusion, made way for the Persians to rush in; and thus they took possession of the palace, and killed the king, who with his sword in his hand came out to meet them. The king being killed, and those who were about him being put to flight, the rest submitted, and the Medes and Persians became masters of the place; B. C. 538. The reduction of Babylon put an end to the Babylonian empire, and finally fulfilled, in the name and character

rafter of the conqueror, and in the various circumstances that attended this event, the prophecies which Isaiah, Jeremiah, and Daniel, had uttered against this proud metropolis. However, the tower or temple stood to the time of Xerxes; but in his return from the Grecian expedition, he first plundered it of its wealth, then demolished the whole, and laid it in ruins. Alexander, on his return to Babylon from his Indian expedition, proposed to rebuild it, and to make it the feat of his empire; but his death prevented his accomplishing that design. After the death of Alexander, the city of Babylon began to decline apace; and its decay was chiefly owing to the vicinity of Seleucia, which was built by Seleucus Nicator, as it is said to mortify the Babylonians, and peopled with 500,000 persons drawn from Babylon.

We learn further from a fragment of Diodorus Siculus, produced by Valesius, and quoted from him by Vitringus (Comment. in Jesaiam, c. 13. vol. i. p. 421.), that a king of Parthia sent many of the Babylonians, under the most trivial pretences, into slavery, burnt the forum and some of the temples of Babylon, and demolished the bell parts of the city. This happened about 130 years B.C. Diodorus Siculus (l. ii.) describes the buildings as ruined or destroyed in his time (B.C. 44.), and asserts that only a small part of the city was inhabited, but that the greatest part of it within the walls was tiled. Strabo (l. xvi. p. 1073.), who wrote not long after Diodorus (B.C. 30.), says, that part of the city was demolished by the Persians, and part of it decayed by time and the neglect of the Macedonians, particularly after the building of Seleucia, and the removal of the royal court thither. Strabo applies to Babylon what a comic poet said of Megalopolis in Arcadia; "The great city is now become a great desert." Pliny also (H.N. l. 6. c. 30.) affirms (A.D. 66.), that it was reduced to solitude by the neighbourhood of Seleucia. Pausanias, about A.D. 153, compares Megalopolis to Babylon, and says (Arcad. c. 33. p. 668. ed. Kuhni), that of Babylon, the greatest city which the fun ever saw, nothing remained but the walls. Maximus Tyrius (Diff. 6.) mentions it as lying neglected and forsaken; and Lucian intimates (Επιτομ. five Contemplantes), that in a little time it would be sought for and not be found, like Nineveh. Constantine the Great, in an oration preserved by Eusebius, says, that he himself was upon the spot, and beheld the desolate and miserable condition of the city. In the time of Jerome, about the close of the fourth century, it was converted into a chase for keeping wild beasts within the compass of its walls, for the hunting of the later kings of Persia. St. Jerome adds, that, excepting the brick walls, which after many years are repaired for the inclosing of wild beasts, the whole space within is desolation. Hieron. Comment. in Isai. c. 13. c. 14. vol. iii. p. 111. 115. ed. Benedic. Benjamin of Tudela, who lived in the twelfth century, asserts (Itin. p. 76.), that ancient Babylon is now laid waste, but that some ruins are still to be seen of Nebuchadnezzar's palace, into which men fear to enter on account of the serpents and scorpions that are in the midst of it. Teixeira, a Portuguese, in his description of his travels from India to Italy, cited by Bochart (Phaleg. l. 4. c. 15.), and by Prideaux (pt. 1. b. 8.), affirms, that of this great and famous city nothing but a few vestiges remained, and that there was not any place in the whole region less frequented. Rauwolf, a German traveller, whose travels have been edited by Ray, passed this way, A.D. 1574, and describes the ruins of this famous city, which he found in the village of Eligo, not far from Bagdad. He mentions some piers and arches of the old bridge over the Euphrates, and the ruins of the castle and tower, which are the habitations of venomous creatures, that are so dangerous as not to be accessible with safety,

except during two months in winter, when these animals never stir out of their holes. Petrus Vallenfis, or Della Valle, was at Bagdad in 1616, and visited the ruins, as they are thought to be, of ancient Babylon, which, he says, appear in confusion like a huge mountain, and exhibit animals corresponding in form and situation to the pyramids erected by Strabo the tower of Belus, and being probably the tower of Nimrod in Babylon, or Babel, as the place is called. But besides this large mass, there are no traces of ruins sufficient to convince an observer that so great a city as Babylon was ever situated in that place. Tavernier says, that at the parting of the Tigris, which is but a little way from Bagdad, there is the foundation of a city which may seem to have been a large league in compass. Some of the wall, he says, are yet standing, upon which six coaches may pass abreast. They are made of burnt brick, ten feet square and three thick. The chronicles of the country represent this as the site of the ancient Babylon. But this intelligent traveller adopts the opinion of the Arabs, and conceives the ruins observed by himself, and also by Benjamin the Jew, Rauwolf, and Della Valle, to be the remains, not of Nebuchadnezzar's palace, or of the tower of Babel, but of some tower built by one of their princes, and designed as a beacon to assemble his subjects in time of war. Hanway (Trav. vol. iv. p. 3. c. 10. p. 78.) says, that the ruins of Babylon, placed about fifteen leagues to the south of Bagdad, are now so much effaced, that there are hardly any vestiges of them to point out the situation.

Whoever compares these accounts, given more in detail by the authors above cited, with the predictions of the ancient prophets, will perceive, and be led to acknowledge, how punctually the ravages of time have contributed to accomplish them. To this purpose bishop Newton observes (Desert. on the Prophecies, vol. vii. p. 285.), that when Babylon "was converted into a chase for wild beasts to feed and breed there," then were exactly accomplished the words of the prophets, that "The wild beasts of the desert, with the wild beasts of the islands, should dwell there, and cry in their desolate houses." One part of the country was overflowed by the river's having been turned out of its course, and never restored again to its former channel, and thence became boggy and marshy, so that it might literally be said to be "a possession for the bittern, and pools of water." Another part is described as dry and naked, and barren of every thing, so that thereby was fulfilled another prophecy, which seemed in some measure to contradict the former, "Her cities are a desolation, a dry land and a wilderness, a land wherein no man dwelleth, neither doth any son of man pass thereby." The place thereabout is represented as overrun with serpents, scorpions, and all sorts of venomous and unclean creatures, so that "their houses are full of doleful creatures, and dragons cry in their desolate places; and Babylon is become heaps, a dwelling for dragons, an astonishment and an hissing, without an inhabitant." For all these reasons, "neither can the Arabian pitch his tent there, neither can the shepherds water their flocks there." And when we find that modern travellers cannot now certainly discover the spot of ground whereon this renowned city was once situated, we may very properly say, "How is Babylon become a desolation among the nations! Every purpose of the Lord hath he performed against Babylon, to make the land of Babylon a desolation, without an inhabitant:" and the expression is no less true than sublime, that "The Lord of hosts hath swept it with the besom of destruction." "How wonderful (adds the prelate) are such predictions compared with the events, and what a convincing argument of the truth and divinity of the holy scriptures! Well might

might God allege this as a memorable instance of his pre-science, and challenge all the false gods and their votaries to produce the like. *Ih. xlv. 21. xlvii. 10.* And indeed where can you find a similar instance, but in scripture, from the beginning of the world to this day?" The triumphant ode upon the fall of Babylon, recited in the fourteenth chapter of *Ishaiab*, merits particular attention, as it is truly admirable for the severest strokes of irony, as well as for the sublimest strains of poetry. "The Greek poet *Alceus*, who is celebrated for his hatred to tyrants, and whose odes were animated with the spirit of liberty no less than with the spirit of poetry, we may presume to say, never wrote any thing comparable to it." *Bishop Lowth*, in his excellent lectures upon the sacred poetry of the Hebrews, hath justly described it as one of the most spirited, most sublime, and most perfect compositions of the lyric kind, superior to any of the productions of Greece or Rome. See his *Prælect. xiii. p. 120, &c. Prælect. xxviii. p. 277, &c.* *Mr. Mason* hath also imitated it in an English ode, published with some other odes, in 1756.

BABYLON, a city of Egypt, which was watered by the river *Trajanus*, according to *Ptolemy*. It was situated near the Nile, where *Grand Cairo* now stands, or at a small distance from it, and had a castle strongly fortified both by nature and art. Some say, that it was founded by the Persians when they ravaged Egypt under *Cambyfes*, (see *Josephus Antiq.*); and that it was erected in the place where *Latopolis* stood; or according to others, when *Semiramis* visited this country at the head of a formidable army. *Strabo* says (*l. xviii.*), that it was built by some Barbarians, who retired thither by permission of their sovereign, and that in his time the Romans kept in garrison there one of the three legions that were stationed in Egypt. From the fortrefs of Babylon, the mountain gently sloped to the bank of the Nile; and 150 slaves were continually employed there in raising the water by means of wheels and an aqueduct. The Persians, who were worshippers of the sun, kept up a perpetual fire in this place, which occasioned its being called by the Arabs "The castle of the Lights." See **CAIRO**, and **FOSTAT**.

BABYLON, in *Scripture History*, is a name figuratively given by the sacred writers, particularly by *St. Peter*, *1 Ep. ch. v. v. 13.* and by the author of the *Revelations*, *ch. xvii. and xviii.* and also by the fathers, to Rome; partly on account of her greatness, pride, and oppression of God's people, and partly for her resemblance of it in idolatry; that kingdom so fully representing the idolatry of the church of Rome in the description given of it in the sixth chapter of *Baruch*, that scarcely any real difference betwixt them can be observed. *Whitby's Paraphrase*, *vol. ii. p. 661. p. 753.*

BABYLONIA, or **CHALDÆA**, an ancient kingdom of Asia, was founded by *Nimrod*, the grandson of *Ham*, and continued distinct and separate from that of *Assyria*, till *Ninus* conquered Babylon, and made it tributary to the *Assyrian* empire. (See **ASSYRIA**.) This country was known, in ancient times, by the names of *Shinar*, and *Shinaar*, which appellation it seems to have retained even in the time of *Daniel*. The name of Babylon is universally supposed to have been derived from that of the tower of *Babel*; and the name of *Chaldæa* arose from the *Chaldæans*, or *Chasdim*. (*Joseph. Ant. l. i. c. 7.*) These two names sometimes extend to the whole country, being indifferently taken for each other; and sometimes they are limited to certain parts. By Babylon, or *Babylonia*, is meant the country more immediately in the neighbourhood of the city of Babylon; and by *Chaldæa*, that which extends southward to the Persian gulf. *Chaldæa* is

used by the writers of the Old Testament for the whole country (*Jer. xxiv. 5. xxv. 12. l. 8. Ezek. xii. 13.*); and *Babylonia*, generally speaking, by profane authors. (*Diodor. Sic. l. ii. c. 11, 12. Strabo, l. xvi. sub init.*) It lies between thirty and thirty-five degrees of north latitude; and was bounded, according to *Ptolemy*, on the north by *Mesopotamia*, on the east by the *Tigris*, on the west by *Arabia Deserta*, and on the south by the *Persian gulf* and part of *Arabia Felix*. In *Babylonia*, properly so called and considered as a distinct province from *Chaldæa*, were the following cities; viz. *Babylon*, the metropolis, (See **BABYLON**); *Vologesia*, or *Vologesocerta*, built on the *Euphrates* by *Vologesis*, king of the *Parthians*, in the time of *Vespasian*; *Barfita*, probably *Strabo's* *Borsippa*, sacred to *Diana* and *Apollo*, famous in the time of this geographer for a woollen manufacture, and for being the habitation of a certain sect of *Chaldæans*, thence called *Borsippeni*; *Idiccara*, on the *Euphrates* and the borders of *Arabia Deserta*; *Coche*, in the island *Mesene*, formed by the *Tigris*; *Sura*; and *Pombedita*, of which the situation is very uncertain. In ancient times the *Babylonian* name, extending far beyond the limits both of *Babylonia* and *Chaldæa*, comprised all, or the greater part of the provinces subject to the *Babylonian* empire. See **EMPIRE**.

The air of this country was generally temperate and salubrious; though it was occasionally subject to extraordinary heat and a pestilential wind. As it seldom rained, the inhabitants were under a necessity of watering their lands by means of wheels and engines, and of trenches and canals, which flowed from the *Euphrates* to the *Tigris*. The soil was rich, the climate was for the most part excellent, and the inhabitants were industrious; and therefore this country vied, in respect of fertility, with any other spot on the face of the earth. The southern parts of it, between the rivers, have been compared with the *Delta* of Egypt, which it resembles by its natural and artificial islands, and by being almost under the same parallel of latitude; and the other part of it, or *Chaldæa* properly so called, between the *Euphrates* and the mountains of *Babylon*, as they are commonly termed, is not much less watered by rivers and canals conducted from the *Euphrates*, and large reservoirs of lakes borrowed from the same river. Hence *Herodotus* (*l. i. c. 193.*), compares this country with Egypt; and he says, that, with regard to the plenty of its productions, it was reckoned to be equal to a third part of Asia, or of the *Persian* empire; and that, in the same year, it yielded 300 fold, but generally 200. As it was low, flat, and well-watered, it abounded with willows, and was called "the valley of willows," as *Frideaux* (*Conn. p. i. b. 1. p. 105.*), after *Bochart*, corrects the text, *Ih. xv. 7.* The palm also flourished naturally every where, and particularly the date kind, which afforded bread, wine, and honey; but the vine, olive, and fig-tree, did not succeed here any more than in Egypt. But as to grain, it exceeded every other land; the millet and sesame shot up to the size of trees; and the leaves of the barley and wheat were usually four fingers broad. The sesame afforded oil, instead of the olive; and the palm yielded wine instead of the grape. This fertility was owing in a great measure to the inundations of the *Euphrates* and *Tigris*, in the months of June, July, and August; the snow of the mountains of *Armenia* melting in those months; and to guard against injury from these inundations, the inhabitants formed artificial rivers and canals, by which they distributed the waters, and maintained an easy communication with one another. For the purpose of mutual intercourse, and particularly of navigating the *Euphrates*, they had boats, of a round form, constructed like wicker-baskets, which were covered

covered with hides, and guided by two oars or paddles. They had neither head nor stern; but being of different fizes, they served for carrying various quantities of their commodities to Babylon, whence they returned by land, the rapidity of the stream not allowing them to return by water.

The government of Babylon, like that of Assyria, was despotic, and the sceptre seems to have been hereditary. Their potentates, however, who assumed divine titles, and who received divine honours, administered their government by a variety of officers, civil and military; and these were divided into three classes: the first had the charge of virgins, and of their disposal in marriage, and were to judge in cases of adultery, and similar matters; the second took cognizance of thefts; and the third of all other crimes. The chief officers of the king's household were the captain of his guard, who had the execution of his arbitrary and sanguinary commands; the prince of the eunuchs, who had the charge of the education and subsistence of the youth of the palace; and the prime minister, resembling the Turkish vizier, who sat in the king's gate, as it was called, to hear complaints, and to pass judgment. Besides these, there was also a master of the magicians, whose province it was to satisfy the king on subjects that respected the prognostication of futurity. Among their laws, which were vague and variable, one of the best seems to have been that which respected marriage, and which was calculated to increase the number of inhabitants; for which, see ASSYRIA. Their punishments were arbitrary, and depended upon the will of a capricious monarch. Beheading, cutting to pieces, turning the house of the criminal into a dunghill, and burning in a fiery furnace, were penalties, which were executed by order of the kings of Babylon. The religion and boasted learning of the Babylonians were so blended together, that they are not easily separated: for the Chaldees, properly so called, were not only their priests, but also their learned men; whose whole science seems to have been subservient to the purposes of superstition. (See BELUS, and SABAEISM.) As the Babylonians gave rise to all the idolatries and superstitions that prevailed among the neighbouring nations, they are charged with having introduced the horrible custom of sacrificing human victims, in order to appease or conciliate their deities. The Babylonians were much addicted to judicial astrology; and ascribed an influence to the stars and planets, in the explication of which their chief science consisted. Astronomy was with them subservient to astrology, and the former was cultivated in subordination to the latter. Indeed, the principal part, if not the whole, of their philosophy and learning, consisted in the application of this fanciful and unfounded science. However, some have distinguished, with justice, between the Chaldees, and Babylonians, ascribing to the latter a more accurate and extensive acquaintance with the principles of astronomy, mathematics, and mechanics, than the former. (See CHALDEAN PHILOSOPHY.) Of their music and poetry, we have few certain records. They are said to have excelled in architecture and sculpture, in the arts of designing, and of casting metals, as the ornaments of their metropolis seem to testify. Their manufactures, particularly of rich embroideries, sumptuous vestments, magnificent carpets, and fine linen, were famous; and they sent their purple into the eastern parts as an article of traffic. Their commerce, especially when Babylon was in the meridian of her glory, must have been considerable. The metropolis was advantageously situated for this purpose; being as it were in the midst of the world, and having, by means of the Euphrates and Tigris, an easy communication with the western and northern parts, and also with the eastern by means of the Persian gulf. With regard to their

customs, we may mention in particular their mode of treating sick persons. Having no physicians, they exposed them publicly in the most frequented places, that all who saw them might offer their advice, if they had, either from their own experience or that of others, any knowledge of their case. Their dead they embalmed with honey and wax, and their manner of mourning resembled that of the Egyptians. The Babylonians were, in a high degree, credulous and superstitious: and much addicted to licentiousness and debauchery in their general conduct. In their dress, they affected pride and ostentation. Their under garment was a linen veil, which hung down to the feet; over this they had another of woollen; and their outer garment was a white mantle or cloak. They covered their hair to grow; adorned their heads with a turban or tiara; and anointed their bodies with the oil of sesame. Every individual wore a ring with a seal on his finger, and bore in his hand a carved staff or sceptre, the head of which was adorned with some figure, as that of an eagle, a lion, an eagle, or some such emblem. On their feet they wore a kind of slippers. The inhabitants of this country were divided not only into two great tribes, the Babylonians, and Chaldeans, properly so called, but into other subordinate sects. Three of these are said to have fed upon nothing but fish, which they dried in the sun, and formed into paste, thus supplying the want of bread.

As to the history of the kingdom of Babylon, distinguished from the kingdom of Assyria, the first king of this country mentioned in Ptolemy's Astronomical Canon, is Nabonassar, to whom Pul or Phul bequeathed it, as he did that of Assyria to Tiglath-Pileser, in the year 747 B. C. The latter resided at Nineveh; and the former at Babylon. From this period, commonly denominated the era of Nabonassar, to the year 625, B. C. when Nabopolassar began his reign, nothing remarkable occurs in the history of the kings of Babylon; excepting that Assaradinus or Esarhadon, king of Assyria, the brother and successor of Senacherib, took possession of the kingdom of Babylon, B. C. 680; and that upon his death, these kingdoms of Assyria and Babylon were again separated, B. C. 668. In the twentieth year of Nabopolassar, B. C. 606, Nineveh was taken and destroyed by the united armies of Cyaxares and Nabopolassar, and the seat of the empire transferred to Babylon. This Nabopolassar, sometimes called Nebuchadnezzar, was the father of the famous Nebuchadnezzar, or Nabocolassar, whose history occurs in the sacred writings, and who commenced his reign in the year 604 B. C. From this period, to the conquest of Babylon by Cyrus, in the reign of Naonadius, Labyrinthus of Herodotus, and Belshazzar of Scripture, the son of Evil-Merodach by Nitocris, and the grandson of Nebuchadnezzar, in the year 538 B. C. the history of Babylon presents nothing worthy of particular notice. For an account of the conquest of Cyrus, which terminated the Babylonian empire and subjected it to the Persians, see BABYLON. From this time, Babylonia was never erected into a distinct kingdom, but has borne the vicissitudes of the great conquerors who have at different times appeared in Asia. It is now frequently the object of contention between the Turks and Persians. *Anc. Un. Hist.* vol. iii. p. 367—437. *Rollin's Anc. Hist.* vol. ii. p. 1—153.

BABYLONIAN, BABYLONIC, or BABYLONIC, *Cambrige, Emper. Esola, Gemara, Hour, Talud, Year, &c.* See the several articles.

BABYLONICA TEXTA, in *Antiquity*, denote a rich sort of weavings, or hangings, denominated from the city of Babylon, where the practice of interweaving divers colours in their hanging first obtained. *Plin. H. N. lib. viii. c. 8.*

Hence also Babylonian garments, Babylonian skins, Babylonian carpets, housings, &c.; and *Babylonica folana*, which were coverings laid over couches, &c. painted with gold, purple, and other colours.

BABYLONIAN, *Babylonius*, is also used in some *Ancient Writers*, for an astrologer, or any thing relating to astrology. Hence *Babylonia Cura*, the art of casting nativities; and *numerii Babylonii*, the computation of astrologers. Hor. lib. i. od. 12.

BABYLONICS, or **CHALDAICS**, in *Literary History*, a fragment of the ancient history of the world, ending at 267 years before Christ; and composed by Berosus or a priest of Babylon, about the time of Alexander. Stanley H. R. Phil.

The Babylonics were very consonant with Scripture, as Josephus and the ancient Christian chronologers assure us; whence the author is usually supposed to have consulted the Jewish writers. He speaks of an universal deluge, an ark, &c.; he reckons ten generations between the first man and the deluge; and he marks the duration of the several generations by *Saroi* or periods of 223 lunar months, which reduced to years, differ but little from the chronology of Moses. There now remain only a few imperfect extracts, preserved chiefly by Josephus and Syncellus. They were forged by Annius of Viterbo. Fabr. Bib. Græc. tom. xiv. p. 175. See **BEROSUS**, and **CHALDÆAN PHILOSOPHY**.

BABYRSA, in *Ancient Geography*, a strong place of Armenia Major, situate in the mountains, near Artaxates, where were kept the treasures of Tigranes and Artabazus.

BABYRUSSA, in *Zoology*, a species of *Sus*, or hog, having two tusks growing from the lower part of the front. This is the horned-hog of Grew; *porcus indicus babyroussa dictus* of Ray; and *baby-roussa* of Buffon. In the arrangement of the French naturalists, it belongs to the genus of *cochons*, and order *pachydermes*.

The babyroussa is described by Dr. Shaw, to be nearly of the size of a common hog, but of a somewhat longer form, and with more slender limbs; and to be covered, instead of bristles, with fine, short, and somewhat woolly hair, of a deep brown or blackish colour, interspersed with a few bristles on the upper and hinder part of the back. It is also distinguished by the very extraordinary position and form of the upper tusks, which instead of being situated internally on the edge of the jaw as in other animals, are placed externally, perforating the skin of the snout, and turning upwards towards the forehead; and as the animal advances in age, becoming so extremely long and curved as to touch the forehead. These continue their curvature downwards, by which means they must of necessity lose their power as offensive weapons, which they probably possess in the younger animals; the tusks of the lower jaw are formed as in the rest of the genus, and are also long, sharp, and curved; but not of equal magnitude with those of the upper. The upper tusks are of a fine hard grain, like that of ivory; the eyes are small; the ears somewhat erect, and pointed; the tail rather long, slender, and tufted at the end with long hairs.

The babyroussa is a gregarious animal, and is found in large herds in many parts of Java, Amboina, and some other Indian islands, but is said never to be found on the continent of India. Their food is entirely of a vegetable nature, and they often feed on the leaves of trees. When sleeping, or resting themselves in a standing posture, they are said often to hook or support themselves by placing the upper tusks across the lower branches of the trees. When pursued, they will often plunge into a river, or even into the sea, if near, and can swim with great vigour and facility, and to a vast distance. The voice of the babyroussa is said to resemble that of the common hog, but it occasionally utters also a

strong or loud growling note. It is sometimes tamed by the inhabitants of the Indian islands, and the flesh is considered as wholesome food. Vide Shaw Gen. Zool. Erxleben, &c.

Some writers imagine this quadruped to have been mentioned by Elian, Pliny, and other ancient writers. It is thought to be the animal noticed under the name of tetracheros, or four-horned, by the former; and that kind of Indian boar, described by Pliny as having two very long bent teeth in the lower jaw, and two others rising in front. Aper in India, Flin. &c. Aper cornutus, Calpurn; aper indicus orientalis habi ræsa dictus, Scha; strange hogs, hogs with horns, Purch. pilgr.: eberhirsch oder hirseheber, Knorrdelic, &c.

BABYSENGA, in *Ancient Geography*, an ancient town of India, on the other side of the Ganges. Ptolemy.

BABYTACE, a town of Asia, seated on the northern bank of the Tigris. Pliny.

BAC, in *Navigation*, is used for a praam or ferry-boat.

BAC, in *Brewing*. See **BACK**.

BACA, or **BATATHA**, in *Ancient Geography*, a village of Palestine, which served as a boundary between the Tyrians and Galilee.

BACA, in *Geography*, a town of North America, in New Navarre, forty-five miles north-east of Cinaloa.

BACA. See **BAZA**.

BACACUM, or **BAGACUM**, in *Ancient Geography*, a town of the Nervii, in Gallia Belgica; now *Babay*.

BACADUCHI, in *Geography*, a town of North America, in New Navarre, 240 miles north of Cinaloa.

BACAIM, or **BACAM**. See **BASSEEN**.

BACALA, a town of India, on this side of the Ganges, on the eastern coast, in the kingdom of Arracan.

BACALAL, a lake and small country of North America, in the peninsula of Yucatan.

BACALAN, a town of Asia, in Tokarestan, one of the southern provinces of Great Bucharia, at a small distance N. W. from Anderab. N. lat. 36° 12'. E. long. 67° 35'.

BACALEO, **BACALIEU**, **BACCOLOM**, or **BACCOLAN**, an island on the east coast of Newfoundland, about nine leagues from cape St. Francis, and eight leagues north by east from Portugal cove, is about two leagues long, and half a league broad. This island is about a league from the main, with a fair channel between for any ships. N. lat. 48° 24'. W. long. 52° 34'.

BACAM, a town of North America, in New Navarre, 165 miles north-west of Cinaloa.

BACANO, a small lake of Italy, near a village of the same name, in the patrimony of St. Peter, out of which issues the small river **CREMERA**.

BACANORA, a town of North America, in New Navarre, 230 miles south of Casa Grand.

BACANTIBI, in *Ecclesiastical Antiquity*, wandering clerks, who strolled from church to church. Bingham.

The word seems formed by corruption from *vacantivi*.

BACAPA, in *Geography*, a town of North America, in New Navarre, 120 miles south-west of Casa Grand.

BACAR. See **BAHAR**.

BACARAT, a town of France, in the department of the Meurte, and chief place of a canton in the district of Luneville; four leagues south-east of Luneville.

BACARDO, a town of Italy, in the state of Genoa, three miles N. E. of Vintimiglia.

BACASERAY, or **BAKTSCHISARAY**, a town in the peninsula of the Crim-Tartary, where the khans usually resided, seventy miles south of Precop. It was partly burned by the Russians in 1736. N. lat. 45° 30'. E. long. 35° 10'.

BACAY, a town of India, on the other side of the Ganges,

Ganges, the capital of a country of the same name, on the eastern bank of the river Ava.

BACBAKIRI, in *Ornithology*, the name by which le merle á plastron noir de Ceylan, or Bullon, is known at the cape of Good Hope; because its note very clearly expresses the syllables *ba-ha-ki-ri*. This is the green-pye from Ceylon of Edwards; Ceylon thrush of Latham; and *turdus Zeylonus* of Linnæus.

BACCA, BERRY, in *Botany*, denotes such fruits as consist of a pericarpium full of juice and seeds, without any valves. The seeds have no membranous capsule or covering, but are disposed promiscuously throughout the pulp, as in solanum, &c., and are generally placed on foot-stalks attached to receptacles within the pulp, as in ribes, &c. The berry is said to be *proper* when it is a true pericarpium, formed of a germen; and *improper*, when it is formed from other parts of the fructification, as in morus, rosa, juniperus, taxus, &c. A large succulent calyx becomes a berry; in juniperus the three petals become the umbilicus; in poterium the berry is formed of the tube of the corolla; in fragaria, &c. it is formed of the top of the receptacle; in rubus, &c. it is formed from a seed, which is the receptacle of the berry; in rufens, &c. it is inclosed within, and is part of the necessary. The berry is commonly either round or oval; and is frequently furnished with an umbilicus, as in ribes, &c. It does not naturally open to disperse the seeds like the capsule; that office being performed by birds and other animals.

BACCÆ *Bermudenses*, in the *Materia Medica*, the name of the fruit or berries of the *sapindus*, or *soap-berry-tree*.

BACCAIÆ, in *Ancient Geography*, a town of Asia, in Syria, seated on a plain between the mountains and the river Orontes.

BACCALAN, in *Geography*, a small island in the Red sea, on the coast of Arabia Felix, about 36 geographical miles N. W. of Iohaia. It is inhabited by fishermen, and has no water in summer, which is then brought from Fooilat.

BACCALARIA, in *Middle Age Writers*, denotes a kind of country farms, consisting of several manfes. Du-Cange.

BACCALARIA *Dominicaria*, or *Indominicata*, was more particularly used for a farm belonging to the lord, and kept in his own hands.

BACCANELLUS, JOHANNES, in *Biography*, a native of Rheggio, lived in the early part of the sixteenth century. He was deformed in body, and of a diminutive stature, but these defects were abundantly compensated by the powers of his mind, as Bravourus testifies. We have of him the following works, which were much esteemed: "De consensu Medicorum, in curandis morbis," lib. 4.; and "De consensu Medicorum in cognoscendis simplicibus Liber," Lut. 1554, Venet. 1555 and 1558, and Lugd. 1572, 12mo. containing a judicious abridgment of the opinions of the early Greek writers, on these subjects. Linden. Rediv. p. 524.

BACCARACH, in *Geography*, a town of Germany, in the Lower Palatinate, formerly imperial and free, but now subject to the elector palatine, who has contributed to its prosperity by allowing the Calvinists and Lutherans to establish their forms of worship there, under equal privileges with the Roman Catholics; seated on the left bank of the Rhine, at the foot of a mountain called Wottfberg. It is famous for its wines; whence it is supposed to have its name corrupted from "Bacchara," the altar of Bacchus. Baccarach was so completely pillaged by the troops of Louis XIV. in 1689, that the French commander was obliged, on the night before he left the town, to sleep on straw, which was used next day for burning it; eight miles north of Deux Ponts, and

twenty-three fourth of Coblenz. N. lat. 50° 2'. E. long. 7° 52'.

BACCARACH *Wine*, a name of a particular kind of wine, by some esteemed a kind of Rhenish; but Portius, who has written expressly on the subject, observes that it differs from all the common Rhenish wine, in colour, odour, taste, and virtue.

BACCARUM, in *Entomology*, a species of *Acarus*, found on gooseberries, currants, and other fruit-trees. The abdomen is distended, red, and dusky on the sides. Linn. Fn. Succ.

BACCARUM, a species of *Cimex*, of a somewhat fulvous colour; margin of the abdomen spotted with brown. Degeer, Gmelin. Inhabits Europe.

BACCHEÆ, in *Antiquity*, the priestesses of Bacchus, who celebrated the orgia, or mysteries of that god.

The word was also used for the ivy crowns and garlands worn by the priests of Bacchus, in offering sacrifices to him.

BACCHANALIA, religious feasts in honour of Bacchus, celebrated with much solemnity among the ancients, particularly the Athenians, who even computed their years by them, till the commencement of Olympiads.

The bacchanalia are sometimes also called orgia, derived, as some conceive, from the Greek *οργη*, *fury*; on account of the madnet and enthusiasm wherewith the people appeared to be possessed at the time of their celebration.

They were held in autumn, and took their rise, according to Herodotus, from Egypt, where they were known under the name of the mysteries of Isis and Osiris; whence, according to Diodorus, they were brought into Greece by Melampus; and they afterwards passed into Italy and Gaul, and were adopted almost throughout the whole Pagan world.

The form and disposition of the solemnity depended, at Athens, on the archon, and was at first exceeding simple; but, by degrees, it became incumbered with a number of ridiculous ceremonies, and attended with much dissoluteness and debauchery; insomuch that the Romans, who grew ashamed of them, suppressed them by a senatus-consultum throughout all Italy, A. U. C. 568. B. C. 186. It was a saying of Plato, recorded by Diogenes Laertius, (l. iii. Segin. 39.), that to drink to excess was not allowable, except upon the festival of that god who is the giver of wine.

The women had a great share in the solemnity, which is said to have been instituted on their account; for a great number of them attended Bacchus in his expedition to India, carrying in their hands the *thyrsus*, i. e. a *stile lance*, covered with ivy and vine leaves, singing his victories and triumphs wherever they went; the ceremony was kept up after Bacchus's deification, under the title of Bacchanalia, and the women were intitled priestesses thereof, under that of *Bacche* or *Bacchantes*.

These priestesses, at the time of the feast, ran through the streets, and over the mountains, covered with tiger's skins, their hair dishevelled, their thyrsus in one hand, and torches in the other, howling and shrieking *εὐφροσύνη, εὐφροσύνη, or εὐφροσύνη*, or *La Bogy*.

Men and women met promiscuously at the feast, all perfectly naked, except only for the vine-leaves and clusters of grapes, which bound their heads and hips; here they danced and jumped tumultuously, and, with strange gesticulations, sang hymns to Bacchus, till, being weary and giddy, they tumbled down.

The licentiousness of these, and of some other festivals, was to well known, that it was the advice of wise men to

married women to abstain from the feasts of Bacchus, and Ceres, and the mother of the gods. Hence that saying of Aristippus, mentioned by Sextus Empiricus, concerning a chaste woman, "That she will not be corrupted even at the Bacchanals;" intimating the great danger of being vitiated that attended these festivals.

BACCHANALIA, *Bacchanals*, is also a name given to pictures, or basso-relievos, whereon the feast is represented, consisting chiefly of dances, nudities, and the like. Of these basso-relievos, we have seven or eight in the "Monumenti inediti" of Winkelmann. They are also exhibited on a fine vase of agate, preserved in the abbey of St. Denis, in France.

There are antique bacchanals still seen on several ancient friezes. The bacchanals painted by Poussin are excellent.

In the Justinian garden at Rome, there is a marble vase of most precious workmanship, upon which is a representation of these orgies of Bacchus. The vase, from the beauty of its sculpture, is supposed to be by the hand of Saurus. The whole pomp of one of these processions is there admirably represented; in which are introduced Bacchus, the Bacchanals, the Menades, the players on flutes, matrons and virgins, with the crotalum or cymbalum, and tympanum; fawns and satyrs, holding in their hands vases and cups; priests leading the victims destined for sacrifice, such as the boar, the he-goat, and the bull; and, lastly, old Silenus, drunk, upon his ass, which he is hardly able to guide. Burney's Hist. Mus. vol. i. p. 300.

Some writers call the Romish CARNAVAL, the *Christian Bacchanalia*.

BACCHARIS, in *Botany*, ploughman's spikenard. Lin. 949. Schreb. 1285. Gertn. t. 166. Juss. 185. Class, *Syngnesia polygamia superflua*. Nat. Ord. *Compositæ. Corymbifera* Juss. Gen. Char. *Cal.* common, cylindrical, imbricate; scales linear, acute. *Cor.* compound, equal; corollules hermaphrodite and female mixed; proper, to the hermaphrodite, funnel-form, five-cleft; to the females, scarcely apparent, almost none. *Stam.* filaments five, capillary, very small; anthers cylindrical, tubular. *Pyl.* gem ovate; style filiform, the length of the flower; stigma bifid. *Per.* none. *Calyx* unchanged. *Seal.* solitary, very short, oblong; down simple. *Ree.* naked.

Eff. Gen. Char. *Cal.* imbricate, cylindrical; florets female, mixed with hermaphrodites; down simple. *Recept.* naked. *Obj.* This genus scarcely differs from that of *Conyza*.

Species, 1. *B. jugoslavica*, Peruvian ploughman's spikenard. *Eupatorium Africanum*, &c. Pluk. Phyt. t. 328. f. 2. "Leaves lanceolate, longitudinally tooth-ferrate." Five or six feet high. The female florets with a trisid corolla are very abundant. The hermaphrodites at the disk are few and five-cleft; scales of the calyx in a state of maturity spread very much; florets of the disk barren, of the ray fertile, subulate, scarcely toothed; recept. conical. A native of America. Cultivated at the Chelsea garden in 1696. 2. *B. nerifolia*, oleander-leaved ploughman's spikenard. "Leaves lanceolate, ferrate at the upper part with one or two toothlets." This rises, with a soft shrubby stalk, to the height of eight or ten feet. Flowers of an herbaceous colour, produced in spikes at the extremities of the branches. 3. *B. arborosa*. "Leaves elliptic-lanceolate, quite entire, naked, petioled." About three feet high, with a trunk the thickness of the human arm. Leaves alternate, acute, rough; the terminal corymbs panicled. Observed in woods on the island of Johanna, by Koenig. 4. *B. halimifolia*, sea-purslane-leaved ploughman's spikenard, or groundsel tree. "Leaves obovate, emarginate-crenate in the up-

per part." Stems shrubby, six feet high; leaves many, like those of goose-foot, but stiffer, irregularly placed on the branches; flowers crowded, naked, at the ends of the twigs, not handsome, so that it is rather for the foliage of the plant, which continues green throughout the year, that it is usually cultivated. A native of North America. Cultivated by bishop Compton in 1688. 5. *B. Dioscoridis*. "Leaves broad, lanceolate, toothed, sessile, stipuled." Shrubby, six feet high; leaves alternate, half stem-clasping, deeply indented at the base, soft; panicles small; calyx shorter than the flower. It is wrongly named *Baccharis* of Dioscorides, see *Supp. Plant.* 367. A native of Egypt. 6. *B. indica*. "Leaves obovate, tooth-letted, petioled." Leaves smooth; branches with raised streaks; corymb large, terminating; peduncles angular, with subulate bracts; calyxes cylindrical, smooth. A native of Ceylon, and the cape of Good Hope. 7. *B. brasiliensis*. "Leaves obovate, entire, scabrous, sessile, veined underneath." Stem somewhat angular; leaves obtuse, almost quite entire; panicles nearly naked, with remote alternate flowers; down ferruginous. It differs from the *indica* in having stiffer, sessile, and scarcely toothed leaves, and its flowers larger, fewer, and more remote. A native of Brasil. 8. *B. fetida*. "Leaves lanceolate, ferrate-toothed, corymbs leafy." Six or seven feet high; leaves long, hoary on the under side, of a disagreeable smell when handled; corymbs terminal. A native of North America. Cultivated here in 1729. 9. *B. chinensis*. *Lour. Coch.* 494. "Leaves lanceolate, quite entire, tomentose beneath, stalked; peduncles many-flowered, axillary." An under-shrub, three feet high, erect, simple, round; leaves alternate, stalked; flowers yellow, oblong. A native of China, near Canton.

Propagation and Culture. Species 1. may be propagated by cuttings, planted in a shady border, during any of the summer months; or by seeds sown on a common border in the spring. If planted in a warm situation, it will live in mild winters in the open air; but it is usually kept in the green-house, and placed out in summer. It requires much water in warm weather. The second species is difficult to propagate, for the cuttings will seldom take root, and it rarely has shoots near the ground to lay down, so that in Holland they lay down the entire head of young plants, sitting the smaller branches, in the same manner as is practiced for carnations, laying them into the ground, and forking each down to prevent their rising: these, when duly watered, will put out roots in one year, when they may be taken off, and planted in small pots filled with light earth, and placed in the shade till they have taken new root. In summer they ought to be kept in a sheltered situation, and in the green-house in winter. The fourth species may be propagated by cuttings planted in April or May, in a shady border, and if properly watered they will be fit for transplanting in the places where they are to remain at Michaelmas. The eighth species may be also propagated by cuttings, which in about two months take root, when they are to be potted and kept under a frame during the winter. The others are more tender and require the protection of a stove, but are little known in this country. See Martyn's Miller's Dict.

BACCHARIS. See ATHANASIA, CHRYSOCOMA, CONYZA.

BACCHARIS was also the name of a sweet ointment among the ancients, so called perhaps from this herb's being a principal ingredient in it.

BACCHAROIDES. See CONYZA.

BACCHI, in *Mechanics*, a kind of ancient machines, in form of goats, used by Jupiter in his wars against the giants. Rudbeck

Rudbeck describes two kinds of bacchi, one made like the battering-ram, wherewith Jupiter demolished the enemies' fortifications; the other contrived to cast fire out of, from whence the Greeks are conjectured to have framed their idea of chimera.

BACCHIAS, and ΑΝΤΙΒΑCCHIAS, in *Ancient Geography*, the name of two islands in the Arabic gulf, according to Pliny. They are called by Ptolemy and Stephanus, *Bacchi* and *Antibacchi insule*.

BACCHIC, something relating to the ceremonies of Bacchus. The celebrated intaglio, called Michael Angelo's ring, is a representation of a bacchic feast.

BACCHIC *Song*, is sometimes used for a *chançon à boire*, or composition to inspire jollity. But, in a more proper sense, it is restrained to a dithyrambic ode, or hymn.

BACCHICA, in *Botany*, is sometimes used for *h. dera*, or *ivy*.

BACCHIGLIONE, in *Geography*, a river of Italy, in the state of Venice, which, after watering Vicenza and Padua, discharges itself into the gulf of Venice, near Chioggia.

BACCHINI, BENEDICT, in *Biography*, a learned monk, was born at Borgo San Donino, in the duchy of Parma, in the year 1651. At the age of sixteen he entered into the order of St. Benedict, in the monastery of Mount Cassin, and applied to his studies so intensely as to injure his health. After having travelled with Arcioni, abbot of the Benedictines at Ferrara, to whom he was secretary, he resigned his office, and settled at Parma. Here he published a literary journal, manifesting great learning and judgment; but it excited against him many enemies, who prevailed with the duke of Parma to banish him from his territory. Bacchini then retired to Modena, where he was patronised by the duke of Modena, and appointed his historiographer and librarian. The materials which he collected for investigating the genealogy and history of the house of Este, were transferred to his successor Muratori, upon his removal to the abbacy of the Benedictines of Modena. In 1705, he founded at Modena an academy of ecclesiastical literature. His last preferment was that of professor of ecclesiastical history in the university of Bologna, where he died, at the age of seventy, in the year 1721. Bacchini was one of the most celebrated scholars of his age, distinguished by his universal learning, refined taste, theological skill, and ecclesiastical philology; to all which he added in early life eloquence as a preacher; and in more mature years critical acumen, and eminent skill in decyphering manuscripts. Besides his literary journal, commenced at Parma in 1686, and continued to 1690, resumed at Modena from 1692 to 1697, and extant in nine volumes 4to.; he wrote in Italian "the History of the Benedictine Monastery of Polirone;" and in Latin, "De Sistrorum Figuris ac Differentiâ," 4to. Bononiæ, 1691, and reprinted at Utrecht, 4to. 1696, with notes by Tollius; "De Ecclesiasticæ Hierarchiæ Originibus," 4to. Modenæ, 1703; and some other small pieces. *Nouv. Dict. Histor. Gen. Biog.*

BACCHIS, in *Ancient Geography*, a town of Egypt, near the lake Mœris. Ptolemy.

BACCHIUM, an island of the Ægean sea, opposite to Phocæa, at the entrance of the gulf of Smyrna. The temples and statues, with which it was richly adorned, were ransacked by the Romans.

BACCHIUS, in the *Latin Poetry*, a kind of foot, consisting of three syllables: whereof the first is short, and the two latter long; as *ἄγγιστῶν*.

The bacchius is the reverse of a dactyl, and takes its name from that of Bacchus, because frequently used in the

hymns composed in his honour. It was also called among the ancients, *anotrius*, *trigodius*, *fabians*; and by the Greeks, *παρὰ μῦθον*.

BACCHIUS SENIOR, in *Biography*, one of the seven Greek writers in music, collected and published with a Latin translation and notes, by Meibomius, in 1652, is supposed to have flourished about the time of Ptolemy, that is, in the second century. His "Introduction to the Art of Music," is in dialogue; in the course of which all the terms used in the ancient Greek music are defined, and explained in Greek characters of notation.

Bacchius is the only one of these seven ancient musical writers, who, like Ptolemy, allows of no more than seven modes. See *MODES*. On the subject of rhythm, he quotes Aristoxenus, Nicomachus, Leophantus, and Didymus; so that it is certain he wrote subsequent to all those authors.

BACCHUS, in *Entomology*, a large species of *SCARABÆUS*, that inhabits the cape of Good Hope. The shield of the head is four-toothed; thorax gibbous, and with the wing-cases glabrous. Fabricius.

BACCHUS, a species of *CURCULIO* that inhabits Europe. It is coppery, with the snout and ends of the feet black. Fabricius, &c.

BACCHUS, a species of *MONOCULUS*, with an orbicular shell: antennæ extended horizontally: tail denticulated on each side. Müller entomoftr. Inhabits rivers.

BACCHUS, in *Mythology*, a name synonymous among the Phœnicians with "mourning," and supposed to be derived from the Phœnician term *bakab*, *to weep*, and given to several deities, or rather to the same god, acknowledged under various distinct epithets and characters in the different countries where he was worshipped. In Egypt, he was called *Osiris*; in Arabia, *Adoneus*; in Mylia, *Phœnæus*; in India, *Dionysus*, or *Dionysus*; by the Lucanians, *Pentheus*; throughout the Roman dominions, *Liber*, &c. &c. The reasons assigned for these different appellations, by which the same god was distinguished, are stated by Banier in the second volume of his "Mythology." It is natural to suppose that the Greeks and Romans, in their usual manner, bestowed upon the *one* Bacchus whom they worshipped, the several actions and attributes of the *many* divinities known by that name, and by other equivalent denominations in different countries. Cicero (*de Nat. Deor.* iii. 23.) mentions five divinities known by the name of Bacchus, and thus adds two to the three of Diodorus Siculus and Philostratus. Antiquity, however, has chiefly distinguished two gods, under the title of Bacchus; that of Egypt, the son of Ammon, and the same with Osiris; and that of the Greeks, or of Thebes in Bœotia, the son of Jupiter and Semelé. The Bacchus of Egypt was the Dionysus of the Arabians, so called from the city of Nyfa in Arabia Felix, where he was brought up, and worshipped by them in consequence of the glory he had acquired by leading his army into India. (See *DIONYSUS*.) According to Sir Isaac Newton (*Chron. and Op.* vol. v. p. 77—80.), this great Bacchus, whom the Arabians so denominated from a word which in their language signified "great," was the same with Sesac or Sesostris, who became king of Egypt in the reign of Solomon. (1 Kings xi. 40.) See *SESAC*, and *SESOSTRIS*.

All agree (says this author) that Bacchus was the same king of Egypt with Osiris (see *OSIRIS*); and he supposes that the Cælus, or Uranus, or Jupiter Uranius of the Arabians, the other god besides Dionysus whom they worshipped, was the same king of Egypt with Ammon, the father of Bacchus, according to the poet:

“*Quamvis Æthiopum populis, Arabumque beatis
Gentibus, atque Indis unus sit Jupiter Ammon.*”

(See AMMON.) Sir Isaac Newton adds, that when Ariadne, the daughter of Minos, was deserted by Theseus in the island Naxos or Dia, and taken up by Glaucus, an Egyptian commander at sea, she became the mistress of the great Bacchus, who was at that time returning from India in triumph; and by him she had two sons, Phylas and Eumendon, who were Argonauts. This Bacchus was caught in bed in Phrygia with Venus, the mother of Æneas, according to Homer (*Odys. l. viii. v. 292.*), just before he came over the Hellespont and invaded Thrace; and he married Ariadne, the daughter of Minos, according to Hesiod (*Theogon, v. 947.*); and therefore, by the testimony of both Homer and Hesiod, who wrote before the Greeks and Egyptians corrupted their antiquities, this Bacchus was one generation older than the Argonauts; and so being king of Egypt at the same time with Sesostris, they must be one and the same king. They also agree in their actions: Bacchus invaded India and Greece: and after he was routed by the army of Perseus, and the war was composed, the Greeks did him great honours, and built a temple to him at Argos, and called it the temple of the Ctesian Bacchus, because, as Pausanias relates (*l. 2. c. 23.*), Ariadne was buried in it.

The distinctive character of this Indian Bacchus was a long beard, whence he was denominated “the bearded Bacchus,” or *Καλιπρωγυαν*. Some have supposed that there was another Bacchus peculiar to Egypt, and the most ancient of all; and, indeed, Diodorus Siculus seems to warrant this opinion, by mentioning three different deities under this appellation. Accordingly, Bochart (*Geog. Sacr. l. i. c. 18. apud Oper. t. i. col. 439, &c.*) suggests, that Bacchus was the same with Nimrod the father of Ninus; and he supposes that the worship of this deity originated in Assyria, and from thence was transmitted to the Syrians and Phœnicians; and that it was communicated by the Phœnicians to the Greeks. Many of his names, attributes, and actions bear an obvious allusion to the scripture history, and are most satisfactorily elucidated by it. Amongst those who have referred the origin of Bacchus, and the worship that was performed in honour of him, to the earliest antiquity, and very nearly to the dispersion at Babel, we may mention the learned Mr. Bryant, who discovers in the history of the exploits of this illustrious person, references to the migration of the Cushite colonies, or of the sons of Chus, who, upon the dispersion, partly betook themselves eastward to the Indus and Ganges, and partly passed into Egypt. See CUSHITES, and DISPERSION.

The Theban Bacchus, or Grecian Bacchus, is particularly distinguished by Diodorus Siculus, *l. iii.* This historian informs us, that Orpheus first deified the son of Semele by the name of Bacchus, and that he appointed his ceremonies in Greece, in order to render the family of Cadmus, the grandfather of the Grecian Bacchus, illustrious. Semele, it is said, was struck with lightning at the very instant of her son's birth; and the child was probably denominated Bacchus, from the grief which this melancholy accident might have occasioned in the family. Cadmus, with a view of concealing his daughter's dishonour, conveyed away his infant grandson, as it should seem, to some of his relations in Phœnicia or Egypt. After having been there instructed in the mysteries of Isis and Osiris, and initiated in all the magical or juggling tricks of the Egyptian priests and magicians, and having attained the maturity of age, he returned to Thebes with the traditional retinue of the original deity of the same name, and claimed divine honours; which, after

some opposition, were allowed him. To this Grecian Bacchus the actions of Osiris were ascribed, together with a variety of absurd and disgraceful adventures in which his prototype had no concern. Hence the Theban Bacchus became a monster of licentiousness and debauchery; whereas the Egyptian was of a very contrary character. Of course the mysteries of the former were attended with the most shocking abominations. See BACCHANALIA.

According to the account of Diodorus Siculus (*l. iii. p. 207.*) there was no nation upon earth, neither Græcia nor foreign, that was not indebted to this deity for some mark of his munificence and favour. He taught the people to plant the vine, and to preserve the juice of the grape, and to lay up the fruits of the earth in proper repositories. Those who possessed an harsh and ungenial soil, not adapted to the cultivation of the vine, were shewn the art of making a drink from barley, not less grateful than that which proceeded from the grape. He adds (*l. iv. p. 210.*), that the person, from whom these blessings were derived, is represented of the highest antiquity, and the greatest benefactor ever known by mankind. Such is also the history given of Osiris, under which character, says Bryant (*Ant. Myth. vol. iii. p. 445.*), we are to understand a people who went forth and performed all that has been mentioned. Their religion consisted in the worship of the sun under various titles; accordingly however Dionusus or Bacchus may be diversified by various names or titles, all of them, as this learned writer imagines, with regard to worship, relate ultimately to the sun. Such was also the opinion of Selden (*De Diis Syris, p. 77.*) To this worship were added, by the ancient people to whom Bryant refers, divine honours paid to their ancestors, the Baalim of the first ages: all which were attended with particular mysterious rites, in which were commemorated the circumstances of the deluge, and the history of the great patriarch by whom mankind was preserved. Bacchus was esteemed one of the founders of medicine.

Diodorus Siculus further informs us, that it was Bacchus, the son of Semele, who invented farces and theatres, and who first established a music school, exempting from all military functions such musicians as discovered great abilities in their art; on which account, says the same author, musicians formed into companies have since frequently enjoyed great privileges.

Dr. Burney (*Hist. Music, vol. i. p. 298.*) observes, that the dithyrambs, which gave birth to dramatic representations, are as ancient as the worship of Bacchus in Greece; and there is little doubt but that the ceremonies of his mysteries gave rise to the pomp and illusions of the theatre. Many of the most splendid exhibitions upon the stage for the entertainment of the people at Athens and Rome being performed upon the festivals of Bacchus, gave occasion to the calling all those that were employed in them, whether for singing, dancing, or reciting, “servants of Bacchus.” Pausanias, in his *Attics* (*p. 7. cl. Kühnii*), speaks of a place at Athens consecrated to Bacchus the *finger*; thus named, he says, for the same reason as Apollo is called the chief and conductor of the Muses. Whence it should seem, says Burney (*ubi supra*), “that Bacchus was regarded by the Athenians not only as the god of wine, but of *song*; and it must be owned, that his followers, in their cups, have been much inclined to singing ever since. Indeed we are certain, that in none of the orgies, processions, triumphs, and festivals, instituted by the ancients to the honour and memory of this prince of *Uns zivende* music was forgotten, as may be still gathered from ancient sculpture, where we find not only that musicians, male and female, regaled him with the lyre,

lyre, the flute, and with song; but that he was accompanied by fawns and satyrs playing upon timbrels, cymbals, bagpipes, and horns; these Suidas calls his ministrals; and Strabo gives them the appellations of Bacchi, Sileni, Satyri, Bacchæ, Lingæ, Thyæ, Marillones, Naiades, Nymphæ, and Thyri. These representations have furnished subjects for the finest remains of ancient sculpture; and the most voluptuous passages of ancient poetry are descriptions of the orgies and festivals of Bacchus.

Nonnus, an Egyptian of Pentapolis, who lived in the fifth century, has collected all the fabulous adventures of Bacchus, and exhibited them in a beautiful, but irregular, poem, under the title of "Dionysiacs." See DIONYSIACA, and NONNUS.

The Grecian Bacchus, the god of wine and song, is usually represented under the figure of a jolly beardless youth, crowned with ivy (that plant, as it is said, being reputed an antidote to the intoxicating effects of wine), and also vine-leaves; bearing in one hand a spear or thyrsus, wrapped with the same, and in the other, grapes, a cup or a horn for drinking; and drawn on a car by tigers and panthers. He is sometimes exhibited with a mitre on the head, or a kind of band or fillet raised in front, and falling back over the shoulders, and with his temples ornamented by horns. These horns originated from the relation he sustained to the sun, whose rays were thus represented. On the Greek medals, Bacchus is known by his crown of ivy or vine, his diadem and horn, with a tiger and satyrs around him.

BACCHUS, in *Experimental Philosophy*, is the name of a small brass apparatus (*Pneumatics*, Pl. IX. fig. 73.) seated on a cask, with a tube proceeding from the mouth to the barrel; this is filled with red wine, or coloured water, so that being put under a receiver, when the air is exhausted, the liquor is thrown up into his mouth, by the expansion of confined air, and the rosy god seems to be at his usual employment; while he is drinking, his belly expands, which is effected by a bladder, containing a small quantity of air, concealed under his shirt.

BACCHYLIDES, in *Biography*, a celebrated Greek lyric poet, the nephew of Simonides, was a native of the island of Ceos, and flourished in the 82d olympiad, B. C. 452. He is reckoned the last of the nine lyric poets of ancient Greece. The purity of his style, the correctness of his manner, and the regular and connected beauties of his work (See Longin. de Sublim. c. 33.) obtained for him an applause of which Pindar might have been jealous. These two poets divided, for some time, the favour of king Hiero, and the suitresses of his courtiers; but when the royal patronage no longer prevented each from taking his true place, Pindar flared to the skies, and Bacchylides remained on earth. The compositions of Bacchylides consisted of hymns, odes, and epigrams, which abounded in moral sentiment; so that the emperor Julian, according to Ammianus Marcellinus, was so much delighted with them, that he was frequently accustomed to repeat his verses. Horace is said sometimes to have imitated him in some of his pieces, particularly in the prophecy of Nereus, which was suggested by the Greek poet's vaticination of Callandra. Some fragments only of Bacchylides now remain. Anacharsis, vol. vi. p. 342.

BACCHYLUS, a Christian divine, was bishop of Corinth in the second century. He is mentioned by Dusebius, with Polyerates bishop of Antioch, and others, who had left testimonies of the orthodoxy of their faith in writing. He afterwards speaks of a letter written by Bacchylus, about the time of celebrating Easter. Jerom, in his Catalogue, says, that Bacchylus, bishop of Corinth, who nou-

rished in the time of the emperor Severus, wrote an elegant book about Easter, in the name of all the bishops of Achaia. His works are lost. Euseb. H. E. l. v. c. 22, 23. p. 192. Hieron. de Vir. Illust. c. 44. Lardner's Works, vol. ii. p. 305.

BACCIFEROUS PLANTS, in *Botany*, are such as bear berries, i. e. fruit, covered with a thin membrane, whereof is contained a pulp, which grows soft and moist when ripe, and incloses the seed within its substance. The bacciferous trees Mr. Ray divides into four kinds: 1. Such as bear a caliculate, or naked berry, the flower and calyx both falling off together, and leaving the berry bare, as the affras tree, &c. 2. Such as have a naked monopyrrenous fruit, that is, containing in it only one seed; as the arbutus, the torcbinthus, leucæus, &c. 3. Such as have a naked, but a polypyrrenous fruit, that is, containing two or more kernels or seeds within it, as the jacinthum, lignitum, &c. 4. Such as have their fruit composed of many aleni or round soft balls, set close together, like a bunch of grapes; as the uva uatica, the rubus vulgaris, rubus idæus, and the rubus minor fructu cæruleo.

BACCINIUM, or BACCINA, in *Antiq. polyt.* a basin or vessel to hold water to wash the hands. The holding the basin, or waiting at the basin, on the day of the king's coronation, was an ancient tenure in feoffment. Lib. Rub. Scaccar. f. 137.

BACCICI, or BACCET, in *Biography*. See GAULI.

BACCIO, FR. BARTOLOMEO, called *Bartoloni* à S. Marco, a painter of history and portrait, was born at Savignane, near Florence, in 1469, and became a disciple of Cosimo Rosselli; but derived his principal knowledge in the art of painting from Leonardo da Vinci. He understood the true principles of design better than most masters of his time, and was also a considerable painter in perspective; so that he directed the studies of Raphael with regard to the art of managing and uniting colours, as well as the rules of perspective. Some years after Raphael left Florence, Baccio visited Rome; and by the observations he made on the antiques, and the works of Raphael, he made great improvement, which was manifested in his picture of St. Sebastian. This picture, which he finished after his return to Florence, was so well designed, so naturally and beautifully coloured, and had also such an expression of pain and agony, that it was removed from public view in the chapel of the convent, because it made too strong an impression on the imaginations of many women who beheld it. He was very laborious, and studious nature; he designed the naked correctly; his figures had much grace, and his colouring was admirable. To him is ascribed the first invention of the machine called by the artists a layman, and at this day generally used. Upon this he placed his draperies, for the purpose of more accurately observing their natural and their more elegant folds. A capital picture of the Ascension by Baccio is in the Florentine Collection. He died in 1517. Pilkington.

BACCHUS, ANDREW, a native of Ancona, practised medicine at Rome, towards the end of the 16th century. He was physician to Cardinal Meano Columna, and afterwards to pope Sixtus the fifth. A man of indefatigable industry, and of great genius and learning, as his numerous publications testify. The principal of them "De Thermis, Lacuibus, Fluminibus, et Balneis totius Orbis," 8vo. v. l. first printed at Venice, 1571; again 1588; then at Rome, 1622; at Padua, 1711, 1713. The last edition is augmented with an eighth book, containing analyses of the different mineral waters, with observations extracted from other writers on the subject. We have also of this author, treatises, "De Venenis, et de Acidosis," 4to. Rome, 1589; "De Dignitate

Dignitate Theriacæ," also 4to. Patavii, 1583; "De Naturali Vinorum Historia, de Vinis Italiae, et de Conviviis Antiquiorum," fol. Romæ, 1596; "De Gemmis et Lapidibus pretiosis, de eorum viribus et usu," 12mo. Francof. 1603, and 1643; with various other works. Haller Bib. Med. Pract. p. 157.

BACCOFOE, in *Botany*, the name of a fruit very common in Guinea. It is like the banana, except that it is whiter, thicker, and shorter. The taste and smell are both very agreeable, and some pretend, that on cutting it through transversely, there is the figure of a crucifix on each side of it. Phil. Trans. N. 108.

BACH, SEBASTIAN, in *Biography*. The illustrious family of Bach has produced more great musicians, than any other single family in Germany, or, perhaps, in Europe; as previous to the great eminence to which Sebastian had arrived, early in the last century, his family, according to Walther, had distinguished itself in the profession of music, particularly in organ-playing, for four generations. Innumerable are the stories still circulating in Germany, of Sebastian Bach's conflicts and triumphs over great competitors, till at length, like a courser often victorious, his form was so high, as to discourage all competition. He was as superior to all organ-players on the continent, as Handel was in England. The performances and compositions of these two great musicians, not only surpassed those of all their cotemporaries, but established a style of playing and writing for the organ, which is still respected and imitated by the greatest organists in Germany, where men of superior abilities have always abounded, and been celebrated, not only for treating the manuals, but the pedals of that noble instrument.

Sebastian Bach is said by Marpurge, in his "Art de la Fugue," to have been "many great musicians in one, profound in science, fertile in fancy, and in taste easy and natural;" he should rather have said, original and refined, for to the epithets easy and natural many are unwilling to assent; as this truly great man seems by his works for the organ, to have been constantly in search of what was new and difficult, without the least attention to nature and facility.

Old Kirkman, the harpsichord maker, used to relate the extraordinary curiosity excited at Salzburg, when Handel and Sebastian Bach happened to meet in that city. On their going together to the cathedral, they found it so full that they could scarcely get to the organ-loft; and when one of them opened the organ, it was not possible for more persons to crowd into the church. But so great was the fame of these performers, that those who could not gain admission into the interior of the building, procured ladders, and placed them at the windows, in order to gratify their ears with all the passages which the full organ could convey to them through all impediments.

Of *Sebastian Bach*, who was successively cantor, organist, and music director, at Leipzig, all the musical writers of Germany for these last sixty years, have born testimony to the abilities. Quantz in his "Art of Playing the Flute," written during the life of Bach, says, that this admirable musician had brought organ playing to the highest degree of perfection.

The challenge which he received and accepted, from the celebrated French organist Marchand, at Dresden, is well known in Germany. Upon the arrival of Marchand in that city, after he had vanquished all the organists of France and Italy, he offered to play extempore with any German whom the king of Poland could prevail upon to enter the lists against him; no one at Dresden had the courage to encounter so successful a champion; but an express being sent to

Sebastian Bach, who was at that time a young man, and residing at Weimar, he came away immediately, and, like another David, vanquished this Goliath. It must not, however, be concluded from this defeat, that Marchand was a mean performer; if that had been the case, the victory over him would have added nothing to the fame of his competitor. It was an honour to Pompey that he was conquered by Cæsar, and to Marchand to be only vanquished by Bach.

This was the Bach whom the learned editor of the Latin Theaurus, John Matthias Gefner, has celebrated in his notes on Quintilian, i. xii. p. 61. where the ancient citharedists are extolled for the use they made of their feet as well as their hands (perhaps merely to beat time) in their performance. The critic addressing himself to the shade of Quintilian, exclaims; "you would think but slightly, my dear Fabius, of all those exertions of the citharedists, if you could revisit the world, and attend the exhibitions of Bach, one of my colleagues in the university of Leipzig; who, when at the great organ, while every finger of both hands is engaged at the manuals, his feet are running over the pedals with a skill and velocity which several of your citharedists with 500 tibicinists could not emulate; nor is his dexterity inferior in directing a band of thirty or forty performers, all employed at once; correcting the time of one by his nod, of another by his foot, and of a third by holding up a threatening finger; giving the right note to one from the top of his voice, to another from the bottom, and to a third from the middle of it; if you could have seen him amidst the very powerful sounds with which he was surrounded, performing a very difficult part himself, yet marking whence proceeded the least discordance, and aiding those that erred; favourer as I am of antiquity, the exertions of our Bach appear to me to effect what not many Orpheuses, nor twenty Arions, could achieve."—"Maximus alioquin antiquitatis factor, multos unum Orpheas et viginti Arionas complexum Bachium meum, et si quis illi similis sit forte, arbitror." Sebastian Bach died at Leipzig in 1754.

BACH, *Charles Philip Emanuel*, son of Sebastian, resided many years at Berlin, in the service of Frederic II. king of Prussia; he was afterwards music-director at Hamburg, and long regarded as the greatest composer and performer on keyed instruments of his time; he was certainly the founder of the present style of composition for the piano-forte, as his father and Handel had been for that of the organ. It was observed by Abel, that if Sebastian Bach and his admirable son Emanuel, instead of being music-directors in commercial cities, had been fortunately employed to compose for the stage and public of great capitals, such as Naples, Paris, or London, and for performers of the first class, they would doubtless have simplified their style more to the level of their judges; the one would have sacrificed all unmeaning art and contrivance, and the other have been less fantastical and *recherché*; and both, by writing in a style more popular, and generally intelligible and pleasing, would have extended their fame, and been indisputably the greatest musicians of the eighteenth century.

Emanuel Bach, in his life, written at our request by himself, has some excellent reflections on his own style, which he formed and polished by hearing the greatest performers, vocal and instrumental, of his youth, who visited his father, or were employed in the theatre at Berlin. When the critics, says he, are disposed to judge impartially, which seldom happens, they are frequently too severe on works that come under their lash, from not knowing the circumstances that gave them birth, or remembering

ing the author's original intention. But how seldom are critics found to possess feeling, science, probity, and courage; qualities without which no one should set up for a sovereign judge. It is a melancholy truth, that musical criticism, which ought to be useful to the art, is in Germany a trade, commonly carried on by dry, malignant, and stupid writers. He then declares that of all his works, those for the clavichord or piano-forte are the chief in which he has indulged his own feelings and ideas. His principal wish has been to play and compose in the most vocal manner possible, notwithstanding the great defect of all keyed instruments, except the organ, in not sustaining their tone. But to make a harpsichord or piano-forte sing, is not easily accomplished; as the ear must not be tired by too thin a harmony, nor flunped by too full an accompaniment. In his opinion, music ought to touch the heart, and he never found that this could be effected by running, rattling, drumming, or arpeggios.

If Haydn ever looked up to any great master as a model, it seems to have been C. P. E. Bach: the bold modulation, rests, pauses, and free use of semitones, and unexpected flights of Haydn, remind us frequently of Bach's early works more than of any other composer. But in writing for violins, he has surpassed his model in facility and invention; freaks, whim, and even buffonery, appear natural to Haydn, which in the works of his imitators seem downright caprice and affectation. E. M. Bach used to be censured for his extraneous modulation, crudities, and difficulties; but, like the hard words of Dr. Johnson, to which the public by degrees became reconciled, every German composer takes the same liberties now as Bach, and every English writer uses Johnson's language with impunity. Emanuel Bach died at Hamburg, 1788, at near eighty years of age.

BACH, *John Christian*, arrived in England 1763, during the opera regency of the admirable female singer and actress, Colomba Mattei, who had engaged him as a composer of the serious opera. He was the youngest son of Sebastian Bach, and had been a considerable time in Italy, where he added new lustre to his name and family by his dramatic productions, and had been appointed by the empress queen organist of the Duomo at Milan.

On his arrival here, he was extremely mortified to find that he had no better fingers to write for than Ciordani and the Cremonini, two performers hardly worthy to be ranked in the second class; and for some time he totally declined composing for our stage, being unwilling, as a stranger, to trull his reputation to such performers. But, at length, having heard the De Amicis sing two or three serious songs in private, it suggested to him the idea of giving her the first woman's part in his serious opera; and having communicated his design to Mattei the impresaria, matters were soon arranged, and the De Amicis, who afterwards held the first rank among female singers in the serious operas of Naples and other great cities of Italy, was now first taken from the comic opera, and invested with the character of principal woman in the serious. And during the rest of the season, on Tuesday nights, she delighted the town as the representative of Thalia, and on Saturdays as that of Melpomene.

John Christian Bach's first opera in England, called *Orion, ossia Diana vendicata*, was honoured with the presence of their Majesties on the first night, February the 19th, 1763, and extremely applauded by a very numerous audience. Every judge of music perceived the emanations of genius throughout the whole performance; but were chiefly struck with the richness of the harmony, the ingenious

texture of the parts, and above all with the new and happy use he had made of wind-instruments; this being the first time that clarinets had obtained admission in our opera orchestras. Their Majesties honoured the second representation likewise with their presence, and no other serious opera was wanting for near three months. *Zembla*, however, a second serious opera by this composer, was brought out in May, which ran more than a month, when the season closed.

The principal songs of these two operas, though excellent, being calculated to display the copiousness of voice and delicate and difficult execution and expression of De Amicis, were not likely to become common or to run out of the opera house. The rest of the airs were so judiciously sung, that they were more admired as instrumental pieces, than compositions for the voice. But this excellent manner soon convinced us that he possessed every requisite for a great musician, by the facility he afterwards composed in every style of good singing; by his symphonies, quartets, and concertos for almost every species of instrument, as well as by his expressive and manly performance on the piano-forte. It is with pleasure that we take this opportunity of doing justice to the talent and abilities of a man who improved our taste both in composition and performance. Having very early in life been deprived of the instructions of his father, the great Sebastian Bach, he was for some time a scholar of his elder brother, the celebrated Charles Phil. Emanuel Bach, under whom he became a fine performer on keyed-instruments; but on going to Italy, and going to Italy, where his chief study was the composition of vocal music, he assured us, that during many years he made little use of a harpsichord or piano-forte but to compose for or accompany a voice. When he arrived in England, his style of playing was so much diminished, that he recovered many of the losses his hand had suffered by disuse, and by being constantly cramped and crippled with a pen; but he never was able to regulate it with force and steadiness sufficient for great difficulties; and in several his compositions for the piano-forte, such as *Ladies can execute* songs than instrumental pieces for the display of great execution. On which account, they lose much of their effect when played without the accompaniments, which are admirable, and so masterly and interesting to an audience, that want of hand, or complication in the harpsichord part is never discovered.

There are many admirable airs in the operas he composed for our stage that long remained in favour. The richness of the accompaniment perhaps deserve more praise than the originality of the melodies; which, however, are always natural, elegant, and in the best taste of Italy at the time he came over. The Neapolitan school where he studied, is manifest in his cantatas, and the science of his father and brother in his harmony. The operas of this master are the first in which De Capos disappeared, and with about this time began to be generally discontinued; the second part being incorporated with the first, to which, after modulation to the fifth of the key, the singer generally returns.

Bach seems to have been the first composer who observed the law of *campanella* as a *prima* *prima*. Before his time, contrast there frequently was, in the works of others; but it seems to have been accidental. Bach in his symphonies, and other instrumental pieces, as well as his songs, seldom failed, after a rapid and noisy passage, to introduce one that was slow and soothing. His symphonies seem infinitely more original than either his songs or harpsichord pieces, of which the harmony, mixture of wind-instruments, and general richness and variety of accompaniment, are certainly the

most prominent features. In the sonatas and concertos which he composed for his own playing, when his hand was feeble, or likely to tire, he diverted the attention of the audience to some other instrument; and he had Abel, Fischer, Cramer, Croft, Cervetto, and other excellent musicians to write for, and take his part, whenever he wanted support.

In 1755, he new set Metastasio's *Adriano in Siria*, in the performance of which the rich, powerful, and mellifluous voice of Manzoni was assigned the principal part. The expectations of the public the first night this drama was performed, occasioned such a crowd at the King's theatre as had been seldom seen there before. It was impossible for a third part of the company collected together on this occasion to obtain places. But whether from heat or inconvenience, the unreasonableness of expectation, the composer being out of fancy, or too anxious to please, the opera failed. Every one seemed to come out of the theatre disappointed, and the drama was performed but two or three times. This seemed matter of great triumph to the Italians, who began to be jealous of the Germanic body of musicians at this time in the kingdom. The songs were printed by the elder Weleker, and many of them sung afterwards at concerts with great applause, and found, as detached airs, excellent, though they had been unfortunate in their totality.

Soon after his arrival in England, J. C. Bach and his countryman Abel uniting interests, opened a subscription for a weekly concert; and as their own compositions were new and excellent, and the best performers of all kinds which our capital could supply enlisted under their banners, this concert was better patronised and longer supported than perhaps any one had ever been in this country; having continued for full twenty years with uninterrupted prosperity. Bach had not been long in London before he had the honour of being appointed chamber-musician and music-master to her majesty; and his merit seems to have been constantly well understood and royally patronized at St. James's to the end of his life, which he terminated, after a short illness, in 1782. And having much more genius than worldly prudence, he left his widow Mrs. Bach (formerly the signora *Graffi*, first woman at the opera during the run of *Gluck's Orfeo*) in very indigent circumstances; but her majesty finding that she wished to return to her own country, settled a pension upon her to enable her to end her days there in ease and comfort.

BACH, in *Geography*. See BATHA.

BACHA, in *Ornithology*, a species of *FALCO* figured in the fifteenth plate of LeVallant's work on the birds of Africa. It is about the size of that kind of falcon which we call the common buzzard; and it naturally belongs to that tribe of rapacious birds. The prevailing colour is a very deep brown, with the lower parts of the body and belly spotted with white, and a large band of the same white colour disposed transversely upon the tail. On the back of the head is a tuft of white feathers, with black tips, that forms a crest; the beak and legs are yellow. The plumage of the female is varied with whitish and yellow.

This is a solitary and ferocious creature; and its chief haunts are the barren mountainous parts of South America. It utters a piercing cry, which as it rebounds among the rocks is truly lamentable. The rapidity of this bird in flight is remarkable; and its patience when waiting for its prey is not less deserving mention; it will remain for hours together in one posture, and be during that time so completely immovable as to be mistaken for a point of the rock on which it rests; but the moment a lizard or any other reptile appears on which it feeds, it darts down upon it with the

greatest velocity. These birds build their nests in the craggy hollows of the rock; and the female lays two, or at most three, eggs at a time.

BACHAASH, in *Geography*, a small island among the western islands of Scotland, near the north-east coast of North Vail.

BACHELERI, LA, a town of France, in the department of the Dordogne, and chief place of a canton, in the district of Montignac; four leagues north of Sarlat.

BACHELOR, or BACHELOR, BACCALAUREUS, in *Middle Age Writers*, was a denomination given to those who had attained to knighthood, but were not rich enough, or had not a sufficient number of vassals, to have their banner carried before them in battle; or, if they were of the order of bannerets, were not yet of age to display their own banner, but obliged to march to war under the banner of another.

Camden and others define bachelor, a person of a middle degree between a knight and an esquire, of less age and standing than the former, but superior to the latter.

Others will have bachelor to have been a common name for all degrees between a mere gentleman and a baron.— Thus we find the lord admiral, when he was neither an earl nor baron, denominated a bachelor.—“Ant it is to weet, that when the admiral rideth to assemble a shippe of war, or other, for the business and affairs of the realm, if he be a bachelor, he shall take for his day-wages four shillings sterling; if he be an earl or baron, he shall take wages after his estate and degree.”

BACHELOR was more peculiarly a title given to a young cavalier, who made his first campaign, and received the military girdle accordingly.

BACHELOR was also a denomination given to him who had overcome another in a tournament, the first time he ever engaged.

BACHELORS, *Knights*, in *Heraldry*. See KNIGHTS *Bachelors*.

BACHELORS is also used in a college sense, to denote a person possessed of the *baccalaureate*, which is the first degree in the liberal arts or sciences.

The degree of bachelor was first introduced in the thirteenth century by pope Gregory IX. but it remains still unknown in Italy. At Oxford, before a person is entitled to the degree of bachelor of arts, he must have studied there four years; three years more to become master of arts; and seven more to commence bachelor of divinity.

At Cambridge, to commence bachelor of arts, he must have been admitted near four years, and above three years more before he commence master; and seven more still to become bachelor of divinity. He may commence bachelor of law after having studied it six years.

At Paris, to pass bachelor in theology, a person must have studied two years in philosophy and three years in theology, and held two acts of examination in the Sorbonne. Bachelors in the canon law are admitted after two years study in the same, and sustaining an act according to the forms. A bachelor of physic must have studied two years in medicine, after having been four years master of arts in the university, and having stood an examination; after which he is invested with the fur, in order to be licensed.

In the university of Paris, before the foundation of divinity-professorships, those who had studied divinity six years were admitted to go through their course, whence they were called *baccalarii cursores*; and as there were two courses, the first employed in explaining the Bible, during three successive years; the second, in explaining the master of the sentences for one year; those who were in their Bible course

were

were called *baccalarii Biblici*; and those arrived at the sentences, *baccalarii sententiarii*; and, lastly, those who had gone through both, were denominated *baccalarii formati*, or *formed bachelors*.

At present, *formed bachelor* denotes a person who has taken the degree regularly after the due course of study and exercises, required by the statutes; by way of opposition to a *current bachelor*, who is admitted in the way of grace, or by diploma.

We also find mention of bachelors of the church, *baccalarii ecclesie*.—The bishop with his canons and *baccalarii*, *cum consilio & consensu omnium canonivorum suorum & baccalariorum*.

There is scarce any word whose origin is more controverted among the critics than that of *bachelor*, *baccalarius*, or *baccalaureus*: the two different acceptations of the word literary and military, above recited, have each of them their advocates, who assert each to be the primitive sense, and derive the word accordingly.

Among those who hold the military bachelor to be the more ancient, is Cujas, who derives the word from *baccalarius*, a kind of cavalry, anciently in great esteem. Du-Cange deduces it from *baccalaria*, a kind of fees, or farms, consisting of several pieces of ground, each whereof contained twelve acres, or as much as two oxen would plough; the possessors of which *baccalaria* were called bachelors.

Caseneuve and Altaferra derive bachelor from *baculus*, or *bacillus*, a staff, because the young cavaliers exercised themselves in fighting with staves. Martinius derives it from *baccalaureus*, i. e. *baccā laureā donatus*, in allusion to the ancient custom of crowning poets with laurels, *baccis lauri*; as was the case with Petrarch at Rome in 1341. Aleiat and Vives are of the same opinion; nor is this etymology improbable.

BACHELORS, in the livery companies of London, are those not yet admitted to the livery.

These companies generally consist of a master, two wardens, the livery, and the bachelors, who are yet but in expectation of dignity in the company, and have their function only in attendance on the master and wardens; they are also called yeomen.

BACHELOR is also a name given in the six companies of merchants at Paris to the elders, and such as having served the offices, have a right to be called by the masters and wardens to be present with them, and assist them in some of their functions, particularly in what relates to the *chef d'œuvres*, or matter-pieces, of such as are candidates for being admitted masters.

BACHELOR is also particularly used for a man not married, or who is yet in a state of celibacy.

The Roman censors frequently imposed fines on old bachelors. Dion. Halicarnassens mentions an old constitution, by which all persons of full age were obliged to marry. But the most celebrated law of this kind was that made under Augustus, called the *lex Julia de maritandis ordinibus*, and by Horace (Carm. Secul. v. 5.) *lex marita*, by which bachelors were made incapable of legacies of inheritances by will, unless from their near relations. See PAPIAN-POPULIEN LAW.

The Rabbins maintain, that, by the laws of Moses, every person, except some few, is obliged in conscience to marry at twenty years of age: this makes one of their 613 precepts. Hence those maxims so frequent among their casuists; such as, that he who does not take the necessary measures to leave heirs behind him, is not a man, but ought to be reputed a homicide. Lycurgus was not more favourable; by his laws bachelors are branded with infamy, excluded

from all offices civil and military, and even from the shows and public sports. At certain feasts they were forced to appear, to be exposed to the public derision, and led naked round the market-place. At one of their feasts, the women led them in this condition to the altars, where they obliged them to make *amende honorable* to nature, accompanied with a number of blows, and lashes with a rod at discretion. To complete the affront, they forced them to sing certain songs composed in their own derision.

The Christian religion is more indulgent to the bachelor-state: the ancient church recommended it as preferable to, and more perfect than the matrimonial state.

In the canon law, we find injunctions on bachelors, when arrived at puberty, either to marry, or turn monk and profess chastity in earnest.

In Great Britain, taxes have been occasionally levied on bachelors, as by 7 W. III. 1695, which imposed a tax on such, after 25 years of age, of 12l. 10s. for a duke, and 1s. for a common person; and the taxes laid on others have been increased with regard to bachelors, as in the case of the duty on servants by stat. 25 Geo. III. c. 43. See SERVANTS.

BACHELORS, in *Geography*, a river of South America, which runs into a bay of the same name, on the north side of the straits of Magellan. N. lat. 53° 38'. W. long. 73° 52'.

BACHER, the name of a chain of Austrian mountains, in the south of Stiria.

BACHER'S *Toxic Pills*, in the *Materia Medica*. See HELLEBORE, and PILLS.

BACHIAN, or BATCHIAN, in *Geography*, one of the Molucca islands, lying south from Machian, and possessed, since the year 1610, by the Dutch. This is the largest of the little Moluccas, and is governed by a sultan, who is likewise sovereign of Oubi and Ceram, together with Goram. This monarch has a pension from the Dutch, either for the destruction or supply of nutmegs; but he is otherwise little subservient. Bachian rises into woody hills, and through the idleness or oppression of its inhabitants, is suffered to become wild and desert, although by cultivation it is capable of becoming fertile and productive, and it was represented as formerly producing the best cloves in the Moluccas. On the shores, as in most of the other isles of this archipelago, there are prodigious rocks of coral, of infinite variety and beauty. Its principal town is Sabongo; it is about twelve leagues in circuit, and has a burning mountain. It is situated nearly under the equinoctial in S. lat. 0° 25'. and E. long. 125° 5'.

BACHINA, in *Ancient Geography*, an island of the Mediterranean sea, near Smyraa, according to Pliny; called by Livy, *Bachium*.

BACHMUT, a town of Russia, in the province of Ekaterinostav, 104 miles W. N. W. of Azot. N. lat. 48° 25'. E. long. 37° 44'.

BACHO, a river of North Wales, which runs into the Severn near Landalos, in Montgomeryshire.

BACHOLKZ, or VONCHOTSCH, a town of Poland, in the Palatinate of Sandomitz, 20 miles south of Radom.

BACHOVIVS, REINER, in *Biography*, a German civilian, was born at Cologne, in 1544, and resided at Leipsic, where he suffered persecution on account of his religious principles, as he professed attachment to the doctrines of Calvin, rather than to those of Luther. Compelled not only to resign his public offices, but to quit Leipsic, he withdrew into the Palatinate, and found in the elector a generous patron. At Heidelberg, he held several honourable and lucrative posts till his death in 1614. In a theological

tract, intitled, "The Catechism of the Palatinate," he cited the writings of the fathers in defence of Calvinism. His son, of the same name, was professor of civil law in the university of Heidelberg, which he filled with distinguished reputation for more than 20 years, till the city was taken by count Tilly, and the university was dissolved by the elector Palatine. Upon this event, he quitted Heidelberg; but having suffered many disappointments and vexations on account of his Protestant principles, he returned to Heidelberg, and having united with the Catholic church, he was restored to his office upon the re-establishment of the university. His works, besides other law tracts, are "Exercitationes ad partem posteriorem Chilias Fabri," published in 1624, folio; "De Actionibus," 1626; "De Pignoribus et Hypothecis," 1627; "Disputationes de variis Juris Civilis Materiis," 8vo. Heidelberg. 1624; and "In Institutionum Juris Justiniani Libros quatuor Commentarii," 4to. Francf. 1628. Gen. Dict. Nouv. Dict. Hist.

BACHSTELZE, (*Wäisse Bachstelze*), in *Ornithology*, the name of the *MOTACILLA Alba*, or white wag-tail, in Frisch. Hist. Birds.

BACHU, in *Geography*. See BAKU.

BACILLARIA, in *Natural History*, a genus of *VERMES Infusoria* in Gmelin's Syst. Nat. of which only a single species is described, viz. *paradoxa*. In this genus the body consists of straw-like cylinders placed parallel to each other, and frequently changes its direction and arrangement. Müll. Gmel. &c.

BACILLARIS, a species of *TÆNIA*, with the head rounded, and proboscis pyriform; joints extremely narrow, and resembling pieces of straw placed on each other. Goëze. Infests the intestines of the mole; size of a very fine thread; neck without joints.

BACILLI, or BACULI, in the *Materia Medica*, such compositions as are made up in a cylindrical figure, like a stick; thus called from the Latin *baculus*, a staff. See LOZENGE.

BACINET, in *Ancient Armour*. See BASSINET.

BACK. See DORSUM.

BACK Bone. See SPINE.

BACK, in the *Manege*, and among *Farriers*. A horse's back should be straight, not hollow, which is called *saddle-backed*; horses of this kind are generally light, and carry their heads high, but are deficient in strength and service. A horse with a weak back is apt to stumble.

In the French riding-schools, to mount a horse *a dos*, is to mount him bare backed, without a saddle.

BACK, in *Brewing*, a large flat kind of tub or vessel, wherein the wort is put to stand and cool before boiling.

The ingredients of beer pass through three kinds of vessels.

They are mashed in one, worked in another, and cooled in a third, called *backs* or *coolers*.

To gauge a Brewer's BACK. Most backs have their sides straight; in case, however, they be not, but make either an acute or obtuse angle with the bottom, the true length and breadth must be carefully taken in the middle of every inch in depth; from whence the area may be found upon every tenth. For finding the area of the back, this rule must be observed, to multiply the length by the breadth, and divide by 282; which gives the contents in ale gallons.

To find the true dip of a BACK. Because backs are not placed level, but sloping, for conveniency of drawing off the wort; therefore, were the dip taken in too deep a place, the subject would be wronged; as would the king, if it were taken in too shallow a part; to guard against which, as many dips as are thought convenient must be taken; these being added together, and divided by the

number of dips, will give a mean depth. When this is done, trial being made in different parts of the back, until one is found which answers exactly to the mean depth; let a mark or notch be made at the side of the back, to point it out as the true dipping place for the future.

The bottom of large backs ought to be every where equally and well supported, to secure them from warping, which else they will do, more and more as they grow older. Those who make backs and other vessels for brewers, are denominated *back-makers*; and the workmanship consists partly of carpentry and partly of cooperage.

BACK, in the *Distillery*, a vessel in which liquor is put to be fermented.

BACK, or *Dutchman's Cap*, in *Geography*, one of the small islands of Scotland, eleven miles south-east of Coll.

BACK, *Iron*, is a large plate of cast iron, frequently adorned with figures in low relief, intended to preserve the stonework of a chimney-back, and to reflect the heat of the fire.

BACK a Ship, *To*, in *Sea Language*: when the wind is cross, or nearly off shore, or in the opposite direction, ships will always back by the mizen top-sail, assisted, if necessary, by the mizen stay-sail. If there be no mizen top-sail, the main top-sail is used. In backing, always keep a slight cable, to wind the ship, that the anchor may be drawn round. If the wind be not sufficient for this purpose, the ship must be hove a-peak.

BACK the Anchor, is to carry out a small anchor a-head of the large one, in order to support it in bad ground, and to prevent its loosening or coming home.

BACK a-stern, in rowing, is to impel the boat with her stern foremost, by means of the oars.

BACK of the Post. See STERN-Post.

BACK the Sails, is to put them in a situation that will occasion the ship to retreat or move a-stern. This operation, however, is only performed in narrow channels, when a ship is carried along sideways by the tide or current, and strives to avoid any thing that may interrupt her progress, as shoals, vessels at anchor, &c. or in the line of battle, when a ship would put herself into a situation opposite to another with which she is engaged.

BACKBEROND, or BACKBEREND, in *Law Writers*, denotes a criminal caught carrying off something on his back.

In this sense Bracton uses it for a species of what the civilians call manifest theft, *furtum manifestum*.

In the *Forest Laws*, backberond is one of the four circumstances, or cases, wherein a forester may arrest the body of an offender against vert or venison in the forest. The others are *stable-stand*, *dog-draw*, and *bloody-hand*.

BACK-Board, in *Maritime Affairs*, is of a semicircular figure, placed transversely in the after-part of a boat, like the back of a chair, to recline against while sitting in the *stern-sheets*.

BACKELEYS, in *Zoology*, a denomination, derived from *backeley*, which in the Hottentot language signifies war, and given by the Hottentots to those oxen which they train for war and use with success, as the Indians employ the elephants in their combats. In all their armies there are considerable troops of these oxen, which are easily governed, and which are let loose by the chief, when a proper opportunity occurs. They instantly dart with impetuosity on the enemy; striking with their horns, kicking, and trampling under their feet every thing that opposes their fury. By running furiously into the ranks and putting them into disorder, they prepare an easy victory for their masters. These animals are likewise of great use in guarding the flocks. At the smallest signal from the keeper, they collect and bring back those that wander; and they

also run with great fury upon strangers, and serve to secure the flocks and herds against the attacks of the buichies, or robbers of cattle. Every kraal has at least six of these backeys, which are chosen from among the fiercest oxen; and after they have been duly trained, they distinguish friends from enemies, understand signals, and obey the voice of their master. If a stranger, and particularly an European, should approach the cattle, without being accompanied by a Hottentot, his life would be in great danger. These backeys would soon run round him at full gallop, and if not protected by the shepherds, by fire arms, or by suddenly climbing a tree, his destruction would be inevitable. Kolbe, *Voyage and Description du cap de Bonne Esperance*, cited by Buffon, vol. vi. p. 184. ed. Smellie.

BACKER, or **BAKKER**, **JACQUES**, in *Biography*, an historical painter was born at Antwerp in 1520, and received instruction from his father: after the death of his father, he resided in the house of Jacopo Palermo, a picture-dealer, who, for the gratification of his own avarice, kept him incessantly employed, and disposed of his pictures at Paris, where they were much admired and fetched a high price; whilst the artist himself was continued in an obscure and depressed condition. He was distinguished by a clean light manner of penciling, and a very pleasing tint of colour. He died in 1560. Pilkington.

BACKER, or **Bakker**, **Jacob**, a painter of portrait and history, was born at Harlingen, in 1609, but resided chiefly at Amsterdam; where he acquired the reputation of an extraordinary painter, particularly of portraits, which he executed with strength, spirit, and a graceful resemblance. He was so remarkable for his expedition, that he is said to have painted the half-length portrait of a lady in one day, though he adorned the figure with rich drapery, and several ornamental jewels. He succeeded also in painting historical subjects; and in this style his picture of Cimon and Iphigenia has been much extolled by connoisseurs. In designing academy figures, his expression was so just, and his outline so correct, that he obtained the prize from all his competitors; and his works are bought up at very high prices in the Low Countries. His capital picture of the Last Judgment, preserved in the church of the Carmelites at Amsterdam, is well designed and well coloured. He died in 1651; or, according to Descamps, in 1641. Pilkington.

BACKEREEL, called **BACQUEIRELLI**, **WILLIAM**, was born at Antwerp, and was a disciple of Rubens, at the same time with Vandyck. At the commencement of the exercise of their profession, Backereel was deemed little, if at all, inferior to Vandyck; as appears from the works of the former in the church of the Augustin monks at Antwerp, where these two great artists painted as competitors; and each possessing a mode peculiar to himself, the superiority was not determined in favour of either. Backereel, by the exercise of his poetical talents, and particularly by his satires against the Jesuits, incurred the persecution of this powerful fraternity, and by their persecution, he was compelled to leave Antwerp, so that his country was deprived of the honour which must have accrued to it from his performances as a painter. In Italy, and the Low Countries, there were seven or eight eminent painters, of the name of Backereel. Pilkington.

BACK-GAMMON, a game played with dice and tables, to be learned only by observation and practice. This game is said to have been invented in Wales, in the period preceding the conquest, and to have derived its name from two Welsh words, *bach*, little, and *cammon*, battle. Gloss. ad Leges Wallias, a voc. Tawlbwrdd, cited by Henry, vol. iv. p. 404. 8vo.

BACK-HOOPER, or **Backhoe**, a machine long used in several parts of England, particularly in Hampshire, Wiltshire, and Sussex, for winnowing corn. An improved construction of this machine, illustrated by a figure, was proposed by Dr. Hales, in the year 1747, which, he says, will not only render it fit for winnowing corn looser and better than by any other means hitherto used, but also for clearing it of the small corn, seeds, chaff, fruit-balls, &c. to such perfection, as to make it proper for seed-corn. See Hales's *Uses of Ventilation*, part II. p. 227, &c.

BACKHUYSEN, **LEONARD**, in *Biography*, an eminent painter of ships, sea-peaces, and sea-ports, was born at Embden, in 1631, and after receiving early instruction from Albert Van Everdingen, acquired his principal knowledge by frequenting the painting-rooms of great masters, and particularly Henry Drubbeis, and observing their various methods of touching and colouring. His improvement was very considerable, and his drawings were in such estimation, that several of them were purchased at 100 florins a-piece. Whilst he was painting, his mind was so much engaged, that he would not allow his most intimate friends to have access to him, lest his ideas should be interrupted. He studied nature with singular attention in all her forms; in gales, calms, storms, clouds, rocks, skies, lights, and shadows; and he expressed every subject with so sweet a pencil, and such a degree of transparency and lustre, as placed him above all the artists of his time in that style, the younger Vandervelde excepted. It was his frequent custom to go out to sea in a storm, in order to store his mind with grand images, directly deduced from nature; and at the moment of his landing, he flew to his palette, that the traces of those incidents which had occurred might not be obliterated by delay. Backhuysen perfectly understood the management of the chiaro-scuro; and he was thus able to give uncommon force and beauty to his objects. He also strictly observed the truth of perspective, in the distances of his vessels, the receding of the grounds on the shores, and the different buildings, which he described in the sea-ports. His works may be easily distinguished by an observant eye, from the freedom and neatness of his touch; from the clearness, and natural agitation or quiescence of the water; from a peculiar tint in his clouds and skies; and also from the exact proportions of his ships, and the gracefulness of their position.

For a picture, exhibiting a multitude of vessels, and a view of the city at a distance, he received from the burgo-masters of Amsterdam 1300 guilders, and a considerable present; and this picture was afterwards given to the king of France, who placed it in the Louvre. No painter was ever more honoured by the visits of kings and princes than Backhuysen; the king of Prussia was one of their number; and the Czar Peter the Great took delight in seeing him at work, and often endeavoured to draw, after vessels which he had designed. He was remarkably assiduous; and yet the number of pictures which he finished, and the exquisite manner in which they are painted, are astonishing. He died in 1709. Pilkington.

BACKING a Colt, in the *Manege*, the operation of breaking him to the saddle, or bringing him to endure a rider.

To back a colt, they usually take him into ploughed ground, trot him a while, to rid him of his wantonness; then having one lay to his head, and govern the chaffing-rein, the master mounts his back, not suddenly, but by degrees, first making several offers, or half-risings: when he bears these patiently, he mounts in earnest, and settles in his place, cherishing him, &c.

BACKING Warrants, in *Law*, denotes the signing of such

such as have been issued by a justice of the peace in one county, by a justice of the peace in another county, which is necessary before they can be executed there. This practice, which had long prevailed without law, is authorized by statutes 23 Geo. II. c. 26. and 24 Geo. II. c. 55. And now, by statute 13 Geo. III. c. 31. any warrant for apprehending an English offender, who may have escaped into Scotland, and *vice versa*, may be endorsed and executed by the local magistrates, and the offender conveyed back to that part of the united kingdom, in which such offence was committed.

BACK-Nails. See **NAIL**.

BACK-Painting, is used by some for the art of pasting of prints and other designs on glass.

The art consists chiefly in laying the print upon a piece of crown-glass, of such a size as fits the print. In order to do this, the print must be soaked in clean water for forty-eight hours, if it be on very strong, close, and hard gummed paper; but if on a soft, spongy paper, two hours will sometimes be sufficient. The picture, being well soaked, must be laid between four sheets of paper, two over and two under it, that the moisture may be drawn out of it. Instead of soaking the print, it may be rolled up and boiled for about two hours, more or less, according to the quality of the paper, in water; and this mode will answer the purpose as well as soaking it. In the mean while, let the glass upon which the print is to be laid be warmed at the fire; then with a hog's-hair brush dipped in melted Strasburg turpentine, spread the turpentine smoothly and evenly on the glass. Then lay the print upon the glass, rubbing it gently from one end to the other, that it may lie close. With the finger, rub off the paper from the back side of the print, till nothing can be seen but the print, like a thin film left upon the glass, and set it aside to dry. When it is dry, varnish it over with some white transparent varnish, that the print may be seen through it, which is now fit for painting.

Having prepared a variety of oil colours, which must be ground very fine, and tempered very stiff, lay such colours on the transparent print as each particular part requires, the master-lines of the print guiding the pencil; and thus each colour will appear fair to the eye on the other side of the glass, and look almost as well as a painted piece, if it be done neatly. The shadows of the print are generally sufficient for the shadow of every colour; but if it be desired to give a shadow by the pencil, the shadows should be laid on first, and the other colours afterward. The chief care to be used in this part of the work, is that of laying the colours on thick enough, that they may be struck plainly through the glass.

BACK-River, in *Geography*. See **BALTIMORE**.

BACKS, among dealers in leather, denote the thickest and best tanned hides, used chiefly for soles of shoes. See **BETTS**.

BACKS of a Hip. See **HIP**.

BACK-staff, in *Navigation*, an instrument, by the French called the *English quadrant*. It was invented by captain Davis, about the year 1590; and is of good use in taking the sun's altitude at sea. It consists of three vanes, A, B, and C, and of two concentric arches (*Plate 1. Navigation, fig. 2.*); the vane at A, called the *horizon-vane*; that at B, the *shade-vane*; and that at C, the *sight-vane*. The left arch B (or ED) is of 60 degrees, and that of C (or FG) of 30 degrees.

To use the back-staff. The shadow-vane B is set upon the 60 arch, to an even degree of some latitude, less by 10 or 15 degrees than you judge the complement of the sun's al-

titude will be; the horizon vane is put on at A, and the sight-vane on the 30 arch FG: the observer's back being then turned to the sun (whence the name of *back-staff*, or *back-quadrant*), he lifts up the instrument, and looks through the sight-vane, raising or falling the quadrant, till the shadow of the upper edge of the shade-vane fall on the upper edge of the slit of the horizon vane; and then if he can see the horizon through the said slit, the observation is well made; but if the sea appear instead of the horizon, the sight vane must be moved lower towards F; if the sky appear, it must be moved upward towards G, and thus tried till it comes right: then he observes how many degrees and minutes are cut by that edge of the sight-vane which answers to the sight-hole, and to them adds the degrees cut by the upper edge of the shade-vane: the sum is the sun's distance from the zenith, or the complement of his altitude. To find the sun's meridian, or greatest altitude on any day, continue the observation as long as the altitude is found to increase, which you will perceive by the appearance of the sea, instead of the horizon, removing the sight-vane lower; but when you perceive the sky appear instead of the horizon, the altitude is diminished; therefore, desist from farther observation at that time, and add the degrees upon the 60 arch to the degrees and minutes upon the 30 arch, and the sum is the zenith distance, or co-altitude of the sun's upper limb.

And because it is the zenith distance, or co-altitude of the upper limb of the sun, and not the centre, that is given by the quadrant, in observing by the upper edge of the shade-vane, add 16 minutes, the sun's semidiameter, to that which is produced by your observation, and the sum is the true zenith distance of the sun's centre. If you observe by the lower part of the shadow of the shade-vane, then the lower limb of the sun gives the shadow; and, therefore, you must subtract 16 minutes from what the instrument gives; but considering the height of the observer above the surface of the sea, which is commonly between 16 and 20 feet, you may take 5 or 6 minutes from the 16 minutes, and make the allowance but of 10 minutes or 12 minutes, to be added instead of 16 minutes.

Mr. Flamsteed contrived a glass *lens*, or double convex, to be placed in the middle of the shade-vane, which makes a small bright spot on the slit of the horizon-vane, instead of the shade; which is a great improvement, if the glass be truly made; for, by this means, the instrument may be used in hazy weather, and a much more accurate observation made in clear weather than could be by the shadow.

The theory of this quadrant is very intelligible: for the line AC being horizontal, the arc *fGC* is equal to the height of the sun above the horizon; but this arc *fGC* is equal to the sum of the arcs *BE + GC*; and the arc *afF = 90° = the altitude and zenith distance taken together; consequently the zenith distance = the arcs *fd + Cf = DB + CF*.*

When the horizon is obscured by hazy weather, Davis's quadrant is of no use; and this often occasions distressing consequences. Means have therefore been sought for to remedy this defect. Mr. Hadley has recommended and described a spirit level for this purpose. Mr. Leigh proposed to fix a water-level to the quadrant; and he has likewise given the description and use of an apparatus to be added to this instrument, consisting of a mercurial level, which he prefers, with reason, to a water-level. See *Phil. Trans. N° 430, Sec. or Martyn's Abr. vol. viii. p. 357, 360, &c.*

It has been observed, that one great objection against this instrument is the trouble and time lost in fixing the sight-vane upward or downward, which sometimes cannot conveniently

conveniently be done without taking the quadrant from the eye, by which an opportunity may be lost for making the observation. But this defect is easily removed by having a long index or ruler fitted to the quadrant; one end moving round the centre to which the horizon-vane is fixed, and having the sight-vane fixed to the other end. By this contrivance the sight vane may be readily raised higher, or lowered, by the motion of the index about its centre; and this may be done without taking the instrument from the eye. See **QUADRANT**.

BACK-Stays of a Ship, are ropes belonging to the main-mast and fore-mast, and the masts belonging to the m, serving to keep them from pitching forwards, or overboard. See **STAYS**.

BACK-Stays, Travelling, are used in bad weather to support the fore and main-top masts; they splice into a span, round the top mast, under the parrel, and let up in the chain, with a luff-tackle, to an eye-bolt. They travel up and down the top-mast occasionally with tricing lines that splice into a thimble, on each side of the span, and through blocks seized to the top-mast trundle-trees, and lead into the top.

BACK-Worm, a name given by *Sportsmen* to a disease very common among hawks, and called also *filander*; which see.

BACO, in *Geography*, the capital of Mindoro, one of the Philippine islands, where the Alcaide, or governor, resides. Its environs are well watered by springs proceeding from mountains covered with sarsaparilla. See **MINDORO**.

BACOPA, in *Botany*, a name by which some authors call the banana tree, or *musa fructu breviori*. Piso.

BACOFEN, in *Geography*, a town of Bohemia, in the circle of Boleflaw, five miles N. N. E. from Jung Buntzlau.

BACON, swine's flesh, salted, and dried in the chimney. Writers on this branch of œconomics give rules for the hanging, the salting, and curing of bacon, larding with bacon, &c.

This appears to be in general an extremely improper and unwholesome aliment, especially for people who do not use great exercise; for those who do may almost eat any thing without injury. Swine's flesh, considered as an aliment, is none of the best; and when hardened by salt, and dried by smoke, it is rendered more indigestible, and in consequence of that, productive of obstructions in a very great degree. We may add, that the fat of bacon frequently becomes rancid and acrimonious, and often even excoriates the mouth and throat.

BACON-Sward, denotes the thick outer skin taken off the lard or fat. Old historians and law writers speak of the *service of the bacon*, a custom in the manor of Whichenore in Staffordshire, and priory of Dunmow in Essex; in the former of which places, by an ancient grant of the lord, a sitch of bacon, with half a quarter of wheat, was to be given to every married couple, who could swear, that having been married a year and a day, they would never within that time have once exchanged their mate for any other person on earth, however richer, fairer, or the like. But they were to bring two of their neighbours to swear with them, that they believed they swore the truth. On this, the lord of another neighbouring manor, of Rudlow, was to find a horse saddled, and a sack to carry the bounty in, with drums and trumpets, as far as a day's journey out of the manor: all the tenants of the manor being summoned to attend, and pay service to the bacon. Plott's Hist. Staff. c. x.

The *bacon of Dunmow*, first erected under Henry III. was on much the same footing; only the tenor of the oath was, that the parties had never once repented, or wished themselves unmarried again. Ib. c. x. sect. 80.

BACON, Robert, in *Biography*, an English divine of the

thirteenth century, was born about the year 1168, completed his education at Paris, and returning to Oxford, where he had commenced his studies, read lectures in divinity, and became a famous preacher. In one of his sermons, preached at Oxford, in 1233, before Henry III., he reproved the king for his partiality to foreigners, and faithfully informed him, that this was the principal cause of the discontent which prevailed among his subjects. Such was the impression made by this address, that the king is said to have discovered a disposition to listen to the complaints of his nobles. Bacon was favoured with the friendship and patronage of Edmund Rich, called St. Edmund, archbishop of Canterbury; and after his decease, in 1240, wrote his life. He was also the author of several commentaries, sermons, and lectures. Some have supposed that he was the brother of the celebrated Roger Bacon; but as Robert died in 1248, at an advanced age, and Roger was not born till the year 1214, it is not probable that they were brothers. Biog. Brit.

BACON, Roger, a celebrated English monk of the Franciscan order, was born at Ilchester in Somersetshire, in the year 1214, and at an early age received the rudiments of learning and science at Oxford, where he prosecuted his studies with an arduous and success which secured to him the patronage and friendship of the most eminent men in that university. In the number of these we may reckon Robert Grossethead, bishop of Lincoln, to whom he was particularly indebted, and of whom he speaks in terms of high commendation; Edmund Rich, archbishop of Canterbury; William Shirwood, chancellor of Lincoln; and Richard Fishacre, who was a distinguished lecturer in the sciences both at Oxford and at Paris. Having spent some years at Oxford in the study of the languages, logic, mathematics, and various branches of philosophy, he removed, according to the custom of that age, to Paris, where he was distinguished both by his assiduity and improvement, and where, in token of his acknowledged eminence in literature and science, he received the degree of doctor in theology. While he was in France, or soon after his return to England, in the year 1240, he took the monastic habit in the order of St. Francis, and with a view of pursuing his studies and researches with the greater advantage, he settled at Oxford. Such was the esteem in which he was generally held, and so high were the expectations which his contemporaries entertained of the benefits that would result to science from the vigour of his mind and the assiduity of his application, that he was enabled, by generous contributions, to collect books, to construct instruments, and to prosecute his experiments, during a course of twenty years, at an expence of 2000l, which, considering the time in which he lived, was a very large sum. His growing fame, however, excited envy; and the monks of his own order industriously circulated a report, that he held converse with evil spirits, and practised magical arts. His enemies so far prevailed, that, under a pretence of dangerous innovations, tending to disturb the peace of the church, which Bacon was attempting to introduce, he was restrained from reading lectures to the young students in the university; and at length so closely confined as to be debarred from all intercourse with his friends, and from receiving a necessary supply of food. The prelates and the monks, says Bacon himself (Epist. ad Cler. IV.), were afraid lest his own writings should extend beyond the limits of his convent, and be seen by any besides themselves and the pope. But other circumstances had contributed to excite against Bacon the spirit of persecution. He had censured the clergy, on account both of their ignorance and immorality; he was particularly intimate with bishop Grossethead, who had written a letter of reproof to pope Innocent IV. and declared to his confidant

dent's associates, that in his judgment the pope was anti-christ; and he himself had written freely to the pope, concerning the necessity of a reformation. The efforts of malevolence, whatever might have been the real or pretended causes from which they originated, could not deprive this great man of the esteem and respect to which his distinguished talents and character entitled him. Such was the high opinion entertained by the cardinal bishop of Sabina, who was the pope's legate in England, of his genius and merit, that he requested from him a complete copy of all his works. As he was restrained, by the prohibition of his own fraternity, from communicating any of his works to any person whatever, he at first declined complying with the cardinal's request; but as soon as he heard that the cardinal-legate was raised to the pontifical dignity, under the name of Clement IV. he signified to him by letter his readiness to perform what his holiness had desired; and the pope assured him of protection against any interference of his own order. Bacon immediately began to collect, arrange, and improve the pieces he had already written, and having digested them into one volume under the title of "Opus Majus" (the greater work), he sent it to the pope, in the year 1267, by a special messenger, whose name was John of Paris, and who was his own favourite disciple. This John of Paris was a poor boy, of promising talents, taken by Bacon under his tuition, in order to try by experience the efficacy of his peculiar mode of instruction; and, as the result of it, he observes, "that there was no room to conceive any high notions of the perfection of human wisdom, when it was possible, in a year's time, to teach a young man all that, with the utmost industry and application, a zealous inquirer after knowledge was able either to acquire or to discover in the space of twenty, or even forty years." (See *Opus Majus*, p. 29, and *Jebb's Preface*.) The pope was so gratified with the present of this learned work, that it procured for Bacon extraordinary favour and encouragement in his studies.

With the life of the enlightened and liberal Clement IV. terminated the tranquillity of this philosopher; for in 1278, under the pontificate of Nicholas III. and with the sanction of his authority, Jerom de Esculo, or de Ascoli, general of the Franciscan order, prohibited the reading of his works, and sentenced him to imprisonment. The pretended cause of this severity has been sought by some writers in tracts of Bacon on necromancy, astrology, and alchemy; but the true reason was most probably that dread of innovation which Bacon's improvements in science caused in the minds of bigotted or interested persons. Bacon continued in prison for ten years; but upon the accession of Jerom de Esculo to the papal see, under the name of Nicholas IV., he attempted to conciliate the favour of the pope, by presenting to him a treatise "On the Means of avoiding the Infirmities of Old Age;" but his endeavours seem to have been ineffectual, as he still remained in prison, and was not released till about the latter end of this pontificate, when some English noblemen interceded in his favour, and obtained for him his liberty. Upon his return to Oxford, he wrote, at the request of his friends, "A Compendium of Theology," of which a copy is preserved in the Royal library. This work appears, from internal evidence, to have been written about the year 1291; and as additions were afterwards made to it, it is hence inferred that the author lived till the year 1292, or the seventy-eighth year of his age. The learned editor of his "Opus Majus" dates his death in 1294; but Anthony Wood, from two MSS. which he mentions, fixes the time of it to the 11th of June, 1292; and Dr. Freind acquiesces in this opinion. He is said to have died in tranquillity, in the

college of his order, and to have been interred in their church. Tradition reports, that in order to prevent the uneasiness occasioned by his enemies, in the earlier period of his life, and while he was prosecuting his studies, and performing his experiments at Brazen-nose hall at Oxford, he was obliged to retire from the university into a solitary place, called to this day "Friar Bacon's Study;" and Mr. Hearne informs us, that he sometimes retired in the summer to Sunning Well.

When we contemplate the extraordinary powers and attainments of Bacon, and review the important and useful discoveries that were made by him in various branches of science, and compare them with the period in which he lived, we shall not be surprised that he was distinguished by the title of "doctor mirabilis," or wonderful doctor; whatever might be the reasons which induced the monks of his order thus to discriminate him. With respect to his knowledge of the languages, which he thought to be the foundation of all true learning, it appears that he was perfect master of the Latin, Greek, and Hebrew, and that he had studied those languages with a degree of critical exactness which renders some of his observations in that part of the "Opus Majus," which treats on this subject, judicious and instructive. With various branches of the mathematics he was well acquainted: and in mechanics his knowledge was such, that, in the judgment of Dr. Freind, "a greater genius had not arisen since the days of Archimedes." Accordingly, in his treatise, intitled, "Epistola Fratris Rogeri Baconis de secretis Operibus Artis et Naturæ, et de Nullitate Magiæ," he proposes the construction of wonderful instruments, which may be artificially contrived, by which such things (says he) may be done without the help of magic, as magic itself is incapable of performing. "For a vessel may be so constructed, and oars therein so disposed, as to make more way with one man in her, than another vessel fully manned." "It is possible (says he) to make a chariot which, without any assistance of animals, shall move with that irrepressible force which is ascribed to those scythed chariots in which the ancients fought." "It is possible," adds our author, "to make instruments for flying, so that a man sitting in the middle thereof, and steering with a kind of rudder, may manage what is contrived to answer the end of wings, so as to divide and pass through the air. It is no less possible to make a machine of a very small size, and yet capable of raising or sinking the greatest weights, which may be of infinite use on certain occasions, for by the help of such an instrument, not above three inches high, or less, a man may be able to deliver himself and his companions out of prison, and to ascend or descend at pleasure." Hence it has been inferred that Bacon was acquainted with the perpetual screw. Our author's knowledge of the science of optics was so accurate and comprehensive, that he is justly allowed to have understood the theory and practice of many of those discoveries, the application of which has been so important and useful in more modern times. Besides the descriptions of the camera obscura, and of burning glasses, which are found in his writings, we have unquestionable evidence that he was well acquainted with the properties of convex and concave lenses, and with the effects of refraction; and some have even ascribed to him the honour of having invented the telescope. (See these several articles.) In geography his researches were various and extensive; and his acquaintance with astronomy enabled him to discover the errors of the calendar, and to propose the proper method of correcting them. See *CALENDAR*.

Although Roger Bacon was in some instances misled by the visionary projects of the alchemists of his age, and though

though he indulged chimerical notions of the medicinal virtues of the aurum potable, or tincture of gold, and of a secret charm for renewing the native heat of old men, he was led by his chemical processes into an acquaintance with the properties of bodies, and a variety of discoveries that were no less important and useful than novel and curious. Such, in particular, was that of the ingredients and effects of gun-powder, which was for a long time supposed to have been the invention of a much later period. (See GUN-POWDER.) Of his medical knowledge we have evidence in his "Treatise on Old Age," blended with many things that are obscure and fanciful; and though he so far partook of the superstition of the times as to place some confidence in judicial astrology, he was an enemy to necromancy and magic, was altogether unfounded; and the story of his having constructed a brazen head, which proposed and answered questions, is as ridiculous as it is groundless. The first object of this calumny, was his patron Robert Grouthead or Grosthead, bishop of Lincoln; and similar tales have been related of pope Sylvester II., Albertus Magnus, and other eminent philosophers; but they gained credit merely with mean and ignorant persons. In logic and metaphysics, as well as in philology, and the politer parts of learning, Bacon was equal, if not superior, to most of his contemporaries; and his treatise on Ethics, or moral philosophy, contains many excellent principles for directing the judgment, and regulating the conduct. To theology, all his other studies were subservient; and he directed both his actions and his writings to the glory of God, and the good of his fellow-creatures. To the holy scriptures he paid due deference; and he enforced the study of them in their original languages, and an assiduous application to the several branches of learning which he thought necessary for rightly understanding and interpreting them. This seems to have been the object of his last treatise, which he left as a kind of testament to his order.

As the whole life of friar Bacon was spent in study and writing, we need not wonder that his works were very numerous. Bale speaks of upwards of fourscore books written by him; and Dr. Jebb has digested a still greater number, under the distinct heads of grammar, mathematics, physics, optics, geography, astronomy, chronology, chemistry, magic, medicine, logic, metaphysics, ethics, theology, philology, and miscellany. It seems, however, that the number has been multiplied by means of the different titles under which various copies of the same treatise have been dispersed, and by considering the titles of distinct chapters of his work, as the titles of separate treatises. Accordingly, eleven of these pieces will be found in the work intitled, "Epistola Fratris Rogeri Baconis, &c." already mentioned, published in 4to. at Paris, in 1542; in 8vo. at Basil, in 1593; in 8vo. at Hamburgh, in 1608 and 1618. This treatise abounds with various physical facts and observations, and exposes the futility of the several practices of necromancy, charms, divination, and magic. The "Opus Majus," written in the form of an epistle or address to pope Clement IV. is professedly a digest of the author's former writings. "In this curious and valuable work, Bacon describes the impediments which hinder men from arriving at true and useful knowledge; illustrates, at large, the usefulness of the studies of grammar, mathematics, and perspective; explains the nature and value of experiments in philosophy; and earnestly exhorts the pontiff whom he addresses, to give all possible encouragement to science in general, and particularly to the study of nature. This work, which affords abundant proofs of the author's superior talents, and, considering the time

in which he lived, of his wonderful knowledge, long remained buried in obscurity, and never appeared in print till, in 1733, Dr. Jebb, from various collated MSS. sent from the press of William Bowyer, a correct and beautiful edition in folio. Bacon wrote many chemical tracts, most of which may be found in "Thesaurus Chemicus," printed in 8vo. at Francfort, 1623, 1624; others are in MS. in the university library of Leyden. His treatise "On the Means of avoiding the Infirmities of Old Age," in which, beside a regular course of life, he recommends the use of certain secret and extraordinary medicines, was first printed at Oxford in 1592, and afterwards translated into English, with notes, by Dr. Richard Browne, under the title of "The Cure of Old Age, and Preservation of Youth," 8vo. 1683. Several tracts of friar Bacon, yet unpublished, remain in MS.; a piece, bearing the title of "Liber Naturalium;" a treatise on Chronology, intitled, "Computus Rogeri Baconis;" and the "Compendium of Theology;" are to be seen in the King's library; and two other works, which the author called "Opus Minus," and "Opus Tertium," remain in the Cotton library; and other pieces might probably be found by diligent search."

Although in the present advanced state of literature and science, we could not expect to derive much accession to our means of knowledge from the publication and study of friar Bacon's works, yet as a display of the astonishing powers of the human intellect, and as a valuable part of the history of knowledge, they ought to be preserved and known. The want of a complete edition of his works is the less to be regretted, since the public have been put into possession of his "Opus Majus," by Dr. Jebb.

From the brief account that has been given of the talents and performances of friar Bacon, it will appear, that he contributed, in a very eminent degree, to illuminate the dark age in which he lived, and to prepare the way, by emancipating the mind from the authority of Aristotle, and pursuing a plan of experiment and induction in the prosecution of science, for those discoveries and improvements, which have distinguished a later period. Although allowance should be made for the language of panegyric, which characterizes Bacon as the "brightest and most universal genius that perhaps the world ever saw;" he must ever be regarded as a prodigy of learning and science, and a very high rank must be assigned to him among those who have been instruments of enlightening and reforming the world. Jebb's Pref. to Bacon's Opus Majus. Cave, H. L. t. ii. p. 325. Biog. Brit.

BACON, *Sir Nicholas*, an eminent lawyer, and lord keeper of the great seal in the reign of queen Elizabeth, was the descendant of an ancient and honourable family in the county of Suffolk, and born in the year 1510 at Chiffchunt in Kent. He was sent at an early age to Corpus Christi or Bennet college at Cambridge, and finished his education by travelling into France. Upon his return, he entered at Gray's inn, and distinguished himself by the study of the law. By favour of Henry VIII. he obtained a grant of several manors in Suffolk, when the monastery of St. Edmondshury was dissolved; and was appointed attorney in the court of records; which office he retained during the reign of Edward VI. Having, by his prudence and moderation, escaped the dangers of the reign of Mary, he was honoured with knighthood on the accession of queen Elizabeth; and in 1558, he was intrusted with the custody of the great seal, and admitted a member of the privy council. He took an active part in the administration of this period, and was eminently instrumental in the settlement of religion. It has been said, that he incurred the displeasure of Elizabeth by joining

joining the party that was adverse to the title of the queen of Scots; but from "A Discourse upon certain points touching the inheritance of the crown, conceived by sir Anthony Brown, and answered by sir Nicholas Bacon," published in 1723, by Nathaniel Booth, of Gray's inn, Esq., from the original MS., it has been inferred, that sir Nicholas Bacon was a most strenuous assenter of the title of the queen of Scots, in opposition to sir Anthony Brown, who had contended for the right of the house of Suffolk. However this be, he was placed by Elizabeth, in 1568, at the head of the commission for hearing the disputes between that unfortunate princess and her rebellious subjects; and in 1571, he again acted in the same capacity. From this time he was a principal agent in the counsels of Elizabeth, and by his inflexible adherence to the Protestant cause, shared the odium of the Popish faction in common with her other principal ministers. As a statesman, he manifested great skill in properly balancing the different parties, and it is thought that he instructed the queen in this art, which he found to necessary and useful. In the chancery he distinguished himself by a very moderate use of power, and by shewing great respect to the common law. His private as well as his public conduct was regulated with great discretion, and a moderate use of the fortune which he had acquired. His motto was "Mediocria firma," and he was accordingly content to be safe, but did not wish to be great. In his set speeches he attained the reputation of uniting two opposite characters, viz. those of a witty and a weighty speaker. That he was not unduly exalted in his own opinion, notwithstanding his eminent talents and preferment, appears from his modest answer to queen Elizabeth, when on a visit to him at Redgrave, she told him that his house was too little for him: "Not so, madam," replied sir Nicholas, "but your majesty has made me too great for my house." In deference to her majesty's opinion, he added two wings to it; and he also indulged his taste for building and gardening, at Gorhambury, near St. Albans, which was a manor taken from the ancient abhey of this place. Having retained his office of lord keeper for more than twenty years, with the reputation of a wise statesman and faithful counsellor, he died, after an illness of a few days, on the twentieth of February 1579, in the sixty-ninth year of his age. Of his writings there are extant in MS. several discourses on topics of law and politics, and also a commentary on the twelve minor prophets. *Biog. Brit.*

BACON, Francis, baron of Verulam, viscount of St. Albans, and high chancellor of England in the reign of James I. the glory and ornament of his age and nation, was the son of sir Nicholas Bacon, mentioned in the last article, by his second wife Anne, the daughter of sir Anthony Cook, tutor to king Edward VI.; and born in London on the twenty-second of January 1561. In his childhood he manifested indications of singular genius, from which those who conversed with him might have deduced prefaces of his future attainments. In reply to queen Elizabeth, who asked him how old he was, he instantly replied, "Just two years younger than your majesty's happy reign;" and her majesty, condescending frequently to converse with him, and forming a high opinion of the solidity of his sense, and the gravity of his behaviour, used pleasantly to call him "her young lord keeper." At the age of thirteen, in the year 1573, he was entered a student in Trinity college, in the university of Cambridge, where his progress under the tuition of Dr. John Whitgift, afterwards archbishop of Canterbury, was rapid and surprising. Before he had completed his sixteenth year, he began to perceive the imperfections of the Aristotelian philosophy, which was then the reigning system,

and probably to form designs of introducing a more rational and profitable method of pursuing philosophical researches. To this purpose, we are assured by Dr. Rawley, who was his chaplain and biographer, and to whom he communicated several particulars relating to the earlier period of his life, that his objections against the prevalent philosophy were not owing to any disrespect of Aristotle himself, of whom he entertained a very high opinion, but to the utility of his philosophy, which was calculated to produce and perpetuate disputes, rather than to afford any substantial benefit to mankind; and these sentiments of it he retained through life. In order to perfect his education, and to extend his knowledge of the world, his father sent him to France, and placed him under the patronage of sir Amias Pawlet, who was then the queen's ambassador at Paris. In this situation he gained the esteem and confidence of sir Amias to such a degree, that he was intrusted by him with a commission to the queen, which required both secrecy and dispatch; and having executed this commission in a manner highly honourable to himself, and equally satisfactory to the queen and ambassador, he returned to Paris, and from thence travelled through several of the provinces, for the purpose of gaining a more accurate and extensive acquaintance with the manners and customs of the country. The result of his inquiries appears in a treatise, intitled "Of the state of Europe," and written when he was no more than nineteen years of age. The unexpected death of his father obliged him to return suddenly from France, and to engage in some lucrative profession. Accordingly he determined upon the profession of the law, and entered himself in the Society of Gray's Inn, where by assiduous application he obtained such a degree of reputation, that at the age of twenty-eight years he was appointed by the queen to the honourable office of her learned counsel extraordinary in the law. Whilst he was studying at Gray's Inn, and in the twenty-sixth year of his age, he formed the plan of that great philosophical work, afterwards completed, and intitled, the "Instauracion of the Sciences," which will not only render his name immortal, but do honour to his age and country, as long as learning shall flourish. The title of the work which our author composed at this time, was "Temporis partum maximum," or the "Greatest birth of time;" with respect to which it appears, from a letter written towards the close of his life to father Fulgentio, a learned Italian, that he lived to regret the juvenile folly and vain confidence which led him to prefix to it this pompous title. These rudiments of Bacon's philosophy have been supposed to be lost; but it has been suggested (see Mallet's edition of Bacon's works, Append. to vol. i. p. 17.) that they probably remain under the more modest title "Of the Interpretation of Nature," and that philosophers may still have the pleasure of tracing the steps by which this great genius advanced from one discovery in science to another in forming and establishing his system.

From the high rank of a philosopher, in which Bacon appears with acknowledged pre-eminence, we are obliged to descend, in tracing the outlines of his history, to the level of ordinary men, and to contemplate him as an humiliating example of human frailty. Reduced by his father's death to circumstances which rendered it necessary for him either to pursue his philosophical speculations in obscure retirement, or to become an obsequious dependant on the court; he unfortunately chose the latter alternative. Allied by marriage to the lord treasurer Burleigh, and to his son Robert Cecil, principal secretary of state, he indulged reasonable expectations of advancement; but his friendship for the earl of Essex, Cecil's avowed enemy, interposed an obstacle in the way of his

his preferment. The interest of lord Burleigh procured for him merely the reversion of the office of register to the star-chamber, worth about 1600*l.* a year, which he did not obtain for twenty years. In 1594, Cecil represented him to the queen as a man wholly devoted to speculation, and prevented his being advanced to the post of solicitor-general, which the earl of Essex endeavoured to procure for him; but as a compensation for this disappointment, the earl presented him with a landed estate, which was afterwards sold, at less than its value, for 1800*l.* Bacon, however, after this singular expression of friendly attachment on the part of Essex, proved ungrateful; and in the moment of danger abandoned his friend and benefactor; pleaded against him on his trial for high treason; produced evidence to his injury from his letters; and after his execution, vindicated the conduct of administration, in an appeal to the public, under the title of "A Declaration of the Treasons of Robert earl of Essex." In this "Declaration" there occurred some apparent marks of tenderness for the reputation of Essex, which led the queen to observe to him, that "old love could not easily be forgotten;" but whilst they proved that he was counteracting his feelings by his conduct, they were insufficient to exculpate the baseness of his ingratitude. His conduct on this occasion excited against him such general dissatisfaction, that he found it necessary to write an elaborate defence under the title of "Apology;" but no art or eloquence could avail to stifle the public indignation. From the queen he received no additional honours or emoluments during the remainder of her reign; and to persons in power he was an object of jealousy and aversion.

In public concerns, however, he acted with firmness and dignity. Having been chosen, in 1593, to represent the county of Middlesex in parliament, he took the popular side, though a servant of the crown, against her majesty's ministers; and in the question of subsidies, to which he indeed assented, he delivered a speech, the freedom of which offended the queen, and prevented his advancement. Towards the end of her reign he became more fervent in his parliamentary conduct; for which his only plea was his poverty, and debts which he had incurred, and for which he had been twice arrested.

Upon the accession of James I. Bacon was distinguished by the favour of his new sovereign, and in 1603 received the honour of knighthood. In the first parliament of this reign, he regained his popularity by undertaking the redress of grievances, arising from the exactions of the royal purveyors; and in the conduct of this business he gave satisfaction both to the house and to the king. From the former he received a vote of thanks, and from the latter a patent to be one of the king's counsel, with a salary of 40*l.* a year, accompanied with a pension from the crown of 60*l.* a year, for special services rendered by his brother Anthony Bacon and himself. Notwithstanding the opposition of Cecil, now earl of Salisbury, and of sir Edward Coke, attorney-general, he pursued with steady perseverance his plans of advancement; and by promoting the king's favourite object of an union between the two kingdoms, and by publishing, in 1605, one of his most important works "On the advancement of learning," he so far succeeded in gaining the favour of his royal master, that in 1607 he was appointed to supply the place of sir John Doddridge, as solicitor-general. His practice also was at this time very extensive and profitable, and he also improved his fortune by marriage with the daughter of Benedict Barnham Esq. a wealthy alderman of the city of London. Whilst he displayed his eminent talents both in the senate and in the courts, he was not inattentive to his grand philosophical speculations and pursuits.

Of the outline of his intended work he circulated copies, under the title of "Cogitata et visa," in order to obtain the animadversions of the learned; and in 1610, he published his treatise, intitled, "Of the Wisdom of the Ancients." In 1611, he was appointed one of the judges of the Marshalsea court, and about the same time became register to the star-chamber, granted to him by Elizabeth in reversion; and in 1613, he was made attorney-general. In the exercise of this office he supported the arbitrary power of government in some of the state trials; but on various other occasions he performed his duty with fidelity, and was active in his exertions for suppressing the savage practice of duelling.

Notwithstanding the assistance of his circumstances and income, his prodigality rendered him indigent; and his ambition, which led him to aspire after the first dignity in the law, concurring with his penury, induced him to seek it by culpable servility and artifice. With this view he cultivated the friendship of George Villiers, afterwards duke of Buckingham, the king's favourite; and having selfish ends to secure, this friendship on his part degenerated into a mean and crouching servility. Apprehending the speedy death of the lord chancellor, he not only petitioned the king for this high office, but basely traduced the talents and character of those who were likely to be his competitors, and enforced his application by avowing his ready obedience, and his power of influencing the lower house of parliament. His solicitation, seconded by the interest of the earl of Buckingham, prevailed; and in March 1617, he was honoured with the seals, and the title of lord keeper. In the beginning of 1619, he was created lord high chancellor of England, and baron of Verulam, which title was exchanged, in the following year, for that of viscount of St. Albans. In this year, viz. in 1620, he presented the world with a work, which he had been twelve years in completing, his "Novum Organum;" or the second part of his grand "Instauracion of the Sciences." The high department in the law, which he sought with so much anxiety, and with such sacrifices of personal honour, proved in the issue an occasion of vexation and disgrace. By opposing the proposed treaty of marriage between Charles prince of Wales, and the infanta of Spain, he offended the king; and by endeavouring to prevent the marriage of sir John Villiers, Buckingham's brother, and sir Edward Coke's daughter, he displeased the favourite. The misunderstanding occasioned by both these circumstanes soon subsided; and whilst he increased his assiduity in promoting the private interest of his royal master, he countenanced and encouraged the rapacity of Buckingham, by affixing the great seal to patents that were intended to be instruments of extortion. At length his conduct in various circumstances, involving his own pecuniary advantage, became so atrocious, that national justice demanded an inquiry. The parliament, summoned by James at the beginning of the year 1613, for the purpose of obtaining legal supplies, entered on this business; and as they proceeded, the king encouraged them to persevere. "Spare none," said he, "where you find just cause to punish." The further they extended their inquiries, new occasions of complaint presented themselves, and these furnished materials for a parliamentary accusation. Accordingly, the cause was transferred to the house of lords, and twenty distinct charges of corruption and bribery, amounting to several thousand pounds, were exhibited before the select committee. The chancellor was alarmed, and earnestly solicited the king's protection. A short recess of parliament delayed his danger; but this temporary expedient served only to aggravate the evil, and to increase the public clamour. Wishing to evade a minute inquiry, the humbled culprit addressed a submissive letter to the house of lords, and exerted

all his powers of eloquence to induce the peers to content themselves with dismissing him from the high office which he had disgraced. They insisted, however, on a particular confession, respecting each article of bribery and corruption of which he was accused; and the chancellor confessed his guilt with regard to most of the twenty-three articles of corruption which were exhibited against him, whilst he extenuated some of them, and again threw himself on the mercy of the house. Upon being asked whether the confession which had been read was written by his own hand, he replied, "It is my act, my hand, my heart; I beseech your lordships to be merciful to a broken reed." The house moved his majesty to sequester the seals, which was accordingly done; and then proceeded to pass sentence; which was, "That the lord viscount St. Albans, lord chancellor of England, shall undergo fine and ransom of 40,000*l.*; that he shall be imprisoned in the Tower during the king's pleasure; that he shall for ever be incapable of any office or employment in the state or commonwealth; and that he shall never sit in parliament, or come within the verge of the court." This sentence, severe as it may seem, and for which collateral causes have been alleged, was the result of the strict exercise of justice. Thus degraded under a just sentence, we cannot forbear pitying a man, who, among other crimes, suffered his servants to become the instruments of his ruin; and who in passing by several of his retainers, that stood up to salute him, sarcastically said to them; "Sit down, my masters; your rise has been my fall."

Thus degraded and banished into solitude, reproached by his own mind as well as by the public censure, and depressed by a load of debt, he retained the vigour of his faculties to such a degree, that he returned with ardour to his favourite pursuits, and produced various writings of singular merit in history, morals, and philosophy. Through all the vicissitudes of his life, he kept in view the great object of the improvement of science, to which his attention was directed in the early period of his youth. From contemplating the examples of Demosthenes, Cicero, and Seneca, who, like himself, had occupied high stations, had fallen into delinquency, and had been banished into retirement, he derived consolation; and in imitation of them, he determined to devote the remainder of his time to philosophy, and writing. He might, indeed, have adopted the language in which Cicero addresses philosophy: "Ad te confugimus; a te opem petimus; tibi nos, ut antea magnâ ex parte, sic nunc penitus totosque tradimus." "To thee I fly; from thee I seek support; to thee I devote myself, as formerly in part, so now entirely and altogether." It is observed, however, that neither philosophy nor experience had taught Bacon a lesson of moderation. After his release from confinement in the Tower, which was soon granted him, and the entire remission of his sentence gradually obtained, he possessed a royal pension of 1200*l.* a year, in addition to 600*l.* a year, accruing to him from the alienation office, and 700*l.* a year derived from his own estate; but he lived with a magnificence and splendor which had no bounds. In his way to London, his coach was attended by a number of attendants on horseback; he was met by the prince of Wales, who asked whose equipage it was, and being told that it was lord St. Albans, attended by his friends, his highness remarked; "Well, do what we can, this man seems to go out like a snuff." With such prodigality, it is no wonder that at his death his debts should have amounted to 22,000*l.* As an instance of his humility, we may cite his reply to the French ambassador, who upon reading a French translation of his Essays, paid him the fulsome compliment of comparing him to angels; "If the politeness of others compare me to an angel, my own infirmities remind me that

I am a man;" and of self-command we have a singular display in his behaviour, when he received information by a friend that his application for an important favour at court had proved unsuccessful; at this time he was dictating to his chaplain an account of some experiments in philosophy, and he calmly said, "Be it so;" and dismissing his friend with thanks for his service, he turned to his chaplain, saying; "Well, Sir, if that business will not succeed, let us go on with this, which is in our power;" and he continued to dictate to him for some time, without hesitation of speech, or interruption of thought.

Lord Bacon pursued his philosophical researches to the last, in the midst of bodily infirmities, occasioned by intense study, multiplicity of business, and, above all, by anxiety and anguish of mind. In the winter of 1625, his health and spirits were much impaired; but in the following spring he made an excursion into the country, for the purpose of making experiments on the preservation of bodies. Having exposed himself imprudently to noxious effluvia, he was suddenly seized with pains in his head and stomach, which made it necessary for him to stop at the earl of Arundel's house at Highgate. Here he fell sick of a fever, and, after a week's illness, expired on the ninth of April 1626, in the sixty-sixth year of his age. In a letter addressed to the nobleman in whose house he expired, he compares himself to the elder Pliny, who lost his life by approaching too near to mount Vesuvius during an irruption. He was buried in the chapel of St. Michael's church, within the precincts of Old Verulam. Verses to his memory were written in various languages by the most eminent scholars of the university of Cambridge; but the most honourable memorial of this great man is found in his immortal writings.

Before we can duly appreciate the value of lord Bacon's philosophical works, we should duly consider the state of philosophy, and the method of pursuing science which prevailed, at the period in which he lived. The authority of Aristotle was absolute; his logic, physics, and metaphysics, were the principal guides in all scholastic disquisitions; and the science that was principally cultivated was such as consisted of words and notions, and seemed to exclude the study of nature. Instead of investigating the properties of bodies and the laws of motion by which all effects are produced, this science, or philosophy, if it may be so called, was conversant about logical definitions and distinctions, and about speculations that were altogether barren and unprofitable. This kind of captious philosophy was not only useless, but a real obstacle to all advances in sound learning, human and divine. Some few persons, indeed, had before the time of lord Bacon ventured to dissent from Aristotle; and the fields of natural knowledge had been cultivated and improved by friar Bacon, Galileo, Copernicus, and others. But there was still wanting one great and comprehensive plan that might embrace the almost infinite varieties of science, and guide our inquiries aright in all. This, lord Bacon first conceived in its utmost extent, to his own lasting honour, and to the general advantage of mankind. To him belongs the praise of having invented, methodised, and in a considerable degree perfected, this general plan for the improvement of natural science by the only sure method of experiment. With a mind commanding and comprehensive, prompt in invention, patient in inquiry, and subtle in discrimination, neither affecting novelty nor idolising antiquity, he formed and in a great measure executed his grand plan, "The Instauration of the Sciences." This plan comprehended six capital parts. Of these, the *first* part proposes a general survey of human knowledge, and is executed in the admirable treatise, intitled, "The Advancement of Learning." He begins
with

with accurately reviewing the state of learning as it stood through all its provinces and divisions; that he might not lose himself on a subject so vast and of such variety, he ranges, according to the three faculties of the soul, memory, fancy, and understanding, the several sciences and arts under three great classes, history, poetry, and philosophy. He observes and points out defects and errors; and then suggests proper means for supplying omissions and rectifying mistakes. At the end of this treatise he has marked out in one general chart the several tracts of science that lay still neglected or unknown.

The *second*, and the most considerable part, is the "Novum Organum," or new method of employing the reasoning faculties in the pursuit of truth. Here our author offers to the world a new and better logic, calculated not to supply arguments for controversy, but arts for the use of mankind; not to triumph over an enemy by the sophistry of disputation, but to subdue nature itself by experiment and inquiry. Rejecting syllogism as a mere instrument of disputation, and finding no certainty in the hypothetical systems of ancient philosophy, the author recommends and explains the more slow but more satisfactory method of induction, which subjects natural objects to the test of observation and experience, in order to furnish certain facts as the foundation of general truths.

The *third* part is the "Sylva Sylvarum," or history of nature, which furnishes materials for a natural and experimental history; upon which the organ, or the instrument, which the author has provided for the investigation of nature, may be employed. The phenomena of the universe are ranged in this repository under three principal heads, viz. the history of generations or the production of all species, according to the ordinary laws of nature; that of preter-generations, or births deviating from the stated rule; and the history of nature as confined or assisted, changed or tortured by the art of man. Of such a history the use is either to acquire the knowledge of qualities in themselves, or to serve for the first matter of a true and useful philosophy. The facts and observations that are here collected together are possibly not always correct; but they are valuable, as they furnish a pattern of the manner in which such researches should be pursued.

The *fourth* part, or "Scala Intellectus," is a series of steps by which the understanding might regularly ascend in its philosophical inquiries; and it is evidently intended as a particular application and illustration of the author's method of philosophizing.

The *fifth* part, or "Anticipationes Philosophiæ secundæ," was designed to contain philosophical hints and suggestions, but nothing of this remains besides the title and scheme.

The *sixth*, and sublimest part, was proposed for exhibiting the universal principles of natural knowledge, deduced from experiments, in a regular and complete system; but this the author despaired of being himself able to accomplish. Having laid the foundation of a grand edifice, he left the superstructure to be completed by the united and continued labours of philosophers in future ages.

Among the more popular works of lord Bacon, the principal are his "History of Henry VII." which, allowing for some faults, and particularly for its partiality to Henry, with a view of flattering his grandson James, at whose desire it was written, may be justly admired for vigorous conception and energy of language; his "Wisdom of the Ancients," in which he endeavours, with greater ingenuity than solidity, to unveil the hidden sense of the fables of antiquity; his "Moral Essays," containing many just reflections on subjects, which, in the author's own phraseology "come home to men's business and bosoms;" and his law tracts, speeches,

letters, and other miscellaneous papers, relative to personal or public affairs, and abounding with curious and interesting matter. These valuable writings, which were gradually collected, have been repeatedly published on the continent in Latin. An edition in folio was printed at Frankfurt in 1665; and another by Arnold at Leipzig, in 1694. They have passed separately and collectively through several editions in English; in 1740, they were published in 4 volumes, folio; but the most complete edition is that printed at London in 1778, in five volumes, quarto.

The character of lord Bacon seems to be pretty justly delineated by Mr. Hume in his History, vol. vi. p. 52. He represents him as "a man universally admired for the greatness of his genius, and beloved for the courtliness and humanity of his behaviour. He was the great ornament of his age and nation; and nought was wanting to render him the ornament of human nature itself, but that strength of mind which might check his intemperate desire of preferment that could add nothing to his dignity, and restrain his profuse inclination to expence that could be requisite neither for his honour nor entertainment. His want of economy, and his indulgence to servants, had involved him in necessities; and, in order to supply his prodigality, he had been tempted to take bribes, and that in a very open manner, from suitors in chancery." "If we consider," says he, "the variety of talents displayed by this man; as a public speaker, a man of business, a wit, a courtier, a companion, an author, and a philosopher, he is justly the object of great admiration." He adds; "if we consider him merely as an author and philosopher, the light in which we view him at present, though very estimable, he was yet inferior to his cotemporary Galileo, perhaps even to Kepler." "The national spirit," adds Hume, "which prevails among the English, and which forms their great happiness, is the cause why they bestow on all their eminent writers, and on Bacon among the rest, such praises and acclamations as may often appear partial and excessive." In answer to these strictures it has been justly observed (Brit. Biog. vol. iv. p. 154.) that "Galileo was undoubtedly an illustrious man, and Kepler an admirable astronomer; but though we admit their superiority in astronomy, mechanics, and some particular branches of physical knowledge, it does by no means follow that either of them was a greater philosopher than Bacon. The praise of Bacon is founded not upon his skill in this or that particular branch of knowledge, but on his great and comprehensive understanding, which took in almost the whole extent of universal science. And he was so little indebted to the partiality of his countrymen, that his writings appear, for some time at least, to have been more esteemed and admired in foreign countries than in England."

Mrs. Macaulay expresses in very strong terms her abhorrence of his character, when she says (vol. i. p. 157.), that "philosophy itself was degraded by a conjunction with his mean soul." But with respect to the strength and extent of his genius, this female writer says, "his precious bequests to posterity paint them stronger than can any other pen." It must however be confessed, that it was some discredit to Bacon, that he could not perceive the reasonableness of the system of Copernicus; but perhaps he understood less of astronomy, and was less sensible of its deficiencies, than of any other part of science and philosophy. With confidence in the merit of his own productions, and assuring himself of posthumous fame, lord Bacon introduces in his last will this remarkable passage:—"My name and memory I leave to foreign nations; and to mine own countrymen, after some time is passed over." Upon the superstructure that has been raised on the foundation of experimental phi-

lofophy which he has established, this infcription will be read, fays one of his biographers, by diftant pofterity, "BACON, THE FATHER OF EXPERIMENTAL PHILOSOPHY."

Upon the whole, in contemplating the character of Bacon, excluſively of his incontestible merit as a philoſopher, notwithstanding all the allowances that are made in his favour, from the ſpirit of the times, from his own peculiar circumſtances, and from other conſiderations, yet, when we call to mind his ſlavish ſubmiſſion in general to the will of the crown, and eſpecially his ingratitude to Eſſex, and his corruption as a judge, we are conſtrained, though not without great regret, to acquieſce in the juſtice of the deſcription given of him by Mr. Pope, (Eſſ. on Man, ep. iv. v. 277.)

"If parts allure thee, think how Bacon thin'd,
The wiſeſt, brighteſt, meaneſt of mankind."

Acknowledging the propriety of this representation, we may infer from it the infinite ſuperiority of the purſuits of intellect above thoſe of ambition. "Had Bacon contented himſelf with being a philoſopher, without aſpiring after the honours of a ſtateſman and a courtier, he would have been a greater and a happier man." Mallet's Life of lord Bacon, prefixed to the edition of his works, 1753. Brucker's Hiſt. Phil. by Enfield, vol. ii. p. 520, &c. Biog. Brit. Gen. Biog.

Though not a practical muſician, nor a writer *ex profeſſo* on the muſical art or ſcience, yet it is ſo manifeſt by his Nat. Hiſt. cent. ii. that he had done muſic the honour to beſtow much meditation on the theory of ſound, we are proud to devote to him an article among muſic's benefactors.

He treats of the philoſophy or production of ſound, not by calculation, but by obſervation and experiments on Nature herſelf. He does not call octaves *replicates* (which is a Gallicism), but a recurrence. He thinks (and thinks rightly), that our not cultivating quarter tones, or enharmonic, is from their not being capable of harmony; and it ſeems a proof, among others, that the ancient Greeks had no harmony, or muſic in parts.

He ſpeaks of ſliding from one ſound to another by ſmall degrees, which are delightful. This we uſed to think a refinement of late times.

The *clavecin oculaire*, or ocular harpſichord of Pere Caſtel, was certainly ſuggeſted to him by the experiment, N^o 3, ſecond cent.

The powers of ſound on the ſpirits and affections; that ſound depends on motion; that the incloſure of ſound increaſes its force; that the tone of voice at the ſame pitch is of a different quality in a room, and in the open air, and in different rooms, are his diſcoveries. He denies, indeed, what was afterwards proved by the air-pump, that ſound cannot be produced in an exhauſted receiver.

Sound is carried along a wall better than in open ſpace; and better on the ſmooth ſurface of a river or piece of water, than on land.

Dr. Holder, in his Elements of Speech, has but ingeniouſly extended one of ſir Francis Bacon's experiments.

Derham's experiments on the propagation and motion of ſound, were pointed out by the 20th experiment of ſir Francis.

The late honourable Daines Barrington's experiments on birds, their power of imitation, and of teaching each other, ſeem to have ſprung from ſir Francis's experiments on the imitation of ſound, cent. iii.

Conſent of viſibles and inviſibles, advances ſomewhat further towards an ocular harpſichord.

The *ſons harmoniques*, which Galileo and father Merſennus were obſerving about this time, had not eſcaped the penetrating and active mind of our great philoſopher; and

the *acouſſicon*, or ear-trumpet, is here firſt pointed out, N^o 285.

His reflection at the end of N^o 290, ſhall cloſe this article.

"We have laboured, as may appear in this diſquiſition of ſounds, diligently; both becauſe ſound is one of the moſt hidden portions of nature, and becauſe it is of a virtue that may be called incorporeal and immatrate; whereof there be in nature but few. Beſides, we were willing, now in theſe our firſt centuries, to make a pattern or precedent of an exact inquiſition, and we ſhall do the like hereafter on ſome other ſubjects that require it. For we deſire that men ſhould learn and perceive, how ſevere a thing the true diſquiſition of nature is; and ſhould accuſtom themſelves by the light of particulars to enlarge their minds to the amplitude of the world, and not reduce the world to the narrowneſs of their minds."

BACON, in *Geography*, a town of Perſia, in the province of Segeltan; 90 miles N. N. E. of Zareng.

BACONE, a town of Italy, in the duchy of Tuſcany, 28 miles N. E. of Florence.

BACONTHORP, or BACON, JOHN, in *Biography*, an Engliſh monk of the thirteenth century, was born at Baconthorp, a village in Norfolk, and aſſumed the monaſtic habit in the convent of Blackney in the ſame county. He received his education at Oxford and Paris; and in his youth was attached to the philoſophy of Averroes, who taught that one intelligent principle animates all human beings. At a general aſſembly of the order of Engliſh carmelites held in London in 1329, he was choſen one of their provincials. Being invited to Rome about four years afterwards, he gave offence by allowing, in public diſputation, too much latitude in the marriage of perſons mutually related. But he afterwards maintained, that in degrees of conſanguinity prohibited by the divine law, the pope has no diſpenſing power. His ſtature was ſmall; but his mind was eminently vigorous and active. He was diſtinguiſhed through life by the appellation of the "Reſolute Doctor;" and after his death he was celebrated both in proſe and verſe, as a zealous defender of the Catholic faith againſt Jews, Turks, and Heretics. Some few of the many books which he wrote were printed; among theſe were "Commentaries, or Queſtions on the four books of Sentences," Milan, 1510, and 1611; and "A Compendium of the Law of Chriſt," Venice, 1527. He died at London in 1346. Cave, H. L. vol. ii. Appendix, p. 27. Biog. Brit.

BACOPA, in *Botany*. Lin. gen. Schreb. n. 266. Aubl. 49. Juſt. 313. Claſs, *pentandria monogynia*. Nat. Ord. *Jucculente: portulacæ*, Juſt. Gen. Char. *Cal.* perianth one-leafed, five parted; two of the parts oblong, concave, acute; the two inferior reflex, ovate, acute; the ſingle ſuperior one broader, roundiſh, undulated. *Cor.* one-petalled; tube ſhort, towards the oriſce a little enlarged; border five-parted; parts ovate, oblong, obtuſe, equal, ſpreading. *Stam.* filaments five, inſerted into the tube of the corolla; anthers ſagittate. *Pyl.* germ ovate, compressed, below inſerted by the calyx growing to it; ſtyle ſhort; ſigma headed. *Per.* capſule one-celled. *Seeds* many, extremely ſmall.

Eſſ. Gen. Char. *Cor.* with a ſhort tube, ſpreading at the top. *Stam.* inſerted into the tube of the corolla; ſigma headed, capſ. one-celled.

Species, 1. *B. aquatica*. Aubl. Guian. 129. t. 49. This plant puts forth ſeveral cylindrical, ſucculent, knotty ſtems; leaves oppoſite, ſtem claspng or rather connate, thick, oblong, concave, ſharp, ſmooth; flowers ſolitary, peduncled, alternate from the axillæ; below the calyx there ſtands a pair of fleſhy bractes on the long peduncle; corolla blue,

It puts forth roots from the knots, both as it runs along the ground, and as it lies on the surface of the water. A native of Cayenne, on the borders of rivulets, flowering in December. The inhabitants of the island call it *herbe aux brulures*, on account of its being used for curing buras.

BACQUERE, BENEDICT, in *Biography*. Of this writer, who lived towards the end of the seventeenth century, but of whose life no memorials have come to us, we have a much esteemed work, "Salvator Senum," published 1672; and, if it is not the same work, "Senum Medicus, præferibens observanda, ut sine magna molestia senectus protrahatur." Colon. 1673, and 1683, 8vo. Haller Bib. Med. Pract. Morf. Carrera says, that Bacquere was professor of theology, and prior of the abbey of Dunes, which Eloy observes is very probable, as at the end of the directions for the preservation of the health of aged persons, is another work intitled, "Salvator Senus, remedia suggerens pro Senum salute eterna." Eloy. Diction. Hist. De la Med. v. i. p. 242.

BACQUET, JOHN, a learned French lawyer, was advocate to the king, and flourished at the close of the sixteenth century. He wrote many excellent law-tracts, which were published with notes by Ferriere at Lyons, in 2 vols. folio, in 1744. He died in 1597. Nouv. Dict. Hist.

BACTISHUA, or **БОКТ ЈЕСУ**, *Servants of J. Jus*, a Christian family famed in the East for their knowledge of physic.

BACTISHUA, GEORGE, the first of the family of whom we have any account, who besides his skill in medicine, was eminent for his proficiency in the Persian and Arabian languages, received his education at Jondisabur, or Nisabur, the capital of Korasan. Sapores king of the Persians is said to have built this city, A. C. 272, in honour of his queen, the daughter of the emperor Aurelian, who sent with her several Greek physicians. These men, settling there, received and propagated the doctrines of Hippocrates, in the east, and hence, Freind conjectures, it happened, that most of the celebrated Arabian physicians, Rhazes, Haly Abbas, Avicenna, were educated in the more eastern parts of Asia. George, being sent for to Bagdad, by Almanzor, the second caliph of the house of Abbas, to relieve him of a complaint of his stomach, in which he was successful, was detained there, and at the desire of the caliph, translated several books of physic; and when, on account of his ill health, he desired leave to return to his country, Almanzor sent him home with great honour, and a reward of 10,000 aurei. Rhazes and Serapion have recorded in their works many of the maxims and medicines of George. The answer was remarkable which he made to Almanzor, who had condescended to solicit his conversion from Christianity to Mahometanism, and offered to insure him a place in paradise upon his compliance. "No," replied the doctor, "I am very well contented to go wheresoever my forefathers have gone, be it to heaven or to hell." Ruffel's Aleppo, vol. ii. Append. p. 5.

Gabriel, the son of **George**, was in equal estimation with the caliph Haroun Al Raschid, whom he cured of an apoplexy, by directing him to be bled, which was performed, though contrary to the opinion of the other physicians. Freind annexed to his History of Physic, the life of Gabriel, translated into Latin, from the Arabic of Abi-Osbai. The translation was performed at the expence of Dr. Mead. The work is principally remarkable for the extravagant praises bestowed on Gabriel, and the account of the high honours and prodigious wealth heaped by the caliphs on their physicians. Freind's History of Physic, vol. ii. Haller. Bib. Med. Pract. For an account of others of this family, which in succession supplied the caliphs with physicians for above two centuries; see Ruffel's Aleppo (*ubi supra*).

BACTRIA, or **BACTRIANA**, in *Ancient Geography*, a country of Asia, was bounded on the west by Margiana and Aria, on the north by the river Oxus, which separated it from Sogdiana, on the south by the mountains called Paropamisus, which covered the north of India, and on the east by mountains which separated it from Asiatic Scythia and the country of the Massagetae. It comprehended the present provinces of Balk and Gaur, and probably, says major Rennell, part of Korasan. It was a large, fruitful, and well-peopled country, and contained, according to Ammianus Marcellinus (l. xxiii.) a great number of cities mentioned by the ancients; but the metropolis was *Bactra*, called also Zariaspa, and now **BALK**, from which, or from the river Bactrus, the country derived its name. Quintus Curtius (l. vii. c. 4.) deduces the name both of the city and country from the river Bactrus, which watered the environs of the capital. Pliny (l. vi. c. 15, 16.) places Bactria on the river Zariaspe; and Curtius, on the Bactrus, at the foot of mount Paropamisus; but Ptolemy describes it as situated on the river Dargidus, in the heart of the country, at a great distance from this mountain, which was the southern boundary. The chief river of Bactria, with regard to the names of which there is considerable confusion, were the Oxus, the Ochus, the Orgomenes, or as Ptolemy calls it, Dargomenes, which, uniting with the Oxus, fell into the Oxus; the Zariaspa, or Zariaspes; the Arctenis; and the Dargidus. That part of Bactria, which was watered by the river Oxus, is described by the ancients as a very fruitful country, abounding with pastures, and well stocked with cattle of a very large size; but the southern parts were sandy deserts, through which travellers journeyed only in the night, being under a necessity of guiding themselves by the stars, as if they were at sea, and exposed to the danger of being buried in the sand. The country was inhabited by the following nations: the Saltrae and Zariaspa; the Chomari, or Comarians, placed by Ptolemy near the sources of the Jaxartes, toward the eastern boundaries of Sogdiana; the Comi; the Acinacae; the Tanbazae, or Tambyzi; the Thocare, or Tochari, who were mountaineers on the declivity which regards Bactriana, whence the modern Tokarestan; the Marycai; the Scorde; the Varii; the Aradix; the Orisippi; the Amarispii, and some others. The Bactrians in general were reckoned good soldiers, and were always at war, either among themselves, or with the neighbouring nations. Herodotus says they were archers, and used bows made of their country reed or cane, and had short darts. In other respects they were accoutred, like the Medes, who wore tiaras, tunics, and breeches, with a dagger at their girdles. They were enemies to every kind of luxury. Pliny informs us, that they used to expose their old people after a certain age, to be devoured by fierce mastiffs, which they kept for that purpose, and called sepulchral dogs. He adds, that they allowed their daughters to associate with any who they liked, and that incontinence was not disreputable even to the women.

The early history of Bactria is, like that of other ancient nations, involved in considerable obscurity and uncertainty. According to Diodorus, the Bactrian government, in the earlier ages, was monarchical. Zoroaster is said by Eusebius (in Chron.) to have reigned in Bactria, and to have been contemporary with Ninus, who made war upon him, and subdued his country. But Ctesias, followed by Diodorus, mentions one Oxyartes, who reigned in Bactria, when that country was reduced by Ninus, and he says that Zoroaster was contemporary with Cyrus the Great. But the history of this Persian lawgiver is lost in remote antiquity. It has been asserted by some writers, that Ninus subdued all Asia, except India and Bactriana. However this be, all authors

are agreed, that Bactria was subdued, first by the Assyrians, and afterwards by the Persians under Cyrus the Great. After the overthrow of the Persian empire by Alexander (B. C. 323.), it fell under the power of the Macedonians, and was held by the successors of Seleucus Nicator, till the reign of Antiochus Theos, when Theodotus, about the year B. C. 249, from being governor of that province, became king, and strengthened himself so effectually in his new kingdom, while Antiochus was engaged in a war with Ptolemy Philadelphus, king of Egypt, that he could never afterwards dispossess him of his acquisitions. He was succeeded by his son Theodotus, who, strengthening himself by an alliance with Arsaces, the founder of the Parthian monarchy, considerably enlarged his kingdom. Theodotus, being vanquished by Euthydemus, was expelled the kingdom; and Euthydemus was succeeded by his brother Menander, who extended his conquests to several countries that were unknown to Alexander the Great. The possessions which Menander had reduced were retained by his nephew and successor Demetrius, and enlarged by several new acquisitions. Having left the kingdom of Bactria in a very flourishing condition, he was succeeded by his son Eucratides, who invaded India, and made himself master of all those provinces which had been subjected by Alexander. During the reigns of these six princes, the commerce of Bactria with India was very considerable. The district near the mouth of the Indus, which Alexander had subdued, was recovered; and military operations were carried on in India, with such success, that the Bactrian kings penetrated far into the interior part of the country; and proud of the conquests which they had made, as well as of the extensive dominions over which they reigned, some of them assumed the title of "Great King," which distinguished the Persian monarchs in the days of their highest splendour. Apollodorus, the Bactrian historian, asserts that Eucratides possessed one thousand cities. The learned Bayer, in his interesting history, advances many arguments to prove that the Greeks of Bactriana imparted the first lineaments of science to the Hindus. M. Pezron, in his "Antiquities of Nations," alleges, that there was a people in the upper regions of Asia, beyond Media and mount Imaus, who in the first ages spread themselves over Bactria and Margiana, and proceeding by Armenia and Cappadocia, at last passed over into Europe. These people were called Saccæ. In the mean time, the Cimmerians, who were of the same family, went by the north; and having made various incursions, at last settled above the Luxine sea, near the Palus Mæotis. The learned Bryant is of opinion, that this account is not warranted by sufficient authority on the part of the writers to whom M. Pezron appeals. Although such people as the Cimmerians actually existed upon the Mæotis, yet that they came from Bactria, and fought their way through different countries; and that they were the brethren of the Scythians styled Saccæ, and took the upper route, when the others were making their inroad below, are circumstances which, says Bryant (Anal. Mythol. vol. iii. p. 131.), have not the least shadow of evidence. Another writer of our own nation (see Wise's Hist. & Chron. of the Fabulous Ages, p. 119.) supposes, that all sciences centered of old in Bactria, called Bochari, or "the land of books." (See SACÆ, and SCYTHIA.) But to return from this digression: Eucratides, king of Bactria, was treacherously murdered by his son of the same name, who usurped the throne; but he was expelled by the united forces of the Scythians who attacked it on one side, and of the Parthians who attacked it on the other, and was soon after killed in attempting to recover it. The Greeks, says Strabo (l. xi. p. 779.), were deprived of Bactria by tribes or herds of Scythian Nomades, who came from the country

beyond the Iaxartes, and were known by the names of Afii, Pafiani, Tachari, and Sacarauli. This fact coincides with the relation of the Chinese historians, cited by M. de Guignes (Mem. de Liter. t. xxv. Mem. p. 19.), and is confirmed by it. By them we are informed, that about 126 years before the Christian æra, a powerful horde of Tartars, pushed from their native seats on the confines of China, and obliged to move towards the west by the pressure of a more numerous body that rolled on behind them, passed the Iaxartes, and pouring in upon Bactria, like an irresistible torrent, overwhelmed that kingdom, and put an end to the dominion of the Greeks there, after it had been established near 130 years. The kings, who reigned in Bactria in the times of the Roman emperors Adrian, Antoninus Pius, and Valerian, were all of Scythian extraction; but the Scythians were in their turn driven out by the Huns, who reigned in Bactria in the time of Ladislaus IV. king of Hungary.

BACTRIANI, in *Geography*, a town of Asia, in the country of Georgia, 60 miles north of Teflis.

BACTRIANUS, in *Zoology*, a species of CAMELUS, having two bunches on the back. Linn. This differs very little in appearance from the common Arabian camel, except in being rather larger, and having two bunches on the back instead of one. It is an inhabitant of the western and northern parts of India, and also of the deserts bordering on China; the breeds of this kind are in more esteem for their swiftness than the other. In Arabia, we are told, it is chiefly kept for the use of the great, being not a native of that country, but imported from India, &c. Of this animal, as well as of the Arabian kind, there are several races or varieties, differing like those of horses in strength, size, swiftness, and elegance of form. A breed of peculiar swiftness is said to be reared in China, where it is distinguished by the expressive title of *Fong Kyo Fo*, or camels with feet of wind. A white variety occurs in some parts of Siberia; and lastly, a hybrid or mixed breed is said to be occasionally obtained between the Bactrian and the Arabian camel. Shaw, &c.

BACTRIS, in *Botany* (*αὐτὸ τοῦ βακτρῆος, a staff; canes* being made of the stems). Lin. gen. Schreb. n. 1693. Jacqu. Amer. t. 171. Gaertn. 9. 139. Class, *monoclea hexandria*. Nat. Ord. *Palms*. Generic character; * Male flowers. *Cal.* spathe universal, one-leaved; spadix branched; perianth one-leaved, three-parted, small; parts lanceolate, concave, coloured. *Cor.* one-petalled, three-cleft; tube short; clefts ovate, acute, erect. *Stam.* filaments six, subulate, erect, of the length of the corolla, inserted into the middle of the tube; anthers oblong, incumbent. * Female flowers few, in the same spadix, intermixed with the male ones. *Cal.* spathe the same as in the males; perianth one-leaved, bell-shaped, three-toothed, pointed, coloured, very small, permanent. *Cor.* one-petalled, erect, three-toothed, permanent. *Pist.* germ ovate, large; style very short; stigma headed, obscurely three-cleft. *Per.* drupe coriaceous, roundish, fibrous-succulent, sharp-pointed with the style. *Seed*, nut roundish, depressed on each side; marked on the sides with three holes; kernel solid.

Ess. Gen. Char. Male. *Cal.* three-parted. *Cor.* one-petalled, three-cleft. *Stam.* six. Female. *Cal.* one-leaved, three-toothed. *Cor.* one-petalled, three-toothed; stigma obscurely three-cleft; drupe coriaceous.

Species, 1. *B. minor*. Jacqu. l. c. Ic. select. t. 256. *B. minima* Gaertn. Fruct. 2. 269.—conf. *B. globosa minor* Eusd. 1. 22. quæ *Coccos aculeata*, Swartz & Hort. Kew Palma, 7. Brown Jam. 344. "Fruit roundish." Root creeping; trunk upright, armed with numerous prickles, about an inch in diameter, seldom more than twelve feet high. The flowers usually appear as soon as it has attained the

the height of about four feet; leaves frondose, few, stem-clasping at the base, pinnate; the rib prickly; the leaflets ensiform, acuminate, shining, flat, ferrate-prickly; spathes axillary, solitary, spreading, continuing long after the fruit is ripe; flowers without scent, very slightly tinged with yellow; fruit the colour and size of a common cherry, containing an acid juice of which the Americans make a sort of wine. Canes are made of the stem; they are dark-coloured, shining, jointed, very light, and called by the French *Cannes de Tobago*. 2. *B. major*, Jacqu. l. c. "Fruit ovate." This resembles the former, but grows to the height of twenty-five feet with a stem more than two inches in diameter. Leaves six feet long; leaflets nearly two feet, with the marginal prickles brown, and more conspicuous than those in the other species; spadix compressed, flat, reclining; fruit of the form and size of an egg, acuminate with the style, fibrous, succulent, covered with a dark purple coriaceous coat, of which the natives make a vinous liquor. The nut is large, of a dark colour, ovate-oblong, with an acuminate trifid apex, and three obscure holes, two above the middle, and the third higher; kernel oblong, blunt at both ends, cartilaginous, solid. The fruits are called *Cocorotes*, and sold in the market. Both these plants are natives of Carthage in South America.

BACTRIS, in *Entomology*, a species of *BRUCHUS* that lives in the nuts of the American palms. It is cinereous; wing-cases rather smooth; posterior thighs ovate; tanks incurved. Linn. Amoen. Ac. Gmel. &c.

BACTROPERATA, also written *baetropereta*, compounded of *βακτρον*, *staff*, and *περα*, *bag*, or *budget*, an ancient appellation given to philosophers by way of contempt, denoting a man with a staff and a budget.

BACUACHI, in *Geography*, a town of North America, in New Navarre, 135 miles south of Casa Grand.

BACULARES, a sect of ANABAPTISTS, so called, as holding it unlawful to bear a sword, or any other arms besides a staff.

BACULARIUS, in *Writers of the Middle Age*, an ecclesiastical apparitor, or vergier, who carries a staff, *baculus*, in his hand, as an ensign of his office.

BACULE, in *Fortification*, a kind of portecullis, or gate, made like a pit-fall with a counterpoise, and supported by two great stakes. It is usually made before the *corps de guard* advancing near the gate.

BACULI. See **BACILLI**.

BACULI, *Sandii Pauli*, or batons of St. Paul, a kind of figured stones, of the same substance with those resembling the bristles of some American *echini*, called by Dr. Plott *lapides Judaici*.

BACULOMETRY, the art of measuring accessible and inaccessible distances, by the help of *laculi*, staves or rods. Schwenter has explained this art in his "Geometria Practica;" the rules of it are also laid down by Wolfius in his Elements; Ozanam also gives an illustration of the principles of baculometry. See **DISTANCE**, and **LONGIMETRY**.

BACULOSUS ECCLESIASTICUS, in some *Ancient Laws*, is used for a bishop or abbot, dignified with the pastoral staff, or crozier.

BACULUS DIVINATORIUS, or *Virgula Divina*, a branch of hazle-tree, of a forked figure, used for the discovery of mines, springs, &c. See *VIRGULA Divina*.

BADA, in *Ancient Geography*, a town of Africa, according to Ortelius and St. Cyprian.—Also a river of Phœnicia, in the vicinity of the town of Paltois, near which was a tomb said to be that of Memnon, son of Tithonus, and nephew of Priam, king of Troy. Strabo, l. xv.

BADA, or *Badas*, in *Zoology*. This is the name of the RHINOCEROS among the negroes on the coast of Angola.

BADACUM, in *Ancient Geography*, a town of Nencia, situate near the Danube. Ptolemy.

BADAGIS, in *Geography*, a town of Korafen, on the southern borders of the ancient desert of Margiana. N. lat. 35° 20'. E. long. 59° 28'.

BADAGSHAN, or **BADAKSHAN**, an ancient city of Independent Tartary, in Great Bucharia, seated on the north side of the river Anni, or Harat, not far to the north of Anderab in Tokarestan. In the last century, this city belonged to the khan of Great Buchana, or rather of Samarcand; and being secluded in a branch of the Belar Alps, was used as a state prison for rivals or insurgents. Badakshan was small, but well built and populous; and its inhabitants were enriched by the gold, silver, and rubies found in its neighbourhood; the grains of gold and silver abounding in the torrents which descend from the mountains, when the snow melts in the beginning of summer. Several Caravans for Little Bucharia and China pass by this city. Ebn Haukal mentions that there were not only mines of rubies and lazulite near Badakshan; but that there was abundance of musk. It is situated above 100 miles from the source of the Amu, 230 from Balk, and 210 from Anglien in the province of Samarcand. N. lat. 36° 15'. E. long. 68° 45'.

BADAGRY, a town of Africa, in the country of Benin.

BADAJOZ, **PAX AUGUSTA**, a considerable town of Spain, being the capital of Estremadura, and a frontier fortress towards Portugal. It is seated near the river Guadiana, on a gentle rise, which on one side is covered with olive-trees, and on the other side of the river are some fortified hills. Over the river is a handsome stone bridge, built, as it has been said, by the Romans, but as the inscription on it states, by Philip II. The streets are clean, and partly straight, and well-paved; and there are a few large houses, with some handsome churches and towers. The fortifications are not very strong; but it has sustained two sieges, one by the Portuguese in 1658; and another by the English and Dutch, aided by the Portuguese, in 1705. N. lat. 38° 43'. W. long. 6° 19'.

BADANATHA, in *Ancient Geography*, a town of Arabia Felix, in the country of the Thamudai. Piny.

BADARA, a town of Asia, in Gedrosia.—Also, a town of Asia, in Caramania. Ptolemy.

BADASKA, in *Geography*, a town of Siberia, on the side of the Angara; 80 miles N.N.W. of Tschukli.

BADATIUM, in *Ancient Geography*, a town of the Tauric Chersonesus. Ptolemy.

BADAUSA, a town of Asia, in Mesopotamia. Ptolemy.

BADDAMMY, in *Geography*, a town of Hindoostan, in the country of the Vissapur, eighty miles south of Vissapur. N. lat. 16° 10'. E. long. 75° 47'.

BADELONA, **BADALONA**, or **BADLONA**, an ancient town of Spain, in Catalonia, seated on the east of the Mediterranean, about six miles north-east of Barcelona.

BADELU, or **PADIBOU**, a country of Africa, on the borders of the river Gambia.

BADELUNDSAHS, a long narrow sandy tract of land in Sweden, in the province of Westmannland, where the Dines were totally defeated in 1521.

BADEN, a district or county of Switzerland, lying on both sides of the river Limmat, and bounded on the west by the river Aar, on the north by the Rhine, and on the south by the Reuss, became a bailiage of the eight ancient cantons in 1418, when the canton of Zurich took possession of the town and county, and so continued till the year 1712. A civil war breaking out at that time between the

Protestant and Catholic cantons, Baden was besieged and taken by the troops of Zurich and Bern; and at the peace of Arau, it was ceded to those two cantons and Glarus, which, on account of its neutrality, preserved its right of joint sovereignty. Until 1712, the diet assembled at Baden; but was afterwards transferred to Frauenfeld. The three cantons alternately appointed a bailiff, who resided in the castle. The inhabitants elected their own magistrates, and had their own judicial courts. In civil proceedings, an appeal lies to the bailiff, and from his decision to the syndicate, composed of the deputies of the three cantons, and in the last resort to the three cantons themselves. In penal causes, the criminal court condemns, and the bailiff enjoys the power of pardoning, or mitigating the sentence. This bailiage comprehends about 138 square geographical miles, and contains 24,000 persons. In consequence of the French revolution, a new division took place in 1798: the county of Baden, the free bailiages, and a small portion of the south-western part of Zurich, were constituted one of the 18 Swiss departments or cantons, and Baden was its capital; but according to the constitution of the 29th of May 1801, Argovie, re-united with Baden and with the upper part of the Frickthal, was made one of the 17 departments or cantons of Switzerland; and six representatives were appointed to be deputed by it to the diet. The soil of this district is fertile; in general it abounds with grain and fruit, and on the sides of the Limmatt it produces wine. The mountains yield excellent free-stone, marble, and iron ore. The greater number of the inhabitants are Roman Catholics.

BADEN, the capital of the above district or canton, is situated on the side of the river Limmatt, in a plain flanked by two hills, between which the river runs. It derived its name and its origin from the warm baths in its neighbourhood, which were famous before the Christian era, and are mentioned by the ancients under the name of *Aquæ* and *Thermæ Helveticae*. It was a Roman fortress, erected to curb the Alemanni or Germans, and was rased when the Helvetians, who supported Otho, were routed by Cæcina, general to Vitellius. Being rebuilt, it was taken by the Germans; fell afterwards under the dominion of the Franks, was in the tenth century incorporated in the German empire, and became successively subject to the dukes of Zæringen, to the counts of Kyburgh, and to Rhodolph of Hapsburgh. When his descendant Frederic, duke of Austria, was put under the ban of the empire, in 1418, it came into the possession of the canton of Zurich, which purchased it of the emperor Sigismund, and subjected it to the eight cantons. (See the preceding article.) Many monuments of antiquity have been found in this place; such as statues of several heathen gods, made of alabaster; Roman coins, formed of bronze, of Augustus, Vespasian, Decius, &c.; and several medals of the Roman emperors, of gold, silver, copper, and bronze. There are two churches in this city; one collegiate, and the other a monastery of capuchins, near the town-house, in which the diet formerly assembled. Before the castle, which is the residence of the bailiff, there is a stone-pillar, erected in honour of the emperor Trajan, who paved in this country a road eighty-five Italian miles long. The inhabitants are rigid Roman Catholics, and were formerly insolent in their behaviour towards the Protestants. The baths are seated on each side of the river, about a quarter of a league from the city. Adjacent to the small baths is a village, and to the large, a town, seated on a hill of steep ascent. The water of the baths is conveyed to inns and private houses by means of pipes, of which there are about sixty. And in the middle of the towns there are public baths, supplied by a spring in the street, where the

poor may bathe gratis. All the baths are hot, and they are used for drinking as well as for bathing. They serve, like others of a similar kind, to give relief in a variety of diseases. (See *WATERS, Medicinal*.) About a mile from Baden, at a place called Wettingen, where the Limmatt flows with the greatest rapidity, there is a beautiful piece of mechanism, which is a wooden bridge, 240 feet long, and suspended above twenty feet from the surface of the water. It was the last work of Grubenman, the self-taught architect, and exceeds in elegance that of Schaffhausen. Mr. Coxe (*Trav. Swift*, vol. i. 137.) has given a geometrical elevation of it. Baden is distant $14\frac{1}{2}$ miles from Zurich. N. lat. $47^{\circ} 21'$. E. long. $8^{\circ} 12'$.

BADEN, a margravate of Germany, in the circle of Swabia, is divided into the upper and lower margravate. The upper, or the marquifate of Baden-Baden, terminates wellward on the Rhine, though a small part of it lies west of that river, and is bounded on the north-west by the lower margravate of Baden-Durlach, on the east by the duchy of Wurtemberg and the county of Eberstein, and on the south by the Ortenau and the Brisgau. The principal towns are Rastadt, Baden, Etlingen, Stembach, and Stolhofen. The margrave is a sovereign prince, and has a vote in the college of princes. The established religion is Roman catholic. The lower margravate, or that of Baden-Durlach, is bounded on the west by the Rhine, on the south by the upper margravate of Baden, on the east by the duchy of Wurtemberg, and on the north by the bishopric of Spire. The principal towns are Carlsruhe, Durlach, Pforzheim, Muhlburg, and Emmingen. This prince has two votes in the college of princes, one for Baden-Durlach, and the other for the margravate of Stockberg, which belongs to him, and lies in and along the Brisgau. The reigning family, and the country in general, profess Lutheranism, with a toleration of Protestants, Catholics, and Jews at Carlsruhe. The whole margravate of Baden is a populous and fertile country, abounding with corn, hemp, flax, bees-wax, wood, and wine. Venison and wild-fowl are so plentiful that they are the common diet of the peasants. Their hogs, being fed with chestnuts, furnish excellent bacon. They have free-stone for building, marble of various colours, and some agate. Manufactures are much encouraged, and the country is in a flourishing condition. The territories of the margrave of Baden comprehend 832 square miles, and 200 000 inhabitants. The annual revenue is estimated at 1,200,000 florins; and the military establishment consists of 3000 men, of whom 300 are cavalry.

BADEN, a town of Germany, and capital of the upper margravate of Baden, is seated on the river Oalbach near the Rhine, among vineyards. It has a fine castle, on the top of a mountain, where the prince often resides during the summer. It is famous for its hot baths, whence it derives its name: distant four miles south from Rastadt. N. lat. $48^{\circ} 46'$. E. long. $9^{\circ} 24'$.

BADEN, a town of Germany, in the archduchy of Austria, seated on the river Schwocha, and much frequented on account of its baths. The town is walled, and has three churches; twelve miles S. S. W. from Vienna. N. lat. $48^{\circ} 3'$. E. long. $16^{\circ} 12'$.

BADENOCH, a district forming the eastern part of Inverness-shire, in Scotland, extending from east to west about thirty-three miles, and in the broadest part twenty-seven miles from north-east to south-west. It is barren and hilly, and abounds with deer and game.

BADENS, FRANCIS, in *Biography*, a painter of history and portraits, was born at Antwerp, in 1571, and acquired the first rudiments of the art from his father; and, by visiting Rome and other parts of Italy, acquired a good taste

in design, and a very pleasing manner. Upon his return to his own country, his merit was so generally acknowledged, that he was distinguished by the name of the Italian painter. His touch was light and spirited, and his colouring warm, so that he had the honour of being the first who introduced among his countrymen a good taste for colouring. The news of his brother's assassination occasioned his death in 1603, which was much regretted by every lover of the art. Pilkington.

BADENSIS, in *Entomology*, a species of *CURCULIO*, about the size of *C. cerasi*. It is black; legs pitchy. Gmelin, Blom. This insect inhabits Germany; the thorax is rather smooth and ovate; wing-veins obsoletely striated; thighs clavated.

BADENSIS, in *Ornithology*, a species of *EMBERIZA* found in the neighbourhood of Baden. The colour is olive, streaked with blackish, beneath paler; chin orange; breast striated with blackish. Sander Naturf.

BADENUCHI, in *Geography*, a town of North America, in the province of New Navarre; 125 miles south of Casa Grand.

BADENWEILER, a town of Germany, in the circle of Swabia, and margravate of Baden-Baden. N. lat. 47° 55'. E. long. 7° 50'.

BADERA, in *Ancient Geography*, *Basge*, a place of Gaul, belonging to the Volcae Tectosages, in the Narbonensis prima, on the rout from Toulouse to Narbonne, and south-east of the first of these towns.

BADESSUS, a town of Asia, placed by Ptolemy in Caria.

BADEY, in *Geography*, a town of Persia, in the province of Korafan; 140 miles north-west of Herat.

BADGE, in *Naval Architecture*, signifies a sort of ornament placed on the outside of small ships very near the stern, containing either a window, for the convenience of the cabin, or a representation of it. It is commonly decorated with marine figures, martial instruments, or such like emblems.

BADGE, in *Heraldry*. See *DEVICE*.

BADGER, *Common*, in *Zoology*, *ursus meles* of Linn. and Gmel. See *URSUS MELES*. The badger's skin is of some use in commerce. Their fat is sold by the druggists, as a remedy against disorders of the kidneys and the sciatica; and their hair, for the making pencils for painters and gilders.

BADGER, from *bagulo*, *I carry*, or from the Fr. *baggage*, *a bundle*; whence *bagazier*, *a carrier of goods*; a licensed huckster, or person privileged to buy corn, or other provisions, and to carry them from one place to another to make profit of them, without being reputed an engrosser. In the statutes he is also called a *ladder*, or *lader of corn*, 5 & 6 Ed. VI. c. 14. 5 El. c. 12.—We also read of badgers, or retailers of salt, 9 W. III. c. 6. If any person shall act as a badger without licence, which continues in force one year, he shall forfeit five pounds, one moiety to the king, and the other to the proprietor. 13 Eliz. c. 25. § 20.

BADGER-hunting. See *HUNTING*.

BADIA, in *Conchology*, a species of *CYPRÆA*, having an oblong gibbous shell, above bay-colour, dotted with brown and white. Gmelin, &c. Its native place is unknown.

BADIA, a species of *HELIX*, called by Born *helix ungalina*; it is about an inch in height, and rather more than an inch and a half in length; and of a chestnut colour. The shell is umbilicated, subglobose, smooth, depressed above; aperture lunar. Gmelin.

BADIA, a species of *PATELLA*, the shell of which is

somewhat convex, brown, bay-colour with n; with twelve larger rays, each surrounded on both sides by a rib; and smaller rays. The varieties of this kind are numerous; and no less than sixteen of them are described by Schrn. Ent. in Conch. n. Litterat. &c. The shells of all are from two inches and three quarters in length, the more or less of different specimens, and nearly smooth; if a rib or two are dotted with green, but the shell is red; in others the upper surface is spotted all over with that colour; shells of this kind occur in which green or brown is distributed in rows or dots; sometimes they are spotted with yellow, or spotted with yellow or black in the four corners. The colour is often variegated with rays, and not variegated with the rows of blue dots; and a spatulate form is found or green spot in the bottom, surrounded by a pale or reddish shell, which is more or less pale, and of different colours and different shells; the inner surface is usually either brown, yellow, liver-colour, or hoary-green.

BADIA, in *Ancient Geography*, a town of Spain, in Bætica, supposed to be the present *BADAJOS*.

BADIA, in *Geography*, a town of Italy, in the duchy of Tuscany, seventeen miles north of Florence.—*Alib*, a town in the same duchy, fifteen miles west of Volterra.

BADIAGA, in the *Materia Medica*, the name of a sort of spongy substance, common in the shops in Mexico, and some other northern kingdoms; used for taking away the livid marks from blows and bruises, which the powder of it is said to do in a night's time.

We owe the knowledge of this medicine, and its history, to the accurate Duxbaum. He observes, that the substance is always found under water, and is of a very singular and peculiar nature. It somewhat resembles the *agaricus*, and somewhat the sponges, but differs greatly from both, in that it is full of small round granules, resembling beads. It is of a loose, light, and spongy structure, and is made up of a number of fibres of an herbaceous matter, and is dry, rigid, and friable between the fingers. This may serve as the generical character of the badiaga, of which this accurate observer has found three different species. Linnæus makes it a species of sponge.

BADIAN, or *BADIANA*, the seed of the anise-tree, or of a tree resembling it, that grows in China; and sometimes used by the Chinese, and also by the Dutch, to give an aromatic taste to their tea.

BADIATH, in *Ancient Geography*, a town of Africa, in Libya interior.

BADIGEON, a mixture of plaster and free-stone, well ground together, and sifted; used by statuaries to fill up the little holes, and repair the defects in stones, whereof they make their statues and other work.

The same term is also used by joiners, for saw-duil mixed with strong glue, wherewith they fill up the chaps, and other defects in wood, after it is wrought.

BADILE, *ΑΥΤΟΣΙΟ*, in *Biography*, a painter of history and portrait, was born at Verona in 1480, and by assiduous application excelled his predecessors in an acquaintance with the true principles of his art. He was allowed to be a very eminent artist; and he had the honour of having for his disciples, Paolo Veronese, and Baptista Zelotti. His colouring was admirable; his carnations beautiful; and his portraits preserved the perfect resemblance of flesh and real life. He died in 1560. Pilkington.

BADILETTERS, a name given to a race of horsemen resident in the mountains, in the vicinity of Circassia, and of the Nogai Tartars, who in some measure retain their independence.

BADINGEN, in *Geography*, a town of Germany, in the

circle of Upper Saxony, and old mark of Brandenburg, seven miles west of Steadal.

BADJOURA, a large village of Egypt, on the western shore of the Nile, not far from Fushout, in N. lat. $26^{\circ} 3' 16''$.

BADIS, in *Ancient Geography*, a town of Carmania, seated on the coast of the Persian gulf, near the promontory of Carpella. Nearchus's Periplus.—Also, an episcopal town of Africa, according to Ortelius, who cites St. Augustin.

BADIS, in *Geography*, a fortress of Livonia, on the south side of the gulf of Finland, about seven leagues east from Revel, in N. lat. $59^{\circ} 15'$, and E. long. $24^{\circ} 36'$.

BADIUS, in *Entomology*, a species of *CLERMBYX* (*Stenocoru*) that inhabits Siberia. It is of a bay colour, with the thorax and wing cast. Triat. J. Lepsch, It.

BADIUS, in *Ornithology*, a species of *FALCO*, about thirteen inches in length; a native of Ceylon; and described in Brown's illustrations under the name of the *Irocon barak*. The legs are pale; head and body above brown, beneath white with yellow lunar spots; tail pale brown, with four dusky lines. Gmelin, &c.

BADKIS, in *Geography*, a town of Persia, in the province of Kofasan, thirty-six miles north of Herat. N. lat. $35^{\circ} 26'$. E. long. $60^{\circ} 35'$.

BADOCI, a town of Russia, on the north coast of lake Bielo, in the government of Novogorod, 196 miles north-east of Novogorod.

BADOUCE, in *Natural History*, the East Indian name of a fruit very common in that part of the world. It is round, and of the size of one of our common apples; it is yellow on the outside, and white within. It resembles the *manzoullon*, but its pulp is more transparent; its taste is very agreeable, and has some resemblance to that of our gooseberries.

BADRACHILLUM, in *Geography*, a town of Hindostan, in the Moodajec Boonla country, 72 miles N. E. of Rajamu dry, and 50 east of Bearen.

BADRAL, a town of European Turkey, in Moldavia, ten miles north of Stephanowze.

BADRINUS, in *Ancient Geography*, *Fusato Grande*, a river of Italy, in the territory of the Baii.

BADRIS, a town of Africa, in Marmarica. Anton. Itin.

BADUCCA, in *Botany*. See *CAPPARIS*.

BADUEL CLAUD, in *Biography*, a protestant divine of the sixteenth century, was a native of Nîmes, and under the patronage of the queen of Navarre was appointed rector of the university in that city. In 1557 he became the pastor of a church in the neighbourhood of Geneva, and taught nat ematics and philosophy till his death in 1561. He translated into Latin, the sermons and some other works, of Calvin, published at Geneva in 1557, 8vo. He also wrote "De ratione vitæ studiosæ ac literatæ in Matrimonio collocandæ ac d. gendæ," 4to, printed at Lyons in 1544, and translated into Latin in 1548; "De Collegio et Universitate Nemaufensi," printed at Lyons in 1654; "Acta Martyrum nostri Sæculi," Gen. v. 1556; and also Latin orations and epistles. His Latinity is commended; and he was much esteemed for his learning and piety. Gen. Diâ.

BADUENNÆ LUCUS, or **BADUHENNA**, in *Ancient Geography*, the name of a forest in Germany, mentioned by Tacitus. Its situation is not ascertained. This was the place where Civilis formed his conspiracy against the Romans.

BADULATO, in *Geography*, a town of Italy, in the kingdom of Naples, and province of Calabria Ultra, four miles S. S. E. of Squillace.

BADY, a river and an adjacent place of Peloponnesus in the territory of Elis, mentioned by Pausanias. After a war which depopulated the country, the women, it is said, presented their supplications to Minerva, that they might supply the waste by a new progeny in consequence of their first intercourse with their husbands; their petitions were granted; and they erected a temple in honour of the goddess, and hence the name *Bady* or *Badu*. *Bzæu*, or in the Dorian dialect *Adz*, i. e. pleasant or agreeable.

BÆA, the name of a mountain in the island of Cephalonia.

BÆBÆ, a small town of Asia, in Caria. Steph. Byz.

BÆBARZANA, or **BABARNANA**, a town of Asia, in Aria.

BÆBRO, the name of a town of Spain, mentioned by Pliny.

BÆCKIA, in *Botany* (named in honour of Dr. Beck physician to the king of Sweden). Linn. g. 491. Schreb. 670. Julf. 321. Clafs. *Umbellaria monogynia*. Nat. Ord. *calycanthemæ*. *Onagrea*, Junl. Gen. Char. *Cal.* perianth one-lobed, funnel-form, five-toothed, permanent. *Cor.* petals five, roundish, patulous, inserted into the calyx. *Stam.* filaments eight, of which six are equal, two solitary, very short, bent in; anthers subovate, small. *Pyl.* germ roundish; style filiform, shorter than the corolla; stigma capitate. *Per.* capsule globular, crowned, four-celled, four-valved. *Seeds* roundish, angular on one side.

Ess. Gen. Char. *Cal.* funnel-form, five-toothed. *Cor.* five-petalled; caps. globular, four-celled, crowned.

Species, *B. frutescens*. Reich. 2. 200. Osb. It. 231. t. 1. This shrub has the habit of southernwood, with wand-like branches, and opposite short simple twigs; leaves opposite, linear, sharp, toothed, entire; flowers axillary, solitary, on a naked peduncle the length of the flower, much shorter than the leaves. A native of China, where it is called *Tiongina*.

BÆCOLICUM, or **BÆCOLICOS**, in *Ancient Geography, a mountain of Africa, in the Pentapolis. Ptolemy.*

BÆCOR, a place of Spain, in Bætica, where Viriatus wintered after having been defeated by Fabius Maximus Æmilianus. Appian.

BÆCULA, a town of Hispænia Tarragonensis, in the territory, or at least in the vicinity of the Authetani. Ptolemy.

BÆDOO, in *Geography*, a district of Africa, to the west of the river Niger, mentioned by Mr. Park in the narrative of his journey.

BÆLAMA (*Glupea Balama*), in *Ichthyology*, the name of a fish found in the Red Sea, and described by Forsk. Fn. Arab.—It is *clupea setirostris* of Gmelin.

BÆLON, in *Ancient Geography, a town of Spain, north-west of Mellaria, upon the straits of Gades, which carried on a considerable commerce in salt with Tingis, on the opposite shore.*

BAEN, in *Geography*, a town of European Turkey, in Moldavia, sixteen miles N. N. W. of Niemeez.

BÆNUM, in *Ancient Geography*, a town of Arabia Felix. Ptolemy.

BÆOBOTRYS, in *Botany*, (from *Bzov*, small, and *Botrys*, a raceme, the fructifications being in thin racemes). Linn. gen. Schreb. 318. Forster, Gen. 11. Clafs. *pentandria monogynia*. Gen. Char. *Cal.* perianth double; exterior three-leaved; leaflets roundish, concave, smaller; inferior one-leaved, bell-shaped, short, five-cleft, growing to the germ; clefts ovate, permanent, converging after flowering, and crowning the fruit. *Cor.* one-petalled, tubular; tube very short; border five cleft, erect; clefts rounded, very short.

short. *Stam.* filaments five, very short, in the middle of the tube; anthers heart-shaped. *Pist.* germ globose, half-superior; style cylindrical, very short, permanent; stigma obtuse, tuberculated. *Per.* berry globose, somewhat dry, one-celled, growing to the calyx. *Seeds* several, angular, affixed to a columnar receptacle in the bottom of the berry.

Species, Leobotrys nemoralis. Forst. Flor. Austr. 97. A native of the isle of Tanna, in the South seas.

BÆONES, in *Geography*, the name given by Arrian to an island in the Indian ocean, on the other side of the river Indus.

BAER, and **WELISSE BAER**, in *Zoology*, the names of the *Black bear*, and *Polar bear*, in "Ridinger's Animals."

BÆRENBEISSER, the **BULL DOG**, Ridinger. *Canis molossus.* Gmel.

BAERSTIUS, or **VERENSTIL**, **HENRY**, in *Biography*, a mathematician, flourished in the beginning of the sixteenth century. He was a printer at Louvain, and the author of the following curious mathematical treatises: "Tabula perpetua Longitudinum ac Latitudinum Planetarum," 1520; "De compositione et usu Decretorii Planetarum," 1530; "De compositione et usu Quadrantis," 1537. Moren.

BÆRSFRAT, a painter of sea-ports, sea-shores, and fish, was an eminent master, whose works were much esteemed, though the place and time of his nativity are unknown. His pictures are easily distinguished by a general brightness diffused through the whole, and particularly in his skies. His drawing was correct, and his perspective true; he copied every object from nature, and was exact in his representations of sea-ports, ships of war, and vessels of a smaller size, which he distributed with judgment, so as to produce a very pleasing effect. His pencil is light and clean, his touch spirited, and his colouring always transparent; and he generally finished his pictures very neatly. He died in 1687. Pilkington.

BÆRUS, in *Ancient Geography*, a town of Macedonia. Ptolemy.

BÆSAMPSA, a town situated in the Arabian gulf, supposed by some interpreters to be the same with the Beth-Shemesh, or the house of the sun, mentioned by Joshua.

BÆSIPPO, a town of Spain, situate about twelve miles from Bælon, and at a somewhat less distance eastward from the promontory of Juno. Anton. Itin.

BÆTANA, a town of India, on this side the Ganges, seated on the river Namaguna, and said by Ptolemy to be the capital and residence of the Siropoleni.

BÆTERRÆ, **BEZIERS**, a town, which was a Roman colony, situate in Narbonensis Prima, a southern province of Gaul, at a small distance north east from Narbo. It was the station of the veterans of the seventh legion, who built two temples, one dedicated to Augustus, and another to his daughter Julia. Tiberius also adorned this city; and in the fourth century it was one of the most considerable in Gaul. But in the fifth century it was taken by the Visigoths, who demolished its splendid edifices. It was afterwards re-established; but taken possession of by the Saracens in 736. In the next year Charles expelled them, and destroyed the city, so that they might not be able to re-fortify it.

BÆTHAUTA, a town of Asia, in Mesopotamia. Ptolemy.

BÆTICA, a province comprehending the southern part of Spain, and corresponding to the present Andalusia and Grenada. This was one of the three provinces into which Augustus divided Spain; the other two being Lusitania

and Tarraconensis. It derived its name from the river Bætis, since called Tartessus, and now Guadalquivir, or the great river; and was bounded on the west side by Lusitania, on the south by the Mediterranean and Gulf of Gadus, and on the north by the Cantabric sea, and the Gulf of Biscay. Its limits towards the north-east were fluctuating, and cannot be easily ascertained. The Bætis divided this province into two parts; on the one side of which, towards the Anas, were situate the Tartetani, whose territory was called Tartetania, but it was better known by the name of Bætania. On the other side was situated the Bastuli, Bæthuli, and Cærtani, along the Mediterranean coast. It was the richest and most fertile province of Spain. It was famous for its wool; and its fertility was such, that its produce, according to Pliny (lib. 1. c. 13.), was on his dried fold. It is well known that the Phœnicians were long ago established on this coast, and that the Carthaginians had settlements in this country. Polybius speaks in high terms of the wealth of Bætania, and of the magnificence of the court of one of its sovereigns. Bætiana, according to this author, contained 175 cities; of which eight were colonies, eight municipal, twenty-nine enjoyed the Jus Latinum, twenty-six, six free, and 120 stipendiary or such as paid taxes. The chief mountains were Mammus, now Sierra Morena, and Orosopda, a part of the present Sierra Nevada. The principal rivers were the Anas and Bætis; and the chief towns were Bæt. Acci, Eþbeis, Castulo, Corduba, Arigi, Hispals, and Gades.

BÆTIS, now **GUADALQUIVIR**, a river of Spain, in Bætica, which had its source, according to Pliny, in the mountains called Saltus Eugeniensis; or to the south-east of Orosopda, pursued its course towards the west, washing Castulo, Corduba, and Hispals, and discharged itself by many outlets or mouths into the sea. The inhabitants of the country called it Cirtium and Certis, and the Arabs Cirtus, derived, according to Mariana, from the oriental term *kiriath*, a town, and denoting the river of towns, on account of the number of those which it watered. See **GUADALQUIVIR**.

BÆTIUM, the name of a town of Macedonia.

BÆTIUS, a river of Arabia Felix.—Also, a mountain of Asia, in Drangiana. Ptolemy.

BÆTULO, a town of Spain, belonging to the Laetani, at a small distance south-east from Barcino; now *Bathons*.

BÆTURIA. See **BÆTICA**.

BÆTUS, in *Ichthyology*, a name given by Aristotle and other of the ancient Greeks, to the fish called by some Latin writers *cottus*; and particularly to one kind supposed to be that described by Linnæus under the name of *gobio*; and called the *bull-head*, or *miller's thumb*, in England.

BÆTYLOS, or **BÆTYLION**, in *Antiquity*, a kind of stones worshipped among the Greeks, Phrygians, and other nations of the East; supposed by some modern naturalists to be the same with our ceramida, or thunder-stone.

The priests of Cybele carried a betylos on their breast, representing the mother of the gods.

According to Damascius, cited by Photius, they had many of these betylia, which were consecrated to different gods, as Saturn, Jupiter, the sun, &c. Bœchart (Chanaan. l. ii. c. 2. vol. i. p. 708.) derives the origin of this superstitious practice from the stone which Jacob erected at Bethel. Wheresoever the practice was deduced, it was very extensive and prevalent; not in the eastern countries, no idol was more common than oblong stones, which were denominated by the Greeks *zais*, *pilars*. In some parts of Egypt, they were planted on both sides of their roads. In the temple of Heliogabalus, in Syria, there was one which they pretended

pretended to have fallen from heaven : and a black stone of this kind was fetched from Tyrga, with great ceremony, together with the priests that belonged to it, by a Roman embassy, at the head of which was Scipio Nafica.

BÆZA, in *Geography*, a town of Spain, in the province of Andalusia, and country of Jaen, seated on a high hill three miles from the river Guadalquivir. It was anciently the see of a bishop, which was removed to Jaen in 1249, and a kind of university founded by John d'Avila. It was taken by the Moors about the end of the fifteenth century. N. lat. $37^{\circ} 45'$. E. long. $3^{\circ} 15'$.

BÆZA, a town of South America, the capital of the government of Quixos, in the province of Quito, in Peru, was founded by Gil Ramirez D'Avalos in the year 1559. Bæza, though the first built town in this country, has remained very small, which is owing to the building of the two cities of Avila, and Arehidona, which became the chief objects of the attention of the settlers. But these places have not merited the title of cities, which was given them, when they were founded; because the country is much inferior to Quito with regard to its air and fertility, and the other enjoyments of life. Bæza is much declined, and consists only of eight or nine thatched houses, with about twenty inhabitants of all ages; so that from being the capital as it once was, it is now annexed to the parish of Papallaeta, in which town resides the priest, who has also under his care another town called Maspu. This decay was the unavoidable consequence of the removal of the governor, who has of late resided at Archidona. See **QUIXOS**.

BÆZILLO, a town of Spain, in Old Castile, three leagues from Valladolid.

BÆFETAS, or **BÆTTAS**, a cloth made entirely of coarse white cotton thread, which comes from the East Indies. Those of Surat are the best.

BÆFFA, or **BORO**, in *Geography*, a neat village of Africa, on the Grain coast, about a mile east of Sanguin; which supplies ships with ivory and pepper. It is easily distinguished by a long sandy point, surrounded with rocks, that project into the sea. The language spoken in this place is a kind of corrupt Portuguese, or rather a mixed language.

BÆFFA, *Cape*, is the south-west point of the island of Cyprus in the Mediterranean, in N. lat. $34^{\circ} 37'$. E. long. $32^{\circ} 18'$. Near this harbour stood the ancient Paphos, where was a temple consecrated to Venus (see **PAPHOS**); it is now succeeded by ruins, a village, a mean castle, and equally mean houses, and a few Greek churches of the same description; and the name Paphos is converted into Bæffa or Bæffo. In the rocks is found a very fine rock-crystal, which is called the Bæffa diamond, because it is procured from the environs of Bæffa.

BÆFFIN'S BAY, is the largest gulf or bay of North America, and was called from William Bæffin, who, accompanied by captain Robert Bylot, attempted, in 1616, to find a passage through Davis's straits. In a large sense it extends nearly north and north-west from cape Farewel in West Greenland, as far as Whale sound, passing through the part of it called Davis's straits, and reaches from the parallel of 63° to that of 65° N. lat. In a more confined sense it comprehends from 70° to 80° , being bounded on the north by the Arctic continent or lands approaching towards the north pole, on the east by Greenland, on the south by Davis's straits, the ocean, and several islands which lie between this gulf and Hudson's bay, and on the west by a part of North America. Bæffin seems to have restricted this appellation to the sea between 72° and 78° N. lat. and says that he traded with the Greenlanders at Horn sound,

in the seventy-third degree, but in the seventy-fourth degree he found no natives, but several plains where tents had been set up, from which he concluded, that at certain seasons of the summer people resided there. The sea was full of seals and unicorn fish; and in Sir Thomas Smith's sound, in the seventy-eighth degree, he found the largest whales. See Crantz's Hist. of Greenland, vol. i. p. 16. In our maps it opens into the Atlantic ocean through Bæffin's and Davis's straits, between the broken land on the American coast, and that west of New Greenland, and between cape Chidley on the Labrador coast and cape Farewel on that of West Greenland; and on the south-west of Davis's straits it has a communication with Hudson's bay, through a cluster of islands. Some maps shew a communication with Hudson's bay, in the 70th degree of N. lat. and in the 70th of W. long. Bæffin's bay is laid down as extending from 46° W. long. to 94° , which allowing only sixteen geographical miles for the degree, would give a length of 768 geographical miles; and the breadth on the west side is represented as little inferior. But the extent and limits of this sea have not yet been accurately ascertained: nor has the west coast of Greenland been explored beyond N. lat. 72° or Sanderfon's Hope, and an old Danish settlement called Opernerig. In the middle of Bæffin's bay many maps present a large tract called James island, which some have imagined to be a promontory passing from Greenland; or it is probably a large isle in the north of Hudson sea, laid down from erroneous observations. This bay has been sometimes called Bylot's bay.

BÆFFIN'S Strait is a passage between James island and the most eastern of Cumberland islands, from the gulf of the ocean into Bæffin's bay. This, and Davis's strait on the east of James island, and Cumberland strait on the south-west between the Cumberland islands, seem to shew that the proper boundary of Bæffin's bay does not reach so far south as to cape Farewel.

BÆFFING, or **BLACK RIVER**, a principal branch of the Senegal river in Africa. Mr. Park, in his "Travels in the Interior Districts of Africa," describes a singular bridge erected by the Fallonkas over this river. It consists of two tall trees, which when tied together by the tops, reach from one side of the river to the other; the roots resting upon the rocks, and the tops floating in the water. When a few trees have been placed in this direction, they are covered with dry bamboos, so as to form a floating bridge, with a sloping gangway at each end, where the trees rest upon the rocks. In the rainy season this bridge is carried away by the swelling of the river.

BÆFFWEN LARE lies in that part of Sweden called Sudermanland; it is extensive, and contains many islands.

BAG, in *Commerce*, a term used to signify different quantities of certain commodities: a bag of almonds, for instance, is about 3 cwt.; of aniseeds, from 3 to 4 cwt.; of pepper, from 1½ to 3 cwt.; of goats-hair, from 2 to 4 cwt.; of cotton-yarn, from 2½ to 4 cwt. &c.

BAG, *Sacculus*, in *Medicine* and *Pharmacy*, denotes a kind of fomentation, prepared of proper ingredients, inclosed in a bag, to be applied externally to a part diseased for present relief. Dispensatory writers describe cordial bags, used in deliquians; bags for the side, for the stomach, in weakness of the stomach; anodyne bags to ease pain in any part. Wines and ales are frequently medicated by putting into them bags full of proper ingredients.

Sweet bags are compositions of perfumes, scented powders, and the like, inclosed in bags, to give a fragrancy to clothes, &c.

BAG, in *Barriery*. See **CHEWING-BALLS**.

BAG, *Oil*. See OIL.

BAG, *Petty*. See PETTY.

BAGS, *Sind*. See SAND.

BAG, or *Baggy Point*, in *Geography*, is a not^d promontory among seamen on the north coast of Devon, at the north-west point of the entrance into Barnstaple bay. N. lat. $51^{\circ} 10'$. W. long. $4^{\circ} 32'$.

BAGA, in *Ancient Geography*, a town of Africa Propria, being one of those which were re-established by the emperor Justinian, according to Procopius.

BAGA, or *Baga*, a town of Asia, in Pisidia.

BAGADA, a town of Ethiopia, near Egypt. Pliny.—Also, a small town of Asia, in Suisium. Diab. Sic.

BAGADANIA, a large plain of Asia, in Cappadocia, placed by Strabo between mount Taurus and mount Argea, about 3000 fadua more easterly than the Euxine sea.

BAGADAT, a name by which fowls call the carrier pigeon, the *columba tabularia* of Moore. This name is probably a corruption of the word Bagdat, the name of a city from whence they are sometimes brought to Europe; being originally brought thither from Persia.

BAGADUCA POINT, in *Geography*, a head-land of America within Penobscot bay, in the district of Maine.

BAGAGNANA, in *Ancient Geography*, a mountain of Asia, in Armenia, where they obtain diamonds, according to the ancient physician Aëtius, the Armenian Col.

BAGAN, in *Geography*, a town of Servia, twenty miles north from Nissa.

BAGANZA, a river of Italy, which joins the river Parma, at the city of Parma.

BAGANZOLA, a town of Italy, in the duchy of Parma, four miles north of Parma.—Also, another town in the same duchy four miles south of Parma.

BAGARACA, in *Ancient Geography*, a town of Thrace, Anton. Itin.

BAGARD, CHARLES, in *Biography*, born at Nancy, in Jan. 1696, was early initiated into the practice of physic by his father Anthony, who had acquired considerable reputation in that art. To the influence our physician had with Stanislaus the first titular king of Poland, and duke of Lorraine, we are indebted for the botanical garden and the college of medicine at Nancy, of which he was the first president. He died of apoplexy in December 1772. Besides numerous dissertations on medical and philosophical subjects, we have the following, by this author: “Dissertation sur l’histoire de la Theriaque,” published 1755; “Dispensatorium Pharmaceuticum,” Paris, 1771, fol.; “Praxi Materiae Medicinæ,” See. 1771, 8vo. “Dissertation sur les Montres du Règne Végétal, Noy, 1768, 8vo. Eloy. Diction. Hist. Haller. Biblioth. Botan.

BAGARDA, in *Ancient Geography*, a town of Asia, in Parnopamisus. Ptolemy.

BAGASE, a town of Africa, in Libya Interior. Ptolemy.

BAGASIS, *Baggai*, a town of Africa, situated on a river at the foot and to the east of mount Audus.

BAGAT, in *Geography*, a town of France, one league west from Paris.

BAGATHUSA, *Caff*, lies on the south-east coast of Arabia, fifteen leagues east from Shahar. Under the lee of this cape there is good anchorage; but the sea rages on this coast from April to July to such a degree that no ship can live in it.

BAGATINS, or COURIERS, a name given to the pigeon-carriers.

BAGAUDÆ, or BACAUDÆ, in *History*, an ancient faction of peasants, or malecontents, who ravaged Gaul, and

assumed the name *bagaudæ*, which, according to some authors, signified, in the Gallic language, *forced rebels*; according to others, *tribes*; according to others, *rollers*; which last signification others allow the word had, but then it was only after the time of the *bagaudæ*, and doubtless took its rise from them. Du-Cange.

The *bagaudæ* were a rabble troop of plowmen and shepherd, whom the grievous weight of their taxes induced to take up arms under the reign of Claudius II., about A. D. 269, in order to rid themselves of a tyranny which seemed to them worse than death. Incited by oppression, they rebelled by thousands, the fury of the barbarians, and did waste the countries which they ought to have cultivated. At this time their strength must have been considerable, as they held a siege of seven months to the city of Autun, and at length took it by force. Under Aurelian and Probus, no mention of them occurs, because it is probable that the valor and activity of those warlike princes kept them in awe. But under the reign of Dioclesian, about the year 286, excited by the injustice, violence, and cruelty of Constantine, they renewed their revolt, and they were commanded by two men, whose names were Athaus and Amardus, each of whom had the boldness to assume the title of Augustus. Maximian, who was admitted by Dioclesian as a colleague in the government, A. D. 286, subdued the *bagaudæ* partly by clemency and partly by force. It does not appear what became of the two chiefs of the rebels; but Maximian informs us, that the name and the faction of the *bagaudæ* were revived in the fifth century. Crevier's Hist. Lit. p. vol. vi. p. 282.

BAGAUZE, is the name which is given, in the Antilles islands, to the figs eaten after they have passed through the mill. They are dried, and used for boiling the sugar.

BAGDAD, in *Geography*, a large and populous city of Asiatic Turkey, in that division of Diarbeck called Irak-Arabi, is seated on the eastern banks of the Tigris, N. lat. $33^{\circ} 22'$. E. long. $44^{\circ} 21'$. It has been erroneously supposed by several geographers to be the old Babylon, though it be at a distance from the ruins of this ancient metropolis. It is computed to be about 1500 paces in length, 7 or 800 in breadth, and 3200 in circumference. Mr. Jackson, in his “*Journey from India to England*” in 1767, says that it extends three miles along the eastern bank of the river; and that the length of the walls from the river being about two miles, it has the form of an oblong square. Its walls are all of brick, with towers and large towers at proper distances, in form of bastions, and defended by about 60 pieces of cannon. The castle is large, and flanked by some small towers with cannon; and the garrison usually consists of 900 foot, 4000 horse, and 60 gunners. The number of inhabitants, if we may credit the accounts of the Arabian writers, was formerly very considerable; but it is now reduced to fifteen or twenty thousand, including those who live in a suburb on the other side of the Tigris, at the end of the bridge of boats, which are separated every night to prevent surpris. But notwithstanding this number of inhabitants, the town has still many empty spaces within its walls, and it is for the most part but indifferently built. Many of the public buildings, however, such as the mosques, minarets, and tombs, are constructed of hewn stone, and make a very handsome appearance. There is also an extensive bazar, which is well supplied with a variety of articles. Several of these buildings are arched, in order to guard against the excessive heat of the sun; and as scorpions, tarantulas, and other noxious insects, are numerous, persons, in order to avoid them, in the summer season, sleep on the tops of their houses. The environs of Bagdad to the west

west and north are altogether barren; to the east there are excellent gardens; and the opposite bank of the river supplies a great variety of fruit and vegetables. The city itself, though much reduced in extent, magnificence, and wealth, as well as population, is now supposed to contain more treasure than any other city of equal size in the world; and the immense quantity of specie and bullion, says Johnson (*ubi supra*), found in the coffers of the late Kya, or prime minister, amounting to upwards of three millions sterling, seems to warrant such a conjecture.

This city, which was for many ages the capital of the Saracen empire and the stated residence of the caliphs, was founded by Al-Manfor, the second of the family of the Abassides, in the 145th year of the Hegira, A. D. 762. The Rawandis having attempted to assassinate him in the city of Al-Hishmiah, he determined to build a new city; and he selected for the site of it, a spot, sufficiently distant from Cuia, the inhabitants of which were treacherous and inconstant in their attachment, secure against the attacks of those who might wish to dispute the caliphate with him, and situate in the middle of a tract which would furnish an ample supply of provisions by means of the rivers to which it gave easy access. Having consulted his astrologers and engaged skilful workmen, he commenced his undertaking. As to the name by which it was to be distinguished, some have derived it from the Persian *Baghdod*, which signifies the *gift* or *present of Bagh*, pretending that the plain on which it stood was given by Chosro, named Anshirwan, to one of his wives, and that she had there erected a chapel or oratory dedicated to her favourite idol called *Bagh*. In process of time this chapel became the chosen residence of a venerable hermit, who reported to Al-Manfor a tradition that a city was to be built in this place: but it is needless to cite any further particulars. Others say, that the verdant plain on which this city was built, had been the cell of a Christian monk, called Baghdad; and others say, that this monk was called Dad, and that he possessed a beautiful and extensive garden, whence the place where the city was founded received the appellation of Baghdad, or "the garden of Dad." The new metropolis was also denominated *Medinat Al Salam* "the city of peace," either in allusion to the name of Jerusalem, or because, at the time when it was finished, all the commotions in the empire were appeased, and almost every nation in Asia had submitted, or was become tributary. The first city erected by Al-Manfor was situated on the western bank of the Tigris; but the Persians taking offence at the erection of a city to near their frontiers, a new city was afterwards built on the eastern banks of the river called "the camp, or fortress of Al-Moldi;" and both these cities being wanted, formed the ancient Baghdad. The caliph had a superb and magnificent palace in each portion of the new city. Baghdad was erected on the ruins of Seleucia, the remains of which, as well as of Ctesiphon furnished the materials; and it seems to have been divided by the Tigris, as ancient Babylon was by the Euphrates. In the 199th year of the Hegira, A. D. 766, this famous capital of the Abbasid empire was finished. It was of a circular form, inclosed by a double wall, and flanked with a considerable number of towers. The castle, or citadel, was in the middle of it, and commanded every part of the town. Between the eastern and western parts of the city a bridge was constructed in order to facilitate a communication between them. Besides several public buildings erected by the caliph Al-Mansur Bidah, there was a famous college founded by this prince, which has been extolled by Al-Luharijus, on account of the beauty and elegance of its structure, the number of students it contained, as well

as the learned men it produced, and the ample revenues fettered upon it, and superior in his time to every other house of learning in the known world. Among the students there were 300 who devoted themselves entirely to the study of the Mahometan law, according to the decisions of the four chief sects of the Sunnites, each of which sects had a professor in this college. For several ages Baghdad, besides being the seat of power, abounded more with learned men than any other place in the Mahometan dominions, except Mecca and Medina. It was also extremely populous, and contained several forts and castles, capable of making a tolerable defence, and deriving their respective names from their founders. The language spoken in this city was one of the most polite and elegant dialects of the Arabic, as there was a greater concourse of nobility and learned men, who excelled in many branches of literature, for several ages, in this city than in almost any other of the east. The city had also a mint, in which were coined a great number of dirhems and dinars. Baghdad continued to be the seat of the caliphs of the race of Al-Abbas for 500 years; but at length, in the year of the Hegira 656, A. D. 1258, the conquest of Iran, or Persia, was achieved by Holagou Khan, the grandson of Zingis, the brother and lieutenant of the two successive emperors Mangou and Cublai. After a siege of two months, it was stormed and sacked by the Moguls; and their savage commander pronounced the death of the caliph Moïtasem, the last of the temporal successors of Mahomet; and thus the family of the Abassides was extinguished. The Tartars or Moguls having plundered and set it on fire, and massacred many of the inhabitants, enriched themselves by its spoil, as it was then reckoned one of the most considerable cities in the world; and they retained possession of it till the year of the Hegira 795, A. D. 1392, when it was taken by Tamerlane, for the first time, from Sultan Ahmed, the son of Ays, who conveyed his baggage beyond the Tigris, and abandoned the capital to the conqueror; and it was taken a second time in the year of the Hegira 803, A. D. 1400, from the same sultan, who had recovered possession of it. After this capture, it was restored by Tamerlane to the sultan; but in the year 815, A. D. 1412, the sultan was finally expelled by the Turcoman Cara Josef. The descendants and successors of Tamerlane remained masters of Baghdad till the year of the Hegira 875, A. D. 1470, when they were expelled by Hassan, surnamed Uzun, or Uzun-Car. The princes of this family possessed it till the year of the Hegira 914, A. D. 1508, when Shah Ismael, surnamed Soli, the first prince of that race which afterwards reigned in Persia, made himself master of it. From that time it was an object of contest in the wars between the Persians and the Turks, for 100 years. The Turks took it under Sultan Soliman, and the Persians retook it under Shah Abbas the Great, king of Persia; but being at length besieged by a formidable army under Amurath III, it was surrendered to him by Shah Soli, king of Persia, A. D. 1638; and from this time it has remained in the possession of the Turks. Herbelot B. b. Or. p. 154. From this disastrous period the trade of the place has considerably decayed, as the sultan rifled all the rich merchants. However, though it groans at present under the Turkish yoke, Baghdad is a celebrated emporium and frontier of the Ottoman empire, on the side of Persia, to which not only many merchants, but likewise an incredible number of passengers, travelling from Natolia, Syria, Palestine, and Egypt, into Persia, continually resort. Its situation on the banks of the Tigris renders it convenient for trade; but the heat of the climate is so excessive, that the inhabitants are obliged to keep their markets in the night during the summer, and to sleep, as we have already said,

on their terraces. The military government is under a pacha or basha, who uses various despotic methods to extort money from the inhabitants, and particularly from the Jews and Christians, who are the principal merchants of the city, and who have been in a great measure driven from it by the oppression they have suffered. The civil administration is exercised by a cadi, who acts as judge, president, and musli, with a tefterdar or treasurer under him, who collects the revenue of the grand signior. The pilgrims that visit Mecca by land are obliged to pass through Bagdad, and every one of them pays a tribute or toll, equivalent to four piasters, to the bashaw, which branch of the revenue yields annually a considerable sum to the grand signior. The revenues are computed at 125 lacks of piasters, amounting to about 1,562,500 l. sterling; but of these, not more than one quarter are collected, by reason of the indolence of the Turks. 2. The bashaw lives in all the splendour of a sovereign prince, and maintains a very large army, he has recourse to great justice and oppression, in order to obtain the necessary supply. The inhabitants of this city are chiefly Persians, Armenians, Turks, Arabs, and Jews, and of these the last act as brokers, or bankers, to the merchants. The Jews, notwithstanding the severity with which they are treated, are instead to be here from a reverence to the prophet Ezekiel, whose mausoleum they pretend is a day's journey from the city. Many of them likewise annually resort hither from other parts to visit the prophet's tomb. Two chapels are allowed for those of the Romish and Greek persuasion. In this city there are several beautiful mosques, into which Christians are not suffered to enter, for fear of their being defiled. The Mahometan women are very richly dressed, wearing bracelets on their arms and jewels in their ears. The Arabian women wear rings in the partition between their nostrils, which are bored for this purpose.

The ruins of ancient Babylon are situated about fifteen leagues to the south of Bagdad. See BABELON.

BAGDEDIN, MAHOMET, in *Biography*, an Arabian mathematician, lived in the tenth century and is reported to be the author of several treatises in geometry, among which is one "On the division of superficies," translated into Latin by John Dee of London, and by Frederic Commandini of Urbino, who published this treatise at Pesaro in 1570. Some have supposed that Bagdedin was merely the translator of this work from Greek into Arabic, and that it was written by Euclid, or some other ancient mathematician. Moreri.

BAGENBON HEAD, in *Geography*, a cape of Ireland, in the Atlantic ocean, on the coast of Wexford. N. lat. 52° 9'. W. long. 6° 48'.

BAGGAGE, is particularly used, in the *Military Art*, for the necessaries, utensils, apparel, &c. of the officers and soldiers. The baggage includes also women, children, sutlers, &c.

The baggage is well called by the Roman writers, *impedimenta*, on account of the great trouble and expence attending it. Unless strict discipline be kept, great inconveniences may arise from it; whence several military laws and ordinances relating to the baggage.

The baggage-waggons, before a march, are appointed a rendezvous, where they are marshalled by the waggon-master-general, according to the rank the several regiments bear in the army. On a march, they are sometimes ordered to follow the respective columns of the army, sometimes to follow the march of the artillery, and sometimes to make a column of themselves. The general's baggage is generally first. If the army march from the right, the baggage of that wing has the van; if from the left, the baggage of the

left has the van. Each waggon has a distinguishing flag, to shew to what regiment it belongs.

BAGGAGE, *Packing up the, vasa colligere*, was a term among the Romans, for preparing to go to war, or to be ready for an expedition.

The formula by which the soldiers declared they were in readiness, was *vasa conlignare*.

The Roman distinguished two kinds of baggage, a greater and lesser; the lesser was carried by the soldier on his back, and called *fasces*; consisting of the things most necessary to life, and which he could not do without. Hence *colligere fasces*, packing up the baggage, is used for decamping, *vasa movere*. The greater and heavier was carried on horses and vehicles, and called *curra*. Hence *omnia tubicula sua, fornica hominum*. The baggage-horses were denominated *stramentarii equi*.

The Roman soldiers in their marches were heavy laden, insomuch that they were called, by way of jest, *mulæ mariani*, and *stratonæ*. They had four sorts of luggage, which they never went without, viz. corn, or *bulglum*, utensils, *valli*, and arms.—Cicero observes, that they used to carry with them above half a month's provisions; and we have instances in Livy, where they carried provisions for a whole month. Their utensils comprehended those proper for gathering fuel, dressing their meat, and even for fortification, or intrenchment; and what is more, a chain for binding captives.

For arms, the foot carried a spear, shield, saw, basket, *ratrum*, hatchet, *lorum*, *folæ*, &c. Also pikes or pales, *valli*, for the sudden fortifying a camp; sometimes seven, or even twelve of these pales were carried by each man, though generally, as Polybius tells us, only three or four. On the Trajan column we see soldiers represented with this fardle of corn, utensils, pikes, &c. gathered into a bundle, and laid on their shoulders.

Thus inured to labour, they grew strong, and able to undergo any fatigue in battle; the greatest part of which ever tired them, or put them out of breath. In after-times, when discipline declined, this luggage was thrown on carriages, and porters' shoulders.

The Macedonians were not less inured to hardship than the Romans; when Philip first formed an army, he forbid all use of carriages; yet with all their load, they would march in a summer's day, twenty miles in military rank.

BAGGER, JOHN, in *Biography*, a Danish divine, and bishop of Copenhagen, was born at Lundon in 1626. After prosecuting his studies under the ablest masters in Germany, the Netherlands, and England, he settled in his native place, and was appointed professor of the oriental languages. At the age of twenty-nine years, he was advanced to the episcopal see of Copenhagen, and discharged the duties of his office with distinguished approbation. He reviv'd the ritual of public worship established by Christian IV., and published several learned and eloquent discourses in Latin and Danish. He died at the early age of forty-seven. A logical treatise of Bagger, under the title of "De principis perfectivis Syllogismorum," was printed in 4to. at Copenhagen in 1665. Moreri.

BAGGING of Hops. See HOPS.

BAGHYRETTY, in *Geography*, a river of India, supposed by major Rennell, to be the true head of the Ganges, which joins the Alacknundr. river, the former proceeding from the north, and the latter from the north-east, at Deuprag, or the middle Gangoutra, i. e. the fall or cascade of the Ganga, or Ganges, at a few miles distance below Sirinagur; and then they form the proper Ganges of Hindostan, which

alter-

afterwards issues through mount Sewalick, at Hurdwar, the lower Gangoutra. Of these two streams Abicknundra is the largest; and at Srwagun, seated on its banks, being confined in a channel 120 yards wide, it runs with astonishing rapidity, and is crossed by means of rope bridges of singular construction. This river has its source in the snowy mountains of Thibet; and it is probably the same river which Du-Halde mentions under the name of Manchou. The Baghyretty river has its source far more remote; but the direction of its course above the upper Gangoutra is unknown. According to the information of Mr. Daniël, the Baghyretty river separates, at a considerable distance below the Cow's Mouth, into two branches; the easternmost of which is said to be the Mucknundra. But this depends upon a vague report of travellers, which, says major Rennell, cannot be depended upon. Rennell's Memoir, p. 371.

BAGIA, in *Ancient Geography*, a promontory of Carmania, near which was a rock consecrated to the sun. Ptolemy.

BAGIA, in *Geography*, a town of Persia, in the province of Farshitan, 120 miles north-east of Schiras.

BAGIENNA, in *Ancient Geography*, a town of Asia, in Armenia Major. Ptolemy.

BAGIEU, **JACQUES**, in *Biography*, surgeon to a regiment of cavalry, in the middle of the last century, and author of several valuable works on chirurgical subjects, particularly on the method of treating gun-shot wounds. He opposes the frequent amputation of limbs, so common in France, and reduces the cases, rendering that operation necessary, to a very small number. He defends experience, as more valuable than theory; no course of reading, or study, being competent to supply the place of practice, the light or knowledge obtained from which is often incommunicable. He commends Amb. Parey's practice in gun-shot wounds, of first using emollient applications, and then making large openings for discharging the confined matter. He does not admit the efficacy of the Peruvian bark in checking the progress of gangrene, which he thinks has its boundaries affixed by nature. He is supposed, by Portal, to be the author of "Lettre de M. Chirurgien de Province, a M. Chirurgien de Paris," 8vo. 1740.—Also, "Deux Lettres d'un Chirurgien de l'Armée, l'une sur plusieurs chapitres du tr. de la gangrene de M. Quesnai, l'autre sur le tr. des armes a feu, de M. Desportes;" Paris, 1750. 12mo. "Nouvelle Lettre de M. Bagieu, &c." 1751, 12mo. "Examen de Plusieurs parties de la Chirurgie, &c." 2 vol. 1756. Haller Bib. Chirurg.

BAGISARA, in *Ancient Geography*, a port of Carmania. Arrian.

BAGISTANA, a town of Asia, in Upper Media, at the foot of the mountains in which are the sources of the river Gyndes; south-west of Ecbatana.

BAGISTANUS, a mountain of Asia, between Babilonia and Media, consecrated to Jupiter. Diod. Sicul.

BAGITAN, in *Geography*, a town of Persia, in the province of Segestan, 110 miles north of Zarcug.

BAGIÛRA, a town of Egypt, twenty-five miles south of Girgê.

BAGLAFFCHTE, in *Ornithology*, the name of Gmelin's *Ixia philippina*, var. β , in Buffon's history of birds.

BAGLANA, or **BUGLANEH**, in *Geography*, a province of the Mogul empire, in the peninsula of India, encompassed by Guzerat, Dowlatabad, and Candesh. It is included within a ridge of the Gaults, and is exceedingly mountainous, but contains also many fertile and pleasant tracts. Few countries possess greater advantages, with regard to natural

strength; and these are augmented by no fewer than nine strong fortresses, seated on the summits of rocks, of which Sulheir and Mulheir are accounted impregnable. According to Abdul Humeed, Baglana extended from the sea-coast near Surat, which was its western boundary, to the borders of Dowlatabad (or Aurungabad) eastward; being in length 100 common cosses, and in breadth, from Naderbar and Sultampur on the north, to Nassick Trimbuck on the south, 70 cosses. Shahnawaz, though he agrees with Abdul Humeed, with respect to the length, allows about 30 for the breadth; and major Rennell says, that it certainly is not 70 cosses, and yet much more than 30, in distance between the assigned limits on the north and south. It has owed its independence, not merely to its natural strength, but to the address of its rajahs, who united the princes of the kingdoms of Guzerat, Dowlatabad, and Candesh, by which it was surrounded. Whenever the conquest of it was attempted by any one of these princes, the other two aided in its defence. When the surrounding kingdoms successively fell under the Mogul power, the rajah, for the first time, acknowledged a superior, and visited the court of Achar. But even then the Moguls contented themselves merely with a tribute, until the rapid progress of Aureng Zeb's conquests and power in the Deccan. Its revenue, previously to the Mogul conquest, was about 80,000l. Rennell's Mem. p. 259.

BAGLIONE, **COSTANZA**, in *Biography*, a most pleasing singer, and excellent actress, in the comic opera at Milan, in 1770, at the head of a Eologuesse musical family, of which six sisters were all singers, doubling the number of our Abrams's, but not the merit. Three of these sisters went afterwards to Paris, "who pleased there so much (says M. La Borde), as to make us wish to hear the rest." *Essai sur la Musique*.

BAGLIVI, **GEORGE**, born, Haller says, in Ragusa, a city in Dalmatia, in the year 1668, applied himself early to the study of medicine. After attending the lessons of the professors at Naples and at Padua, at which latter place he graduated, to improve himself further, he travelled over Italy, and settling at length at Rome, viz. in 1692, was advanced to the chair of professor of the theory of medicine and of anatomy, by pope Innocent XII. to whom he dedicated his first work, "De Praxi Medica, ad priscam observandi rationem revocanda;" lib. iv. printed in 1696, 8vo.

In this work the author laments the degraded state of medicine in his time, which he attributes to the neglect of observation and experiment, and of the study of the writings of the ancient Greek physicians, particularly of Hippocrates, joined to an inordinate passion for speculative reasoning. He acknowledges, however, the improvements that had been made in anatomy and physiology, and that the theory of the moderns, founded on these improvements, far excelled the hypothetical reasoning of the ancients; and thence conjectures, that when we shall sedulously bend our minds to practical observations, we shall as far excel the ancients in our knowledge of the true method of treating diseases, as we then excelled them in theory.

Examining the question, whether theory or practice conduces most to a knowledge of the method of curing diseases, he determines in favour of practice, but recommends both; "Quæcumque," he says (*Opera omnia*, 4to. p. 127.), "de medicina meditato fueris, pro veris non habebis, nisi prius ad lydeum praxeos lapidem revoveris; quod si repetita experientia inveneris vera, pro veris semper habeto. De bono, aut malo vino, judicare non poteris, nisi gustaveris; perfectus musicus non erit, nisi cecinerit; nec miles strenuus, nisi bella gesserit." Baglivi is accused of plagiarism, and

of being himself too much addicted to theory; his credulity is also censured, for suffering himself to be imposed on by vagabonds, pretending to labour under various nervous affections, in consequence of having been bitten by a tarantula, a species of spider common in some parts of Italy, and that they could only be cured by certain musical sounds. But we shall be disposed to moderate our censure of Baglivi, when we find our countryman Dr. Mead (who, though born about the same time, lived nearly fifty years after him) attempting to account for these extraordinary effects of the bite of the insect, attributing them to the temperature of the climate, and of the inhabitants of Apulia, where the spider is most frequent, and explaining, on philosophical principles, the manner in which music operates in allaying the tumult in the constitution occasioned by the poison. Mead seems to think it not improbable that Pythagoras first introduced this mode of practice, in curing the effects of the bite of the tarantula. See his *Medical Works*, 4to. p. 66, &c. The same year, viz. 1696, Baglivi published his dissertation "De Anatome, morfu, et eff. etibus Tarantulæ;" then followed his treatise "De Fibra motrice et marbosa." In this work is contained the author's theory, borrowed from Pachioni (to whom, however, he says, *Op. Om.* p. 258, he communicated his observations), of the origin of the motion of the solids; which he attributes, cap. iv. to a consent between the heart and the dura mater. In 1704 he published at Rome "De Medicina secundum ad rectum statum usum Canones;" and in 1705, "De progressionem Terre motus." These, with various other dissertations, have been collected and published under the title of "Opera Omnia," which has passed through numerous editions; and though his theory has long since given place to others, in their turn to yield to theories perhaps equally fallible, the work will always deserve the attention of the medical students, for the numerous and valuable observations with which it abounds. Baglivi died in the year 1707, aged only 38 years. Haller. *Bib. Med. Pract. and Bib. Anatom.*

BAGNA, in *Geography*, a town of Servia, twenty miles north-east of Parkin.

BAGNACAVALLIO, a town of Italy, in the state of the church, and duchy of Ferrara, on the river Seno, forty miles west of Ravenna.

BAGNAGAR. See **HYDRABAD**.

BAGNALET, a town of France, one league east of Paris.

BAGNARA, a sea-port town of Italy, in the kingdom of Naples, and province of Calabria Ultra, destroyed by an earthquake in the year 1783; fourteen miles west of Oppido. N. lat. 38° 15'. E. long. 16° 8'.

BAGNARBIA, a town of Italy, in the state of the church, and province of Patrimonio, with a Bishop's see; six miles south of Orvieto. N. lat. 42° 36'. E. long. 12° 10'.

BAGNERES De Luchon, a town of France, in the department of the Upper Garonne, and chief place of a canton in the district of St. Gaudens, near the source of the river Garonne, at the foot of the Pyrenæes, possessing some medicinal springs; seven leagues south of St. Gaudens.

BAGNERES en Bigorre, a town of France, and principal place of a district in the department of the Higher Pyrenæes, seated on the Adour; celebrated for its baths, which are much frequented in spring and autumn, a small but neat town; ten miles south of Tarbes. N. lat. 43° 3'. E. long. 10° 12'.

BAGNEUX, a town of France, 1½ league S. S. W. of Paris.

BAGNI, a town of European Turkey, in Romania, forty miles west of Philippopolis.—Also, a town of Italy, in the kingdom of Naples, and country of Lavora, eight miles south of Sezza.—Also, a town of European Turkey, in the province of Macedonia, on the river Vardar, forty-four miles N. N. E. of Akrida.

BAGNIALACK, a town of European Turkey, in the province of Bosnia. N. lat. 44°. E. long. 18° 10'.

BAGNIO, an Italian term signifying a *bath*; it is used by us for a house with conveniences for bathing, scalding, and otherwise cleaning the body; and sometimes for worse purposes.

BAGNIO is also become a general name in Turkey for the prisons where their slaves are inclosed; it being usual in these prisons to have baths.

BAGNOLENCES, or **BAGNOLENSIS**, in *Eccl. Hist.* a sect in the sixth century, who were thought Manichees, though they denied their error.—They rejected the Old Testament, and part of the New; held the world to be eternal; and affirmed, that God did not create the soul when he infused it into the body.

They derive their name from *Bagnole*, a city in Languedoc, where they were chiefly found.

BAGNOLS, in *Geography*, a town of France, in the department of the Gard, and chief place of a canton in the district of Pont St. Esprit, two leagues south of Pont St. Esprit.

BAGNOLS, les Bains, a town of France, in the department of the Lozerre, and chief place of a canton in the district of Mende, eight miles east of Mende.

BAGNUOLO a town of Italy, in the kingdom of Naples, and Principato Ultra, twelve miles west of Conza.

BAGOI, among the *Antient Persians, were the slaves with those called by the Latins, *proboscis*, viz. a species of eunuchs, in whom the canal of the penis was distorted by a tight vinculum, thro' they could not enter the women.*

BAGORODITZ, in *Geography*, one of the twelve districts of the government of Tula, in Russia, situated on the river Upa.

BAGOUS, in *Antient Geography, a name given to a ridge of mountains which were part of the mountainous toward the source of the river Indus.*

BAGPIPE, a musical instrument of the wind kind, chiefly used in country places, especially in the North.—It consists of two principal parts; the first a leather bag, which is blown up like a foot-ball, by means of a pipe vent, or little tube, fitted to it, and stopped by a valve.

The other part consists of three pipes or flutes; the first, called the great pipe, or drone; and the second, the little one, which passes the wind only out at the bottom; the third has a reed, and is played on by compressing the bag under the arm when full, and opening or stopping the holes, which are eight, with the fingers. The little pipe is ordinarily a foot long, that played on thirteen inches, and the port vent six.

The bagpipe takes in the compass of three octaves.

This instrument was not unknown to the ancients. It was called by the Greeks *αγασ*; by the Romans *tibia utricularis*. The Italians call it *piro-carnomfo*; the French *usite* and *clabanca*. In the first edition of the French *Encyclopædie*, there is a minute and elaborate description of the instrument, its construction, scale, &c. By the ornaments mentioned, it must have been admitted into good company.

The invention of it is derived by some from Tubal; others ascribe it to Pan; others to Mercury, to Faunus, to Mars,

fyas, and to the young Sicilian shepherd Daphnis, who first composed pastorals.

An anonymous French author has published a treatise of the bagpipe, "Traité de la Mufette," with a new method of learning to play on it without a master. Fol. Par. 1672.

BAGPIPE *the Mizen*, in *Sea Language*, is to lay it aback, by bringing the sheet to the mizen-boards.

BAGRADA, or **BRAGADA**, now *Mejerda*, in *Ancient Geography*, a river of Africa Propria, the source of which Ptolemy fixes in mount Mampfarus, erroneously representing its course to have been from north to south; whereas it flows in a direction from west to east. It is equal, says Dr. Shaw (*Travels*, p. 77.), to the Isis united with the Cherwell, and continues winding, through its whole course, along a rich and fertile country, with the soil of which it becomes so well saturated, that it is of the same colour with the Nile, and has the same property of making encroachments on the sea. To this circumstance may be ascribed the many changes which appear to have been made at one time or other in the channel of it; and to this also it is owing that an open creek of the sea, into which the Mejerda about a century ago discharged itself, is now circumscribed by the mud, and become a large navigable pond, the anti-harbour, as Dr. Shaw calls it, to port Farina. The situation of Utica and of Carthage, with respect to this river, are materially altered. (See **CARTHAGE**, and **UTICA**.) Bochart (l. i. c. 24.) deduces the name Bagrada, from בִּרְכָה or בִּרְכַתָּה *barakta*, a pond, agreeably to the description of Silius Italicus, l. vi. 140:—

"Turbidus arentes lento pede fulcat arenas
Bagrada, non ullo Libycis in sinibus amne
Victus limosas extendere latius undas,
Et stagnante vado patulos involvere campos."

BAGRADAS, a river which flowed on the confines of Persia and Carmania, and discharged itself into the Persian gulf. Ptolemy.

BAGRE, in *Ichthyology*, a species of **SILURUS** that inhabits South America. The posterior dorsal fin is fat or fleshy; first ray of the dorsal and pectoral fin setaceous; beards four. Gmel.

BAG-REEF, in *Sea Language*, denotes a fourth or lower reef of sail, sometimes used in the royal navy.

BAGSZELAR, in *Geography*, a town of European Turkey, in the province of Bulgaria, 20 miles north-east of Ternova.

BAGUETTE, in *Architecture*, a little round moulding, less than an astragal; sometimes carved and enriched with foliage, pearls, ribbands, laurels, &c. According to M. Le Clerc, when the baguette is enriched with ornaments, it changes its name, and is called *chaplet*; and unornamented, it is a *bead*.

BAHAMA ISLANDS, in *Geography*, a name commonly applied by the English geographers to that cluster of small islands, reefs, and rocks of sand, which stretch in a north-westerly direction for the space of near 300 leagues from the northern coast of Hispaniola to the Bahama strait, opposite to the Florida shore; or from about 20° to 28° N. lat. and from about 70° to 80° W. long. This whole group is called by the Spaniards *Lucayos*. The island of Bahama, which gives name to the rest, N. lat. 26° 45'. W. long. 78° 35', is about 25 leagues distant from the continent of Florida; it is about 50 miles long, and scarcely any where 16 broad. The number of these islands is said to be about 500, of which, however, some are merely rocks. Though their number is considerable, and some of them are of a large size, our knowledge of them is very imperfect.

They were first discovered by Columbus, A.D. 1492; and the first land he discovered was that of Guanahani, on which he landed to return thanks for his success, and to erect a cross; and he denominated the island San Salvadore, taking possession of it in the name of his Catholic majesty. This island, in the vicinity of Providence island, is known to the English navigators by the name of Cat island. Columbus, however, made no settlement in these islands. About the year 1629, it is said (see Anderson's Comm. vol. ii. p. 37.), the English began to plant on the island of Providence, which till then was uninhabited; and after the conclusion of peace with Spain, king Charles I. renewed his grant of this and the other Bahama islands. In the year 1666, captain Sayle, an Englishman, was forced in his passage to Carolina, by stress of weather, to land upon one of these islands; and upon his return to England, he made so favourable a report of them, that six of the proprietaries of Carolina solicited, and obtained a grant of them. Captain Sayle, in a second visit to the island of Providence, which was one of them, discovered the advantage which England might derive from it; and he made the government of England so sensible of it, that about the year 1672 they sent thither a governor and a colony. But the settlement was disturbed by Spanish pirates; and the island of Providence, and the other Bahamas, were abandoned. The chief town of Providence, called Nassau, consisted at this time of 150 houses. The island afterwards became a nest of pirates, who interrupted the American navigation; and on this account, an order was issued by his majesty king George I. on the conclusion of a peace with Spain in 1721, to fortify and settle the island, and to dislodge these outlaws. The English in the Bahama islands have been computed at three or four thousand; half being settled in Providence, where is the fort called Nassau; and a small harbour. But the natural barrenness of the soil, and the narrow length of these isles, which exposes them to the heat and to the winds, account for their comparative insignificance in this grand commercial archipelago. Of their present state, little satisfactory information has been obtained even by the lords of the committee of council for the affairs of trade and plantations. To the inquiries of their lordships in 1789, as to the extent of territory in these islands, the quantity of land in cultivation, the number of white inhabitants, productions, and exports, &c. the only answer that could be obtained from the governor was this, "that it was at that time impossible to ascertain any of those particulars." It appears, however, from the testimony of other persons, that these islands in general are rocky and barren; that the only article cultivated for exportation is cotton, of which the medium export is 1500 bags of two hundred weight; that the inhabitants, who in 1773 consisted of 2052 whites and 2241 blacks, have been of late years considerably augmented by emigrants from North America; but of their present number no precise account is given. Edwards's Hist. of the West Indies, vol. i. p. 470.

BAHAMA Straits, called the *gulf of Florida*, the narrow sea between the coast of America and the Bahama islands, about 45 leagues long, and 16 broad.

BAHAMA Bank, *Great*, a bank of sand extending from near the island of Cuba, N. lat. 22° 20', to the Bahama islands, N. lat. 26° 15'. The sand which lies to the north of the island Bahama is called *Little Bahama Bank*.

BAHAR, or **BARR**, in *Commerce*, a weight used at Ternate, Moca, in the Moluccas, Achem, and divers other parts of the East Indies. There are two kinds, the great, with which spice is weighed, equal to 524 lb. 9 oz. avoirdupois. The little bahar served for the weighing quicksilver,

ver, vermilion, ivory, silk, musk, and other precious wares, equal to 437 lb. 9 oz. avoirdupois weight.

BAHAR, in *Geography*, one of the eleven soubahs, or provinces, into which Acbar divided Hindostan proper; bounded on the east by Bengal, on the north by Napaul and Boodan, on the south by Orissa, and on the west by Oude, Benares, and Allehabad. It has been estimated at 250 miles from north to south, and at 200 miles from west to east. It produces wheat, rice, peas, &c.; but the principal article of export is saltpetre; most of that which is imported by the East India company being manufactured within this province. The capital is Patna. Mr. Frazer, in his "Life of Nadir Shah," states the revenues of this province, under Aureng-Zebe, at 101½ lacks of rupees. The greatest part of Bahar is possessed by the British nation; but there are several purgunnahs, or hundreds, on the south-west of Little Nagpour, that were formerly classed as belonging to Bahar, which are now in the possession of the Mahrattas.

BAHAR, a town of Hindostan, in the province of the same name; remarkable for its number of funeral monuments; 30 miles south-east of Patna, and 220 north-west of Calcutta. N. lat. 25° 14'. E. long. 85° 45'.

BAHAR, or *Bazen*, a town of Persia, in the province of Kerman; 40 miles south-east of Sirgian.

BAHARITES, derived from the Arabian *bahar*, or *sea*, and denoting *maritime*, in *History*, the denomination of a class of persons in Egypt, who having assassinated Touran Chah, the last of the family of the Moubites, reigned over Egypt and Syria for 136 years, and had 27 kings. The Baharites were of Turkish origin. Nejm Eddin purchased them of the Syrian merchants. They were dethroned in their turn by the Mamalukes or Circassian slaves, in the year 784 of the Hegira, A. D. 1382; who formed a new dynasty which kept possession of Egypt until the conquest of Selim, emperor of the Ottomans, in the year 923 of the Hegira, A. D. 1517.

BAHARNAGASH, a country of Abyssinia, adjoining to the province of Tigre, and situate between the river Atufaspes and the Arabian gulf. Its capital is Dobarwa, in N. lat. 15° 22'. E. long. 39°.

BAHAS, in *Geography*, a town of Arabia, sixteen miles N.N.W. of Lohëia.

BAHBELGONG, a town of Hindostan, in the country of Baglana; 65 miles west of Aurungabad. N. lat. 20° 45'. E. long. 74° 51' 30".

BAHI, a province of the island of Luçon or Manilla, one of the Philippine islands. It produces excellent betel, which the Spaniards are continually chewing; and it is the place where most of the ships are built. The province is about 30 leagues in circuit, and contains about 6000 tributary natives.

BAHIA, DE TODOS LOS SANTOS, a province of Brasil, in South America, and the richest in the whole country; but the air and climate do not correspond with other natural advantages. The province is so fertile in sugar and other articles of commerce, that the Portuguese resort in great numbers to it, as the seat of affluence, and also of pleasure and grandeur. The capital called *St. Salvador*, or *Ciudad de Bahia*, is populous and magnificent, and by far the most gay and opulent city in Brasil. It stands in a bay in S. lat. 12° 11'; it is naturally strong, and is also well fortified and defended by a numerous garrison. See **ALL SAINTS**, and **ST. SALVADOR**.

BAHIR, in *Literary History*, denotes *famous* and *illustrious*, and is particularly used for a book of the Jews, treating of the profound mysteries of the cabbala; being the most ancient of the Rabbinical works.

BAHIRA, or **RIF**, in *Geography*, the northern district of Egypt, extending from the division of the Nile to the east and west branches, on both sides to the Mediterranean. The principal towns are Alexandria, Rosetta, Damietta, Menuf, Mansoura, Tineh, Catich, and Fouch.

BAHIRA, among the *Ancient Arabs*, a name given to one of the four kinds of camels or sheep, which, for some reasons of their religion, were turned out at liberty with an earmark, no longer to be used for service like other cattle.

The bahira, with the *fabah*, *swafira*, and *harrî*, were denounced by Mahomet as no ordinance of God.

Authors are not agreed as to the characters of the bahira.

BAHRAITCH, in *Geography*, a town of Hindostan, in the province of Oude, 55 miles N.N.E. of Lucknow. N. lat. 27° 30'. E. long. 81° 57'.

BAHRDT, CHARLES FREDERIC, in *Biography*, a theological and satirical writer, was born at Bischofswerde, Aug. 25th, 1741. Having commenced his education, without much improvement, under private tuition at Leipzig, where his father lived, he was removed to a public school, and afterwards to the grammar school at Pforte. From thence he returned to Leipzig, where after receiving some private instruction in the Greek and Latin from Ernesti, he was entered in the university, and quitting it after two years, he commenced preacher in the vicinity of Leipzig. In 1761, he was admitted to the degree of master of arts, and some years after he was appointed extraordinary professor of sacred philosophy. In 1763, he published a work, intitled, "The true Christian in Solitude;" and also his "Commentary on Malachi," in which he endeavoured to display his talents in biblical criticism, and his knowledge of oriental literature. An intrigue, which rendered him a father, defeated all his expectations at Leipzig, and obliged him to retire to Halle; and he was appointed professor of biblical antiquities at Erfurt. Having no salary, but supplied with money by his father, he found his situation agreeable; however he introduced some remarks of a theological kind, which were not thought orthodox; and complaints were preferred against him by Schmidt and Vogel, two clergymen of that city. In order the more successfully to repel the accusation of his antagonists, he purchased the degree of doctor in theology from the university of Erlangen, which gave him a right to read public lectures in divinity; and in 1769, he published in his defence the first part of his "Essay towards a System of the Doctrines contained in the Bible." About this period he also published "The earnest Wishes of a dumb Patriot," in which he attacked the weakest proofs of the fundamental truths of the theological system, and endeavoured to raise suspicions against professor Schmidt of being a Jesuitical sectarian. His conduct in this respect was reprobated by the faculty of divines at Wittenberg, and those of Gottingen recommended reconciliation. In 1770, Bahrdt published at Eisenach his "System of Moral Theology," which was favourably received, and he embarked, from a desire of fame and love of money, in some other projects and undertakings. The approbation generally bestowed on his critical performances induced him to undertake an edition of the Old Testament similar to that announced by Dr. Kennicott; but neither his knowledge nor situation promised success, and his intentions were never fulfilled. He afterwards thought of improving his finances by marriage, and espoused a young widow of Mulhausen with a fortune of 6000 dollars. In 1771, he entered on the office of fourth professor of philosophy at Giessen in Hesse; and here, in the space of four years, he published two "Collections of Sermons," a "Book

of Homilies," his "Apparatus Criticus Veteris Testamenti," "A general Theological Repository," "Outlines of an Ecclesiastical History of the New Testament," "Proposals for explaining the Doctrines of the Church," "A Critical Examination of Michaelis's Translation of the Bible," and "The purest Revelation of God," i. e. a translation of the New Testament with notes. The heterodoxy of his opinions raised a violent storm against him at Giessen; but he escaped it by a removal to the office of director of the philanthropinum of Von Salis at Mauthausen, in Switzerland, with a salary of 2000 florins. He soon however changed his situation, and in 1776 removed to Durkheim, and established a seminary of education at Heidesheim. His philanthropinum was opened in 1777, and for some time it prospered; but he involved himself in debt, and being under a necessity of removing, he determined to visit Holland and England for the purpose of procuring pupils in those countries. On his return to Heidesheim with 13 pupils, he was informed that he had been suspended from all his employments by a conclusion of the imperial council. Bahrdt had now no other resource besides that of quitting the empire, and seeking refuge in Prussia. Accordingly, in 1779, he retired with his family to Halle; and had again recourse to his pen. Here he published extracts from the sacred scriptures, under the title of "The Bible in Miniature," which was printed in 1780; and he delivered private lectures on philosophy, humanity, and rhetoric; and he also read lectures on Tacitus and Juvenal. Upon his first arrival at Halle, he acknowledges, in his life, that there were some latent sparks of religion in his mind; but that they were soon totally extinguished by his intercourse with deists. In the works, therefore, which he now published, he endeavoured to teach the doctrine and history of Christianity separate from every thing supernatural, accommodated to reason, and agreeable to his own ideas of its original simplicity. But his health declining, he was under the necessity of altering his mode of life, and he purchased a vineyard with a small farm attached to it in the neighbourhood of Halle. Part of his mansion was fitted up as a tavern and coffee house; and in this situation Bahrdt acquitted himself as a landlord and a pleasant companion. But his affection and confidence being directed towards a maid servant who managed his house, he obliged his wife, by the most cruel treatment, to leave him; and when she afterwards returned to him, she became a victim to still greater barbarities.

Bahrdt, whilst he was in England, had been initiated in masonry; and in the year 1784, upon the perusal of Stark's book on the mysteries, he adopted the notion that Jesus Christ must have intended, by establishing a secret society, to preserve and diffuse among mankind truth almost banished from the world by priests. This idea he propagated in his "Accomplishment of the Plan and Object of Jesus," and in the third edition of his "Translation of the New Testament." In the year 1784 or 1785, a society of twenty-two united masons was established in Germany, with a view of improving the arts and sciences, commerce, and above all, religion, among the common people. Bahrdt became a member of this society, and proposed that it should engross the business of book-selling, partly with a view to gain money, and partly for obtaining the complete sovereignty of the republic of letters in Germany. This plan, however, not being approved, failed. In 1785 or 1786, he formed another project, which was that of making himself the founder of an avowed deistical sect in Prussia; but it does not appear that he ever seriously attempted it. In 1787, he exerted himself with zeal in supporting the union, and assembled the members; but after a second meeting, he re-

ceived notice to discontinue these assemblies. But his own activity was unintermitting, and he continued to propagate his ideas by an epistolary correspondence during the whole of the year 1788. He also published several works calculated to promote his views, and relating to the union, such as "Observations on the Liberty of the Press and its Boundaries," and "Zamoor, or the Man of the Moon," in which he delineates free-masonry in Germany, as corrupted by the wildest fanaticism and the darkness of popery. There also appeared about this time a comedy, called "The Edict of Religion," universally ascribed to him, on account of which he was arrested, and confined at Halle; and during his imprisonment, he wrote "Morality for the People," which has been represented as the best finished and most valuable of his works, though he completed it in the course of three weeks. Upon his trial, he was acquitted with regard to the charge that related to the union, but declared guilty of having written the comedy, and sentenced to two years imprisonment in the fortress of Magdeburg, which term was mitigated by the king to half that period. During his confinement, his leisure moments were employed in writing the "History of his own Life." After his release, he returned to his vineyard, and renewed his barbarities towards his wife, who abandoned him, and left him at liberty to take home his maid-servant and her children. Here he continued his former life as landlord and writer. Being attacked by a disorder in his throat, he recurred to the too liberal use of mercury, and a fever ensuing, he expired on the 23d of April 1792. His works on morality and religion, besides those already mentioned, were very numerous. His satirical pieces, being of a temporary nature, have sunk into merited oblivion. The genius of Bahrdt was comprehensive and versatile; but his principles and his conduct were licentious; and his history exhibits the perversion of talents, which properly employed and accompanied with integrity, might have rendered him respectable and useful. Gen. Biog.

BAHREIN, BAHREIN, or BARRIN, a fortified town of Arabia, situate on an island of the same name, called also *AVAL*; which see. The name is extended to a group of small islands adjacent to one another, the largest of which is Bahrein. Bahrein once belonged to the Portuguese. When they were driven out of the Persian gulf, it fell into the hands of the sheik of Lachsa; but was taken from him by the Persians. The imam of Oman then made himself master of it; but gave it up again to the Persian monarch for a sum of money. It afterwards changed its owners; but in 1765 it reverted into the possession of the sheik of Abu Schæhr, and he was then sole monarch of the island. It is famous for its pearl fishery. (See PEARL.) N. lat. 26°. E. long. 49°.

BAHREIN is an appellation sometimes given to the province of *Lachsa*; which see.

BAHR EL ABIAD, or the WHITE RIVER, a name given to the real Nile, near its first origin; the sources of which in the African Alps of Kumri remain to be explored.

BAHR EL AZREK, BLUE RIVER, or *Abyssinian Nile*, has its chief spring in a small hillock, situated in a marsh, and joins the Bahr el Abiad, or true Nile, about N. lat. 16°; the latter is tinged, the former is clear. The Bahr el Azrek was mistaken for the real Nile, by the Portuguese writers, Alvarez, Tilcz, &c. probably misled by the vain glory of the Abyssinians; though it was well known to the ancients as quite a distinct river, being the Astapus flowing into the Nile from the Coloe Palus, now the lake of Dembea. Mr. Bruce has adopted the same mistake; and it is said, that when M. d'Anville shewed him his mistake, he resolved to expunge the White river from his map, though

though he acknowledges in his work that it is the largest stream. The Bahr el Azrek is styled Abawi by the Abyssinians. The sources of this river were accurately described in the seventeenth century by Payz, a Portuguese missionary, whose account was published by Kircher and Isaac Vossius; and has been not long ago minutely copied by Bruce, as Hartman has shown by printing the two accounts in parallel columns. Pinkerton's *Mod. Geogr.* vol. ii. p. 725.

BAHRENBURG, in *Geography*, a town of Germany, in the circle of Westphalia, and county of Hoya, on the river Suhlingen, fifteen miles S.S.W. of Hoya.

BAHUS, in *Geography*, a river of France, which runs into the Adour, about a league above the river.

BAHUS. See **BOHUS**.

BAJA, in *Entomology*, a species of *PHALENA* (*Atropa*) of the middle size, that inhabits Europe. The wings are ferruginous, with a small black dot at the base, and a double one at the apex. This is produced from a variegated grey and brown caterpillar, having three dorsal white lines, and yellowish sides. Feeds on the deadly nightshade. *Cmcl. Fabr.*

BAJA, in *Ancient Geography*. See **BAYJA**.

BAJA, in *Geography*, a town of Hungary, on the river Danube, 50 miles N.N.W. of Peterwaradin. N. lat. 46° 40'. E. long. 19° 50'.

BAIA, a sea-port town of Italy, in the kingdom of Naples, and county of Lavora, eleven miles west of Naples. See **BAIÆ**.

BAIABAD, a town of Asiatic Turkey, in the province of Caramania, 28 miles south-east of Kallamoni.

BAJAD, in *Ichthyology*, a species of *SILURUS*, having the posterior dorsal fin fleshy or fat; twelve rays in the anal fin; and beards of the mouth eight. *Forsk. Fu. Arab.* Inhabits the Nile; colour glaucous; length one foot or more.

BAJADOR, or **BAGADORE**, *Cape*, in *Geography*, a cape on the west coast of Africa, in the Atlantic ocean; 120 leagues distant from cape Geer. N. lat. 26° 29'. W. long. 14° 36'.—*Bajador* is also a cape at the north-western extremity of the island of Luzon, one of the Philippine islands.

BAIÆ, in *Ancient Geography*, now **BAIA**, an ancient village of Campania, in Italy, situate between the promontory of Misenum and Puteoli, on the Sinus Baianus; famous for its hot baths, which served the Romans for the purposes both of medicine and pleasure. The hot springs and medicinal vapours that abounded in the environs of this place first, at a very early period, have excited the attention of valetudinarians, as bathing was the constant amusement and refreshment of the Greeks while in health, and their remedy when diseased; but Baiæ does not seem to have attained a degree of celebrity superior to that of other baths, till the Roman commonwealth began to decline. As soon as the plunder of a conquered world was transferred from works of public use and ornament to objects of private luxury, the transcendent advantages which Baiæ offered to Roman voluptuaries, flying from the capital in search of health and pleasure, became an object of peculiar attention. The variety of its natural baths, the softness of its climate, and the beauties of its landscape, captivated the minds of those whose passion for bathing knew no bounds. The abluitions which they might wish to practise at Rome required an enormous expence in aqueducts, stoves, and attendants; but here they found a place, most delightfully seated, where waters naturally heated to any degree of necessary warmth bubbled spontaneously out of the ground; and its easy communication with Rome was also a circumstance that recom-

mended it. Hither the mighty rulers of the empire retired at first for a temporary relaxation, after the fatigue of bloody campaigns and civil contentions. Their habitations were small and modest; but increasing luxury soon added palace to palace, with such expedition and sumptuousness, that space was wanting for the vast demand. Accordingly architects, supported by Roman wealth, extended their foundations by the sea, and drove that element back from its ancient limits. Hence expressed:

“Munus bonis obliuiscitur argis
Sunt uere litora.”

But the sea has since recovered more than it lost. From being a place of resort to a town, Baiæ grew up to a permanent city; and its wealthy inhabitants could not purchase a miracle of art as it was before of nature. Its splendour may be inferred from its innumerable ruins, heaps of marble, statues, statues, and other precious fragments of art. It flourished in full glory to the days of Theodoric the Goth; but the destruction of these decorated palaces soon followed the rupture of the northern conqueror, who overturned the Roman system, sacked and burnt all before them, and destroyed or dispersed the whole race of nobility. No order had been withdrawn its support, than the unbridled sea rushed back upon its old domain; rocks and buttresses were torn asunder and washed away; while promontories, with the forest towers that once crowned their brows, were undermined and tumbled headlong into the deep, where, many feet below the surface, pavements of streets, foundations of houses, and masses of walls, may be discovered. Intentional commotions of the earth contributed also in a great degree to this general devastation. Mephitic vapours and flagrant waters have converted this favourite seat of health into the den of pestilence, at least during the summer heats; and yet Baiæ in its ruined state, and stripped of its ornaments, still presents many beautiful and striking features for the pencil of the artist. N. lat. 41° 6'. E. long. 14° 45'. *Swimb. Trav.* vol. iii. p. 42, &c.

BAJANA, in *Conchology*, a species of *VULVUS* found on the shores of Brasil. The colour is ochraceous, varied with black; and the shell is specifically distinguished by being fragile, glabrous, and marked transversely with a few transverse lines. Figured by Bonanni.

BAJANUS SINUS, in *Ancient Geography*, a bay of Italy in the kingdom of Naples, so called from *Baiæ*, *Portus Baiarum* of Pliny, which was enlarged by Augustus, by giving entrance to the sea into the Lacus Lucrinus, and Averni, ordering it to be called *Portus Julius apud Baiæ*. (Suetonius.) We also read in Tacitus of *Baianus Lacus*, which some have interpreted *Lucrinus*. This gulf is denominated *Canal* by Strabo; and he places it between the cape of Misenum and that of Misenum. The modern name is *Golfo di Pozzuoli*. From the highest point that forms the bay, a large cable commands the road, where foreign ships of war usually ride at anchor, the harbour of Naples not being sufficiently spacious for the reception of a fleet; here they enjoy good shelter, watering, and victualling; but in summer, risk the health of their crews, on account of the unwholesomeness of the air. At the bottom of the bay, and at the foot of the steep rocks which serve as a foundation to the ruins called “Neio’s house,” are some dark caves of great depth, leading to the hottest of all vapour baths. These baths are thirty in number; and they are said to have been adorned with Greek inscriptions and statues denoting, by their expressions and attitudes, what particular part of the human frame was affected and relieved from its pains by each particular bath. The springs at the bottom of the grotto are so hot as to boil an egg hard almost instantaneously. These caverns seem to be the spot where Nature has opened the readiest access

access to the focus of a volcano, which has been within the two last centuries most outrageous in its operations; for to them must be attributed the overturning of the adjacent country, and the total alteration of its surface by the birth of Monte Nuovo, which now blocks up the valley of Averno. Swinb. Trav. vol. iii. p. 48.

BAJAZET I., in *Biography*, sultan of the Turks, was the son and successor of Amurath I., and denominated "Il-derim," or lightning, on account of the fiery energy of his soul, and the rapidity of his destructive march. He succeeded Amurath in the year 1389, being then about 44 years of age; and having secured his authority at home by the execution of his younger brother, who attempted to excite a revolt against him, he prosecuted the ambitious designs of his father. During the fourteen years of his reign, he incessantly moved, at the head of his armies, from Bourfa to Adrianople, from the Danube to the Euphrates; and though he strenuously laboured for the propagation of the law, he invaded, with impartial ambition, the Christian and Mahometan princes of Europe and Asia. Having reduced to his obedience the northern regions of Anatolia, made himself master of Caramania, and imposed a regular form of servitude on the Servians and Bulgarians, he passed the Danube to seek new enemies and new subjects in the heart of Moldavia. Whatever yet adhered to the Greek empire in Thrace, Macedonia, and Thessaly, acknowledged a Turkish master, and he was led through the gates of Thermopylae into Greece by an obsequious bishop. The Turkish communication between Europe and Asia had been dangerous and doubtful, till he stationed at Gallipoli a fleet of galleys to command the Hellespont, and intercept the Latin succours of Constantinople. While the monarch indulged his passions in a boundless range of injustice and cruelty, he imposed on his soldiers the most rigid laws of modesty and abstinence; and the harvest was peaceably reaped and fold within the precincts of his camp. Having obtained the title of sultan from the caliphs who served in Egypt under the yoke of the Mamalukes, he was ambitious of deserving this title; and accordingly he turned his arms against the kingdom of Hungary, the principal theatre of the Turkish victories and defeats. At Nicopolis, near the Danube, he defeated, in 1396, a confederate army of an hundred thousand Christians, headed by Sigismund, the Hungarian king; most of whom were slain or driven into the Danube; and Sigismund, escaping to Constantinople by the river and Black sea, returned after a long circuit to his exhausted kingdom. Among the captives was a body of French crusaders, and in this number were John count of Nevers, the son of the duke of Burgundy, and some of the noblest lords in France. In the pride of victory, Bajazet threatened that he would besiege Buda, that he would subdue the adjacent countries of Germany and Italy, and that he would feed his horse with a bushel of oats on the altar of St. Peter at Rome. Whilst the military talents of Bajazet, manifested on this occasion by the speed and secrecy of his march, and also by the order and evolutions of the battle, have been acknowledged even by his enemies, he has justly been accused of cruelty in the use of victory. The French captives, who survived the slaughter of the day (the count of Nevers and twenty-four lords excepted, who were afterwards ransomed for two hundred thousand ducats) were led before his throne; and as they refused to abjure their faith, they were successively beheaded in his presence. So absolute was his authority, that his word, pronounced either by way of mercy or destruction, was irrevocable. In the treaty, after the battle of Nicopolis, it was stipulated, that the French captives should swear never to bear arms against the person of their conqueror; but

this ungenerous restraint was abolished by Bajazet himself. "I despise," said he to the heir of Burgundy, "thy oaths and thy arms. Thou art young, and mayest be ambitious of effacing the disgrace or misfortune of thy first chivalry. Assemble thy powers, proclaim thy design, and be assured that Bajazet will rejoice to meet thee a second time in the field of battle." The progress of Bajazet, notwithstanding his threats, was checked by a long and painful fit of the gout. Before he directed his arms against the feeble remains of the Eastern empire, he rendered the emperor, Manuel Palaeologus, tributary, and imposed upon him the humiliating condition of having a Turkish cadi and a mosque in his capital. He next threatened and actually invested Constantinople; but he was called away by the menaces of a more formidable tyrant than himself. This was the great Timour, or Tamerlane, who, in the year 1400, began his march from Georgia towards Asia Minor. In his first expedition, Timour was satisfied with the siege and destruction of Siwas, or Sebaste, a strong city on the borders of Anatolia; and with causing 4000 Armenians, who formed the garrison, to be buried alive for the brave and faithful discharge of their duty. He then turned aside to the invasion of Syria and Egypt, sacked and destroyed Aleppo and Damascus, and took possession of Damascus. To Bajazet he offered peace on moderate terms; but the sultan, considering in his strength, employed the interval in collecting all the forces of his empire, and these two potentates met on the plains that surrounded the city of Angora, in July, A. D. 1402, to a memorable conflict, which has immortalized the glory of Timour, and the shame of Bajazet. Such was the event of this severe contest, in which two very numerous and powerful hosts were engaged, that the Turks were entirely broken with dreadful slaughter; and Bajazet, afflicted with the gout in his hands and feet, was transported from the field on the steetest of his horses. He was pursued and taken, and at sun-set brought to the tent of Timour. Bajazet, by the mild expostulation of the conqueror, who, with a soothing pity for his rank and misfortune, mingled just reproaches for his pride and obstinacy, was softened into humiliation. "Had you vanquished," said Timour, "I am not ignorant of the fate which you reserved for myself and my troops; but I disdain to retaliate; your life and honour are secure, and I shall express my gratitude to God by my clemency to man." The "iron cage," in which Bajazet is said to have been imprisoned by Tamerlane, so long and so often repeated as a moral lesson, is now rejected as a fable by the modern writers, who smile at the vulgar credulity. It has been suggested, indeed, that Timour might display an ostentatious magnificence and liberality, towards Bajazet; while, with a view to security, he kept his important prize in a "moveable apartment guarded with bars," and indulged his own pride in carrying him about in triumph. "In the feast of victory," says Gibbon, "to which Bajazet was invited, the Mogul emperor placed a crown on his head, and a sceptre in his hand, with a solemn assurance of restoring him with an increase of glory to the throne of his ancestors. But the effect of this promise was disappointed by the sultan's untimely death; amidst the care of the most skilful physicians, he expired of an apoplexy at Akshehr, the Antioch of Pisidia, about nine months after his defeat," A. D. 1403, in the fifteenth year his reign, and fifty-eighth of his life. "The victor dropped a tear over his grave; his body, with royal pomp, was conveyed to the mausoleum which he had erected at Bourfa; and his son Moufa, after receiving a rich present of gold and jewels, of horses and arms, was invested by a patent in red ink with the kingdom of Anatolia."

The character of Bajazet was that of a despot with violent

lent passions, but not habitually cruel; a lover of justice in the rough summary way practised by arbitrary princes; insatiably ambitious, and much addicted to the erection of pompous edifices for use or ostentation. *Anc. Un. Hist.* vol. xv. p. 202. *Gibbon's Hist.* vol. xi. p. 321. vol. xii. 17. 28. 30.

BAJAZET II., sultan of the Turks, succeeded his father Mahomet II. in 1481. After being freed from the competition of his brother Zizim, or Jem, he engaged, like his predecessors, in wars, and made conquests in Moldavia and Caramania; and he manifested the ferocity of his own disposition by putting to death, at an entertainment in his palace, his famous general Achmet. His war with the sultan of Egypt terminated in the ruin of the latter power; but at its commencement Bajazet lost a great number of troops in an invasion of Syria. He afterwards overran Circassia, and carried many of its inhabitants into captivity. On the expulsion of the Moors from Spain, Bajazet, at the head of the Mahometan religion, was solicited to revenge their cause; and he sent a fleet into the Mediterranean, which defeated the Christian navy, and ravaged the coasts. He afterwards reduced Croatia and Bosnia. In compliance with the request of Sforza, duke of Milan, he declared war against the Venetians, and invaded and plundered Friuli. Marching in person into the Morca, he took Lepanto, Moden, and Durazzo; but in 1503, peace took place between him and the Venetians, who had taken possession of Cephalonia. Besides these foreign wars, Bajazet encountered many civil commotions, occasioned by the rebellion of his son Selim. The issue of these contests was the resignation of the crown to his son, upon which Bajazet, wishing to live in peace and retirement at Demotica, set out on a journey thither, attended by a few friends. His progress was slow, and his son suspected that he was waiting for some favourable turn in his affairs; and therefore his death, after he had proceeded to the distance of about forty miles from Constantinople, was not without reason ascribed to poison administered by a Jewish physician. He died in 1512, at the age of 62, after a reign of 32 years. He was active and vigorous in body and mind, a patron of the learned, himself a proficient in literature, and well versed in the philosophy of Averroes, and a punctual observer of the rites of his religion. At the same time he had the fierceness common to the Ottoman princes, and shed blood without remorse. He is commendable for his attention to the improvement and decoration of his dominions by many edifices of grandeur and utility. *Mod. Un. Hist.* *Gen. Biog.*

BAIBACHTA, in *Geography*, a town of Siberia, on the river Irtysh, 72 miles N. W. of Tara.

BAIBAZAR, a town of Asiatic Turkey, in the province of Caramania, 48 miles west of Angura.

BAIBOUL, a town of Armenia, 45 miles south of Trebizond.

BAICHA, two rivers of Siberia, which run into the Turuchan; one 32, and the other 56 miles N. W. of Turuchansk.

BAIDARS, the name of a kind of small canoes, used among the natives of the Kurilly islands, and of the north-western coast of America. In Sauer's "Account of a geographical and astronomical Expedition to the northern Parts of Russia, by Billings, in the Years 1785 to 1794," we have the following account of their construction. The keel is eighteen feet long, four inches thick on the top, and not three inches deep, or somewhat less, at the bottom. Two upper frames, one on each side, about $1\frac{1}{2}$ inch square, and sixteen feet long, join to a sharp flat board at the head, and are about sixteen inches shorter than the stern, connected by

a thwart which keeps them about twelve inches asunder. Two similar frames are placed near the bottom of the boat, six inches below the upper ones, about one inch square. Round sticks, thin, and about six inches distant from each other, are tied to these frames, and project from the sides; and for the top thwarts are used very strong sticks, nearly as thick as the upper frames, curved, so as to raise the middle of the boat about two inches higher than the sides. Of these thwarts or beams there are thirteen; one of them is placed seven feet from the stern; another is twenty inches nearer the head; and a hoop is fastened between them, in which the rower is seated. This is made strong, and grooved for fastening an open skin, which is tied round the body, so as to prevent any water from getting into the boat, although it were sunk. The frame is covered with the skin of the sea-lion, drawn and sewed over it like a case. The whole is so extremely light, even when sodden with water, that it may be carried with ease in one hand. The head of the boat is double the lower part, sharp, and the upper part is flat, resembling the open mouth of a fish, but thus contrived to keep the head from sinking too deep in the water; and a stick is tied from one end to the other, to prevent its entangling with the sea-weeds. They are easily rowed in a sea, moderately smooth, about ten miles in the hour, and they keep the sea in a fresh gale of wind. The paddles which they use, and which serve for oars and rudders, are double, seven or eight feet long, and are cut in the shape of a peal. If the baidar runs aground, the savage easily sets it afloat again. These baidars are used in the fishery for whales, in the capture of sea-otters, and for other purposes.

BAIDSCHEN, in *Geography*, a town of Prussia, in the province of Lithuania, on the north side of the Pissa, four miles east of Gumbinnen.

BAIER, JOHN JAMES, in *Biography*, born at Iena, in Upper Saxony, in 1677, applied himself early to the study of medicine, and was admitted to the degree of doctor there in the year 1700. In 1704, he was made professor of physiology at Altdorf; and in 1730, president of the academy *Nature Curioforum*. Besides numerous dissertations on various branches of medicine, he published, "Adagiorum Medicorum Centuria," Altd. 4to. 1718. "Hortus Horti Medici Altdorfii." 4to. 1727. "Orationum Varii Argumenti Fasciculus." 4to. 1727. "Biographia Professorum Medicorum qui in Academia Altdorf unquam vixerunt," 4to. 1728. Nuremh. cum Iconibus, Nummis, et Scripserunt Censu. His son Ferdinand James was in considerable esteem as physician at Nuremberg, at the time of his death, which happened in 1735. *Haller Bib. Med. Pract. et Botan.*

BAIEU, in *Zoology*, the name of *Cervus Mexicanus* or Mexican stag, in Baneroff's Guiana, &c.

BAIF, JOHN ANTHONY, in *Biography*, was born at Venice, 1532, where he probably acquired and cherished his passion for music. He was the natural son of the French ambassador to that republic; had been a fellow student with the poet Ronfard, and was closely united to him by friendship and kindred arts. *Baif*, like our sir Philip Sidney, wished to introduce the feet and cadence of the dead languages into the living, and with the like success. He set his own verses to music; not to such music as might be expected from a man of letters, or a *dilettante*, consisting of a single melody, but to counterpoint, or music in different parts. Of this kind he published, in 1561, twelve hymns, or spiritual songs; and, in 1578, several books of songs, all in four parts, of which both the words and the music were his own. When men of learning condescend to study music *à fond*, professors think the art highly honoured by their notice; but poets are very unwilling to return the compliment, and seldom allow a musician

fician to mount Parnassus, or set his foot within the precincts of their dominions. *Baif*, however, was allowed to be as good a musician as poet; and what entitles him to the more notice here, is the having established an academy, or concert at his house, in the suburbs of Paris, where the performance was frequently honoured with the presence of Charles IX. Henry III. and the principal personages of the court.

Merfennus, in *Genes.* p. 1683, has given a particular account of this establishment, the first in France of which we have met with any record. In this academy or concert, dignified by a royal charter, in which voices, viols, and flutes were employed (*veribus, sibilibus, et flutibus constaret*), it was expected to recover the three *genera* of the Greeks, and all the miraculous powers of their ancient music.

BAIKAL, *Lacus, or inland sea*, in *Geogr. phy.* In the steepest part of the Savage mountains (the eastern continuation of the Alai), at the extremity of the chain, where the country changes to a level plain, forming itself by a lower mountain between the lofty abrupt summits, lies a monument of one of the great revolutions that the surface of our earth has ever undergone. A lake, not less remarkable for its internal constitution than for the space which it occupies, heaves its billows within the craggy cliffs of mountains, through which it is to all appearance impossible that any stream could force its way to supply its enormous basin. Nature, in the remotest periods of antiquity, seems here to have opened, by some tremendous convulsion, an abyss into which she might pour her immense stores of water, and cause a part of it to flow over the western level.

This lake extends from 52° N. lat. to $55^{\circ} 41'$, in a direction from south-west to north and north-north-east. Its most common appellation is Baikal, in the maps mare Baikal; but in the surrounding regions it is generally called the Sea, without farther addition; or sometimes the Holy sea. Both these denominations are extremely natural in a country which to a vast distance round knows no larger mass of waters, and in the mouths of people who so frequently experience the benefits it bestows and the perils it threatens. It is therefore not at all surprising that Gmelin's pilot should have ascribed a sudden storm to the anger of the incensed deity of the waters, who felt himself insulted by the foreign invader who called his venerable sea a lake. Safe from the like danger, we shall however pay greater respect to geographical justice, by making use of the latter term.

The lake Baikal is 550 versts in length; and in breadth, where it is the narrowest, 80 versts. To the north it widens to between 70 and 80 versts. Its depth is very unequal; proceeding from 20 to 80 and 100 fathom (the fathom at seven feet). In some places, particularly near the isle of Olchon, according to the affirmation of a fisherman, even a sounding-line of 200 fathom would not reach the bottom. A number of brooks and rivulets pour their waters into this basin; on the map in Georgi's travels, we count fifty of them; many indeed very inconsiderable, though several others may be deemed large; for example, the Selenga and the Upper Angara, which pursue a course of more than 700 versts. The lake has only one outlet; the Lower Angara, which flows into the Yenissy. Though its bed at the part where it comes from the Baikal is two versts broad, and has a very rapid current, yet is it not by far so spacious enough for carrying off all the water collected in that reservoir. Notwithstanding which, the lake never rises more than three feet above its ordinary level, even in the spring season; and therefore it probably may have some subterraneous drain. The bottom, at the shores, consists of

gradually rounded rocky fragments, piled on one another; in the middle, of gravelly sand. The lake is extremely clear, so that in eight fathom water the bottom is distinctly seen; in five or six fathom the smallest objects are discernible. At a distance it appears of a greenish hae, owing to the verdant moss with which the stony bottom is overgrown. It is pure, and very agreeable to the taste; but in the month of July it gets into a sort of fermentation, which is called its flowering, whence it becomes turbid as if mixed with a fine yellowish sand, and loses its good taste. More danger is to be apprehended when keeping within shore, than out upon the main; for the Baikal is extremely subject to violent gales and storms, which strike and split against the lofty mountains that surround it. The mariners know of no more than three winds, which they denominate after the promontories. The south-west, which is the most constant, and the north-east, are innocuous; the north is more formidable, by reason of its violence, and on account of the shallow shores to the south. But the agitation of the water is out of all proportion to the wind; since in a very moderate breeze the lake frequently rages with great fury, whereas furious winds only just increase its agitation. There being no rocks or banks in the middle, the waves usually swell seven feet high, almost always quite to the shore. Even when the violence of the storm has abated, the turbulence of the water continues only falls for several hours. The internal agitations of the lake are still more alarming. With a bright sky, and the surface of the water as smooth as a mirror, all at once the vessel is tossed about with such violent shocks, that the people on board have much ado to save it. In like manner in a particular place a single wave will suddenly arise, which at the same instant is followed by several others. These curious phenomena are supposed to happen in consequence of the contiguity in which the lake is situated below with cliffs in the adjacent mountains, the drafts of wind issuing from which force up the water, though not always perceptible above to the same degree.

Thus continually restless, it is very comprehensible that, notwithstanding the severity of the climate, the Baikal is not frozen over till the month of December or January. Ice-fields, sometimes of ten versts in extension, first form in the bays, and then unite in places, which, previous to the freezing, are covered with a dense cloud. The surface being at length thoroughly consolidated, frequently presents one vast plain of glassy smoothness, though sometimes likewise extremely rough. Snow, on account of the winds, seldom adheres to it; and therefore, especially to the first travellers, it is extremely laborious to the horses. The furious gusts of winds at times project the people who run by the side of the sledges, to the distance of several fathoms forwards; whereby they are in imminent danger of being frozen, or of falling into the chinks of the ice. These chinks become wider and more frequent as the time of the breaking up draws on; boards are then laid across them to facilitate the passage; and in cases of necessity, when the apertures are become too wide to be remedied in that way, canoes are introduced. The ice usually breaks up in May, and then it requires only a few days for dissolving; in several of the bays, however, it lies the whole summer through.

The weather is generally inclement in the parts about the Baikal. The summer is short, and scarcely ever passes without night frosts; the winter announces its approach so early as August, by falls of snow. On the sandy coasts, such plants grow as are elsewhere only found on the coldest mountains. The cause of this inclemency of climate is principally to be attributed to the elevation of the whole region, the snowy summits and icy clefts of the huge mountains, and

and the want of sufficient protection against the north winds.

In the Baikal are numerous islands; most of them, however, very small. The largest is Oelchon, in the northern part, separated from the main land by a sound, in which are eight islands of inferior dimensions. Oelchon is 70 versts in length, eight or ten broad, and terminates to the north in a promontory; the south-east part is lower and destitute of forests; in the south-western part pines, poplars, birch, and willows. The land is so favourable to the nurture of cattle, that the fine doves belonging to the inhabitants find pasture all the winter through, without any particular tending. The population consists of 150 Buriat families, many of whom are owners of between four and five hundred head of sheep. The natural propensity to tillage in all pastoral people here finds no much encouragement; that the Burians pass the greater part of the day in counting.

Round the coast are several objects of consequence to the naturalist. On the western side, above Oelchon, is a very beautiful country, skirted by majestic forests, with a fine view of the lake, are several springs, mostly cold. Amidst these is one of hot water, more remarkable than the rest on account of its saline properties. A Russian officer, returning to the mines having obtained relief from it in some disorder, reduced it to a condour, which yields 5½ gallons every hour; and it is found to be only necessary to dip in this vicinity for coming to hot water. The water is clear, but has somewhat of a foetid taste; the vapour smells like fired gunpowder, and occasions sneezing; birds are boiled in it in twelve minutes, split fish in seven or ten minutes. No snow therefore remains here upon the ground; the lake likewise continues free from ice; and even the cold springs, where they run through the territory of the hot, are taid. These hot sources are used for boiling as well as for drinking. Some years ago a lama performed frequent cures by means of these waters; since his death, however, the Russians are the only persons who occasionally resort to them.

The Upper Angara flows through the northern margin into the lake, after having pursued a course of 800 versts, down several precipices, forming stupendous cataracts, along a tract of near a hundred miles. Not far from its mouth, eastwards, is the Frolika lake, fifteen versts long, and from one to five versts across, remarkable for its extraordinary depth, and for a cataract on its way to the Baikal. The river Frolika, between fifteen and twenty fathoms wide, forms this cataract by rolling over a succession of rocks, extending half a verst, and being twenty feet in perpendicular height. More to the south is again a hot source, pellucid, and in taste resembling soap-water; in the morning the effluvia it casts around is enough to make one sick. The water issues in a copious stream, but is turned to no account.

On the Shamane promontory stands a curious lusus nature; namely, three rocks adjacent to each other, upwards of two hundred feet in height above the water's level. Their tops resemble human heads, with caps on them. It may well be imagined that the particular feature are not small. Of the middle most, which is the largest, the neck is in length seven feet, in the slit of the mouth two families of sea-gulls are commonly lodged; even the eyebrows are not wanting; only there is no trace of an ear. The Tunguses revere these three rocks, as the sea-god Diandü, with his two subordinate deities. He is able to save any Tunguse from drowning, to cause a good draught of fishes, &c.

The peninsula Barguün, thirty versts long and fifteen broad, is thickly wooded, but void of game and fish, con-

sequently cannot boast of a numerous population. Lower down to the south is the Dukhwei or Vapevay lake, five versts long and three broad. Its yellowish stony water is of a mureous acid taste; the whole surface is elevated with its foetid exhalations; yet the water in a well has no remarkable odour. It is used only in pike, perch, and various other sorts of fish, and is never, often in winter, when the ice remains, used for any other use, as it is the principal water. When it is melted, the hard stretch of this mineral makes not so much noise as the lake itself, as from the prodigious quantity of fish that lie corrupting on the shores.

The real source of all the mineral water on the banks of the Baikal is the Turka, discovered near the commencement of the last century, not yet being employed according to its nature. It consists of two springs, some of hot, others of cold water, which have no perceptible difference in their nature. It is extracted by Russians and Burians, I have said, and is also generally sold and drunk from it. The Russians, on their discovery, made use of the Turka plant young for medicinal purposes, but the Burians were contented with cold water, and never resorted to the delicate in the lake view to get the warm water. Without waiting for any revealed authority from the Shamane gods, the Russians commonly use young of these articles; no one, by that means, has met with a profit of ten rubles in the year, a capital sum for this part of the world. A little above the Turka is obtained sulphur, which the lake casts ashore in the spring, hanging to rocks, or incrusting with ice, in lumps often as big as one's fist. This dark brown clammy substance, which probably oozes up from the bottom of the lake, though it bealy viscous, may however be kneaded, and is soluble in moderately warm water. It has rather a fragrant odour, and is used in healing wounds, particularly as a salve for running fires. These parts abound likewise in various species of alkaline salts, which have of late been collected for the use of the apothecaries.

Southward from the Turka is the mouth of the Selenga, the largest river that discharges into the Baikal, and between the two cities Udmuk and Selengsk are situate. In its mouth lie scattered a few islands. Lower down stands the monastery of Pofolsk, which is the leading-place on coming across the Baikal from Irkutsk. The south-western mountainous border of the lake is called Kurak.

We now proceed to the particular description of the nature in this extraordinary lake. As the most remarkable in the prime rank is certainly due to the mineral water, the Russians, colonvankes, and other people, who are settled in the basin from the Irkutsk, have been obliged to dig up a great quantity of a mineral water, which is used for medicinal purposes. There are several of these, which are used for medicinal purposes. Some of them are used for medicinal purposes, otherwise it is even extracted from the water, which is only during winter, and is not used for medicinal purposes. The surface of the lake is generally covered with ice, which is broken from the north, though not every year alike. Should the water ever be found to be up in heaps on the shore, particularly near the mouth of the lake, it is at times thought to arise from that the old fishermen even as well as it is only of late years that they are used for medicinal purposes. Whence and how they are thrown up, and if it can be proved to be consistently attached to the bottom, it is probably in consequence of their usual habits being the same, chains at the bottom of the lake. There may perhaps be connected with the clays at the mountains, which are

already conjectured; and if this be admitted, it is far from improbable, that, in heavy gales, the wind furiously rushing through these vents, may lift them from their holes into the upper water, where, unaccustomed to the outward air, they cannot long survive this change of place. The shoals that are cast ashore are partly devoured by the sea-fowls, and partly boiled to oil by the inhabitants of the strand, which is said to be very fine and well tasted; at least it must be so to the Chinese, who buy it in great quantities.

Another particularity, at least to the Baikal, are the porpuses. As they elsewhere only live in salt water, and never travel far up the rivers, it is the more surprising how they came into this fresh-water lake, which has no communication with the sea, nor with any river that contains these animals. Though the first firmice may fall on the Yenissey and the Angara, yet in neither of those rivers are any of them, now at least, to be found, and it would be extremely difficult for them to shoot the cataracts on the passage from the Yenissey to the Baikal. Perhaps in some great inundation, the sources of the Lena might have communicated with the rivers of the Baikal; and on that occasion the primitive race of them might have strayed hither. They are of the same species with those of the Caspian and the Baltic; excepting that scarcely any of them are of varied hues. They are particularly fond of the ice; and shew themselves above water rather in the winter than in the summer; for which purpose they blow up of themselves air-holes in the ice, which they have the art of keeping constantly open; and in the spring drop their young upon the ice, for whose accommodation they make little huts of snow. The season for the chase of them lasts from the beginning of March to the breaking up of the ice at the latter end of May; the right of catching them is farmed out. They are shot with fire-arms or pierced with javelins; in both cases from a concealment behind a screen of white linen, which the animals mistake for a piece of ice. The old ones are made to yield their blubber; but the young are chiefly sought after because the Chinese are extremely partial to their silver grey skins. In the carrion, the Burats share with the crows. The annual capture is estimated at between 1500 and 2000 of these animals.

The omul (*salmo migratorius*) is a fish of great consequence, in regard to its prodigious numbers, not only to the Baikal, but to all the country round. His ordinary length is from fourteen to sixteen inches; seldom extending to two foot. His flesh is white and tender, and so delicate that he dies as soon as taken out of the water, even though immediately thrown in again. In August, the omuls generally begin to advance in shoals of various bulk, in order to ascend the rivers in which they spawn. In September they return, but in so emaciated a condition, that multitudes die upon the passage. They do not go up every river; those on the western side, not at all, and even not every one on the eastern side of the lake. Each fish is wont to go to spawn in the place where itself received life. They are caught the whole summer long; but mostly at the time of their shoaling in the rivers. With small nets 2000 of them are taken at a draught. They are thrown together in great heaps upon the shore; but ere the fishermen have time to prepare them, the Tunguses, the dogs, and the birds of prey, have devoured a good part of them. The omuls are salted, oil is obtained from them, and even some caviar, which however will keep only a very short time. Besides these, the Baikal produces many other sorts of fish; such as sturgeon, quabs, carp, perch, tench, trout, pike, &c. in great abundance.

One very singular natural phenomenon of the Baikal we have referred to the last, as being probably the original cause of the existence of the lake itself; we mean the earth-

quakes that are very frequent in the parts adjacent. They are most usual in the spring and autumn; generally once, sometimes twice a year. The shocks are not violent, last a few minutes, and do scarcely any mischief. At least the utmost injury that attended any one of the sixteen earthquakes described by professor Georgi, was, that it gently waked him out of his sleep, threw down the stove in the police-office at Selinginsk, and shook off some of the crosses from the tops of the church-spires. Nature seems to have exhausted herself in forming the bed of the Baikal; for it is highly probable that it was the effect of some tremendous earthquake, attended by an extraordinary falling-in of the earth. We are naturally led to this hypothesis by considering the state of the circumjacent region, and of the bottom of the lake. This latter consisting of fragments of demolished rocks, the largest of which thrust up their tops as islands; the coast around is one amazing congeries of rent, broken, and split rocks, to the height generally of forty fathoms; shattered portions of rocks lift their bare summits to the clouds, while the other parts of them lie rooted in the heart of the earth. On the craggy pinnacles of some of the snow-covered mountains lie broken tops of rocks in the shape of bee-hives, which only the powerful hand of nature could have projected thither; as it was she who fenced the Baikal round with majestic cliffs, and fixed their bases in unfathomable pits. But when?—History is silent.—And how?—The naturalist can only conjecture; he has recourse to an earthquake, and imagines, that here perhaps formerly the streams of the Upper Angara flowed, the territory whereof is now ingulfed by the broad lake.

The country round the Baikal forms a part of the government of Irkutsk, and belongs chiefly to the province of Nertshinsk. Irkutsk lies at the distance of about 50 miles westwards from the Baikal. The inhabitants of the confines of the lake are Tunguses, Burats, and Mongoles; the Russians are less numerous, because the land adjacent to it is not favourable to agriculture; though even on the eastern side winter-rye, oats, and barley thrive tolerably well. The whole of the population on the eastern side of the lake, from Turkal to the Upper Angara, amounted, in 1771, to not more than 5000 souls.

Besides the numerous birds of prey that seek their food in the neighbouring forests, multitudes of winged guests are attracted hither by the exuberant stores of fish with which the lake abounds. These consist of the various tribes of mews and hens; but more numerous than all are the gulls, in size resembling a full grown duck, but incomparably heavier. They come in the month of April, and take their departure in October. Every thing bears marks of their devastation; the very trees in which they roost perish, partly by their corrosive dung, and partly in consequence of their biting off the buds. They are said to consume more than one half of the omuls that go up the rivers. This may be thought surprising after what has been before observed of the prodigious quantities of these fish; not however so altogether incredible, when we are informed that these fowls hatch about ten young ones at a brood, and are extremely voracious. Not content with eating their fill, they overload themselves in such a manner, that beneath the rocks where they nestle, the foxes, ermines, magpies, and crows constantly find a plentiful banquet. In many places the nests of them are so numerous, that the people have much ado to pass along the rocks. The isles in the found between Olchon and the main land, being the principal haunt of these birds, take their name from them.

The forests are overrun with quadrupeds. Wolves and bears roam there in great abundance; but the latter at least are

are by no means formidable. Nothing scares them so easily as singing; accordingly the Burets are so considerate as to compose particular tunes for them. The louder the vocal performer pitches his notes, the faster the stupid hearer scampers from him. The Burets hunt them for the sake of their flesh. Stags, elks and roe-buck are very numerous; rein-deer are far less frequent on the northern shore. The wild boars are silver grey, and scarce; both perhaps in consequence of the cold climate. The race of fables is not yet so thinned in these regions as in some others; those taken here are esteemed as eminently valuable; such especially as range about the Upper Angara, are praised for the blackness of their fur. Ermines are so prolific, that while M. Georgi was at Irkutsk, a contract for twenty thousand skins to be delivered at St. Petersburg might be completed in a couple of days. Not less numerous in winter are the white hares, of whose large and stout ears pelisses are made, each at one and one and a half rubles. The Tunguses pay their tribute in squirrel-skins; besides these, many Russian hunters collect a thousand skins in one winter, and yet there is no perceptible diminution of the animals.

BAIKAL, Mines of the. In the region of the Baikal, 434 versts from Irkutsk, on the Lena, extends a bed of copper ore, which seems to reach, for 900 versts, to the river Kiren. The country of the latter river is far more hilly, consisting partly of lime-stone, whence several mineral sources proceed. Nor are specimens of copper wanting. Iron ores and ferruginous stones are every where met with in abundance. On the Lena here and there are hills of argentiferous glatz galax, interspersed with lime-stone, and at times appears in lumps of two or three pounds. It was first explored about sixty years ago by Messrs. Make and Kutuzof. They keep four machines at work at the copper-flatz, near the villages Botova and Shemanova. The ores are green-copper, brown-copper, copper-glass, fabletz-ores and malaquite. The gangues are calcareous and sandy. The narrower the gangue, the richer it is. The proportion is one fourth to forty per cent. copper, but scarcely a trace of silver. On an average one hundred pood of ore yields four pood of good copper.

BAIKAL, Mountains of the. This range of mountains takes nearly the same direction with the Baikal lake, accompanying it on both sides from south to north and north-east, runs down to the west on the right of the Angara, where it flattens in a morasse steppe of prodigious extent: to the east it advances from the origin of the Lena, on both sides of that river, and here likewise dies away in a widely extended flatz-ridge. In general it is a very craggy high-pitched mountain, partly consisting of granite, partly of flint-breccia and lime-stone. In the inferior regions of the Angara, and the Lena, its flatz-mountain greatly declines, and frequently produces coal. From the upper Angarian ridge there runs, as it should seem, a branch westward, through the region between the Podkamennia, and the lower Tunguska, away over the Yenisey, and consists probably of mere flatz-mountains. About the north-eastern part of the Baikal, the Upper Angara, the rivers Mara and Vitim, where lie the famous pits of muscovy-glass, all the mountain is granitic. The mineral contents of these mountains are as yet by far not thoroughly known. The principal of what has been discovered in them, are coals, asphaltus, sulphur-sources, native sulphur, alum, common salt sources, lapis lazuli, muscovy-glass, carnelians, natural prussian blue, and specimens of copper, iron, and lead.—Some tracts of mountains about the Baikal, for example, the Burgundu, and others, are so high that they are covered with never-waiting snow. In the lake itself many lofty

and steep cliffs ascend above the water as islands: some whereof consist of solid white quartz.—The mountains are partly bare, but mostly decked with forests. The most usual kinds of trees are the pinus sylvestris and the birch: but here are likewise great numbers of larches and cedars. The principal rivers which hence derive their streams, are the Selenga, the Angara, the Lena, the Vitim, and the Tungusa. For farther particulars, see Todd's View of the Russian Empire, vol. i. p. 127, & seq.

BAIKALENSIS, in *Ichthyology*, a species of *Carrasius* that inhabits the deep parts of the lake Baikal. It is about nine inches long, soft slender, and rather compressed; and has ventral fins, but dorsal fins very small; the second with cirriferous rays. Pallas, *Gmelin*, &c.

BAIKALITE, in *Mineralogy*, a variety of *Fluorite*.

BAIKALOVA, in *Geography*, a town of Siberia, 112 miles S. S. E. of Abakantk.

BAIL, Louis, in *Biography*, a French divine, born at Abbeville, flourished in the seventeenth century, and wrote several voluminous works, among which are "A Summary of Councils," being a continuation of that by father Ir. Longus de Coriolan, printed in 2 large folio volumes, at Paris, in 1672; and an account of the most celebrated preachers in all ages, under the title of "Sapientia foris prædicans," or "Wisdom uttering her voice in the streets." *Nouv. Dict. Histor.*

BAIL, in *Law*, the setting at liberty one arrested or imprisoned upon any action either civil or criminal, under sureties taken for his appearance at a day and place assigned. It is called *bail*, because hereby the party confined is *baillé*, from the Greek *βαλλω*, delivered into the hands of those who bind themselves for his forthcoming: or from *bail*, used in the sense of a guardian, into whose hands the party is put for security sake: and the end of bail is to satisfy the condemnation and costs, or render the defendant to prison.

Manwood distinguishes between *bail* and *mainprise* thus: he that is mainprised is said to be at large, and to go about at his liberty, without ward, till the time of appearance; whereas he who is let to *bail* to two or more men, is always accounted by law to be in their ward and custody for the time: and they may, if they please, actually keep him in prison.

With respect to bail in civil cases, it is to be observed, that there is both *common* and *special* bail.

Common bail is that given in actions of small prejudice, or slight proof; in which case any nominal sureties are taken; as John Doe, and Richard Roe: this being no other than a form of appearance: whereas *special* bail is given in cases of greater moment, where it is required that the sureties be substantial men, and according to the value of the matter in question.

It has been enacted that no persons should be held to special bail in any action brought for less than ten pounds. In order to which it is required by stat. 13 Car. II. tit. 2. c. 2. that the true cause of action should be expressed in the body of the writ or process. Also no security can be taken in a greater sum than 40*l.* This is observed as to writs issued out of the courts of Westminster-bail, and extended to all inferior courts by 19 Geo. III. c. 70.

The method of putting in bail to the sheriff, is by entering into a bond or obligation, with one or more sureties (not fictitious persons, as in the case of common bail, but real, substantial, responsible bondsmen), which obligation is called the *bail-bond*. The sheriff, if he pleases, may let the defendant go without any sureties; but that is at his own peril: for, after once taking him, the sheriff is bound to keep him safely, so as to be forthcoming in court; otherwise an action lies against him for an escape. But, in

the other hand, he is obliged, by stat. 23 Hen. VI. c. 10. to take, if it be tendered, a sufficient bail-bond; and by stat. 12 Geo. I. c. 29. the sheriff shall take bail for no other sum than such as is sworn to by the plaintiff, and endorsed on the back of the writ. By rule M. 1654, no attorney shall be bail for a defendant in any action, nor his clerk. Cowper, 228. n. But an attorney may be admitted as bail in a criminal case. No sheriff's officer, bailiff, or other person concerned in the execution of process, shall be permitted to be bail in any action or suit depending in K. B. nor persons outlawed after judgment, R. M. 14 Geo. II. Upon the return of the writ, or within four days after, the defendant must *appear* according to the exigency of the writ. This *appearance* is effected by putting in and justifying *bail to the action*; which is commonly called *bail above*. If this be not done, and the bail that were taken by the sheriff *below* are responsible persons, the plaintiff may take an assignment from the sheriff of the bail-bond (under the statute 4 & 5 Ann. c. 16.), and bring an action thereupon against the sheriff's bail. But if the bail so accepted by the sheriff be insolvent persons, the plaintiff may proceed against the sheriff himself, by calling upon him, first to return the writ, if not already done, and afterwards to bring in the body of the defendant; and, if the sheriff does not then cause sufficient bail to be put in and perfected *above*, he will himself be responsible to the plaintiff.

The *bail above*, or *bail to the action*, must be put in, either in open court, or before one of the judges thereof; or else, in the country, before a commissioner appointed for that purpose by virtue of the statute 4 W. & M. c. 4. which must be transmitted to the court. These bail, who must be at least two in number, must enter into a recognizance in court or before the judge or commissioner, in a sum equal (or in some cases double), to that which the plaintiff has sworn to; whereby they do jointly and severally undertake, that if the defendant be condemned in the action, he shall pay the costs and condemnation, or render himself a prisoner, or that they will pay it for him: which recognizance is transmitted to the court in a slip of parchment entitled a *bail-piece*. And if excepted to, the bail must be *perfected*, that is, they must *justify* themselves in court, or before the commissioner in the country, by swearing themselves house-keepers, and each of them to be worth the full sum for which they are bail, after payment of all their debts. See SATISFACTIO.

Special bail is required (as of course), only upon actions of debt, or actions on the case in trover, or for money due, where the plaintiff can swear that the cause of action amounts to ten pounds: but in actions where the damages are precarious, being to be assessed *ad libitum* by a jury, as in actions for words, ejectment, or trespass, it is very seldom possible for a plaintiff to swear to the amount of his cause of action; and therefore no special bail is taken thereon, unless by a judge's order, or the particular directions of the court, in some peculiar species of injuries, as in cases of mayhem or atrocious battery; or upon such special circumstances, as make it absolutely necessary that the defendant should be kept within the reach of justice. Also in actions against heirs, executors, and administrators, for debts of the deceased, special bail is demandable; for the action is not so properly against them in person, as against the effects of the deceased in their possession. But special bail is required even of them, in actions for a *devastavit*, or wasting the goods of the deceased; that wrong being of their own committing.

In civil cases every defendant is bailable; but in criminal matters it is otherwise. Bail may be taken either in court, or in some particular cases by the sheriff, coroner, or other

magistrate; but most usually by the justices of the peace. Regularly in all offences, either against the common law or act of parliament, that are below felony, the offender ought to be admitted to bail, unless it be prohibited by some special act of parliament. By the ancient common law before and since the conquest (2 Inst. 189. Glanv. l. xiv. c. 1.), all felonies were bailable, till murder was excepted by statute; so that persons might be admitted to bail before conviction almost in every case. But the statute Westm. 1. 3 Edward I. c. 15. takes away the power of bailing in treason, and in divers instances of felony. The statutes 23 Hen. VI. c. 9. and 1 & 2 Ph. & Mar. c. 13. give further regulations in this matter; and upon the whole we may collect (2 Inst. 186. 2 Hal. P. C. 129), that no justice of the peace can bail, upon an accusation of treason, of murder, of manslaughter, if the person be clearly the slayer, and not barely suspected to be so, or if any indictment be found against him; such as being committed for felony, have broken prison, because it not only carries a presumption of guilt, but is also superadding one felony to another; persons outlawed; such as have abjured the realm; approvers, and persons by them accused; persons taken with the mainour, or in the fact of felony; persons charged with arson; and excommunicated persons, taken by writ *de excommunicato capiendo*. Others are of a dubious nature, as thieves openly defamed and known; persons charged with other felonies, or manifest and enormous offences, not being of good fame; and accessories to felony, that labour under the same want of reputation. These seem to be in the discretion of the justices, whether bailable or not. Those who must be bailed, on offering sufficient security, are persons of good fame, charged with a bare suspicion of manslaughter, or other inferior homicide; such persons, charged with petit larceny, or any felony, not before specified; or with being accessory to any felony. Lastly, it is agreed, that the court of king's bench, or any judge thereof in time of vacation, may bail for any crime whatsoever, be it treason, murder, or any other offence, according to the circumstances of the case; such persons only excepted, who are committed by either house of parliament during the session, or such as are committed for contempts by any of the king's superior courts of justice. The refusal, or delay, of bail for any person bailable, is an offence against the liberty of the subject in any magistrate, by the common law, as well as by the statute Westm. 1. 3. Edw. 1. c. 15. and the *habeas-corpus* act, 31 Car. II. c. 2. And it is expressly declared by statute 1 W. & M. st. 2. c. 1. that excessive bail ought not to be required; though it is left with the courts to determine, on considering the circumstances of the case, what bail shall be called excessive. On the other hand, if the magistrate take insufficient bail, he is liable to be fined, if the criminal doth not appear. Blackst. Com. vol. iii. vol. iv. For several circumstances and considerations with regard to bail in civil cases and in criminal matters, see Jacob's Law Dict. by Tomlyns, vol. i. Art. *Bail*.

BAIL above, or *BAIL to the Action*, succeeds the return of the writ, or the appearance of the person bailed. See *BAIL*.

BAIL-Bond, is a bond or obligation entered into by one or more sureties, upon putting in bail to the sheriff, insuring the defendant's appearance at the return of the writ. See *BAIL*.

BAIL in Error, expresses the bail given by a person who brings a writ of error after verdict, or who is plaintiff in error.

BAIL-Piece, a small square slip of parchment, with the corners cut off at the bottom, on which is the recognizance of persons who put in bail. See *BAIL*.

BAILS, *Clerk of the*, is an officer belonging to the court of king's bench. He files the bail-pieces taken in that court, and attends for that purpose.

BAILACAN, in *Geography*, a town of Armenia, 181 miles east of Erivan.

BAILAN, a town of Syria, ten miles south of Alexandria.

BAILLE, or **BAIE**, in the *Sea Language*.—The seamen call laling or culling the water by hand out of a boat or ship's hold with buckets, cans, or the like, *bailles*.

When the water is thus *bailed* out, they say the *boat is freed*. They also call those hoops that bear up the tilt of the boat, its *bails*.

BAILEMENT, in *Law*. See **BAILMENT**.

BAILIAGE is used for the office of a bailiff, for the place where he keeps his seat, and for the territory subject to his jurisdiction; which last is also denominated *bailivick*.

BAILIAGE, *Water*, is an ancient duty received by the city of London, for all goods and merchandises brought into or carried out of the port. See **BALLIAGE**.

BAILIE, in *Scots Law*, a judge anciently appointed by the king over such lands not erected into a regality as happened to fall to the crown by forfeiture or otherwise; now abolished. It is also the name of a magistrate in royal boroughs, and of the judge appointed by a baron over lands erected into a barony.

BAILIES, **WILLIAM**, M. D. in *Biography*, practised medicine at London, and then at Bath, about the middle of the last century, but having a dispute with Drs. Oliver and Lucas, who had the greatest share of the business there, he soon quitted that city, and went to Prussia, and was made physician to Frederick the Great, to whom he was recommended as a person of great knowledge and experience in his profession. The king telling him, on his being introduced to him, he must certainly have killed a great number of persons in the course of acquiring his experience, the physician is said to have answered, "pas tant que votre majesté"—not so many as your majesty. The bon mot happened not to displease, and the doctor continued in favour with the king to the time of his death.

In 1757, Dr. Bailies published an essay on the Waters of Bath, with the view probably of making himself known there: also a narrative of facts, proving a conspiracy between the Drs. Oliver and Lucas, to exclude him from all consultations at Bath. Gen. Biog. Dict.

BAILIFF, in a *general sense*, denotes an officer appointed for the administration of justice within a certain district, called *bailivick*.

The word is also written *baile*, *baily*, *layy*, *layie*, and *baillif*, in Latin *ballivus*.—It is formed from the French *baillif*, that is *prefectus provincie*, of *baill*, an old word denoting a guardian or governor of a youth, originally derived from the Latin *balivus*, which signified the same.

Pasquier maintains, that bailiffs were originally a kind of commissioners, or judges delegate, sent into the provinces to examine whether or no justice were well distributed by the counts, who were then the ordinary judges. Loyseau, with more probability, refers the origin of bailiffs to the usurpation and idleness of the great lords, who, having got the administration of justice into their own hands, and being weary of the burden, turned it over to their deputies, whom they called bailiffs.

The bailiffs had, at first, the superintendence of arms, of justice, and of the finances; but abusing their power, they were by degrees stripped of it, and the greatest part of their authority transferred to their lieutenants, who were to be

men of the long robe. In France, they assumed some prerogatives, as being reputed the heads of their respective districts; in their name justice was administered, contracts and other deeds passed, and to them was committed the command of the militia.

From these the English bailiffs originally took both their name and their office: for as the French had eight parliaments, which were supreme courts whence no appeal lay, within the precincts of the several parliaments or provinces, and in which justice was administered by bailiffs, at least by their lieutenants; so in England are several counties where justice was and is still administered by a viscount or sheriff, who appears likewise to have been called bailiff; and his district or county, *bailivick* or *balliva*. In the statute of magna charta, c. 28. and 14 Edw. III. c. 9. the word *bailiff* seems to comprehend as well sheriffs, as bailiffs of hundreds. Farther, the counties were again subdivided into hundreds; within which it is manifest, justice was anciently rendered by officers called bailiffs. And it appears by Bracton (l. 3. tract. 2. c. 34.), that bailiffs of hundreds might anciently hold plea of appeal and approvers. But those hundred-courts are now swallowed up by the county-courts, certain franchises alone excepted; and the bailiff's name and office grown into such contempt, at least these bailiffs of hundreds, that they are now no more than bare messengers, and mandatories within their liberties, to serve writs, and such mean offices. In other respects, the name is still in good esteem; for the chief magistrates in divers towns are called bailiffs; and sometimes the persons to whom the king's cattle are committed are called bailiffs: as the bailiff of Dover castle, &c.

Of the ordinary bailiffs, there are several sorts; viz. bailiffs of liberties, sheriff's bailiffs, bailiffs of lords of manors; bailiffs of husbandry, &c.

BAILIFFS of Liberties, are those bailiffs who are appointed by every lord within his liberty, to execute process and perform such offices therein as the bailiff errant doth at large in the county; but bailiffs errant or itinerant, as they were formerly called, who went up and down the country to serve process, are now out of use.

Bailiffs of liberties and franchises are to be sworn to take distresses, impanel jurors, make returns by indenture between them and sheriffs, &c., and shall be punished for malicious distresses by fine and treble damages, by ancient statutes 12 Ed. II. st. 1. c. 5. 14 Ed. III. st. 1. c. 9. 20 Ed. III. c. 6. 1 Ed. III. st. 1. c. 5. 2 Ed. III. c. 4. 5 Ed. III. c. 4. 11 Hen. VII. c. 15. 27 Hen. VIII. c. 24. 3 Geo. I. c. 15. &c.

The bailiff of a liberty may make an inquisition and extent upon an *extent*. Cro. Car. 319. These bailiffs of liberties cannot arrest a man without a warrant from the sheriff of the county; and yet the sheriff may not enter the liberty himself, at the suit of a subject (unless it be on a *quo minus*, or *capias utlagatum*), without a clause in his writ, *non enim propter aliquam libertatem*, &c. If the sheriff, &c. enter the liberty without such power, the lord of the liberty may have an action against him; though the execution of the writ may stand good. 1 Vent. 406. 2 H. B. 153.

BAILIFFS of Shires, are either bailiffs of hundreds, or special bailiffs. Bailiffs of hundreds are officers appointed over those respective districts by the sheriffs to collect fines therein; to summon jurors; to attend the judges and officers at the assizes and quarter sessions; and also to execute writs and process in the several hundreds. But as these are generally plain men, and not thoroughly skilled in the latter part of their office, that of serving writs, and making arrests and executions, it is now usual to join several lawyers with them;

them; who are generally mean persons employed by the sheriffs on account only of their adroitness and dexterity in hunting and seizing their prey. A bailiff of a liberty is an officer which the court takes notice of; but a sheriff's bailiff is not an officer of the court, but only the sheriff himself. *Parch. 23 Car. 1. B. R.* The arrest of the sheriff's bailiff is the arrest of the sheriff himself, and if any rescous be made of any person arrested, it shall be adjudged done to the sheriff: also, if the bailiff permit a prisoner to escape, action may be brought against the sheriff. *Co. Lit. 61. 168.* Sheriffs are answerable for the misdemeanor of their bailiffs, and are to have remedy against them. *2 Inst. 19.* The latter are therefore usually bound in an obligation with sureties for the execution of their office, and thence are called *bound-bailiffs*, which the common people have corrupted into a much more homely appellation.

There are thirty-six serjeants at mace in London, who may be termed bailiffs, and each of them gives security to the sheriffs. By *stat. 14 Ed. III. c. 9.* sheriffs shall appoint such bailiffs for whom they will answer; and by *stat. 1 Hen. V. c. 4.* no sheriff's bailiff shall be attorney in the king's court. *R. M. 1651.*

BAILIFFS of Lords of Manors. are those that collect their rents, and levy their fines and amercedments; but such a bailiff cannot distrain for an amercedment without a special warrant from the lord or his steward. *Cro. Eliz. 698.* He cannot give licence to commit a trespass, as to cut down trees, &c., though he may license one to go over land, being a trespass to the possession only, the profits of which are at his disposal. *Cro. Jac. 337. 377.* A bailiff may, by himself, or by command of another, take cattle damage-feasant upon the land. *1 Dany. Abr. 685.* Yet amends cannot be tendered to the bailiff, for he may not accept of amends, nor deliver the distress when once taken. *5 Rep. 76.* These bailiffs may do any thing for the benefit of their masters; and it shall stand good till the master disagrees; but they can do nothing to the prejudice of their masters. *Lit. Rep. 70.*

BAILIFFS of Courts-Baron, summon these courts, and execute the process thereof; they present all pound-breaches, cattle strayed, &c.

BAILIFFS of Husbandry, are such as belong to private persons of good estates, and have the disposal of the inferior servants, with regard to their labour; they also fell trees, repair houses, hedges, &c.; and collect the profits of the land for their lord and master, and they render account to him yearly, &c. Besides these, there are also *bailiffs of the forest*, for which see *Manwood*, pt. 1. p. 113.

We also meet with divers other species and denominations of bailiffs in these and the neighbouring countries; as *provincial, royal, itinerant, and heritable, bailiffs; bailiffs of France, of the empire, of boroughs, &c.*

BAILIFF, Provincial, baillivus provincialis, among the French, was an officer appointed to administer justice in a certain province or county, with an authority somewhat like that of our justice of assize, instituted by the dukes and counts in their several territories, after they had procured the inheritance of them. These acted in the name, and by authority, not of the king, as justiciaries, but of the dukes or counts who appointed them, and whose deputies they were. *Spelman* takes them to be the same with what, among our Saxon ancestors, were denominated *aldermen of counties, and graves or reves*, which afterwards became *vicescomites*, and sheriffs.

Appeals lay from these to the bailiffs of France, *baillivi Francie*, who were those appointed over the provinces originally belonging to the crown.

BAILIFFS, Royal, baillivi regii, were those over provinces afterwards annexed to the crown. Something like these still subsists in Scotland, under the title of high or heritable bailiffs; as those of Cunningham, Carrick, and Kyle; the first in the families of the earls of Eglington, the second of the earl of Cassils, the third of the earl of Loudon.

BAILIFFS of Boroughs, baillivi burgorum, were magistrates anciently in cities and towns, answering, in some measure, to what of later times was called *portgrave, mayor, &c.*

Canterbury was a bailiff town five hundred years before it was made a mayor town. Westminster, Southwark, Scarborough, &c. are still governed by bailiffs.

Bailiffs differ in this from mayors, that the latter are always single in one place, whereas there were usually two bailiffs to a city, as formerly at London, and sometimes four, as at Norwich.

BAILIFF of the Empire, was anciently the vicar or regent of the empire; as appears from a letter of Henry of Flanders to pope Innocent III. wherein he says, the princes, barons, and knights, have elected me *bailiff of the empire; baillivus imperii.*

BAILIFF, Water, is an officer anciently established in all port-towns for the searching of ships, as appears from *23 Hen. VI. cap. 5.*

There is such an officer still on foot in the city of London, who supervises and searches all fish brought thither; and gathers the toll arising from the river of Thames.—He attends also on the lord mayor in his expeditions by water, and hath the principal care of marshalling the guests at the table. He also arrests men for debt, or other personal or criminal matters, on the river of Thames, by warrant of his superiors.

BAILLI, DAVID, in *Biography*, a painter of perspective views, and portraits, was born at Leyden in 1584, learned to draw and design under his father, and prosecuted his studies under Adrian Verburg, and Cornelius Vandervoort, with the latter of whom he spent six years. Bailii copied many capital paintings of some great masters, in the possession of Vandervoort, with critical care and observation; and particularly a perspective view of the inside of a church, originally painted by Stenwyck, which was so accurately finished, that Stenwyck himself could scarce distinguish the original from the copy. He travelled for improvement through several parts of Italy, and for some time resided at Rome; and the correctness of his drawing, and the delicate handling and finishing of his pictures, procured for him every where employment, admirers, and friends. In the latter part of his life he discontinued painting, and only drew portraits on vellum with a pen, which he heightened with black-lead, so as to give them wonderful force and roundness. He died in 1638. Pilkington.

BAILIWICK, BAILYWICK, or BAYLIWICK, the territory of a bailiff, or the place within which his jurisdiction is terminated. This is not only taken for the county, as it is frequently called in the writs, but signifies generally that liberty which is exempted from the sheriff of the county, over which the lord of the liberty appointeth a bailiff, with such powers within his precinct, as an under-sheriff exerciseth under the sheriff of the county; such as the bailiff of Westminster, &c. *Stat. 27 Eliz. c. 12.* Wood's *Inst. 206.*

BAILLEAU L'EVEQUE, in *Geography*, a town of France, in the department of the Eure and Loire, and chief place of a canton in the district of Chartres, $1\frac{1}{2}$ league north-west of Chartres.

BAILLEE, a town of France, in the department of the Mayenne, and chief place of a canton in the district

of Chateaugontier, 4½ leagues north-east of Chateaugontier.

BAILLER, in *Law*. See **BAILMENT**.

BAILLET, **ADRIAN**, in *Biography*, an eminent French critic, was born in 1649, of obscure parents, at Neuville, a village near Beauvais. Having completed his education in the college of the city, he took holy orders in 1676, but soon quitted the clerical profession, and devoted himself entirely to study. Lamoignon, president of the parliament of Paris, made him his librarian, and in this station he continued till his death in 1706. He was a man of indefatigable application, and extensive erudition. As he was always reading or writing, it is no wonder that his acquaintance with authors was great, and his works numerous. His principal performance was "*Jugemens des Savans sur les principaux Ouvrages des Auteurs*;" it is a valuable collection of facts and observations. In the first volume he lays down rules for judging of authors and their productions; the three following, published in 1685, treat of printers, critics, translators, authors of discoveries, &c.; and the next five on poets. The work would have been prosecuted agreeably to a plan presented by the author to the public in 1694, if he had not been discouraged by severe criticism and satire in the *Anti-Baillet de Menage*, and other pieces. Abandoning this design, he directed his attention to other subjects; and he wrote, in 1693, "A treatise on the worship of the Virgin Mary;" another in 1695, "On the Care of Souls;" "The Lives of Saints" in 4 vols. fol., and in 17 vols. 8vo. in 1701; "The Life of Descartes," in 2 vols. 4to. in 1691, and abridged in 12mo., in 1692; "The Life of Richer, doctor of the Sorbonne," written in 1692, and published in 1714. "The life of Godfrey Hermant, doctor of the Sorbonne," printed at Amsterdam in 1717, 12mo; "An History of Holland, from the truce of 1609," where Grotius finished, "to the peace of Niméguen," published at Paris, under the name of "Neuville," in 4 vols. 12mo. 1693; "A new and curious Account of Muscovy," under the same name, in 12mo. at Paris, 1698; and "An History of the contents of pope Boniface VIII. with Philip the Fair, king of France," published by father Long, in 12mo. 1718. The "*Jugemens des Savans*" was revised and enlarged by M. de la Monnoye, member of the French academy, and printed at Paris, in 7 vols. 4to. in 1722, and in 17 vols. 12mo. at Amsterdam, in 1725.

Baillet is often tedious and uninteresting, and culpably negligent with regard to his style. Gen. Dict.

BAILLEUL, **JOHN DE**, *Abbé de Jouvall*, was so famed for his skill in reducing luxated joints, Haller says, that his name passed into a proverb, and an expert bone-setter was called a Bailleul. Hal. Bib. Chirurg.

BAILLEUL, in *Geography*, a town of France, in the department of the North, and chief place of a canton in the district of Hazenbrouck; it was formerly fortified, but is now without defence. It contains about 500 houses; three leagues E. S. E. of Cassel, and 4½ W. N. W. of Lille. N. lat. 40° 35'. E. long. 2° 55'.

BAILLEUL, a town of France, in the department of the Sarthe, two leagues from La Fleche.

BAILLAGE, in *History*, the name of a government in Swisserland, of which there are two sorts: the one consisting of certain districts, into which all the aristocratical cantons are divided, over which a particular sort of officer, called a *bailiff*, is appointed by government, to which he is accountable for his administration: the other sort is composed of territories belonging to two or more of them, who alternately appoint a bailiff. This officer, when not restrained by the peculiar privilege of certain districts, has

the care of the police, and jurisdiction in civil and criminal causes in the same limitation; and enjoys a stated revenue arising in different places from various duties and taxes. In case of extinction or mal-administration, an appeal always lies from the bailiff to the cantons, to which the bailiff belongs; and the place, the time, and the members who receive the appeal, are regulated with the utmost exactness. Coxe's Trav. Switz. vol. 1. p. 37.

BAILLIE, **ROBERT**, in *Biography*, a Presbyterian divine of the church of Scotland, was born at Glasgow, in the year 1599, and educated in the university of his native city. After he had taken his degree of master of arts, he applied with diligence to the study of divinity; and having, in 1622, received orders from archbishop Low, he was chosen a regent of philosophy in the university of Glasgow. In 1633, he modestly declined an offer which was made him of a church at Edinburgh, and in 1637 refused to preach a sermon before the assembly in this city for recommending the canon and service book, then published by authority; and stated in a letter to the archbishop of Glasgow the reasons of his refusal. In 1638, he was a member of the famous assembly at Glasgow, which was a prelude to the civil war, and it appears, notwithstanding the moderation of his conduct, that he was not deficient in his zeal against prelacy and Arminianism. He was a member of the following general assemblies till 1653, the time excepted during which he attended the Westminster assembly. In 1640 he was sent by the covenanting lords to London, to draw up an accusation against archbishop Laud, for the innovations he had obtruded upon the church of Scotland. Soon after his return, in 1642, he was appointed one of the professors of divinity at Glasgow; and his reputation was such that he received invitations before this time from the other three universities, all of which he refused. He retained his professorship till the restoration; but was often interrupted in the exercise of it by his residence in England; for in 1643 he was chosen one of the commissioners of the church of Scotland, to the assembly of divines at Westminster. In the principles and views of this assembly he seems to have entirely concurred; he returned, however, to his own country in 1646. When Charles II. was proclaimed in Scotland after the execution of Charles I., Baillie was one of the divines appointed by the general assembly to wait upon his majesty at the Hague, and in a speech delivered on that occasion he expressed, in the strongest terms, his abhorrence of the murder of the late king, and in his sentiments with regard to this event the Presbyterian divines of that period, both at home and abroad, were almost universally agreed. After the restoration, Mr. Baillie was appointed, in 1661, principal of the university of Glasgow; but it is said that a bishopric was offered him, which he absolutely refused. In the course of the year 1662, his health began to decline; and during his illness he was visited by the newly created archbishop of Glasgow, whom he addressed in the following uncourtly language: "Mr. Andrew (I will not call you my lord), king Charles would have made me one of these lords; but I do not find in the New Testament that Christ has any lords in his house." In July of this year Mr. Baillie died at the age of sixty-three years. His character was not more distinguished by his loyalty, than by his zeal for presbytery, and his aversion to prelacy; and he seems to have been actuated, in a very considerable degree, by the intolerant spirit of the age in which he lived. In his letters, he every where manifests his dislike of sectaries; and he hardly omits any convenient opportunity of shewing his disapprobation of the doctrine of toleration. He had also imbibed a considerable portion of that enthusiastic spirit

spirit which was then prevalent, and which protracted the religious services to an astonishing length. Accordingly, Mr. Baillet, in one of his letters, written whilst he was attending the Westminster assembly, speaks of a devotional service that lasted nine hours. Nevertheless, he was a man of considerable learning and ability: he is said to have understood twelve or thirteen languages; and Mr. Woodrow, his biographer, commends his Latin style as not inferior even to the Augustan age. Of his diligence and learning, he left sufficient evidence in his historical work, intitled, "Opus Historicum et Chronologicum." His other writings, which were chiefly on controversial and temporary subjects, and which indicated a degree of violence that is said to have flowed rather from the indignation of other persons than from his own inebriation, are of inferior value. His "Letters and Journals," published at Edinburgh by Robert Aiken, in 1777, in two volumes, do not contain an account of public transactions, both in Scotland and England, from 1537 to 1692, and may cast some light on the civil and ecclesiastical history of that period. (Bosw. Brit.)

BALLOONER, in *Londoning*, is a lion rampant, holding a baton in his mouth.

BALLOU, GUILLAUME DE (*Billobus*), M. D. a physician of considerable eminence in the sixteenth century, was born at Paris in the year 1538. After making great progress in the Greek and Latin languages, and in philosophy, he applied to the study of medicine. In 1570, he was created doctor; and in the year 1580, dean of the faculty of medicine at Paris. In his time the dispute between the surgeons and physicians at Paris, as to their precedence, began, in which Ballois took an active part. It was decided in favour of the physicians, and the privileges usurped by the surgeons annull'd. Ballois was a voluminous writer; but as his works are now little noticed, we shall refer our readers, for titles of the particular treatises, and for an account of their contents, to Haller's *Bib. Med. Pract.*

BAILLY, JEAN-SYLVAIN, a celebrated astronomer and writer of France, was born at Paris, on the fifteenth of September 1736, of a family which had produced distinguished painters for four successive generations. He was bred to the same profession, but manifested an early taste for poetry and the belles lettres. By an accidental acquaintance with La Caille, his attention was directed to the sciences, which he cultivated with assiduity and success. He calculated the orbit of the comet of 1759; and in 1763 he published an useful and elaborate compilation, being the reduction of the observations made by La Caille in 1760 and 1761, on the zodiacal stars. About this time the theory of Jupiter's satellites became a particular object of his inquiries, and in the competition for this prize question of 1764, he had a formidable rival in La Grange, afterwards known as one of the first mathematicians in Europe. The results of his investigations were collected into a treatise, published in 1766, which also contained the first part of his "History of Astronomy." In 1771, he gave a very curious and important memoir on the light of the satellites, and introduced a degree of accuracy till that time unknown in the observations of their eclipses; and in the *Journal Encyclopedique* for May and July 1773, he addressed a letter to M. Bernoulli on some discoveries relating to Jupiter's moons, which he had contested. However, the studies of M. Bailly were not confined to the abstract sciences; but he was no less successful in his cultivation of polite literature. His eulog of Leibnitz, published in 1768, gained the prize of the academy of Berlin; this, and also the euloges of Charles V., of Cornille, of La Caille, of Cook, of Moliere, and of Gresset, printed in 1770, were much admired. In 1775, appeared the first volume of the "History of Astronomy," which indeed

throws the path of science with flowers, and in every respect is a most valuable work; abounding with animated description, luminous narrative, and interesting detail. His peculiar ideas concerning the early state of Upper Asia, occasioned an ingenious correspondence and discussion with the veteran philosopher Voltaire, the substance of which has appeared in two volumes, intitled, "Letters on the Origin of Sciences," and "Letters on the Atlantide of Plato." His imagination shone forth in these essays, erudition was no less conspicuous in a great work composed in the years 1781 and 1782, on the fables and religious creeds of antiquity; which still exists in manuscript, and the publication of which would extend the fame of its author, and gratify the learned world. His opinions on some points happening to coincide with the theories of Buffon, he contracted with that celebrated naturalist an intimate friendship, which was dissolved by Bailly's unceremonious opposition to the election of the abbe Marry into the academie Francaise. The other volumes of the "History of Astronomy" successively appeared, and that capital work was completed in 1787, by the "History of the Indian and Oriental Astronomy," a production of singular acuteness, research, and nice calculation. His "Discourses and Memoirs," which include the euloges before mentioned, were published in two volumes, in 1790; and his memoirs, communicated to the French academy, as they appear in Rozier's index, are as follow: "Memoir upon the theory of the comet of 1759;" "Memoir upon the eclipses of the moon's motions, at the end of the last century;" "First, Second, and Third Memoirs on the theory of Jupiter's satellites, 1763;" "Memoir on the comet of 1762;" vol. for 1763; "Astronomic observation, made at Nodon, 1764;" "On the sun's eclipse of the first of April 1764;" "On the longitude of Pollux, 1764;" "Observations made at the Louvre from 1760 to 1764, 1765;" "On the cause of the variation of the inclination of the orbit of Jupiter's second satellite, 1765;" "On the motion of the Nodes, and on the variation of the inclination of Jupiter's satellites, 1766;" "On the theory of Jupiter's satellites, published by M. Bailly, with tables of their motions, and of those of Jupiter, published by M. Jeaurat, 1766;" "Observations on the opposition of the sun and Jupiter, 1768;" "On the equation of Jupiter's centre, and on some other elements of the theory of that planet, 1768;" "On the transit of Venus over the sun, on the third of June 1769; and on the solar eclipse, the tenth of June, the same year 1769."

Such was the reputation of Bailly, that he was received as an adjunct in the French academy, on the 29th of January 1763, and associate on the 14th of July 1770. In 1771, he was a candidate, under the patronage of Buffon, for the office of secretary; but the interest of Condorcet, and the influence of D'Alembert, prevailed in favour of Condorcet. Of the academie Francaise, he was chosen secretary in 1754; and he was admitted in the following year, into the Academy of Inscriptions and Belles Lettres; the only instance, since Fontenelle, of the same person being at once a member of all the three academies. In 1784, he was nominated one of the commission to examine and report concerning the animal magnetism of Mesmer, as practised by Delton. His report was not only decisive with regard to its object, but furnishes a rule for the investigation of similar delusions. It likewise throws light upon the physical effects produced by moral causes; and these are peculiarly interesting, as causes of this nature have a political influence on the general opinions of society, and the destiny of nations.

M. Bailly, with an ardent, and, as it is generally believed, an honest mind, engaged in the support of that revolution of France, which at the time convulsed Europe, and which, with regard to its consequences, has not yet subsided. His

rise, as a principal agent in the transactions of this event, was very rapid. On the 26th of April 1789, he was nominated secretary by the electors of Paris; he was afterwards appointed deputy to the states general; then chosen president of the "Tiers Etat;" and when this chamber was constituted the national assembly, he continued in the chair. During the struggle between the popular part of the subsisting assemblies and the court, Bailly was the most forward to assert the popular rights, which at that time were new in France; and his temerity would probably have been fatal to himself, if he had not been supported by Mirabeau. Bailly dictated the oath to the members of the tiers etat, "to resist tyrants and tyranny, and never to separate, until they had obtained a free constitution." After the capture of the Bastille, on the 14th of July 1789, he was appointed by public acclamation mayor of the city; and in all his several functions he is said to have acted with integrity, courage, and moderation. But in the midst of revolutions the course which he pursued, was adapted to please neither of the contending parties; and though he acquired great popularity in the various steps by which the cause of the people gained predominance over that of the court, a circumstance occurred, which gave a turn to the popular opinion, and which rendered him an object of inveterate enmity. On the 17th of July 1790, the populace having collected tumultuously to demand the abolition of monarchy, Bailly received orders from the national assembly to disperse the mob. Desirous that the existing laws and regulations should be respected, he arrested certain deputies who came from some military insurgents at Nancy; he opposed the rash proceedings of Marat and Hubert; he was member of a club less promiscuous in its admission of members than that of the jacobins; and he exerted himself in endeavouring to persuade the populace to permit the royal family to depart to St. Cloud. Finally, on an occasion when the multitude assaulted the soldiery in the Champ de Mars, Bailly ordered the latter to fire, by which about forty persons were killed, and more than one hundred wounded. By these concurring circumstances his popularity declined, and at the dissolution of the constituent assembly, in the close of the year 1791, he resigned his office, and was succeeded by Pétion. His health was impaired, and he retired from the scene of tumult, travelled through different provinces of France in the years 1792 and 1793; and pursued his literary and scientific researches. During this period, he wrote memoirs of the events which he had witnessed, and in which he had been a principal actor. Instead of withdrawing from France, which some of his friends advised him to do, he chose rather to submit to the injustice and ingratitude of his country. At the nod of a vulgar tyrant, he was arrested, summarily condemned by a sanguinary tribunal, and, on the 15th of November 1793, was delivered over to appease the vengeance of an incensed and indiscriminating populace. His sufferings were studiously protracted; circumstances of peculiar ignominy attended his execution; and he was executed near the spot where he gave orders for the military to fire on the people. He wore the red shirt, or badge of conspiracy, and was placed in a cart, with his hands tied behind him. In his progress to the place of execution, he was insulted and abused; and when he arrived at the fatal spot, during the removal of the guillotine, he was forced to descend from the cart, and to walk round the field, in order to gratify more completely the rancour of the mob. But all these trials were endured by him with firmness and magnanimity. A by-stander, at the time of his ascending the platform, insultingly exclaimed, "Bailly, you tremble;" to which he

instantly replied, "Yes, but not with fear;" he stood indeed on account of the inclemency of the weather. The character of Bailly, thus prematurely cut off in the fifty-seventh year of his age, may be estimated by his works. In his person he was tall; his deportment was sedate and grave; and he blended firmness with sensibility. During his magistracy, he spent part of his fortune in relieving the wants of the poor; and he retired from office, impoverished rather than enriched; and in the various transactions of his life, he established the character of integrity and disinterestedness. His wife, who was the widow of his intimate friend Raymond Gaye, and whom he married in 1787, survived him. He had eight nephews, whom he educated with all the attention and tenderness of a father. With regard to the motives which actuated his public conduct, there seems to be no difference of opinion, whatever discordant sentiments may be entertained concerning the cause to which his talents and life were devoted. Lalande's Eloge de Bailly.

BAILLY, or BAILLET, *de la Riviere*, physician to king Henry IV., was born at Falaise in Normandy, about the middle of the sixteenth century. He was a strenuous advocate for the doctrines of Paracelsus; and in 1578 he published his "Demolition, seu Aphorismi ecc. continentes summam doctrinæ Paracellicæ," 8vo. Parisiis. It contains a defence of his practice, which being strongly opposed by the contemporary physicians, in the following year he gave his "Responsio ad quæstiones propositas a Medicis Parisiensibus," also in 8vo. In 1580, he published "De peste tractatus," 8vo. Voces viri, Haller says, vix sensum admittunt. We shall omit the titles of his various other writings, which may be found recited in Haller's Bib. Med. Pract. vol. ii. p. 218.

Monf. Carrere says of this physician, that perceiving he was about to die, he called his servants to him singly, and gave to each of them a portion, first of his money, then of his plate and furniture, bidding them, as soon as they had taken what he had given, to leave the house, and see him no more. When the physicians came to visit him, they told him they had found his door open, and the servants and the furniture removed and gone, nothing in fact remaining but the bed on which he lay. Then the doctor, taking leave of his physicians, said, since his baggage was packed up and gone, it was time that he should go also. He died the same day, November the 5th, 1605. Eloy Dict. Hist.

BAILMENT, from Fr. *bailler*, to deliver, in Law, is a delivery of goods in trust, upon a contract expressed or implied that the trust shall be faithfully executed on the part of the *bailee*, a person to whom they are delivered; and the goods re-delivered as soon as the time or use for which they were bailed shall have elapsed or be performed. There are six sorts of bailments, which devolve a care and obligation on the party to whom goods are bailed; and which consequently subject him to an action, if he misbehave with regard to the trust reposed in him.

1. A bare and naked bailment, to keep for the use of the bailer, which is called *depositum*; and such bailee is not chargeable for a common neglect, but it must be a gross one to make him liable. 2. A delivery of goods which are useful to keep, and they are to be returned again in specie, which is called *accommodatum*, or a lending gratis; and in such case the borrower is strictly bound to keep them; for if he be guilty of the least neglect, he shall be answerable, but he shall not be charged where there is no default in him. 3. A delivery of goods for hire, called *locatio* or *conductio*; and the hirer is to take all imaginable care, and restore them at the time; and if he use such care, he shall not be bound.

4. A delivery by way of pledge, called *vadium*; and in such goods the pawnee has a special property; and if the goods be the work for using, the pawnee must not use them; otherwise he may use them at his peril; as jewels pawned to a lady, if she keep them in a bag, and they are stolen, she shall not be charged; but if she go with them to a play, and they are stolen, she shall be answerable. If the pawnee be at a charge in keeping them, he may use them for his reasonable charge; but if, notwithstanding all his diligence, he lose the pledge, yet he shall recover the debt. But if he lose it after the money tendered, he shall be chargeable, for he is a wrong-doer; after money paid (and tender and refusal is the same) it ceases to be a pledge, and therefore the pawnor may either bring an action of *assumpsit*, and declare that the defendant promised to return the goods upon request; or trover, the property being vested in him by the tender. 5. A delivery of goods to be carried for a reward. (See CARRIER.) 6. A delivery of goods to do some act about them (as to carry) without a reward, called by Bracton *mandatum*, in English, an acting by commission; and though he get nothing for his pains, yet if there were any neglect in him, he will be answerable, for his having undertaken a trust is a sufficient consideration; but if the goods be misused by a third person, in the way, without any neglect of his, he will not be liable, being to have no reward.

On this subject, sir William Jones's "Essay on the Law of Bailment" merits particular attention; and the following analysis will convey much knowledge in a short compass. "Definitions. 1. *Bailment*, as before at the beginning of this article. 2. *Deposit* is a bailment of goods to be kept for the bailor without recompence. 3. *Mandate* is a bailment of goods, without reward, to be carried from place to place, or to have some act performed about them. 4. *Lending for use* is a bailment of a thing for a certain time, to be used by the borrower without paying for it. 5. *Pledging*, is a bailment of goods by a debtor to his creditor, to be kept till the debt be discharged. 6. *Letting to hire* is (1) a bailment of a thing to be used by the hirer for a compensation in money; or (2) a letting out of work and labour to be done, or care and attention to be bestowed, by the bailee on the goods bailed, and that for a pecuniary recompence; or (3) of care and pains in carrying the things delivered from one place to another, for a stipulated or implied reward. 7. *Innominate bailments* are these where the compensation for the use of a thing, or for labour and attention is not pecuniary; but either (1) the reciprocal use or the gift of some other thing; or (2) work and pains reciprocally undertaken; or (3) the use or gift of another thing in consideration of care and labour; and conversely. 8. *Ordinary neglect*, is the omission of that care, which every man of common prudence, and capable of governing a family, takes of his own concerns. 9. *Gross neglect*, is the want of that care which every man of common sense, how inattentive soever, takes of his own property. 10. *Slight neglect* is the omission of that diligence which very circumspect and thoughtful persons use in securing their own goods and chattels. 11. *A naked contract* is a contract made without consideration or recompence.

11. The rules which may be considered as axioms flowing from natural reason, good morals, and sound policy, are these. 1. A bailee who derives no benefit from his undertaking, is responsible only for gross neglect. 2. A bailee who alone receives benefit from the bailment, is responsible for slight neglect. 3. When the bailment is beneficial to both parties, the bailee must answer for ordinary neglect. 4. A special agreement of any bailee to answer for more or

less, is in general valid. 5. All bailees are answerable for actual fraud, even though the contrary be stipulated. 6. No bailee shall be charged for a loss by inevitable accident or irresistible force, except by special agreement. 7. Robbery by force is considered as irresistible; but a loss by private stealth is presumptive evidence of ordinary neglect. 8. Gross neglect is a violation of good faith. 9. No action lies to compel performance of a naked contract. 10. A reparation may be obtained by suit for every damage occasioned by an injury. 11. The negligence of a servant, acting by his master's express or implied order, is the negligence of the master.

III. From these rules the following propositions are evidently deducible. 1. A depositary is responsible only for gross neglect; or, in other words, for a violation of good faith. 2. A depositary, whose character is known to his depositor, shall not answer for mere neglect, if he take no better care of his own goods, and they also be spoiled or destroyed. 3. A mandatary to carry is responsible only for gross neglect, or a breach of good faith. 4. A mandatary to perform a work is bound to use a degree of diligence adequate to the performance of it. 5. A man cannot be compelled by action to perform his promise of engaging in a deposit or mandate; but,—6. A reparation may be obtained by suit for damage occasioned by the non-performance of a promise to become a depositary, or a mandatary. 7. A borrower for use is responsible for slight negligence. 8. A pawnee is answerable for ordinary neglect. 9. The hirer of a thing is answerable for ordinary neglect. 10. A workman for hire must answer for ordinary neglect of the goods bailed, and must apply a degree of skill equal to his undertaking. 11. A letter to hire of his care and attention, is responsible for ordinary negligence. 12. A carrier for hire by land or by water is answerable for ordinary neglect.

IV. Exceptions to the above rules and propositions. 1. A man who spontaneously and officiously engages to keep or to carry the goods of another, though without reward, must answer for slight neglect. 2. If a man through strong persuasion and with reluctance undertake the execution of a mandate, no more can be required of him than a fair exertion of his ability. 3. All bailees become responsible for losses by casualty or violence, after their refusal to return the things bailed; on a lawful demand. 4. A borrower and a hirer are answerable in all events, if they keep the things borrowed or hired after the stipulated time, or use them differently from their agreement. 5. A depositary and a pawnee are answerable in all events if they use the things deposited or pawned. 6. An inn-keeper is chargeable for the goods of his guest within his inn, if the guests be robbed by the servants or inmates of the keeper. 7. A common carrier by land or by water must indemnify the owner of the goods carried, if he be robbed of them.

V. It is no exception, but a corollary from the rules, that every bailee is responsible for a loss by accident or force, however inevitable or irresistible; if it be occasioned by that degree of negligence for which the nature of his contract makes him generally answerable."

The following cases may serve to illustrate the above principles.

A man leaves a chest locked up with another to be kept, and doth not make known to him what is therein; if the chest and goods in it are stolen, the person who received them shall not be charged for the same, for he was not trusted with them. And what is said as to stealing is to be understood of all other inevitable accidents; but it is necessary for a man that receives goods to be kept, to receive them in a special manner, viz. to be kept as his own, or at the peril

of the owner. 1 Lill. Abr. 193, 194. And vide 1 Rol. Abr. 338. 2 Show. pl. 166.

If I deliver 100l. to *A.* to buy cattle, and he bestows 50l. of it in cattle, and I bring an action of debt for all, I shall be barred in that action for the money bestowed and charges, &c. but for the rest I shall recover. Hob. 207.

If one deliver his goods to another person, to deliver over to a stranger; the deliverer may countermand his power, and require the goods again; and if the bailee refuse to deliver them, he may have an action of account for them. Co. Litt. 286.

If *A.* delivers goods to *B.* to be delivered over to *C.* *C.* hath the property, and *C.* hath the action against *B.* for *B.* undertakes for the safe delivery to *C.* and hath no property or interest but in order to that purpose. 1 Rol. Abr. 606.: see 1 Bull. 68, 69. where it is said that in case of conversion to his own use, the bailee shall be answerable to both.

But if the bailment were not on valuable consideration, the delivery is countermandable; and in that case, if *A.* the bailor bring trover, he reduces the property again in himself, for the action amounts to a countermand; but if the delivery was on a valuable consideration, then *A.* cannot have trover, because the property is altered; and in trover the property must be proved in the plaintiff. 1 Bull. 68.; see 1 Leon. 30.

And where a man delivers goods to another to be re-delivered to the deliverer at such a day, and before that day the bailee doth sell the goods in market overt; the bailor may at the day seize and take his goods, for the property is not altered. Godb. 160.

If *A.* borrows a horse to ride to Dover, and he rides out of his way, and the owner of the horse meets him, he cannot take the horse from him; for *A.* has a special property in the horse till the journey is determined; and being in lawful possession of the horse, the owner cannot violently seize and take it away; for the continuance of all property is to be taken from the form of the original bargain, which in this case was limited till the appointed journey was finished. Yelv. 172. But the owner may have an action on the case against the bailee for exceeding the purposes of the loan; for so far it is a secret and fallacious abuse of his property; but no general action of trespass, because it is not an open and violent invasion of it. 1 Rol. Rep. 128.

As to borrowing a thing perishable, as corn, wine, or money, or the like, a man must, from the nature of the thing, have an absolute property in them; otherwise it could not supply the uses for which it was lent; and therefore he is obliged to return something of the same sort, the same in quantity and quality with what is borrowed. Dr. & Stud. 129.

But if one lend a horse, &c. he must have the same restored. If a thing lent for use be used to any other end or purpose than that for which it was borrowed, the party may have his action on the case for it, though the thing be never the worse; and if what is borrowed be lost, although it be not by any negligence of the borrower, as if he be robbed of it; or where the thing is impaired or destroyed by his neglect, admitting that he put it to no more service than that for which borrowed, he must make it good; so where one borrows a horse, and puts him in an old rotten house ready to fall, which falls on and kills him, the borrower must answer for the horse. But if such goods borrowed perish by the act of God (or rather, as sir William Jones says, it ought more reverentially to be termed, by *inevitable accident*), in the right use of them; as where the borrower puts the horse, &c. in a strong house, and it falls and kills

him, or it dies by disease, or by default of the owner, the borrower shall not be charged. 1 Inst. 89. 29 Aff. 28. 2 H. 7. 11.

If one delivers a ring to another to keep, and he breaks and converts the same to his own use; or if I deliver my sheep to another to be kept, and he suffers them to be drowned by his negligence; or if the bailee of a horse, or goods, &c. kill or spoil them, in these cases action will lie. 5 Rep. 13. 15 E. 4. 206. 12 E. 4. 13.

If a man deliver goods to another, the bailee shall have a general action of trespass against a stranger, because he is answerable over to the bailor; for a man ought not to be charged with an injury to another, without being able to retire to the original cause of that injury, and in amends there to do himself right. 13 Co. 69. 14 H. 4. 28. 25 H. 7. 14. See Jacob's Law Dictionary by Tomlins, art. *Bailment*. Blackit. Com. vol. ii. p. 376. 451, &c.

BAILO, or BALIO, a name given at Constantinople to the ambassador of Venice residing at the Porte; who also does the office of consul of his nation.

The word is doubtless the remains of the word *bajulu*, which the modern Greeks and Turks have formed into bailo.

The Venetian consuls at Aleppo, Alexandria, Smyrna, and other parts of the Levant, are also denominated bailo.

BAILY, NATHANIEL, in *Biography*, an English writer, living the latter end of the seventeenth century and beginning of the last, author of the "Dictionarium Rusticorum," treating of all sorts of country affairs, particularly of the whole art of gardening, 1704, 8vo. London, republished, much improved, 1726. Haller Bib. Bot.

BAILYBOROUGH, in *Geography*, a market and post town of the county of Cavan in Ireland, which, though of a very mean appearance, has an excellent market. The crops in its vicinity consist of potatoes, flax, and oats, and are very poor. There is a bleach-green contiguous to the town, and there are some small farmers in the neighbourhood, who make butter for market, which is sent to Newry for exportation. Their pigs, which form a considerable article of trade, are sent to the same place. This town has been hitherto very much neglected; but such are its advantages of situation, that if any encouragement were given, it might be easily raised to a state of prosperity and consequence. Between this town and King's Court is a lake, or rather pool, on the summit of a mountain, which is celebrated for its antiscorbutic virtues, and is much frequented from June to August. Many bathe in the lake; but the mud, which is taken up from the depth of thirty feet, and rubbed on the affected parts, is deemed the most efficacious. This mud is a gray shining substance like tar. The lake covers about half a square rood in area, and has a range of lofty hills to the east and west. For about six feet from the surface the water is pure and clear, with something of a chalybeate taste. It is observed of it, that the sun or atmosphere has its effect rather in imparting its general influence, or in reducing the waters by attraction; nor has it ever been frozen, or its temperature altered in the severest winter. Bailyborough is situated fifteen miles north-west from Dublin. Coote's Statist. Survey of Cavan.

BAILYBURG, a town of Sweden, in the province of Westmanaland.

BAIN, a town of France, and principal place of a district in the department of the Loire and Maine, 24 leagues south of Rennes. N. lat. 47. 50. W. lon. 10. 10.

BAIS GONGA, a river of Hindoostan, the name and knowledge of which we are indebted to Col. Conradi's Discoveries

near the southern bank of the Nerbuddah, and runs southward through the heart of Berar; and after a course of 400 miles mixes with the Godavery, within the hills that bound our northern circuits, about ninety miles above the sea. It is not certain how far the Bain Gonga is navigable; but it is mentioned as a large river in the early part of its course; and is probably equal in bulk to the Godavery, when it joins it. Rennell's Mem. p. 246.

BAINBRIDGE, JOHN, in *Biography*, an eminent physician and astronomer, was born at Ashby de la Zouch, in Leicestershire, in 1582, finished his education at Emanuel college in the university of Cambridge, and then retired to his own country, where for some years he taught a grammar school, and practised physic. He also applied himself to the study of mathematics and astronomy, to which he had been devoted from his earliest years. Upon his removal to London, he was admitted a fellow of the college of physicians. His "Description of the comet" in 1618, introduced him to an acquaintance with sir Henry Saville, by whom he was appointed, in 1619, his first professor of astronomy at Oxford, where he settled, having entered himself a master commoner of Merton college, for some years. At the age of forty years he began the study of Arabic, with a view of publishing correct editions of the ancient astronomers. He died at Oxford, November the 3d, 1643, in the sixty-second year of his age. His works that were published are "An Astronomical Description of the late comet from November 18th, 1618, to the 16th of December following," London, 1619, 4to.; "Procli sphaera;" and "Ptolemæi de hypothelibus Planetarum liber singularis;" to which he added Ptolemy's "Canon regnorum," 1620, 4to.; "Canicularia," published at Oxford, in 1648, by Mr. Greaves, together with a demonstration of the heliacal rising of Sirius or the dog-star for the parallel of Lower Egypt, written at the request of archbishop Usher. Several other treatises were prepared for the press, and left in MS. *Obit. Brit.*

BAINDER, in *Geography*, a town of Asiatic Turkey, in the province of Natolia, forty-four miles east from Boli.

BAINDT, a town of Germany, in the circle of Swabia, six miles N. N. E. of Ravensburg.

BAINÉ, a river of England, in Lincolnshire, which passes by Horncastle, Tattersal, &c. and joins the Welham near the last-mentioned place.

BAINETTA, a town of Piedmont, in the province of Coni, on the Orobio, six miles S. E. from Coni, and eight W. S. W. from Mondovi.

BAINS, a town of France, in the department of the Vosges, and chief place of a canton in the district of Darrey 2½ leagues west of Plombières, and 3¼ south-east of Darney.

BAIOCCO, in *Commerce*, a copper coin in modern Rome, equivalent to a tenth part of the julio, or a hundredth part of the ducat.

The baiocco is worth about nine deniers, French money.

BAJOLE, CAPE, in *Geography*, the most northerly cape of Minorea island, in the Mediterranean, ten leagues from the most northerly cape of the island of Majorca.

BAIFIA, a town of North America, in New Navarre, 165 miles south-west from Casa Grand.

BAIRAM, a name given to the great annual feast of the Mahometans.

The word is also written, by some authors, more conformably to the oriental orthography, *bairam*. It is originally Turkish, and signifies literally, a *feast-day*, or *holiday*.

The Mahometans have two bairams, the *great* and the *little*, which Scaliger, Erpenius, Rycaut, Hyde, Chardin,

Bobovius, and other European writers, commonly interchange, giving the appellation *great* to that which the Turks call little, and *vice versa*.

This feast commencing with the new moon, the Mahometans are very scrupulous in observing the time when the new moon commences; to which purpose, observers are sent to the tops of the high mountains, who, the moment they spy the appearance of a new moon, run to the city, and proclaim *muzuladuluk, welcome news*; as it is the signal for beginning the festivity.

The ceremonies are described at large by Rycaut and Tournefort.

BAIRAM, *the Greater*, is properly that held by the pilgrims at Mecca, commencing on the tenth of Dhu'l-hajja, when the victims are slain, and lasting three days. This is called by the Arabs, *id al korban, id al alba*, that is, the feast of the sacrifice, as being celebrated in memory of the sacrifice of Abraham, whose son God redeemed with a great victim. By European writers it is called the *lesser bairam*, as being less taken notice of by the generality of the people, who are not struck with it, because the ceremonies attending it are performed at Mecca, the only scene of the solemnity.

The *Lesser Bairam* is called in Arabic *Id al Fetv*, that is, the feast of breaking the fast, and begins the first of Shawal, immediately succeeding the fast of Ramadan. This is called by the vulgar, and by most others who have written of the Mahometan affairs, the *greater bairam*, because it is observed in an extraordinary manner, and lasts for three days at Constantinople and in other parts of Turkey, and for five or six days in Persia, during which no work is done; but presents pass from one to another, with many other manifestations of joy. If the day after Ramadan should prove so cloudy as to prevent the sight of the new moon, the bairam is put off to the next day, when it begins, though the moon be still obscured. When they celebrate this feast, after numerous ceremonies, or rather strange mimeries, in their mosque, they end it with a solemn prayer against the infidels, to root out Christian princes, or to arm them one against another, that they may have an opportunity to extend the borders of their law. Sale's Prel. Diss. p. 150.

BAIRDSTOWN, or **BEARDSTOWN**, in *Geography*, a flourishing town of America, in Nelson county, Kentucky, containing 216 inhabitants, seated on the head-waters of Salt-river, fifty miles S. E. from Louisville, and about the same distance S. W. from Danville.

BAIROUT, as it is pronounced by the Arabs, and as the modern Greeks pronounce Βερούβ, ΒΕΡΟΥΤ, or the ancient *Berytus*, a town of Syria, in the pachalic of Saïde or Acre, is situated in a plain, which runs out from the foot of mount Lebanon into the sea, narrowing to a point about two leagues from the ordinary line of the shore, and on the north side forms a pretty long road, receiving the river of Nahr-el-Saïb, called also Nahr-Bairout. The frequent floods to which this river is subject in winter, have occasioned the erection of a considerable bridge; but this is in so ruinous a state as to be impassable. The bottom of the road is rocky, which chafes the cables, and renders it insecure. The town of Bairout, which lies about an hour's journey westward towards the point, belonged till of late to the Druzes, but Djezzar took it from them, and placed in it a Turkish garrison. It still continues, however, to be the emporium of the Maronites and the Druzes, where they export their cottons and their silks, almost all of which are sent to Cairo. In return, they receive rice, tobacco, coffee, and specie, which they exchange again for the corn of the Bekaa and the

the Hauran. This commerce maintains near 6000 persons. The dialect of the inhabitants is the most corrupt of any in the country, and is said to unite in itself the twelve dialects enumerated by the Arabian grammarians. The port of Bairout, formed like all the others on the coast by a pier, is, like them, choaked up with sand and ruin. The town is surrounded by a wall, the soft and sandy stone of which may be pierced by a cannon-ball, without breaking or crumbling: in other respects this wall, and its old towers, are defenceless. Bairout is subject to two inconveniences, which will always prevent its becoming a strong place; for it is commanded by a chain of hills to the south-east, and it is altogether destitute of water, which is fetched by the town at the distance of half a quarter of a league, and even this is but indifferent. Djezzar has undertaken to construct a public fountain, as he has done at Acre; but the canal will soon become useless. In digging, in order to form reservoirs, subterraneous ruins have been discovered, from which it appears that the modern town is built on the site of the ancient Berytus; and without the walls, towards the west, heaps of rubbish and shafts of columns indicate that Bairout has formerly been much larger than it is at present. The plain around it is entirely planted with white mulberry trees, which are young and flourishing, and therefore the silk produced here is of the finest quality. In descending from the mountains, the verdure formed by the tops of these trees in the distant bottom of the valley exhibits a very delightful prospect. The heat, and the warmth of the water, render Bairout in summer an inconvenient place of residence; the town, however, is not unhealthy; more especially since the emir Fakr-el-din has planted a wood of fir trees about a league southward of the town. Volney's Travels in Egypt and Syria, vol. ii. p. 187, &c. See BERYTUS.

BAÏSE, a river of France, which runs into the Garonne, near Aiguillon.

BAIT, *White*, in *Ichthyology*, a small fish, which is caught in great plenty, from August 1, to October 1, by stat. 30 Geo. II. c. 21, in the river Thames. See WHITE BAIT.

BAIT, in *Fishing*. Baits make a capital article in angling; on the choice whereof much of the sport depends; different seasons, and different game, having their appropriate baits. The red, or earth-worm, is good for the small fry most of the year round; and small fish are good baits for pikes at all times; sheep's blood and cheese are good bait in April; the bobs, dried wasps, and bees, are for May; brown flies for June; maggots, hornets, wasps, and bees, for July; snails in August; grasshoppers in September; corn, bramble-berries, and seeds, at the fall of the leaf; artificial pastes are for May, June, July, and frogs for March.

Baits are either natural or artificial.

BAITS, *Natural*, include all kinds of worms, as the red worm, maggot, &c. also frogs, grasshoppers, hornets, bees, snails, roaches, bleak, gudgeon, and loaches, &c.

These baits are to be kept each sort separate, and fed with those things which they like best.

The red worm is to be kept in rich black mould, with a little fennel chopped among it; a little ox or cow dung, newly made, is also a very acceptable thing to them. They may be kept in a box, with small holes in it, or in a bag. Red worms, and all other sorts, scour quickly, and grow very tough and bright, on putting them into a thin clout, greased with fresh butter, or grease, before they are put into moss.

This is the best of all things to keep them in; but the moss must be first very well washed, and the water squeezed out again. As to food, a spoonful of cream, dropped into

the moss once in three or four days, is better than any thing else. The moss is to be changed every week, and kept in a cool place.

White large maggot are an excellent bait for many sorts of fish, and they are to be kept on sheep's dung and liver chopped small.

Frogs and grasshoppers are to be kept in wet moss, and long grass; and on moulting this fresh every evening it will keep a long time. They are to have their legs and wings cut off when they are used.

Live flies must be used as they are caught; but wasps, bees, hornets, and humble-bees, may be preserved dry. The best method of drying them, is putting them in an oven after the bread is drawn. Care must be taken that they are not scorched; and when they are taken out they are to have the heads dipped in sheep's blood. This is to be suffered to dry on, and then they are to be preserved in a box. They will keep for three or four months. See ANGLING.

BAITS, *Artificial*, are flies of all kinds and shapes, made of silk, feathers, and the like. The variety of these is very great; there being not only different ones for every season and month in the year, but almost for every fish. See ANGLING.

There are several artificial baits, for intoxicating of fowl, and yet without taunting or hurting the flesh, so as to make it unfit to eat.

BAITS, *Dead*, are pastes of divers sorts, made of corn, cheese, fruits, wasps, sheep's blood, boiled beans, &c.

BAIT, *Ground*. See ANGLING.

BAIT, *Lodger*, is that which remains fixed in one certain place, while the angler may be absent; especially in fishing for pike.

BAIT, *Walling*, is that which the angler attends while he keeps moving from place to place, in quest of the fish.

BAITS of *Hemp*, denote bundles of that plant, pulled and tied up, ready for steeping in water. See FLY-FISHING.

BAIT-EL-LAHAM, the ancient *Bethlehem*, in *Geography*, a town of Syria, in the patriarchal of Damascus, is a village about two leagues south-east of Jerusalem, seated on an eminence in a country full of hills and vallies. The adjacent soil is the best in all these districts; so that fruits, vines, olives, and scumum, succeed here extremely well; and nothing is wanting but cultivation. They reckon about 600 men in this village capable of occasionally bearing arms; and occasions of this kind frequently recur. Sometimes to resist the pacha, sometimes to make war with the adjoining villages, and sometimes in consequence of intestine divisions. Of these 600 men, about 100 are Latin Christians, who have a vicar dependent on the great convent at Jerusalem. The whole trade formerly consisted in the manufacture of beads; but not finding a sufficient vent for them, they have resumed the cultivation of their lands. They make a white wine, which justifies the former celebrity of the wines of Judaea, but it has the property of being very heady. The necessity of uniting for their common defence prevails over their religious differences, and induces the Christians here to live in tolerable harmony with their fellow-citizens the Mahometans. Both are of the party of *Zamani*, which, with its opposite called *Knissi*, divides the whole of Palestine into two factions that are perpetually at variance. The courage of these peasants has been frequently tried, and renders them formidable through the whole country. Volney's Travels, vol. ii. p. 323. See BETHLEHEM.

BAITHOSUS, in *Diagraphy*, a Jewish teacher, and one of the founders of the sect of the Sadducees, flourished in Judaea,

Judea, in the third century before Christ. See *ASTIGONUS* and *SOCHÆUS*.

BAITING, or rather **BATING**, in *Etymology*, is when a hawk flutters with her wings, either from perch or fist, as if it were striving to get away.

BATING also denotes the act of smaller or weaker beasts in attacking or harassing greater and stronger ones.

In this sense we hear of the baiting of bulls and bears by mastiffs, or bull-dogs with short noses, that they may take the better hold.

The baiting of this animal makes his flesh tender and more digestible. In reality, it disposes it for putrefaction, so that, unless taken in time, baited flesh is soon lost.

Bulls, bears, and also hawks, and other animals, were formerly trained for this purpose. This barbarous practice, the first rise of which cannot be satisfactorily ascertained, has the sanction of high antiquity. Fitz-Stephen, who lived in the reign of Henry II., and whose "Description of the City of London" was written in 1174, informs us, that in the forenoon of every holiday, during the winter season, the young Londoners were amused with boars opposed to each other in battle; or with bulls and full-grown bears, baited by dogs. The baiting of horses was never a general practice; but asses, which did not sufficiently answer the purpose of sport, were occasionally treated with the same inhumanity. The practice of bull-baiting was much approved by the nobility in former ages, and was countenanced even by persons of the most exalted rank, without exception even of females. Drasinus, who visited England in the reign of Henry VIII., says (*Adagia*, p. 361.), that there were many herds of bears maintained in this country for the purpose of baiting. When queen Mary visited her sister the princess Elizabeth, during her confinement at Hatfield house, a great exhibition of bear-baiting was presented, immediately after mass in the morning, for their amusement. The same princess, soon after her accession to the throne, entertained the foreign ambassadors with the baiting of bulls and bears. In the sixteenth century there was a place built in the form of a theatre, which served for baiting of bulls and bears: they were fastened behind, and then worried by large English bull-dogs; but not without risk to the dogs from the teeth of the one, and the horns of the other; and it sometimes happened that they were killed on the spot, and fresh ones were supplied in the room of those who were destroyed, wounded, or tired.

When the bull was baited, a collar was put about his neck, fastened to a thick rope about three, four, or five yards long, hung to a hook, and so attached to a stake, that it might turn round. By means of this rope, the bull circulated to watch his enemy, which was a mastiff dog with a short nose. This dog, when properly trained, would creep upon his belly, that he might, if possible, seize the bull by the nose, which he as carefully endeavoured to defend by laying it close to the ground, and with his horns he attempted to toss the dog. On some occasions a dog has been tossed by a bull to the height of thirty or forty feet, and their fall has proved injurious and even fatal to them. The men have been also frequently tossed as well the dogs. The barbarous pastime of bull and bear-baiting is not encouraged by persons of rank and opulence in the present day, but attempts have been projected for suppressing it by legislative interference: when it is practised, which rarely happens, it is attended only by the lowest and most despicable part of the people, a circumstance which indicates a general refinement of manners and prevalence of humanity among the moderns. Houghton's Collections, Strutt's Sports, &c.

Whales are baited by a kind of fish called *orie*, or *Killers*; ten or twelve of which will attack a young whale at once, and not leave him till he is killed. Philosoph. Trans. N^o 287. p. 265.

BAJULARIA, in *Entomology*, a species of *PHALÆNA* (*M. Star*) that inhabits Amboyna. The anterior wings are brown, with two white spots, and a streak of the same colour; posterior ones yellow, with black spots. Fabricius, *Cramer*.

BAJULATIO, the office of a *bajulus* or bailiff.

BAJULUS, an ancient officer in the court of the Greek emperors; whereof there were several degrees: as the grand *bajulus*, who was preceptor of the emperor, and the simple *bajuli*, who were sub-preceptors.

Hence the Italians use the word *bajulus* of a kingdom in the same sense with protector of a kingdom among the English. The word is derived from the Latin verb *bajulare*, to carry, or bear a thing on the arms, or on the shoulder.

Children, and especially those of condition, had anciently, beside their nurse, a woman called *gerula*, as appears from several passages of Tertullian; when weaned, or ready to be weaned, they had men to carry them about to take care of them, who were called *geruli*, and *lajula*, à *gerendo* & *bajulando*.

BAJULUS is also used by Latin writers in the several other senses wherein bailiff is used among us.

BAJULUS was also the name of a conventual officer in the ancient monasteries, to whom belonged the charge of gathering and distributing the money and legacies left for masses and obits; whence he was also denominated *bajulus obituum novorum*.

BAJULUS, in *Entomology*, a species of *CERAMEYX* (*Calididium*) that is found in the trunks of trees in the northern parts of Europe. The thorax is villous, with two tubercles; body brown. Fabricius. This is *cerameyx caudatus* of Degeer; and *leptura bajula* of Scopoli. Gmelin.—*Olf.* a variety of this species (β) is described by Linnæus. Fn. Suec. i. n. 490. The colour of which is testaceous; thorax cinereous, and villous, with two little glabrous lines; in the Fabrician *mantissa*. Another variety (γ) is noticed; it is a native of Saxony, and only half the size of the former.

BAIUS, MICHAEL, in *Biography*, a professor of divinity at Louvain, was born at Melin, in the territory of Aeth, in the year 1513, and educated in the university of Louvain; where he was elected, in 1541, principal of one of the colleges; and in 1544, lecturer in philosophy. In 1550 he took his doctor's degree, and was appointed professor of the holy scriptures. Baius and his associate having adopted the tenets of Luther, and appealing to the authority of Augustin, taught doctrines concerning grace and free-will, contrary to those which had been commonly received in the church of Rome. The complaint of heresy was excited; Baius was accused as a chief instrument of promoting it; and the doctors of the Sorbonne at Paris pronounced a sentence of censure. The clamour against him was circulated; and a number of propositions, collected from books published by him in 1563 and 1564, were transmitted in 1567 to pope Pius IV. The pope issued a bull condemning these propositions; but without mentioning the name of the author, and adding a kind of ambiguous clause, which seemed to intimate, that some of the propositions which he condemned, admitted of a favourable construction. By these measures of policy, suggested by the experience of the evils that had arisen from pursuing a more intemperate conduct with regard to Luther, the person of Baius was exempted from the penalties of ex-

communication, and he continued to exercise his functions, and even to vindicate his doctrines; whilst he solicited the pope to absolve the irregularity. About thirteen years after this transaction, complaints against Baius were renewed; and pope Gregory XIII. at the instigation of the Jesuits, confirmed the sentence of Pius IV. Baius quietly acquiesced in the papal sentence, and concurred in condemning the propositions agreeably to the design and meaning of the bull. Baius, notwithstanding the popular odium which he incurred, retained his office, and received further preferment. He, and Hessel, his associate in the professorship at Louvain, were the two divines commissioned to attend the council of Trent, in the year 1563. In 1575, he was preferred to the deanery of St. Peter at Louvain, and elected chancellor of the university; and, in 1578, was appointed conservator of its privileges. In 1589 he died, at the age of seventy-seven years. Mosheim represents him as equally remarkable on account of the warmth of his piety as the extent of his learning. In proof of his charitable disposition it is alleged, that by his last will he left his whole estate to the poor. His manners were engaging; and Tolet, one of his adversaries of the fraternity of Jesuits, said of him, "Michael Baius nihil doctius, nihil humilior;" nothing can be more learned, nothing more humble than Baius. As his works, relating chiefly to the controversy concerning grace and free-will, are not likely to be now much sought after, it is needless to enumerate them. They were printed entire in 4to. at Cologne, in 1694. They are written with logical precision, and in a neat style. Gen. Dict. Mosh. Eccl. Hist. vol. iv. p. 235, 236.

BAIX, in *Geography*, a town of France, in the department of the Ardeche, two leagues and a half south-east of Privas.

BAIZE, a town of Germany; in the county of Tyrol, eight miles south of Trent.

BAIZE, in *Commerce*. See **BAYS**.

BAKAL, in *Geography*, a town of Russia, in the government of Ufa, ninety-six miles W. N. W. of Ufa.

BAKAN, a town of Asia, in the Birman empire, seated on the river Ava. N. lat. 19° 35'. E. long. 98° 0'.

BAKER, **SIR RICHARD**, in *Biography*, an English historian, was the grandson of sir John Baker, chancellor of the exchequer, in the reign of Henry VIII, and born at Sissingherl in Kent, about the year 1568. He was entered a commoner at Hart's hall, in Oxford, in 1584; and having spent three years in academic studies, finished his education in one of the inns of court, and by travelling. In 1603, he obtained the honour of knighthood; and in 1620 he was appointed high-sheriff for the county of Oxford. By involving himself in pecuniary embarrassment, in consequence of his marriage, he was obliged to take refuge in the Fleet prison, where, after remaining there several years, he terminated his life in 1645. In these circumstances of confinement and humiliating distress, he obtained relief by study, and from the influence of religious principles. Besides other tracts of less importance, in the composition of which he amused himself, his principal work was the "Chronicle of the Kings of England from the Time of the Romans' Government unto the Death of King James," published in folio, at London, in 1641, and afterwards continued by Edward Phillips, a nephew of Milton. This chronicle continued to be popular for several years, and deservedly so if the author's account of it be just; for he says, "that it was collected with so great care and diligence, that if all other of our chronicles should be lost, this only would be sufficient to inform posterity of all passages memorable or worthy to be known." But of this performance a less fa-

vourable opinion has been entertained by others; and the critical examination of Thomas Blount in his "Animadversions upon sir Richard Baker's Chronicle, and its Continuation," published in 12mo., at Oxford, in 1672, in which many and gross errors, respecting dates, names, places, and facts, were pointed out, greatly depreciated its value in the public estimation. Although a new corrected edition, with a second continuation, appeared in 1730, yet Baker's chronicle remained, after all, a performance ill-constructed, injudicious, and unworthy of confidence. Of the writer's taste and style the following commendation of his panegyrist, sir Henry Wotton, will afford an adequate idea: "I much admire the character of your style, which seemeth unto me to have not a little of the African idea of St. Austin's age; full of sweet raptures, and of researching conceits; nothing borrowed, nothing vulgar, and yet all flowing from you. I know not how, with a certain equal facility." Biog. Brit.

BAKER, *Thomas*, an eminent mathematician, was born at Ilton in Somersetshire, about the year 1625, and was educated at Oxford. In 1645 he was elected scholar of Wadham college, took his degree of bachelor of arts in 1647, and soon afterwards left the university. As vicar of Bishops-Nymmet in Devonshire, he lived in studious retirement, and chiefly applied himself to the study of mathematics, in which he excelled. Of this we have sufficient evidence in his work, intitled, "The Geometrical Key, or the Gate of Equations unlocked," and published at London in 1684, 4to. in Latin and English. An account of this book is given in the Phil. Transl. vol. xiv. N° 157. p. 549, 550. (See *CENTRAL Rule*.) To some mathematical queries, sent to him by the members of the Royal Society, not long before his death, he returned an answer so satisfactory, that they gave him a medal, with an inscription honourable and respectful. He died at Bishops-Nymmet, June 5th, 1690, and was buried in his own church. Biog. Brit.

BAKER, *Thomas*, a writer and antiquary of eminence, was born at Lanchester in the county of Durham, in 1656, and studied at St. John's college, Cambridge, where he became a fellow. In 1699 he published, in 8vo., an anonymous work, intitled, "Reflections upon Learning, wherein is shewn the Insufficiency thereof, in its several Particulars, in order to evince the Necessity and Usefulness of Revelation," which passed through several editions, and was regarded, for many years, as a standard of fine writing. As to its style, however, it has been observed, that, whilst it is allowed to be perspicuous and manly, it has no claim to any high degree of elegance; and whatever merit the work in general may be supposed to possess, it will be justly questioned, whether an author, who bestows cold and partial praise on Bacon, who in a chapter of metaphysics omits the mention of Locke, who speaks contemptuously of the Copernican system, and who attacked Le Clerc with an unbecoming asperity, was duly qualified to pass judgment upon general learning. The ingenious Dr. Jortin says of him (Life of Erasmus. p. 550, 551), "that he was no critic himself, and not at all acquainted with the true state of classical books, and particularly of Greek authors." Baker, though he possessed real erudition, and though his remarks are often acute and ingenious, has unduly disparaged the writings of able men, and the discoveries of modern science. In the progress of his life, he pursued studies for which he seems to have been better qualified. As a collector of antiquities, and particularly of such as related to the church and university, he excelled. His talents in this way were employed in collecting materials for a history of the university of Cambridge; but though he lived to an advanced age, the history was never completed.

Baker

Baker was unquestionably a man of integrity and candour. By his conscientious refusal to take the oaths required by government at the accession of George I. he lost his fellowship; but he retained his chambers at St. John's college, where he was highly esteemed, and Mr. Prior, the celebrated poet, gave the profits of his own fellowship to Baker, in order to supply the loss of income which he had suffered. His correspondence with men of learning was extensive; and he was liberal in his literary communications to those who solicited information; and particularly to bishop Burnet, who was indebted to him for several remarks and corrections relating to his "History of the Reformation." These two persons, though very different from each other with regard to their party and principles, maintained a mutual friendship and a candid intercourse, which were honourable to both. Baker's private character was amiable, and he was beloved and respected by all who knew him. He died at Cambridge, July 2d, 1740, in his eighty-fourth year. Of his extensive collections, he left twenty-three volumes in folio, written by his own hand, to lord Oxford, and they now compose part of the Harleian collection in the British museum. He also bequeathed fifteen volumes folio, of a like kind, to the public library at Cambridge, together with other MSS. and printed books. *Biog. Brit.*

"Mr. Baker," says a late biographer, Horatio Walpole earl of Orford, "lived and died in charity with all mankind, and was perhaps the sole instance of a man, who bequeathed his worldly goods to a society that ejected him, and to the ministers of a church in which he had lost preferment." *Memoirs of the Life and Writings of the late Thomas Baker, &c.* by R. Massers, 1784.

BAKER, *Henry*, an ingenious and diligent naturalist, was born in London near the close of the seventeenth or the beginning of the eighteenth century, and apprenticed to a bookseller. This employment, if he ever engaged in it after the expiration of his apprenticeship, he soon relinquished: and having directed particular attention to the methods which might be practicable and useful in the cure of stammering, he engaged in teaching deaf and dumb persons to speak; and in this undertaking he was very successful. He married a daughter of the celebrated Daniel Defoe. In the earlier period of his life, he indulged a taste for poetry, and published, in 1725 and 1726, "Original Poems, serious and humorous," in two parts, in which there are some tales that resemble in wit, and also in licentiousness, those of Prior. He was the author likewise of "The Universe, a Poem intended to restrain the Pride of Man," several times reprinted, and of "An Invocation to Health," reprinted in his "Original Poems." At a more advanced period of life, he pursued various branches of study and experiment in philosophy and natural history, and devoted himself more especially to microscopical researches and observations. In 1740, he was elected a fellow of the Antiquarian and Royal Societies; in both which he was a regular attendant. In 1744, the Royal Society honoured him with sir Godfrey Copley's medal in recompence of his microscopical discoveries, the crystallizations and configurations of saline particles. Among various topics, on which he communicated papers to the Royal Society, that have been published in their Transactions, one was the water-polype (see POLYPE); and his remarks on this curious animal were enlarged into a separate treatise, which passed through several editions. The most important and valuable of his observations are contained in his two principal works, intitled, "The Microscope made easy," and "Employment for the Microscope," of which many editions have been published. Mr. Baker was one of the earliest and most zealous members

of the society for the encouragement of arts, manufactures, and commerce; and by his extensive correspondence he was eminently useful in introducing into his own country several valuable methods of culture. To him we are indebted for the true history of the "Coccus Polonicus," for the "Alpine Strawberry," and for the "Rheum Palmatum." After the first discoveries in electricity, he was one of the first who announced to the public the apprehended medicinal effects that might result from the application of it, and to relate the experiments of this kind which had been made at Rome and Bologna. He did not, however, escape the strictures of critics, and particularly of Dr. Hill, in his review of the works of the Royal Society. It has been said of him, more to the dishonour of those who have thrown out this unjust and invidious reflection than to his disgrace, that he was a philosopher in little things; but cavillers of this description seem to forget that the minute productions of nature display the great first cause as much as the largest; and they too generally escape the vulgar eye. Mr. Baker, says one of his biographers, was "an intelligent, upright, benevolent man, much respected by those who knew him best. His friends were the friends of science and virtue; and it will be always remembered by his cotemporaries, that no one was more ready than himself to assist those with whom he was conversant, in their various researches and endeavours for the advancement of knowledge and the benefit of society. After a life industriously devoted to these great objects, he died at his apartments in the Strand, Nov. 25th, 1774. The bulk of his fortune was bequeathed to his only grandson; and he left 100 l. to the Royal Society for an anatomical or chemical lecture. *Biog. Brit.*

BAKER'S *Central Rule*, in *Mathematics*. See *CENTRAL Rule*.

BAKER'S *Dozen Islands*, in *Geography*, a cluster of islands near the east side of Hudson's bay, about N. lat. 57° 30' and W. long. 81°. to the west of an opening which goes to the east and north-east as far as the south-east end of Hudson's straits.

BAKERSFIELD, a newly-settled township of America, in Franklin county, Vermont, formerly in Chittenden county.

BAKERSTOWN, lies in Cumberland county, and district of Maine, containing 1276 inhabitants; distant 162 miles north-east from Boston.

BAKEU, or BACOU, a town of European Turkey, in the province of Moldavia, 60 miles south-west of Jassy.

BAKEWELL, is an ancient market town of England, in the county of Derby. In the Saxon chronicle it is called *Baldanewyllam*: from which circumstance Mr. Bray conjectures that a bath had been used in this place previous to the year 924, at which time Edward the elder ordered a strongly fortified town to be built in the vicinity. The parish of Bakewell is the most extensive in the county; its length from north to south being more than twenty miles, and its breadth upwards of eight. Its number of houses is 299, and that of inhabitants 1412. In consequence of the extent of this parish, it has nine chapels of ease besides the church in the town. The latter, situated on an eminence, is an ancient and handsome structure, built in the form of a cross, with an octagonal tower in the centre, supporting a lofty spire. The architecture of this fabric combines a variety of styles. The plain Saxon appears in the nave, and the arch of the western doorway is enriched with zigzag ornaments; but the other parts are built in that style which prevailed in the fifteenth century. Here are some ancient and curious monuments. In the church yard is a Catholic stone cross, whose sides are ornamented with a rudely executed

cuted representation of the crucifixion in relief, and other sculptured figures.

The market was formerly held on a Monday, but it is now kept on Fridays. Near the entrance of the town from Ashford is a large mill for the carding, roving, doubling, spinning, and twisting of cotton; in which manufactory from 300 to 350 persons of both sexes are constantly employed. This mill was erected by the late Sir Richard Arkwright, who was the founder of the cotton trade in this neighbourhood. Between the gritstone and limestone strata about Bakewell, is a thick stratum of shale, which being of an argillaceous nature, and retentive of moisture, renders the pasturage extremely good and thriving. Bakewell is 25 miles north of Derby, and 152 miles north-west from London. About three miles east of this town is *Chatsworth*, a magnificent seat of the duke of Devonshire. This celebrated mansion was erected by William the first duke of Devonshire, in the year 1702. It is built in the Ionic order, with a flat roof, surrounded by a balustrade. Its form is nearly a square, of about 190 feet, including a spacious quadrangular court, having a fountain in the centre, with the statue of Orpheus. The fronts which form the quadrangle, are decorated with rich sculptural representations of military trophies. This mansion is sumptuously furnished, and embellished with carved ornaments by the celebrated Gibbons, with painted walls and ceilings, with portraits, also a collection of fossils, &c. The unfortunate Mary, queen of Scots, was doomed to thirteen years' captivity in the old mansion at this place. The park is about nine miles in circumference, and is diversified with much grand, picturesque, and beautiful scenery. The *water-works*, which about fifty or sixty years ago gave Chatsworth great celebrity, are still preserved near the south-east and south sides of the house; but they attract little attention in the midst of such a variety of natural beauties.

About two miles south of Bakewell is *Haddon Hall*, a truly venerable mansion belonging to his grace the duke of Rutland. The high turrets and embattlements of this house, when beheld at some distance, give it the resemblance of an ancient fortified castle. It consists of numerous apartments and offices, which surround two paved quadrangular courts. The most ancient part is the tower of the gateway, which was probably built about the time of Edward the Third. The gallery was erected in the time of queen Elizabeth; but the chapel was raised in the reign of Henry the Sixth. Many of the rooms are very spacious; and the doors were concealed behind the hangings of arras, which must have been always lifted up for persons to pass in and out. Haddon Hall presents perhaps a more complete specimen of the ancient English baronial mansion, than is to be found in any other house in the kingdom. For a particular description of it see the Beauties of England and Wales, vol. iii. p. 494.

At a short distance from Bakewell is *Ashford*, where are some considerable marble works. These were the first of the kind established in England, and great quantities of black and grey marble are sawed and polished. This operation is performed by machinery, which is kept in motion by water. One part, called the sweeping mill from its circular motion, will work upon, and level a set of marble slabs of eighty superficial feet. Beauties of England and Wales, vol. iii.

BAKEWELL Bred, an improved species of sheep, which have been bred by Mr. Bakewell of Dishleigh. See SHEEP.

BAKHUYSEN. See BACKHUYSEN.

BAKIAN. See BACHIAN.

BAKING, the art of preparing bread, or of reducing meals of any kind, whether simple or compound, into bread.

The art of baking among us may be reduced to two; the one for unleavened, the other for leavened bread.

The learned are in great doubt about the time when baking first became a particular profession, and bakers were introduced. It is generally agreed they had their rise in the East, and passed from Greece to Italy after the war with Pyrrhus, about the year of Rome 583. Till which time every housewife was her own baker: for the word *pislor*, which we find in Roman authors before that time, signified a person who ground or pounded the grain in a mill or mortar to prepare it for baking, as Varro observes. According to Athenæus, the Cappadocians were the most applauded bakers, after them the Lydians, then the Phœnicians.

To the foreign bakers brought into Rome, were added a number of freedmen, who were incorporated into a body, or, as they called it, a *college*; from which neither they nor their children were allowed to withdraw.—They held their effects in common, and could not dispose of any part of them. Each bake-house had a *patronus*, who had the superintendency thereof; and these *patroni* elected one out of their number each year, who had the superintendance over the rest, and the care of the college. Out of the body of the bakers, every now and then, one was admitted among the senators.

To preserve honour and honesty in the college of bakers, they were expressly prohibited all alliance with comedians and gladiators; each had his shop or bakehouse, and they were distributed into fourteen regions of the city. They were excused from guardianships and other offices, which might divert them from their employment.

By our own statutes, bakers are declared not to be handicrafts. No man for using the mysteries or sciences of baking, brewing, surveying, or writing, shall be interpreted a handicraft. 22 H. VIII. cap. 13.

The bakers of London make the nineteenth company. They were incorporated about the year 1307, and consist of a master, four wardens, thirty assistants, and one hundred and forty-nine on the livery, besides the commonalty. See COMPANY.

The bakers of London are under the jurisdiction of the lord mayor and aldermen. A penalty is inflicted on bakers selling at a higher price than is set by the lord mayor; and bakers are to set their marks on their bread. The assize of bread is regulated by several statutes. See BREAD.

The manner of baking at Otaheite, and in many islands of the South seas, is as follows. They make fire by rubbing the end of one piece of dry wood upon the side of another, just as the carpenters whet a chisel; they then dig a pit in the ground, about half a foot deep, and two or three yards in circumference; they pave the bottom of it with large pebble stones, which they lay very smooth and even, and then kindle a fire in it with dry leaves and the hulks of the cocoa-nut. When the stones are properly heated, they take out the embers and rake out the ashes on every side, then cover the stones with a layer of green cocoa-nut tree leaves, and wrap up the animal that is to be dressed, in the leaves of the plantain. If it be a small hog, or dog, they wrap them up whole; if large, they split them. When placed in the pit, they cover it with hot embers, and lay upon them bread-fruit and yams wrapped up in like manner in the leaves of the plantain. Over these they spread the remainder of the embers, mixing among them some of the hot stones, with more cocoa-nut tree leaves and then close up all with earth, so that the heat is kept in. After a time proportioned to what is dressing, the oven is opened, and the meat taken out, tender, full of gravy, and, as captain Wallis thought, better in every respect than when it is dressed any other way. Having no

vessels in these islands that could bear the fire, the inhabitants of them had no idea of hot water, or its effects, and therefore always roasted or baked their meat in the manner above related. Hawkesworth's Account of Voyages in the Southern Hemisphere, vol. i. p. 484.

BAKING is used for the expelling a substance, enclosed in a crust, to the fire. See *DRASSING of Mass.*

BAKING Porcelain. See *PORCELAIN.*

BAKON, in *Geography*, a large forest of Hungary, near Veszprin, where Andrew, king of Hungary, in a battle with his brother, was forsaken by his followers, and trampled to death by his enemies.

BAKSAISKATA, a fortress of Russian Tartary, in the government of Caucasus, on the west side of the Ural; 32 miles north of Gudica.

BAKTEGAN, the name of a salt lake of Persia, about fifty miles east of Shiraz, which receives the rivers of Kuren and Bundamir. It is represented in the maps as being about 40 British miles long, and 10 broad.

BAKU, a town of Persia, in the province of Shirvan, on the west coast of the Caspian sea, with a harbour. N. lat. 40° 25'. E. long. 50° 2'.

The bay of Baku is reckoned the safest harbour of the Caspian, because ships may lie there at anchor in seven fathom water; yet in some places the entrance is dangerous on account of shallows, islands, and sand-banks. Baku, like Derbent, is inhabited by Persians, Tartars, and some few Armenian merchants. The principal articles of export by which the traffic of this place is chiefly supported, are the naphtha, and the fine rock-salt, both of which are collected on the east side of the bay. The inhabitants indeed cultivate saffron and cotton, but not with any considerable advantage. The trade of Baku is doubtless of more consequence than that of Derbent, though in fact but very confined, and is mostly carried on with Shamachy, whence it gets silk and silk-stuffs. A Russian consul usually resides here.

BALA, in *Botany*, a name used by some authors for the *musa*, or plantain tree; called also the *banana* and *scoides*, by others.

BALA, in *Ancient Geography*, a city of Pentapolis, so called because it was *swallowed up*, as the word imports, when Lot quitted it. It is more usually denominated *Zohar*.

BALA, in *Geography*, a town in the county of Merioneth, in North Wales, consisting of one street, with a high artificial mount, apparently the keep of a fortress, at the south-east end of it. It is situated on the eastern extremity of the fine lake to which it gives a name, and whose fish contribute largely towards the subsistence of its inhabitants. The fairs and markets are considerable, and abundantly supplied with the produce of the surrounding country, and with flannels, gloves, stockings, &c. In the manufactory of the letter articles, the hand-waives of the town and of the neighbouring villages are constantly employed. "Knitting," observes Mr. Aikin, "is the general leisure work of both sexes in Wales, especially about Elna; and it cannot fail of giving strangers a high idea of the industry of the people, to see the men and women going to market with bundles on their heads, while their hands are employed in working the fleeces of their own sheep into articles of dress, coarse indeed, but equally warm and serviceable with the more costly and elaborate manufactures." Bala is in the parish of Llanyell, a village about one mile from the town. The whole parish includes a population of 2245. Though endowed with many valuable privileges, Bala cannot boast of any particular or elegant structures. It is an incorporated town by prescription, and the government is vested in two

bailliffs and a common council; but neither this nor any other town in the county has ever sent members to parliament. The assizes are kept here and at Dolgelly alternately. Its market is on Saturdays, and here are two fairs annually. It is 35 miles from Holywell, and 203 from London. "The object least worth notice in this neighbourhood is—

"**BALA-POOL**, or *Pimble-morz*, or *Llyn-tegyd*, which is the largest lake in Wales. Its length from N. E. to S. W. is about four miles, and its breadth in the widest part is 1200 yards. The water, like that of most rocky lakes, is so pure that the most delicate chemical tests detected scarcely any perceivable quantity of foreign admixture. The south-western extremity, where three mountain torrents fall into the pool, is the shallowest, owing to the great quantity of earth and stones which are borne down in flood-time from the country through which they flow; the gradual aggregations have formed several banks and low islands in this end of the lake, and in consequence obliged it to encroach proportionally on the north-eastern boundary. This tendency is further increased by the prevalence of strong westerly winds, which drive on the shore a heavier surf than would be imagined. When these two causes combine, a circumstance that not infrequently happens, the waters rise to such an alarming height, as to threaten the town of Bala with an inundation, were it not for a dyke that is raised on the shore: the water being thus obstructed pours over the road at the extremity of the mound, and discharges itself into the low grounds through which the Dee flows, doing no small damage to the rich and extensive pastures. The lake is well stocked with excellent fish, of which the red trout and the gwyniad are esteemed the most delicious. These are all caught by angling from the shore, for Sir W. Wynne, who claims the property of the whole pool, will not allow any boats to be kept on it." The scenery round this lake is much admired for its diversified, wooded, and rocky characteristics. Aikin's Journal of a Tour through North Wales, &c.

From the bottom of this lake issues the river Dee, which is said to pass through it without mingling its waters with those of the lake (see *ABYSSINIA*); and passing under a romantic old bridge, winds gently in a wide and deep stream towards Corwen and Llangollen.

Bala is surrounded with mountains, through which various roads are formed towards Dinafmowthy, towards Llanvillier over the Berwin, and towards Llanrwst in the vicinity of Snowdon.

BALAAAM, in *Scripture Biography*, the son of Beor or Babor, a prophet or diviner, of the city of Pethor on the Euphrates. He was sent for by Balak, king of the Moabites, to curse the Israelites; but he pronounced upon them a blessing. He was killed, together with Balaak, in a battle, in which the Israelites defeated the Midianites, about 1370 years before Christ. Numb. xxii. xxvii. xxiv. Deut. xxxii. 5. 2 Pet. ii. 15. Jude, vers. 11. Rom. ii. 24. It has been a subject of controversy, whether Balaam was a true prophet or a mere stroller, magician, or fortune-teller, *harbala*, as he is called. Numb. xxii. 5. Ogen says, that his whole power consisted in magic and sorcery. Theodoret is of opinion that Balaam did not consult the Lord, but that he was supernaturally inspired, and constrained to speak against his own inclination. Cyril says, that he was a magician, an idolater, and a false prophet, who spoke truth against his will; and St. Ambrose compares him to Caiaphas, who prophesied without being aware of the import of what he said.

Jerom seems to have adopted the opinion of the Hebrews; which was, that Balaam knew the true God, erected altars to him, and that he was a true prophet, though corrupted

rupted by avarice. Numb. xxii. 18. St. Austin and other commentators have inclined to this opinion.

Maimonides thinks, that every thing which happened to Balaam in the way to Balak, was done in a prophetic vision. The abbot Jerusalem, and his followers, suppose Balaam to have been an egregious impostor, who had acquired the reputation of being a prophet, and made a public traffic of his divinatory art. With this view he sets his frequent consultations with God, and delivers his own ideas for divine oracles. He supposes that Moses inserted the history of Balaam, as an episode, from Moshe's memoirs, for the purpose of obviating pressing difficulties on the supposition that Moses was the original writer. Dr. Geddes, in conformity to the free sentiments which he had adopted with regard to the pentateuch, declares it to be his opinion, that this history was written, not by Moses, but by the compiler of the pentateuch, from such traditional stories or scraps of written documents as he could find. "Indeed," he adds, "it has all the air of a legendary tale."

The story of Balaam's ass has often been an object of ridicule among sceptics and infidels. The abbot Jerusalem thinks that 't was all a fiction of Balaam, to save himself from obloquy, if he should bless, instead of cursing, the Israelites. Dr. Jortin (Six Dissertations, Diss. v.) supposes, that Balaam was a worshipper of the true God, and a priest and prophet of great reputation: and that he was sent for by Balak, from a notion which generally prevailed, that priests and prophets could sometimes, by prayers and sacrifices duly and skillfully applied, obtain favours from God, and that their imprecations were efficacious. He conceives that the prophet had been accustomed to revelations, and that he used to receive them in visions, or in dreams of the night. With regard to the intercourse between Balaam and his ass, he conjectures that it was transacted in a trance or vision. Accordingly, he admits that an angel of the Lord did, indeed, come to oppose Balaam in the way, and suffered himself to be seen by the beast, but not by the prophet; that the beast was terrified, and Balaam smote it, and immediately fell into a trance or extacy; and in that state of vision, conversed with the beast first, and then with the angel. The angel presented these objects to his imagination, as strongly as if they had been before his eyes; so that this was still a miraculous or preternatural operation. Dr. Geddes says, that to him there appears nothing strange in the story of the ass, but the manner of telling it; and it ceases to be wonderful, when we recollect the oriental mode of narrating. Balaam is riding on his ass on as yet a doubtful errand; the ass startles at something, and turns aside from the way; thrusts his master's legs against a wall, and at length falls down under him. All this he takes for a bad omen, and a sign that his journey is not agreeable to God. God is thence conceived to be angry with him, and an imaginary dialogue ensues between God and Balaam, as had before been supposed to be held between Balaam and his ass. Geddes's Crit. Remarks, vol. i. p. 394.

BALAAMITES, in *Ecclesiastical History*, the name of a sect in the first age of Christianity, of the same import in the Hebrew language with Nicolaitans in the Greek. See NICOLAITANS.

BALABAC, in *Geography*, one of the Philippine, or rather Bornean islands, between Borneo and Palawa, near the south-western point of the latter island. N. lat. 7° 50'. E. long. 117° 30'.

BALABEA, an island near the north-west end of New Caledonia. S. lat. 20° 7'. E. long. 164° 22'.

BALABOLA. See BOLEBOLA.

BALACHNA. See BALAKHNA.

BALAD, a town of Asia, in the country of Diarbekir, twenty miles north-west of Mosul.

BALADE, the name of a harbour on the north-west coast of New Caledonia, in the South Pacific Ocean, formed by a reef which runs parallel to the coast, at the distance of three leagues, and in the widest extremity of the island. S. lat. 23° 13'. E. long. 164° 10'.

BALÆNA, *M. balæna*, Zool. Lin. A whale is a tribe of cetaceous creatures, which inhabit the seas, and contain a kind of liquid respiration, and breathe air, from the surface of the water, by the means of a blowpipe, that the earlier writers, who were little acquainted with their history, and perhaps filled with their superstitious notions, may be fairly excused for placing them to the tribe of fishes. To say nothing of their anatomy, the want of feet, which is an obvious defect in the whale, was one among other cogent reasons for retaining it with the latter. Our countrymen, Ray and Willoughby, both include the whales in their systems of ichthyology; Ray, whose natural arrangement of the animal files differs from the common practice, divides his fishes into two principal sections, one comprehending those which have lungs for respiration, and the other, those which breathe by means of the gills, and are truly fishes. The reasons he offers for including the former with the fishes are these; because the form of their bodies agrees with those of fishes; because they are entirely naked, or covered only with a smooth skin; and because they live entirely in the water, and have all the manners of fishes. Notwithstanding this, Linnæus, whose accuracy of discrimination an enlightened posterity bid fair to honour and esteem, has referred them to the mammalia tribe of animals; a reference extremely just, but the propriety of which will not appear so obvious at the first glance to the curious observer, as to the accurate anatomist, or indefatigable historian of nature.

The whale, notwithstanding its fish-like external appearance, and residence in the waters, has no other claim to a place among fishes; for its internal anatomy is precisely the same as that of the terrestrial animals, and of the quadruped tribe in particular. Such is the opinion advanced by that first of naturalists, Linnæus; and such is the opinion confirmed by the remarks of that able anatomist the late Mr. Hunter. In a paper presented on the anatomy of whales, to the Royal Society of London, a few years ago by the latter, it is observed, that this order of animals has nothing peculiar to fish, except living in the same element, and being endowed with the same powers of progressive motion, as those fish which are intended to move with a considerable velocity. Although inhabitants of the waters, they belong to the same class as quadrupeds; breathing air, being furnished with lungs, and all other parts peculiar to the economy of that class, and having warm blood. The projecting part, or tail, contains the power that produces progressive motion, and moves the broad terminal fin, the motion of which is similar to that of an oar in sculling a boat; it supercedes the necessity of posterior extremities, and allows of the proper shape for swimming. The tail is flattened horizontally, which is contrary to that of fish; this position of tail giving the direction to the animal in the progressive motion of the body. The two lateral fins, which are analogous to the anterior extremities in the quadruped, are commonly small, varying however in size, and seem to serve as a kind of oars. The element in which they live renders some parts, which are of importance in other animals, useless to them; gives to some parts a different action, and renders others of less account. The larynx, size of the trachea, and number of ribs differ exceedingly. The coccum is only found in some of them. The teeth in some are wanting. The blow-holes are two in number in many; in others only one. The bones alone, in many animals, when properly united

into what is called the skeleton, give the general shape and character of the animal. Thus a quadruped is distinguished from a bird, and even one quadruped from another; it only requiring a skin to be thrown over the skeleton to make the species known. But this is not so decidedly the case in this order of animals, for the skeleton in them does not give the true shape. An immense head, a small neck, few ribs, and in many a short sternum, and no pelvis, with a long spine, terminating in a point, require more than a skin being laid over them in order to give the regular and characteristic form of the animal. The structure of the bones is similar to that of the bones of quadrupeds; they are composed of an animal substance, and an earth that is not animal; they are less compact than those of quadrupeds that are similar to them. From these and other observations we may infer, that the structure, formation, arrangement, and union of the bones, which compose the forms of parts in this order of animals, are much upon the same principle as in quadrupeds. The flesh and muscles of this order of animals are red, resembling those of quadrupeds, and perhaps more like those of the bull or horse than any other animal.

The Linnæan definition of the mammalia class, having a heart with two auricles and two ventricles, and the blood warm and red, applies most strictly to the whale. "The heart," Mr. Hunter says, "is inclosed in its pericardium, which is attached by a broad surface to the diaphragm, as in the human body. It is composed of four cavities, two auricles, and two ventricles; it is more flat than in the quadruped, and adapted to the shape of the chest. The auricles have more fasciuli, and these pass more across the cavity from side to side, than in many other animals; besides being very muscular, they are very elastic, for being stretched they contract again very considerably. There is nothing uncommon or particular in the structure of the ventricles, in the valves of the ventricles, or in that of the arteries." In their amours and mode of producing their young, the whales agree with other creatures of the mammalia tribe; and like them they have teats, and suckle them.

The *balæna* genus is distinguished, according to Linnæus, by having horny laminae in the superior jaw instead of teeth, and a double respiratory orifice on the upper part of the head. By these characters the true whales may be distinguished from the other genera of cetaceous animals, as the monodon, physeter, and delphinus. The history of the whales will be considered under the respective species, of which Linnæus and Gmelin describe the following: MYSTICETUS (common whale), PHYSALUS (fin-fish), BOOPS (pike-headed whale), GIBBOSA (bunched whale), MUSCULUS (round lipped whale), and ROSTRATA (beaked whale). The French naturalists distinguish two other species; Vircy speaks of la baleine Franche, or baleine de Greenland (*B. mysticetus* Linn.), le nord caper, or baleine d'Irlande (*balæna glacialis* Bonn.), le gibbar, or fin-fisch (fin-fish Eng. and *balæna physalus* Linn.), la baleine tampon (*balæna nodosa* Bonn.), la Jabarte (baleen hoops Linn.), le roqual (*balæna musculus* Linn.), and la baleine a bec (*balæna rostrata* Linn.)

In concluding these remarks on the whale tribe, we cannot avoid adverting to the British Zoology of Mr. Pennant, in which these and the other cetaceous animals find on our coasts are admitted under the title of cetaceous fishes; he follows the arrangement proposed by Ray, and seems to object chiefly to that of Linnæus, because "to have preserved the chain of beings entire," he says, Linnæus "should have made the genus of phocæ or seals, and that of manati, immediately precede the whale, those being the links that connect the mammalia or quadrupeds with the fish; for the seal is, in respect to its legs, the most imperfect of the former class, and in the manati the hind feet coalesce, assum-

ing the form of a broad horizontal tail." Brit. Zool. vol. iii.

M. Bloch excludes the whales, and other cetaceous creatures, except the marlin or porpoise, from his work on fishes; but these are included in one of the smaller editions of the work, in the "seventh class, les cétacées." In a prefatory note we are informed, however, that Linnæus places these at the conclusion of the mammalia, immediately after the hog-tribe; but as it might be agreeable to give the entire class in which the largest animals which nature produces are arranged, the omission of Bloch is supplied from Duhamel, with the assistance of Anderson, Bonattre, Artedi, Ray, and Belon.

BALÆNÆ, in *Natural History*, a species of ECHINORHYNCHUS, that infests the intestines of the whale. Phipps. It. Gmelin.

BALÆNARIS, in *Conchology*, a species of LEPAS, having a subconic shell, with six elevated rugose four-parted lobes, and a membranaceous bidentated operculum. Müll. Found adhering to the pectoral fins and wrinkles of *balæna* boops, or pike-headed whale.

BALÆNARUM, in *Entomology*, a species of PHALANGIUM (*Pycnogonum* Fabr.), with two feelers and an ovate body. Gmel. This is phalangium littorale of Stromb. Müll.; pediculus ceti, Baker; pycnogonum littorale Fabr. fn. Groenl.; and acarus marinus seu polygonopus of Pallas. Inhabits European seas, lurking under stones. Back red; sucker advanced, straight, obtuse at the end, with a round perforation; feelers about as long as the sucker, and inserted near its base.

BALAGANSKOI, in *Geography*, a town of Siberia, on the Angara, 30 miles W.N.W. of Irkutsk. N. lat. 53° 45'. E. long. 103° 14'.

BALAGAT, or BALLA-GAUT, a province of the Deccan, in the Indian peninsula. It is a tract naturally very strong, particularly on the west side towards the sea, where a stupendous wall of mountains, called the Gauts, rises abruptly from the low country, called the Concan, or Cockan, supporting, in the nature of a terrace, a vast extent of fertile and populous plains, which are so much elevated, as to render the air cool and pleasant. This elevated tract is continued not only through the Mahratta territories, but extends through the peninsula to the southern extreme of Myfore, and is named *Balla-Gaut*, throughout its whole extent; meaning literally the *Higher* or *Upper Gauts*; or perhaps more correctly the countries lying *above* or *below* the Gauts. In the peninsula, it is applied in contradistinction to *Payen-Gaut*, or the *Lower Gauts*; but in the Deccan, it appears to be used only as a proper name, and not as a comparative; as we have never heard of the Deccan *Payen-Gaut*. Rennell's Mem. Introd. p. 127.

As a province, it was formerly the largest of the three which composed the northern Deccan, bounded on the north by Candish and Berar; on the east by Tellinga; on the west by Baglana and part of Guzerat; and on the south by Visapore. This province, after it fell into the hands of the Moguls, assumed the name of Dowlatabad, from its former capital. It is a fruitful pleasant country, abounding with cotton and sugar. Its chief city is Aurungabad.

BALAGUER, a town of Spain, in Catalonia, seated on the north bank of the river Segra, at the foot of a high hill. N. lat. 41° 38'. E. long. 0° 48'.

BALAKEP, a district of the government of Saratof, in Russia, on the river Kholer.

BALAKHNA, or BALACHNA, a town of Russia, in a district of the same name, being one of the thirteen districts of Nethner Novogorod, on the right side of the Volga. The town was built in 1536, and contains 767 timber houses, and 1489 inhabitants. It trades to St. Peterburg; transports and salt, constructs fishing-boats. It has one monastery.

monastery, five brick, and ten timber churches. N. lat. $56^{\circ} 30'$. E. long. $45^{\circ} 5'$.

BALAKLAVA, a fishing town of Crim Tartary, or Taurida, containing about 200 houses, and seated on a bay of the Black or Euxine sea, in N. lat. $44^{\circ} 35'$. E. long. $33^{\circ} 14'$. The bay forms a harbour; which, in the imperial proclamation declaring Theodosia and Eupatoria free ports, is debarred from navigation.

BALAKZEL, in *Ornithology*, the Turkish name of the heron.

BALALAIKA, in *Musick*, a musical instrument of the bandour kind, of very ancient Slavonian origin; it is in common use both with the Russians and Tartars; according to Niebuhr, it is also frequent in Egypt and Arabia. The body of it is an oblong semicircle, about a span in length, with a neck or finger-board of four spans. It is played on with the fingers like the bandour or guitar; but has only two wires, one of which gives a monotonous bass, and by the other the piece is produced. Under the touch of able fingers, accompanied by a good voice, it sounds agreeably enough; and therefore it is not unfrequently seen in the hands of people of fashion.

BALAMBANGAN, in *Geography*, a small island in the Eastern Pacific ocean, near the northern point of Borneo, between this island and Palawan, remarkable for a settlement attempted by the English in 1773; but evacuated either on account of the unhealthy climate, or of a Dutch invasion. N. lat. $7^{\circ} 10'$. E. long. 117° .

BALAMBUAN, or **PALAMBUAN**, the name of a district or territory on the east part of the island of Java, which produces pepper, cotton, rice, Indian corn, and fruit in great plenty, and which abounds with pastures that feed a great number of horses, antelopes, buffaloes, and oxen. The capital, which is a strong trading town, is of the same name. S. lat. $7^{\circ} 10'$. E. long. $115^{\circ} 30'$.

BALAMBUAN Channel. See **BALLI**.

BALAMIUS, **FERDINAND**, in *Biography*, born in the island of Sicily, about the middle of the sixteenth century, not less celebrated for his accomplishments in polite literature, and his skill in the Greek language, than for his knowledge of medicine, was greatly esteemed by pope Leo X. to whom he was physician. He published in 1556, at Lyons, "De cibis boni et mali succi," translated from the works of Galen; also "Galenus liber de ossibus, ad Tyrones;" 8vo. republished at Frankfort, in fol. with observations by Gaspar Hoffman, 1630. The above are inserted in the edition of Galen's works, published by the Justas, 1586, fol. Since his death the following was printed at Rosloch: "De optima corporis nostri constitutione;" "De bona valetudine;" "De hydrimibus, cucurbitula, &c." 1636, 8vo. Haller Bib. Med. Pract. Eloy Dict. Hist.

BALAM PULLI, in *Botany*, a name used by some authors for the tree whose fruit is the tamarind of the shops.

BALANCE, or **BALLANCE**, *Libra*, in *Mechanics*, one of the seven simple powers, or rather a species of that mechanical power called the lever, used principally for determining the equality or difference of weights in heavy bodies, and consequently their masses or quantities of matter.

The balance is of two kinds, viz. the *ancient* and *modern*. The ancient or Roman, called also *statera Romana*, or steel-yard, consists of a lever or beam, moveable on a centre, and suspended near one of its extremes; on one side the centre are applied the bodies to be weighed, and their weight is estimated by the division marked on the beam, on the other side, where a weight moveable along it keeps the balance in equilibrium. See **STEEL-YARD**.

The modern balance, now ordinarily in use, consists of a

lever, or beam, suspended exactly by the middle; to the extremes whereof are hung scales or basons.

In each case, the beam is called the *jugum*, and the two moieties thereof on each side the axis, the *brachia*, or *arma*; and the handle whereby it is held, *trutina*; the line or which the beam turns, or which divides it brachia, is called the *axis*; and when considered with regard to the length of the brachia, is esteemed but a point, and called the *centre of the balance*; and the places where the weights are applied, the *points of suspension*, or *application*.—That slender part perpendicular to the *jugum*, by which either the *equilibrium*, or preponderancy of bodies is indicated, is called the *scale of the balance*.

In the Roman balance, therefore, the weight used for a counterbalance is the same, but the points of application are various; in the common balance, the counterpoise is various, and the point of application the same.

The principle on which each is founded is the same, and may be conceived from what follows.

BALANCE, *Doctrine of the*.—The beam AB (*Plate Mechanics*, fig. 8.) the principal part of the balance, is a lever of the first kind, which, instead of resting on a fulcrum at C, its centre of motion, is suspended by somewhat fastened to the centre C: so that the mechanism of the balance depends on the same theorem as that of the lever.

Hence, as the known weight is to the unknown, so is the distance of the unknown weight from the centre of motion to the distance of the known weight, where the two weights will counterpoise each other; consequently, the known weights shew the quantity of the unknown.

Or thus: the action of a weight to move a balance is by so much greater, as the point pressed by the weight is more distant from the centre of the balance; and that action follows the proportion of the distance of the said point from that centre. When the balance moves about its centre, the point B describes the arch Bb (fig. 9.); whilst the point A describes the arch Aa, which is the largest of the two; therefore in the motion of the balance, the action of the same weight is different, according to the point to which it is applied; hence it follows, that the proportion of the space gone through by the point at A is as Aa, and at B as Bb, but those arches are to one another as CA, CB.

BALANCE, *Varieties in the Application of the*.—If the brachia of a balance be divided into equal parts, one ounce applied to the ninth division from the centre, will equiponderate with three ounces at the third; and two ounces at the sixth division act as strongly as three at the fourth, &c.

Hence it follows, that the action of a power to move a balance is in a ratio compounded of the power itself, and its distance from the centre; for that distance is as the space gone through in the motion of the balance.

It may be here observed, that the weight equally presses the point of suspension at whatever height it hangs from it, and in the same manner as if it was fixed at the very point; for the weight at all heights equally stretches the cord by which it hangs.

A balance is said to be in equilibrium, when the action of the weights upon the brachia to move the balance are equal, so as mutually to destroy each other. When a balance is in equilibrium, the weights on each side are said to equiponderate: unequal weights may also equiponderate; but then the distances from the centre must be reciprocally as the weights. In which case, if each weight be multiplied by its distance, the products will be equal; which is the foundation of a steel-yard, which see.

Thus in a balance whose brachia are very unequal, a scale hanging at the shortest, and the longest divided into equal parts; if such a weight be applied to it, as at

the first division shall equiponderate with one ounce in the scale; and the body to be weighed be put in the scale, and the above mentioned weight be moved along the longest *brachium*, till the *equilibrium* be found; the number of divisions between the body and the centre shews the number of ounces that the body weighs, and the subdivisions the parts of an ounce. On the same principle also is founded the *designed balance*, which cheats by the inequality of the *brachia*; for instance, take two scales of unequal weights, in the proportion of 9 to 10, and one of them at the tenth division of the balance above described, and another at the ninth division, so that there may be an equilibrium; if then you take any weights, which are to one another as 9 to 10, and put the first in the first scale, and the second in the other scale, they will equiponderate.

But it is easy to discover the deceit of a false balance by changing the weights that are in equilibrio to the contrary scales; and thus the owner of the balance must either confess the fraud, or add to the commodity sold by means of such a balance, not only the quantity by which it was deficient, but also as much as he intended to gain by the fraud, and a fraction of that added weight proportional to the inequality of the arms of the balance. In this case, the buyer, instead of 9½ offered to him for 10½ his due, will have by changing the scales, 11½ pounds. For 9 : 10 :: 10 : 11½.

Several weights, hanging at several distances on one side, may equiponderate with a single weight on the other side: to do this it is required, that the product of that weight, by its distance from the centre, be equal to the sum of the products of all the other weights, each being multiplied by its distance from the centre.

To demonstrate which, hang three weights of an ounce each, at the second, third, and fifth divisions from the centre, and they will equiponderate with the weight of one single ounce applied to the tenth division of the other *brachium*; and the weight of one ounce at the sixth division, and another of three ounces at the fourth division will equiponderate with a weight of two ounces on the other side at the ninth division.

Several weights unequal in number on either side, may equiponderate: in this case if each of them be multiplied by its distance from the centre, the sums of the products on either side will be equal; and if those sums be equal, there will be an *equilibrium*.

To prove which, hang on a weight of two ounces at the fifth division, and two others, each of one ounce, at the second and seventh; and on the other side hang two weights, each also of one ounce, at the ninth and tenth divisions; and these two will equiponderate with those three. A balance of this kind, the arms of which are equally divided, has been sometimes called an *arithmetical balance*; because the arithmetical operations of addition, subtraction, multiplication, and the rule of three, may be easily performed by it.

E. g. To *add* the numbers 2, 3, and 7; apply an ounce weight at the second division, and another on the same arm at the third, and another at the seventh, then take an ounce weight, and move it along the other arm, till the beam is in equilibrium, which will be at the twelfth division; so that $2 + 3 + 7 = 12$.

To *subtract* 5 from 12; hang an ounce weight at one end of the arm at 12 inches, and another at the other end at 5; then move a third ounce weight along the arm till the equilibrium is restored, and it will be found at the seventh division, which gives $12 - 5 = 7$.

To *multiply* 4 by 3; suspend a four ounce weight at the third division on one arm, and move an ounce weight on the

other, till the beam be in equilibrium, and it will mark out $12 = 4 \times 3$.

To *divide* 12 by 4; suspend an ounce at the twelfth division, and move a four ounce weight on the other arm, till there is an equilibrium, and it will be found at the quotient $3 = \frac{12}{4}$, see *Arithmetica*, the first Elem. Math. vol. i. p. 50.

To the joints of a balance it is required, that the points of suspension be exactly in the same line as the centre of the balance; that they be precisely equidistant from that centre on either side; that the *brachia* be as long as conveniently they may, in relation to their thickness, and the weight which they are intended to support; that there be as little friction as possible in the motion of the beam and scales; and lastly, that the centre of gravity of the beam be placed a little below the centre of motion.

We shall here add some further observations, which may serve to illustrate these properties of a good balance, and which deserve attention in the construction of this instrument for purposes that require peculiar accuracy. The balance is properly a lever, whose axis of motion is formed with an edge like that of a knife, and the two dishes or scales at its extremities are hung upon edges of the same kind, which are first made sharp, and then rounded with a fine hone, or a piece of buff leather. On the regular form of this rounded part the excellence of the instrument very much depends. When the lever, or beam of the balance, is considered as a mere line, the two outer edges are called points of suspension, and the inner the fulcrum. The points of suspension are supposed to be at equal distances from the fulcrum, and to be pressed with equal weights when loaded.

1. If the fulcrum be placed in the centre of gravity of the beam, and the three edges be all in the same right line, the beam of the balance will have no tendency to one position more than another, but will rest in any position in which it may be placed, whether the scales be on or off, empty or loaded. 2. If the centre of gravity of the beam, when level, be immediately above the fulcrum, it will overset by the smallest action; that is, the end which is lowest will descend; and it will do this with the greater velocity, in proportion as the center of gravity is higher, and the points of suspension are less loaded. 3. But if the center of gravity of the beam be immediately below the fulcrum, the beam will not rest in any position but when level; and, if disturbed from that position, and then left at liberty, it will vibrate, and at last come to rest in an horizontal position. Its vibrations will be quicker, and its horizontal tendency stronger, the lower the centre of gravity, and the less the weight upon the points of suspension. 4. If the fulcrum be below the line joining the points of suspension, and these be loaded, the beam will overset, unless prevented by the weight of the beam tending to produce an horizontal position, as in the third case. In this last case small weights will equilibrate, as in the last case; a certain exact weight will rest in any position of the beam, as in the first case; and all greater weights will cause the beam to overset, as in the second case. Money scales are often made this way, and will overset with any considerable load. 5. If the fulcrum be above the line joining the points of suspension, the beam will come to the horizontal position, unless prevented by its own weight, as in the second case. If the centre of gravity be nearly in the fulcrum, all the vibrations of the loaded beam will be made in times nearly equal, unless the weights be very small, when they will be slower. The vibrations of balances are quicker, and the horizontal tendency stronger, the higher the fulcrum. When the fulcrum, or centre of motion C, (see *fig. 10.*) is in the right line joining the centres of suspension, it is evident that the equilibrium of equal weights, e. g. P and W, will obtain in every position; for the perpendiculars

diculars let fall from C upon the directions will be always equal to each other. But when C is above or below WP, an equilibrium of equal weights does not occur, unless WP coincide with the horizontal line AB. In this case, the perpendiculars let fall from C upon the directions of W and P, are equal to GB and GA, CG being perpendicular to AB; but when the balance is in any other position WP, the perpendicular CI is greater than CH, because g L, which is less than CI, is equal to gM, which is greater than CH. W will therefore descend and continue to vibrate till its motion be destroyed by friction. (See LEVER.) If P and V be unequal, and C be in the right line WP, the heavier of them will descend till WP be perpendicular to the horizon, or, if the center of motion be not in WP, till $F \times CH = W \times CI$. It is evident from what has been said, that the nearer the centre of gravity of the beam is to the centre of motion, the nicer will be the balance, and the slower its vibrations; thus, if *aCbc* (fig. 11.) be the beam, and C the center of motion, the difference between the effects of having the centre of gravity at K, or *c*, will be the same as if we compared the velocities of two pendulums, of the length CK and Cc, which are in a subduplicate ratio of their lengths. The tendency to an horizontal position is, therefore, increased by lowering the center of gravity, in which case it will also require a greater additional weight to cause it to turn or incline to any given angle, and it is consequently less sensible with a greater load. The fixing of the centre of motion in a balance is, therefore, of peculiar importance, for on this depends the ease with which it will be affected by a smaller weight; and the readiness with which it will return to its horizontal position: and it is evident, that the best position is that in which the centre of motion is a little above the centre of gravity; and even in this it should be proportioned to the distance of the weights from the fulcrum, and the quantity of matter to be weighed, which, in different beams, can only be attained by the practice and experience of the maker.

It has already appeared, that if the arms of a balance be unequal, the weights in equipoise will be unequal in the same proportion. But it should be observed, that though the equality of the arms of a balance is useful in the making of weights by bisection, a balance with unequal arms will weigh as accurately as another with equal arms, provided the standard weight itself be first counterpoised, then taken out of the scale, and the thing to be weighed be put into the scale, and adjusted against the counterpoise: or, when proportional quantities only are considered, the bodies under examination may be weighed against the weights, taking care always to put the weights in the same scale; for then, though the bodies may not be really equal to the weights, yet their proportions to one another will be the same as if they had been accurately equal to them. However, it is indispensably necessary that their relative lengths should continue invariable. For this purpose it is necessary either that the three edges be all truly parallel, or that the points of suspension and support should be always in the same part of the edge, which last requisite is most easily obtained.

If a beam be adjusted so as to have no tendency to any one position, as in case 1. above stated, and the scales be equally loaded; then, if a small weight be added in one of the scales, that balance will turn, and the points of suspension will move with an accelerated motion, similar to that of falling bodies, but as much slower in proportion, very nearly, as the added weight is less than the whole weight borne by the fulcrum. The stronger the tendency to an horizontal position in any balance, or the quicker its vibrations (see cases 3. and 5.), the greater additional weight will be required to cause it to turn or incline to any given angle. If

a balance were to turn with the ten thousandth part of the weight, it would move at the rate of 10000 times slower than a body; that is, the force of the weight, instead of falling through ten feet in a second of time, would fall the same way in ten thousand seconds; and it would require ten thousand years to make a whole third part of an inch; consequently, all accurate weighing must be slow.

Long beams have been generally recommended; because the quantity of motion in a given body varies as its distance from the fulcrum; and, therefore, the greater the distance, the more distinguishable will be the motion arising from a small difference between, e.g. P. and W. Long beams are also thought to have less friction; but this has been doubted. And it has been remarked, that the quicker angular motion, greater strength, and less weight of a short balance, are certain advantages.

The index that is placed perpendicularly to the beam of a balance, in order to ascertain its position, affects its equilibrium, except it be in an horizontal position; the momentum of the index being measured by its weight multiplied into the distance of its centre of gravity, from a line perpendicular to the horizon. But the error that would arise from hence is corrected by continuing the index, or placing a weight on the opposite side of the beam. The scale of a balance should be suspended in such a manner, that in all positions the strings of the scales may be parallel to one another; otherwise the weights, though equal, will not be in equilibrium.

Very delicate balances are not only useful in nice experiment, but they are much more expeditious than others in common weighing. If a pair of scales, with a certain load, be barely sensible to $\frac{1}{27}$ th of a grain, it will require a considerable time to ascertain the weight to that degree of accuracy, because the turn must be observed several times, and it is very small. But if no greater accuracy were required, and scales were used which would turn with the hundredth of a grain, a tenth of a grain, more or less, would make so great a difference in the turn, that it would be seen immediately. A degree of sensibility may be given to a balance, that turns with a certain addition, but is not moved by any smaller weight, by producing a tremulous motion in its parts. Thus, if the edge of a blunt saw, a file, or other similar instrument, be drawn along any part of the case or support of a balance, it will produce a jarring, which will diminish the friction in the moving parts so much, that the turn will be evident with one third or one fourth of the addition that would else have been required. In this way a beam which would only turn by the addition of a tenth of a grain, will turn with the thirtieth or fortieth of a grain. In order to regulate the horizontal tendency in some beams, the fulcrum is placed below the points of suspension, and a sliding-weight is put upon the eye or index, by means of which the centre of gravity may be raised or lowered.

Mr. Nicholson, of whose observations on the properties of the balance we have availed ourselves in the preceding part of this article, has recommended the following list of weights, as proper to accompany it, when it is applied to chemical and similar purposes, viz. 1000 g. 900 g. 800 g. 700 g. 600 g. 500 g. 400 g. 300 g. 200 g. 100 g. 90 g. 80 g. 70 g. 60 g. 50 g. 40 g. 30 g. 20 g. 10 g. 9 g. 8 g. 7 g. 6 g. 5 g. 4 g. 3 g. 2 g. 1 g. $\frac{1}{2}$ g. $\frac{1}{3}$ g. $\frac{1}{4}$ g. $\frac{1}{5}$ g. $\frac{1}{6}$ g. $\frac{1}{7}$ g. $\frac{1}{8}$ g. $\frac{1}{9}$ g. $\frac{1}{10}$ g. $\frac{1}{12}$ g. $\frac{1}{15}$ g. $\frac{1}{20}$ g. $\frac{1}{25}$ g. $\frac{1}{30}$ g. $\frac{1}{40}$ g. $\frac{1}{50}$ g. $\frac{1}{60}$ g. $\frac{1}{70}$ g. $\frac{1}{80}$ g. $\frac{1}{90}$ g. $\frac{1}{100}$ g. With these the philosopher will always have the true number of weights in his scales as there are figures in the number expressing the weights in grains. Mr. Nicholson subjoins an account of some balances, which have been constructed

fructed by different persons for nice experiments. The first he mentions is that of Mulchenbroock, which turned with $\frac{1}{4}$ of a grain, and which weighed to $\frac{1}{177000}$ part of the whole; ascertaining such weights truly to four places of figures. In the Philof. Transf. vol. lxvi. p. 50. we have mention of two accurate balances of Mr. Bolton; one of which would weigh a pound, and turn with $\frac{1}{10}$ of a grain, and give the $\frac{1}{177000}$ of the weight; and the other weighed $\frac{1}{2}$ an ounce, and turned with the $\frac{1}{10}$ of a grain, or the $\frac{1}{177000}$ of the weight. Mr. Read's balance mentioned in p. 511. of the same volume, turned with less than a penny-weight, and even with four grains, when loaded with fifty-five pounds, i. e. about $\frac{1}{177000}$ of the weight, and which might be relied on to five places of figures. Mr. Whitehurst's balance (Ibid. p. 576.) weighs one penny weight, and is sensibly affected with $\frac{1}{3000}$ of a grain, i. e. $\frac{1}{177000}$ part of the weight. Mr. Nicholson's balance, with 1200 grains in each scale, turns with $\frac{1}{10}$ of a grain, or $\frac{1}{177000}$ of the whole. This balance, he says, will serve to determine all weights between 100 grains, and 4000 grains to four places of figures. Mr. Meibom's (mentioned Ibid. vol. lxxvii. p. 207.) is true to three grains with 15 lb an end; and hence the weight is known to $\frac{1}{177000}$ part, or to four, or hardly five places of figures. The balance of Dr. George Fordyce, made by Mr. Ramsden, mentioned in lxxvth volume of the Phil. Transf. when loaded with four or five ounces, shew'd a difference of $\frac{1}{10000}$ of a grain, or $\frac{1}{177000}$ part of the weight. Mr. Magellan's would bear several pounds, and shew $\frac{1}{10}$ of a grain, with one pound an end. This is the $\frac{1}{177000}$ of the weight and answers to five figures. The Royal Society's balance, lately made by Mr. Ramsden, turns on steel edges upon planes of polished crystal, and ascertains a weight to the seven millionth part, and may be used in general practice to determine weights to five places and better. To which we may add, that the balance used by count Rumford, in his experiments for ascertaining the weight ascribed to heat (Phil. Transf. for 1799. part ii.), served, as he informs us (p. 187.), to measure $\frac{1}{177000}$ of the weight which he examined. Nicholson's Chemistry, c. vi. Parkinson's System of Mechanics, &c. p. 134. &c. Defaguliers's Exp. Phil. vol. i. p. 140, &c.

Mr. Ludlam has contrived a balance of a new construction for the woollen manufactures. Their thread is made into skains of the same length; and the fineness of it is denominated from the number of skains which go to a pound; the coarsest being about twelve to the pound, and the finest near sixty. This machine is designed for weighing the skains, in order to determine their respective fineness. It resembles the beam of a common pair of scales; at one end of it is fixed a weight, called a counterpoise, and at the other end a hook; in sorting, the skain to be examined is put upon the hook, and sinks down more or less, according to its weight, till the counterpoise, by rising, balances it: then the index or cock of the beam, points out on a graduated arch the number of skains of that sort which goes to the pound.

A scale, instead of the hook, might be used for weighing money, if the arch were properly divided for that purpose. See a drawing of this machine and the explanation of the theory of it, in Phil. Transf. vol. lx. N^o 25, p. 205.

The *best-lever balance*, is a balance (fig. 12.) which acts by a fixed weight *C*, increasing in power as it ascends along the arc *FG* of a circle, and pointing by an index to the number or division of the arc which denotes the weight of any body put into the scale *E*. With this instrument, one constant weight serves to weigh all others, by only varying the position of the arms of the balance, instead of varying the places or points of suspension in the arms themselves.

The following property of the balance was first sug-

gested by Dr. Hellsam (see his Course of Lectures in Natural Philosophy, published by Dr. Robinson, p. 91), communicated by him to Dr. Defaguliers (see his Course of Experimental Philosophy, vol. i. p. 152.), and published in the Phil. Transf. for 1729. The property is this, that if a man standing in one scale and counterpoised by a weight in the other, lays his hand to any part of the beam, and presses it upwards, he will destroy the equilibrium and cause the scale in which he stands to preponderate. Thus, if a man, whose weight is equal to *W*, standing in one scale and in equilibrio with *P* placed in the other (fig. 8.), press the beam upwards in *D* with a force equal to *Q*, the diminution of *W*'s momentum is equal to $Q \times FD$; and because the reaction at the scale is equal to *Q*, the increase of *W*'s momentum is equal to $Q \times FA$, and consequently *W* will descend with a force equal to $Q \times AD$. If the pressure be upwards at *E*, *W* will descend with a force resulting from this pressure, equal to $Q \times EF$, and from the reaction with a force equal to $Q \times FA$; and, therefore, the whole force of descent is equal to $Q \times EA$. Thus, also, if the pressure be downwards at *D*, the increase of *W*'s momentum is equal to $Q \times FD$, and the diminution of its momentum = $Q \times FA$; and, consequently, *W* will ascend with a force equal to $W \times DA$. If the pressure be downwards at *E*, the diminution of *W*'s momentum, or the increase of *P*'s momentum, is equal to $Q \times EF$, and a part, *Q*, of *W*'s weight being transferred to *E*, the diminution of its momentum, on that account, is equal to $Q \times FA$, and consequently the whole diminution of *W*'s momentum, or force of *P*'s ascent, is equal to $Q \cdot EA$.

BALANCE of the Air, is used to denote the weight of that fluid, whereby, according to its known property, it presses where it is least resisted, till it be equally adjusted in all parts.

BALANCE, Assay, is a nice balance used in determining the exact weight of minute bodies. Its structure is very little different from that of the common sort; except that it is made of the best steel, and fitted for moving with the smallest weight.

The beam of this balance is suspended in a fork, the two legs of which are steel springs joined at the top, but kept together below with a brass pliant clasp, parallel to one another, and at the distance of $2\frac{1}{2}$ lines. When this clasp is taken off, and the legs of the fork stretched out, the axis of the beam may be put into two holes at the ends of the legs, or removed from them. A sharp needle is fixed in the head of the fork, which stands perpendicularly, when the fork is suspended, and is so long, as almost to touch the top of the tongue of the beam put into the fork when in equilibrio. This needle is the test or mark of the equilibrium; and for the convenience of observing it, the legs of the fork are broader in that place, and have an opening two or three lines wide. Two scales made of a thin plate of silver, $1\frac{1}{2}$ inch in diameter, suspended on three small silken strings, almost as long as the beam, and tied together at the top with a silver hook in the form of an S, are hung to the extremities of the beam; and to each of these scales belongs a small dish of silver or blued steel, somewhat less than one inch in diameter, and both of equal weight; the bodies to be weighed are put into these dishes, with a pair of pincers, or with a spoon, or small shovel, when they are pounded; and then the dishes are put into the scales. The balance is suspended on a moveable brass or copper support, consisting of a pedestal, and a pillar set upon it about twenty inches high, at the top of which projects at right angles, an arm one inch in length: at the extremity of this arm is a small pulley three lines in diameter, another at the top of the pillar, and a third near the bottom of it; all which pulleys move with ease on their respective axes. At the distance of $1\frac{1}{2}$ inch below the upper

upper arm, another arm $1\frac{1}{2}$ inch long, projects from the pillar at right angles, with a hole through it two lines long, and a quarter of a line broad, and placed perpendicularly below the pulley of the upper arm, to receive a small plate $1\frac{1}{2}$ inch long, and of such breadth and thickness that it may freely move up and down, and yet not play too freely in the hole. At each extremity of the plate is a small hook. The whole of this apparatus is enclosed in a small case (*fig. 13.*), furnished with glasses, *a, a, a,* at the top and about it. The manner of using the assay-balance is to pass a silken string over the three pulleys of the support and arm; then the support is placed in the middle of the small case, and the other end of the silk string is passed below through a hole in the middle of the lower part of the frame, containing the window in the fore part of the case, and fastened to a small weight of a cubic form. The fork of the balance is suspended on the inferior hook of the plate. By moving backwards and forwards the weight fastened to the string, placed upon the top of the drawer projecting beyond the fore-part of the case, the balance within is either raised or lowered. The bodies to be weighed, and the weights themselves, being put into the dishes; the dishes are put into the scales, through the side windows, which must be opened for that purpose. When any thing is added or taken away, by means either of the pincers, or of the small shovel, or spoon, the balance is let down that the scales may rest upon the bottom of the case; and before it is lifted up again the windows must be shut, especially if the air is not perfectly still. The flat pieces of glass, often placed under the scales of an assay-balance, seem, by their electrical power, capable of attracting, and of thus causing the lighter scale to preponderate where the whole matter weighed is so very small. See *Phil. Trans. N^o 480. p. 245.* The electricity of a flat surface about three inches square has been known to hold down one scale, when there was a weight of about 200 grains in the other.

BALANCE, in *Astronomy*. See **LIBRA**.

BALANCE, in *Horology*, is that part of a clock or watch, which by its motion regulates and determines the beats.—The circular part of it is called the *rim*, and its spindle the *verge*; there belong to it also two *pallets* or nuts, which play in the fangs of the crown-wheel; in pocket watches, that strong fluid, in which the lower pivot of the verge plays, and in the middle of which one pivot of the crown-wheel runs, is called the *potence*: the wrought piece which covers the balance, and in which the upper pivot of the balance plays, is the *cock*: the small spring in the new pocket-watches is called the **REGULATOR**.

It appears from the testimony of historical accounts, as well as other evidences, that the balance was universally adopted in the construction of the first clocks and watches; nor was it till the year 1657, that Mr. Huygens united pendulums with clock-work. (See **PENDULUM**.) In watches of early construction, the balance vibrated merely by the impulses of the wheels, without any other control or regulation; the motion communicated to the balance by one impulse continued till it was destroyed, partly by friction, and partly by a succeeding impulse in the opposite direction; and therefore the vibrations must, of course, have been very unsteady and irregular. These imperfections were in a great measure remedied by Dr. Hooke's ingenious invention of applying a spiral spring to the balance, the action of which on the balance of a watch is similar to that of gravity on a pendulum; each kind of force having the effect of correcting the irregularities of impulse and resistance which otherwise disturb the isochronism of the vibrations. In clocks and watches, the real measure of time is the ba-

VOL. III.

lance, and all the other work serves merely to continue the motion of the balance, and to indicate the time as measured by its vibrations. The regularity of a time-keeper will therefore depend on that of the time in which the balance vibrates; and the investigation of this time of vibration, from the several data or conditions on which it depends, is an important object in this part of mechanical science. See **ESCAPEMENT**, **CLOCK**, **TIME-KEEPERS**, and **WATCHES**.

That the balances of watches, when manufactured of steel, as they generally are, might be in a small degree magnetic, and that this property might have some influence in disturbing their vibrations, some have suspected, and others have denied; but Mr. Varley has lately (see *Philos. Magaz. vol. i. p. 18.*) pointed out a source of error which has been hitherto little, if at all, apprehended; and this is the polarity of the balance, or tendency of a particular point to the north; and of an opposite point to the south, so strong as to be sufficient materially to alter the rate of going of the machine, when put in different positions. If this cause of error had been known, the use of steel balances would have been laid aside long ago, particularly where accurate performance is indispensable, as in time-pieces for astronomical and nautical purposes. Mr. Varley, having ascertained the fact, and knowing the position of the poles, proceeded to examine the effects produced by this cause upon the watch's rate of going. Having put on the pendulum spring, and replaced the balance in the watch, he laid the watch with the dial upwards, that is, with the plane of the balance horizontally, and in such a position that the balance when at its place of rest should have its marked side towards the north; in this situation it gained $5' 35''$ in 24 hours. He then changed its position, so that the marked side of the balance when at rest should be towards the south, and in 24 hours it lost $6' 48''$; producing, by its change of position only, a difference of $12' 23''$ in its rate. This difference must be still further augmented or diminished as the wearer might happen to carry in his waistcoat pocket, a key, a knife, or any other article made of steel. Substituting, in the room of the steel-balance, one made of gold, he found that the watch's rate of going was as uniform as that of any watch on the like construction.

BALANCE, *Hydrostatical*, in *Hydraulics*, is an instrument for determining the specific gravities of bodies. See **HYDROSTATICAL**, and **SPECIFIC GRAVITY**.

BALANCE of Forces, in *Mechanics*. See **COMPOUND MOTION**.

BALANCE, in the *Accounts of Merchants*, is, when the debtor and creditor sides of any distinct account are equal. In such case the account is said to be *balanced*.

Balance of a merchant, or trader's books, is a branch of the art of accountanship. In the method of keeping the books of traders, according to that excellent art of charge and discharge by double entry, such books, if correctly kept, will always be fit for a general balance. For such is the excellency of that method, that the books of themselves must necessarily balance on the whole, though not in every distinct account throughout the ledger. See **BOOK-KEEPING**.

BALANCE, among *Painters*. See **EQUILIBRIUM**.

BALANCE of the Constitution, in *Political Oeconomy*, denotes the security which each part of the legislature possesses in the exercise of the powers assigned to it from the encroachment of the other parts. The political equilibrium signified by this phrase, consists in two contrivances, viz. a *balance of power* and a *balance of interest*. By the former is meant, that there is no power possessed by one part of the legislature, the abuse or excess of which

is not checked by some antagonistic power, residing in another part. Thus the power of the two houses of parliament to frame laws is checked by the king's negative; on the other hand the arbitrary application of this negative is checked by the privilege that parliament possesses of refusing supplies of money to the exigencies of the king's administration. The constitutional maxim, "that the king can do no wrong," is balanced by another maxim not less constitutional, "that the illegal commands of the king do not justify those who assist, or concur, in carrying them into execution;" and by a second rule, subsidiary to this, "that the acts of the crown acquire not any legal force, until authenticated by the subscription of some of its great officers." The power of the crown to direct the military force of the kingdom is balanced by the annual necessity of resorting to parliament for the maintenance and government of that force. The power of the king to declare war is checked by the privilege of the house of commons to grant or withhold supplies by which the war must be carried on. The king's choice of ministers is controlled by the obligation he is under of appointing those men to offices in the state, who are found capable of managing the affairs of his government with the two houses of parliament. By the *balance of interest*, which accompanies and gives efficacy to the *balance of power*, is meant this, that the respective interests of the three states of the empire are so disposed and adjusted, that whichever of the three shall attempt any encroachment, the other two will unite in resisting it. If the king should endeavour to extend his authority by contracting the power and privileges of the commons, the house of lords would see their own dignity endangered by every advance which the crown made to independency, upon the resolutions of parliament. The admission of arbitrary power is no less formidable to the grandeur of the aristocracy than it is fatal to the liberty of the republic; that is, it would reduce the nobility from the hereditary share they possess in the national councils, in which their real greatness consists, to being a part of the empty pageantry of a despotic court. On the other hand, if the house of commons should intrench upon the distinct province, or usurp the established prerogative of the crown, the lords would receive an instant alarm from every new stretch of popular power. In every contest in which the king may be engaged with the representative body, in defence of his established share of authority, he will find a sure ally in the collective power of the nobility. If the nobles should attempt to revive the superiorities exercised by their ancestors under the feudal constitution, the king and the people would alike remember how the one had been insulted, and the other enslaved by that barbarous tyranny. Paley's *Principles of Philosophy*, vol. ii. p. 208—213.

BALANCE of Power, in the *Political System*, originates from, and is maintained by, the alliances of different nations, as their circumstances and interest may require. See this subject stated and discussed more at large under the article *POWER*.

BALANCE of Trade, denotes an equality between the value of commodities bought of foreigners, and the value of the native productions transported into other nations.

The balance of trade with any foreign nation is said to be against or in favour of the country simply as it tends to carry money out, or to bring it in; that is, according as the price of the imports exceeds or falls short of the price of the exports: so invariably is the increase or diminution

of the specie of a country regarded as a test of the public advantage or detriment, which arises from any branch of its commerce. According to Dr. Smith (*Wealth of Nations*, vol. ii. p. 212.), there is no certain criterion by which we can determine on which side what is called the balance between any two countries lies, or of which exports to the greatest value. The two criterions to which an appeal has been usually made on such occasions are, the custom-house books, and the course of exchange. The custom-books, says this writer, are now generally acknowledged to be a very uncertain criterion, on account of the inaccuracy of the valuation at which the greater part of goods is rated in them; and the course of exchange is, perhaps, almost equally precarious.

BALANCE of Annual Produce and Consumption, is that which, according to Dr. Smith (*ubi supra*, p. 250.), necessarily occasions the prosperity or decay of every nation, as it happens to be either favourable or unfavourable. If the exchangeable value of the annual produce exceeds that of the annual consumption, the capital of the society must annually increase in proportion to the excess. The society in this case lives within its revenue, and what is annually saved out of its revenue is naturally added to its capital, and employed so as to increase still further the annual produce. On the contrary, if the exchangeable value of the annual produce fall short of the annual consumption, the capital of the society must annually decay in proportion to this deficiency. The expence of the society in this case exceeds its revenue, and necessarily encroaches upon its capital. Its capital must, therefore, necessarily decay, and together with it, the exchangeable value of the annual produce of its industry. The balance of produce and consumption is entirely different from that which is called the balance of trade. It might take place in a nation which had no foreign trade, but which was entirely separated from all the world. It may take place in the whole globe of the earth, of which the wealth, population, and improvement may be either gradually increasing, or gradually decaying. This balance may be constantly in favour of a nation, though the balance of trade should be generally against it. A nation may import to a greater value than it exports for half a century, perhaps, together; the gold and silver which come into it during all this time may be immediately sent out of it; its circulating coin may gradually decay, different sorts of paper money being substituted in its place, and even the debts too which it contracts in the principal nations with which it deals may be gradually increasing; and yet its real wealth, the exchangeable value of the annual produce of its lands and labour, may, during the same period, have been increasing in a much greater proportion. See on this subject more largely under the articles *COMMERCE*, and *TRADE*.

BALANCE, to, in *Sea Language*, signifies to contract a sail into a narrow compass, in a storm, by retrenching, or, folding up a part of it in one corner. To this purpose serves the *balance-reef*, which is a reef-band that crosses the sail diagonally. See *REEF*.

BALANCE of the Boom Main-sail, is performed after all its reefs are taken in, by rolling up a similar portion of the hindmost or aftmost lower corner called the *chue*, and fastening it strongly to the boom, securing it from being fretted by the cord that fastens it. See *BOOM*.

BALANCE of the Mizzen, is thus performed; the mizen-yard is lowered a little, a small portion of the sail is rolled up at the peak, or upper corner, and fastened to the yard, about one-fifth inward from the outer end, or yard-arm, towards the mast. See *MIZEN*.

BALANCE-Fish, in *Ichthyology*, an English name of the *squalus zygena* of Linnæus and Gmelin. It is also called by some the *hammer-fish*, or *hammer-headed shark*, from the very singular form of the head; and its specific character is taken exclusively from that particular; head very broad, transversely, and hammer-shaped. Salvian calls it *libella ciambetta*; and Belon, *libella, balista, cognolu*, &c. See *ZYGÆNA SQUALUS*.

BALANCERS, or **POIZERS**, in *Entomology*, a term synonymous with the French word *balanciers*, and *halteres* of Linnæus; denoting those little filamentous bodies which terminate in a round, truncated, or oval capitulum, or knob; and of which one is placed on each side of all the dipterous, or two-winged insects, immediately under a small scale or arch, below the wing. In different genera these vary a little in respect of situation, and are also of larger or smaller size in proportion to the other parts of the insect in different kinds.

The use of these organs is by no means obvious. Some imagine that they beat the little arch or scale, beneath which they are situated, in the motion of flying, and thereby occasion that humming or buzzing noise, which every one must have observed the house-fly, flesh-fly, and other very common two-winged insects to emit in flight. The *cicada*, we well know, make a like noise by means of somewhat similar organs under the lamellæ, but whether the noise which the dipterous insects make is occasioned in this manner or not, we shall not presume to say. Olivier thinks it is not, because it appears from certain experiments, that when any of these insects are deprived of the halteres, and are permitted to resume their flight, the same buzzing sound is heard without the slightest variation. The more general opinion is, that they are designed to facilitate the motion of the creature in the air, by equipping, or preserving the true equilibrium, just as a stick, made heavy at each end, is held by rope-dancers to preserve their balance, and hence these organs have been called the balancers. This is most probably the real use of the halteres, notwithstanding that their diminutive size is some objection to such opinion, for when these are accidentally injured, the motion of the creature becomes very irregular, and it evidently appears unable to direct its course with the same facility as before; either suffering great pain, or being deprived of the means it previously possessed.

BALANCIER, a machine used in the striking of coins, medals, counters, and the like. See *COINAGE*.

BALANÆÆ, in *Ancient Geography*, a town seated on the coast of Syria, between the towns of Gabala and Antiradus; convenient for commerce, and furnished with grain and fruits in abundance. Strabo, Pliny, and Ptolemy place it in Syria, properly so called; to the north of the river Eleutherus, which separated Syria from Phœnicia. Under the reign of Theodosius the younger, this town was comprised in the province called Syria secunda: but afterwards belonged to a new province which the emperor Justinian formed under the name of Theodoriade.

BALANITES, in *Natural History*, a name given by the ancients to a stone, seeming to have been of the semiprecious gems. They describe two species of it; the one of which was yellow, and the other green, but each having veins of a flame colour. Their descriptions are too short for us to be able to ascertain what stones, among those known at this time, they meant.

Some think the *balanites* to have been the *lapis Judæicus*, on account of its acorn-like figure and size. Plin. Nat. Hist. lib. xxxviii. cap. 10. ed. Hardouin.

BALANOIDES, in *Conchology*, a species of *LEPAS*, with a conic truncated smooth shell, and obtuse operculum. Linn. Fa. Suec.—Donov. &c. This is *Lobanus parvus vulgaris* of Petiver; and a variety of it with a long tubular stalk is described by Da Costa, Pennant, and Donov. Brit. Shells.

BALANTE, in *Geography*, a town of the island of Celebes, in the country of Banca.

BALANUS, in *Conchology*, the name of a genus of multivalve shells, in the works of several writers on the *testacea*, as Petiver, Gesner, Da Costa, &c. The shells of this kind are comprehended by Linnæus and Gmelin in the genus *LEPAS*, which see.

BALANUS, a species of *LEPAS*, with a conic foveated shell, and sharp-pointed operculum. Found adhering to rocks, stones, shells, &c. in the greatest plenty in all the European seas. Linn. Fa. Suec.—Donov. Brit. Shells, &c.

BALANUS, *βελανος*, or **GLANS**, is sometimes used by *Anatomists* for the nut of the yard. Sometimes also the clitoris is so called.

BALANUS is also sometimes used for a suppository.

BALANUS MYREPSICA, in *Pharmacy*, the *BEN-OIL* which see.

BALANUS, in *Geography*, the name of a port of Italy, in Lucania.

BALARA, in *Ancient Geography*, a commercial city seated on the coast of the Indian ocean, between the mouth of the Indus and that of the Euphrates. Philostratus.

BALARUC, in *Geography*, a town of France, celebrated for its mineral springs, in the department of the Herault, four leagues from Montpellier.

BALARUC, *Waters of*. These are hot springs of some celebrity, employed both internally, and especially as baths. From the description and analysis of Le Roy (in the *Memoires de l'Academie des Sciences* for 1772), they appear to contain a small portion of sea salt, some fixed air, and some deliquescent salts, but no iron nor sulphur. They are limpid, and saltish to the taste. Their temperature when fresh is about 128° Fahr.; but they are cooled down to about 115° before they are used.

BALASCHEV. See *BALARUFF*.

BALASORE, a sea-port town of Hindostan, in the country of Orissa, and a place of considerable trade, seated on the river Gongahar, about twenty miles from its mouth in the bay of Bengal. Ships generally take pilots here to conduct them up the Ganges. It is about 101 geographical miles S. W. from Calcutta. N. lat. 21° 20'. E. long. 87° 1' 30".

BALASS, **BALLAS**, or **BALAIS**, in *Mineralogy*. See *RUBY*.

BALATAM, in *Geography*, a volcanic mountain in the island of Sumatra.

BALATITI, in *Ornithology*, a name given by the people of the Philippine islands to a kind of bird, by the sight of which they divine the event of things. What bird this is has not been ascertained.

BALAUSTINA, in *Conchology*, a species of *TRILINA*, having the shell dilated, orbicular, and one valve furnished with lateral teeth. Inhabits the Mediterranean sea. Colour whitish, with obsolete rufous rays. Size of a lupine seed.

BALAUSTIUM FLORES, *Balaustines*, the flowers of *punica granatum*, or pomegranate tree. These are large rose-like flowers of a deep red colour, set in long, bell-shaped cups, and are brought from the southern parts of Europe. They are mildly astringent, as indeed is the whole of the

pomegranate, and will strike a black with solutions of iron. They have little or no smell, and readily yield their astringent virtue to watery or spirituous menstrua. An extract was formerly prepared from the balauflines, and it entered into some of the officinal powders. It is now almost, if not entirely, disused.

BALAYAN, in *Geography*, a district or province in the island of Manila or Luçon, with a town of the same name. It lies near the city of Manila, and extends along the coast on the east side of the island, is inhabited by about 2500 tributary Indians, and abounds in cotton, rice, and palm-trees.

BALBASTRE, CLAUDE, in *Biography*, an eminent organist at Paris, and a spirited composer, of the old school, for keyed-instruments. He was born at Dijon, 1729, and was a favourite disciple of Rameau, and organist of Nôtre-Dame and S. Roch. He was a zealous cultivator of his art, and suggested to harpichord and piano-forte makers many improvements.

BALBASTRO, in *Geography*, an episcopal town of Spain, in Arragon, seated on the Vero, near its conflux with the Cinca, with a diocese extending over 170 parishes, forty-seven miles N. W. of Barcelona, and forty E. N. E. of Saragossa. N. lat. 41° 50'. E. long. 0° 20'.

BALBEC, BAALBEC, or BALBECK, a famous city of Syria, in the pachalic of Saide, celebrated by the Greeks and Latins under the name of *Heliopolis*, or the city of the sun; described by the Arabians as the wonder of Syria, and denoting by its present Arabic name Balbec, i. e. the *vale of Baal*, its connection with the worship of the sun, of which *Baal*, the chief idol deity of the country, was an appropriate denomination. It is pleasantly situated near the north-east extremity of the valley of Bocat, or Bekaa, at the foot of mount Anti-Libanus, on the last rising ground where the mountain terminates in the plain: it is well watered by the Litane, rising from Anti-Libanus, and the Barbouni from the foot of Libanus, and abounds in gardens. It is of a square figure, extending, as Maundrell conjectured (*Journey from Aleppo to Jerusalem*, p. 135.), about two furlongs on each side; and its houses are of the meanest structure, being such as are usually seen in Turkish villages. Its distance from Damascus is about fifty miles to the north-west, and about thirty miles from the nearest sea-coast, which is the situation of the ancient Byblus. N. lat. 34°. E. long. 36° 45'.

“As we arrive from the south (says Volney, *Travels in Egypt and Syria*, vol. ii. p. 232, &c.), we discover the city at the distance of only a league and a half, behind a hedge of trees, over the verdant tops of which appears a white edging of domes and minarets. After an hour's journey we reach these trees, which are very fine walnuts; and soon after, crossing some ill-cultivated gardens, by winding paths arrive at the entrance of the city. We there perceive a ruined wall, flanked with square towers, which attends the declivity to the right, and traces the precincts of the ancient city. This wall, which is only ten or twelve feet high, permits us to have a view of those void spaces, and heaps of ruins which are the invariable appendage of every Turkish city; but what principally attracts our attention, is a large edifice on the left, which, by its lofty walls, and rich columns, manifestly appears to be one of those temples which antiquity has left for our admiration. These ruins, which are some of the most beautiful and best preserved of any in Asia, merit a particular description.

To give a just idea of them, we must suppose ourselves descending from the interior of the town. After having

crossed the rubbish and huts with which it is filled, we arrive at a vacant place, which appears to have been a square; there, in front towards the west, we perceive a grand ruin, which consists of two pavilions ornamented with pilasters, joined at their bottom angle by a wall 160 feet in length. This front commands the open country from a fort of terrace, on the edge of which we distinguish, with difficulty, the bases of twelve columns, which formerly extended from one pavilion to the other, and formed a portico. The principal gate is obstructed by heaps of stones; but that obstacle surmounted, we enter an empty space, which is an hexagonal court of 180 feet diameter. This court is strewed with broken columns, mutilated capitals, and the remains of pilasters, entablatures, and cornices; around is a row of ruined edifices, which display all the ornaments of the richest architecture. At the end of this court, opposite the west, is an outlet, which formerly was a gate through which we perceive a still more extensive range of ruins, whose magnificence strongly excites curiosity. To have a full prospect of these, we must ascend a slope, up which were the steps to this gate, and we then arrive at the entrance of a square court, much more spacious than the former. The eye is first attracted by the end of this court, where six enormous and majestic columns render the scene astonishingly grand and picturesque. Another object not less interesting, is a second range of columns to the left which appear to have been part of the peristyle of a temple; but before we pass thither, we cannot refuse particular attention to the edifices, which enclose this court on each side. They form a sort of gallery which contains various chambers, seven of which may be reckoned in each of the principal wings: viz. two in a semicircle, and five in an oblong square. The bottom of these apartments still retains pediments of niches and tabernacles, the supporters of which are destroyed. On the side of the court they are open, and present only four and six columns, totally destroyed. It is not easy to conceive the use of these apartments; but this does not diminish our admiration at the beauty of their pilasters, and the richness of the frieze of the entablature. Neither is it possible to avoid remarking the singular effect which results from the mixture of the garlands, the large foliage of the capitals, and the sculpture of wild plants with which they are every where ornamented. In traversing the length of the court, we find in the middle a little square esplanade, where was a pavilion, of which nothing remains but the foundation. At length we arrive at the foot of the six columns; and then first conceive all the boldness of their elevation, and the richness of their workmanship. Their shafts are twenty-one feet eight inches in circumference, and fifty-eight high; so that the total height, including the entablature, is from seventy-one to seventy-two feet. The sight of this superb ruin, thus solitary and unaccompanied, at first strikes us with astonishment; but on a more attentive examination, we discover a series of foundations, which mark an oblong square of 268 feet in length, and 146 wide; and which, it seems probable, was the peristyle of a grand temple, the primary purpose of this whole structure. It presented to the great court, that is to the east, a front of ten columns, with nineteen on each side, which, with the other six, make in all fifty-four. The ground on which it stood was an oblong square, on a level with this court, but narrower than it, so that there was only a terrace of twenty-seven feet wide round the colonnade. The esplanade this produces, fronts the open country, toward the west, by a sloping wall of about thirty feet. This descent, as you approach the city, becomes less steep, so that the foundation of the pavilion is on a level

with

with the termination of the hill, whence it is evident that the whole ground of the courts has been artificially raised. Such was the former state of this edifice; but the southern side of the grand temple was afterwards blocked up to build a smaller one, the peristyle and wall of which are still remaining. This temple, situated some feet lower than the other, presents a side of thirteen columns, by eight in front (in all thirty-four), which are likewise of the Corinthian order; their shafts are fifteen feet eight inches in circumference, and forty-four in height. The building they surround is an oblong square, the front of which, facing the east, is out of the line of the left wing of the great court. To reach it you must cross trunks of columns, heaps of stone, and a ruinous wall by which it is now hid. After surmounting these obstacles, you arrive at the gate, where you may survey the inclosure which was once the habitation of a god; but instead of the awful scene of a prostrate people, and sacrifices offering by a multitude of priests, the sky, which is open from the falling in of the roof, only lets in light to shew a chaos of ruins, covered with dust and weeds. The walls, formerly enriched with all the ornaments of the Corinthian order, now present nothing but pediments of niches, and tabernacles of which almost all the supporters are fallen to the ground. Between these niches is a range of fluted pilasters, whose capitals support a broken entablature; but what remains of it, displays a rich frieze of foliage resting on the heads of satyrs, horses, bulls, &c. Over this entablature was the ancient roof, which was fifty-seven feet wide, and 110 in length. The walls which supported it are thirty-one feet high, and without a window. It is impossible to form any idea of the ornaments of this roof, except from the fragments lying on the ground; but it could not have been richer than the gallery of the peristyle: the principal remaining parts contain tablets in the form of lozenges, on which are represented Jupiter seated on his eagle; Leda caressed by the swan; Diana with her bow and crescent, and several buils which seem to be figures of emperors and empresses. It would lead us too far, to enter more minutely into the description of this astonishing edifice. The lovers of the arts will find it described with the greatest truth and accuracy in a work published at London in 1757, under the title of "Ruins of Balbec." This work, compiled by Mr. Robert Wood, the world owes to the attention and liberality of Mr. Dawkins, who, in 1751, visited Balbec and Palmyra. It is impossible to add any thing to the fidelity of their description.

Several changes, however, have taken place since their journey: for example, they found nine large columns standing; and, in 1784, there were but six. They reckoned nine and twenty at the lesser temple, but there now remain but twenty; the others have been overthrown by the earthquake of 1759. It has likewise so shaken the walls of the lesser temple, that the stone of the soffit of the gate has slid between the two adjoining ones, and descended eight inches; by which means the body of the bird, sculptured on that stone, is suspended, detached from its wings, and the two garlands, which hung from its beak and terminated in two genii. Nature alone has not effected this devastation; the Turks have had their share in the destruction of the columns. Their motive is to procure the iron cramps, which serve to join the several blocks of which each column is composed. These cramps answer so well the end intended, that several of the columns are not even disjoined by their fall: one, among others, as Mr. Wood observes, has penetrated a stone of the temple wall without giving way. Nothing can surpass the workmanship of these columns; they are joined without any cement, yet

there is not room for the blade of a knife between their interstices. After so many ages, they in general still retain their original whiteness. But, what is still more astonishing is, the enormous stones which compose the sloping wall. To the west, the second layer is formed of stones which are from twenty-eight to thirty-five feet long, by about nine in height. Over this layer, at the north-west angle, there are three stones, which alone occupy a space of 175 feet and one half; viz. the first, fifty-eight feet seven inches; the second, fifty-eight feet eleven; and the third, exactly fifty-eight feet; and each of these are twelve feet thick. These stones are of a white granite, with large shining flakes, like gypse; there is a quarry of this kind of stone under the whole city, and in the adjacent mountain, which is open in several places, and, among others, on the right, as we approach the city. There is still lying there a stone, hewn on three sides, which is sixty-nine feet two inches long, twelve feet ten inches broad, and thirteen feet three in thickness. By what means could the ancients move these enormous masses? This is doubtless a problem in mechanics curious to resolve. The inhabitants of Balbec have a very commodious manner of explaining it, by supposing these edifices to have been constructed by Djenoun, or Genii, who obeyed the orders of king Solomon; adding, that the motive of such immense works was to conceal, in subterraneous caverns, vast treasures, which still remain there. To discover these, many have descended into the vaults which range under the whole edifice; but the inutilty of their researches, added to the oppressions and extortions of the governors, who have made their supposed discoveries a pretext, have at length disheartened them; but they imagine the Europeans will be more successful; nor would it be possible to persuade them, but what we are possessed of the magic art of destroying Talismans. It is in vain to oppose reason to ignorance and prejudice: and it would be no less ridiculous to attempt to prove to them that Solomon never was acquainted with the Corinthian order, which was only in use under the Roman emperors. The tradition which ascribes the buildings at Balbec, and also at Palmyra, to Solomon, and on which the inhabitants of the country confidently rely, is founded on an opinion generally prevalent, of his wisdom and love of pleasure, with both which the magnificence, beauty, and disposition, of these buildings perfectly agree; and on the mention of "Tadmor in the wilderness, and the tower of Lebanon looking towards Damascus," which are said in the Old Testament to have been built by his direction. Some have supposed that these are the ruins of a temple of the sun, built by the Phœnicians, because it is certain that the sun was worshipped at this place when the Phœnicians were in their most flourishing state. Others have thought, that these buildings were erected by the Greeks, who succeeded the Phœnicians in the possession of this country, because they are of the Corinthian and Ionic order; but as they are not mentioned from the time of Alexander's conquest to that of Pompey, there is great reason to suppose that they are of later date.

When we consider the extraordinary magnificence of the temple of Balbec, we cannot but be astonished at the silence of the Greek and Roman authors. Mr. Wood, who has carefully examined all the ancient writers, has found no mention of it, except in a fragment of John of Antioch, surnamed Malala, who attributes the building of this edifice to Antoninus Pius. He says that this emperor "built a great temple to Jupiter at Heliopolis, near Libanus, in Phœnicia, which was one of the wonders of the world." This is the only historical authority that has yet been dis-

covered relating to this subject. As these buildings seem to have been erected between the time of Pompey and Caracalla, it is very probable that they were the work of Antoninus Pius. The inscriptions which remain corroborate this opinion, which perfectly accounts for the constant use of the Corinthian order, since that order was not in general use before the third age of Rome; but we ought by no means to allege as an additional proof, the bird sculptured over the gate, for if his crooked beak, large claws, and the caduceus he bears, give him the appearance of an eagle, the tuft of feathers on his head, like that of certain pigeons, proves that he is not the Roman eagle: besides that the same bird is found in the temple of Palmyra, and is therefore evidently an oriental eagle, consecrated to the sun, who was the divinity adored in both these temples. His worship existed at Balbec, in the most remote antiquity. His statue, which resembled that of Osiris, had been brought thither from the Heliopolis of Egypt, and the ceremonies with which he was worshipped there have been described by Macrobius, in his curious work, intitled, "Saturnalia." Mr. Wood supposes, with reason, that the name of Balbec, which in Syriac signifies *City of Baal*, or of the Sun, originated in this worship. The Greeks, by naming it Heliopolis, have, in this instance, only given a literal translation of the oriental word, a practice to which they have not always adhered. We are ignorant of the state of this city in remote antiquity; but it is to be presumed that its situation, on the road from Tyre to Palmyra, gave it some part of the commerce of those opulent capitals. Under the Romans, Heliopolis was constituted a colony by Julius Cæsar, and in the time of Augustus, it is mentioned as a garrison town, for it received part of the veterans of the fifth and eighth legions; and there is still remaining, on the wall of the southern gate on the right, as we enter, an inscription which proves the truth of this, the words *Kenturia Prima*, in Greek characters, being very legible. One hundred and forty years after, Antoninus built there the present temple, instead of the ancient one, which was doubtless falling into ruins; but Christianity having gained the ascendancy under Constantine, the modern temple was neglected, and afterwards converted into a church, a wall of which is now remaining, that hid the sanctuary of the idols. It continued thus until the invasion of the Arabs, when it is probable they envied the Christians so beautiful a building. The church being less frequented, fell to decay; was succeeded, and it was converted into a place of defence; battlements were built on the wall which surrounded it, on the pavilions, and at the angles, which still subsist; and from that time, the temple, exposed to the ravages of war, fell rapidly to ruin.

The state of the city is not less deplorable: the wretched government of the Emirs of the house of Harfouthe had already greatly impaired it; and the earthquake of 1759 completed its destruction. The wars of the Emir Yousef, and Djezzar, have rendered it still more deserted and ruinous: of 5000 inhabitants, at which number they were estimated in 1751, not 1200 are now remaining, and all these poor, without industry or commerce, and cultivating nothing but a little cotton, some maize, and water-melons.

BALBI, JOHN, in *Biography*, a learned Dominican monk of the thirteenth century, was born at Genoa, and hence called "Balbi Januensis;" and distinguished as the author of a grammatical work, intitled "Catholicon," finished in 1286, and entitled to attention principally from its having been one of the first printed books. It was printed in folio at Mentz, in 1460; and this edition is become very scarce.

BALBIAN, JUSTUS, of Alost, in Flanders, studied

at Padua, where he was admitted doctor in medicine, which he practised with considerable reputation, towards the latter end of the sixteenth century, at Gouda. He openly professed the Calvinistic religion, in which faith he died in 1616, and was buried in the principal church of that city, with the following inscription on his tomb:

Singulos dies, singulas vitas puta,
 Justi a Balbian, [sepulchrum:
 Flandri Alostani, Philo-Chymici, ejusque heredum
 Ille heri, ego hodie, tu cras.
 Obiit anno 1616.

In 1539, he published "De Lapide Philosophico Tractatus Septem," Lugd. Bat. 8vo. It is a collection of the works most esteemed among the adepts at that time, among whom our author must be classed. The year following he published at Venice, "Nova Ratio Praxeos Medicæ," Haller. Bib. Med. P. Eloy. Dict. Hist.

BALBINUS, DECIMUS COELIUS, a Roman emperor, was a descendant of a noble family, founded by Cornelius Balbus Theophanes, originally of Cadiz in Spain, who was the friend and historiographer of Pompey, and admitted into the freedom of the city under his patronage. Balbinus was distinguished both as a poet and an orator; and as a magistrate he had governed several provinces with reputation. His fortune was affluent; and his manners liberal and affable. After the defeat and death of the two Gordians, on the 3d of July, A. D. 237, Balbinus was elected emperor by the senate in conjunction with Maximus. Their election was soon succeeded by a tumult at Rome, occasioned by a licentious multitude; who neither loved the rigid Maximus, nor sufficiently feared the mild and humane Balbinus; and who surrounding the temple of Jupiter, demanded, that, besides the two emperors chosen by the senate, a third should be added of the family of the Gordians, as a just return of gratitude to those princes who had sacrificed their lives for the republic. Accordingly, Maximus and Balbinus being driven back into the capitol, a boy, thirteen years of age, the grandson of the elder, and nephew of the younger Gordian, was presented to them, and invested with the title and ornaments of Cæsar. The tumult was appeased by this easy condescension; and the two emperors, as soon as they had been peaceably acknowledged in Rome, prepared to defend Italy against the common enemy. Maximus marched against Maximin, who was then laying siege to Aquileia; but this tyrant having been abandoned by his guards, and assassinated in his tent, Maximus returned in triumph to Rome, and was received with cordial congratulations, not only by his colleague and young Gordian, but by the senate and the people, who persuaded themselves that a golden age would succeed an age of iron. The conduct of the two emperors corresponded with these expectations. The rigour of the one was tempered by the clemency of the other; the oppressive taxes imposed by Maximin were repealed or moderated, discipline was revived, and many salutary laws were enacted. "What reward," said Maximus, "may we expect for delivering Rome from a monster?" To which question Balbinus replied, "the love of the senate, of the people, and of all mankind." "Alas!" rejoined his more penetrating colleague, "Alas! I dread the hatred of the soldiers, and the fatal effects of their resentment." His apprehensions were justified by the event. At length jealousies broke out between the two emperors, and they were thus prevented from uniting in any vigorous measures of defence against their common enemies of the Prætorian camp. These fierce troops, proceeding to an open revolt, seized on both the emperors, stripped them of their garments, dragged them

them ignominiously through the streets of Rome, and terminated the tragedy by inhumanly massacring them. Thus they both fell after a reign of little more than a year, July 15th, A. D. 238. Crevier's Hist. Emp. vol. viii. p. 382, &c. Gibbon's Hist. vol. i. p. 290—305.

BALBOA, VASCO NÚÑEZ DE, a famous Spanish adventurer, was a native of Castile, and one of those who formed a settlement in Hispaniola. In 1510, he commanded a feeble colony, established at Santa Maria al Antigua, or the ancient, so called because it was the first settlement on the southern continent of America. Anxious for being invested with a legal title to the supreme command, he dispatched one of his officers to Spain, in order to solicit a royal commission; and with a view of more effectually recommending himself to the patronage which he was endeavouring to obtain, he made frequent inroads into the adjacent country, subdued several of the caziques, and collected a considerable quantity of gold, which abounded more in that part of the continent than in the islands. In one of his expeditions he met with a young cazique, who expressed his astonishment at the high value which was set upon the gold, which the Spaniards were weighing and distributing: "Why do you quarrel," said he, "about such a trifle? If you are so passionately fond of gold, as to abandon your own country, and to disturb the tranquillity of distant nations for its sake, I will conduct you to a region where the metal, which seems to be the chief object of your admiration and desire, is so common that the meanest utensils are formed of it." Transported with the intelligence, Balboa eagerly inquired where this happy country lay, and how they might arrive at it. The cazique informed them, that at the distance of six suns, or six days journey to the south, they would discover another ocean, near which this wealthy kingdom was situated; but if they intended to attack it, they must assemble forces far superior in number and strength to those which now attended them. This was the first information which the Spaniards received concerning the great southern continent known afterwards by the name of Peru. Balboa diligently prepared for the enterprise; and possessing talents for conducting so hazardous and almost desperate an undertaking as that of marching across the isthmus of Darien, he arranged his troops, amounting upon a muster to only 190 men, who were hardy veterans, that had been inured to the climate of America, and who were ready to follow him through every danger. A thousand Indians attended them to carry their provisions; and to complete their warlike array, they took with them several of those fierce dogs which were no less formidable than destructive to their naked enemies. On the 1st of September, A. D. 1513, he set out on this expedition; and having continued their progress for 25 days through woods and mountains, and amidst contending enemies, he at length reached the top of a mountain from which he was able to discover the ocean, which was the object of their wishes. On viewing this glorious spectacle, which no European eye had ever before beheld, he fell on his knees, and returned thanks to heaven with uplifted hands for conducting him to a discovery so beneficial to his country, and so honourable to himself. His followers united with him in expressions of wonder, exultation, and gratitude. Pursuing their course, they at length arrived at the shore of the ocean; when Balboa, advancing into the waves with his sword and buckler, took possession of it in the name of the king his master, and vowed to defend it with these arms against all his enemies. The part of the great Pacific, or Southern ocean, which Balboa first discovered, still retains the name of the gulf of St. Michael, which he gave to it, and is situated to the east of Panama.

Here he obtained a supply of provisions; and partly by force and partly by free gift, he enriched himself with a considerable quantity of gold and of pearls. He also received information, that there was a mighty and opulent kingdom situated far towards the south-east, where the inhabitants had tame animals, meaning the Llamas afterwards found in Peru, to carry their burdens. His followers were exhausted by fatigue and disease; and he therefore determined to lead them back, instead of attempting to take possession of this country, to their settlement at Santa Maria in Darien; and, after an absence of four months, he returned to it with greater glory and more treasure than the Spaniards had hitherto acquired in any of their expeditions against the New World. Balboa hastened to transmit information of his important discovery to Spain, and to solicit a reinforcement of 1000 men for the conquest of the opulent country, of which he had received so favourable an account. Ferdinand, the king of Spain, determined to avail himself of the intelligence which Balboa had communicated; but regardless of his merit, he appointed Pedrarias Davila to supersede him in the government of Darien. He also provided him with a well equipped fleet and 1200 soldiers, who were joined by a great number of voluntary adventurers. Upon their arrival at Darien, they found Balboa, whose fame had reached Spain, and of whose opulence they had formed such high ideas, clad in a canvas jacket, with coarse hempen sandals, and employed in thatching his own tent with reeds. Balboa, however, received them with dignity; and treated Pedrarias with the deference due to his character. Pedrarias appointed a judicial inquiry to be made into Balboa's conduct, and imposed upon him a considerable fine. At length resentment on the part of one, and the envy of the other, produced dissensions which were very detrimental to the colony. Pedrarias lost many of his men by sickness, and this distress was further augmented by an extreme scarcity of provisions; and the new governor incensed the natives by rapacious proceedings, which desolated the whole country from the gulf of Darien to the lake of Nicaragua. Balboa sent violent remonstrances to Spain against the imprudent government of Pedrarias, which had ruined a happy and flourishing colony; and Pedrarias recriminated by accusing him of having deceived the king, by magnifying his own exploits, as well as by a false representation of the opulence and value of the country. Ferdinand, sensible of his own imprudence in having superseded Balboa, appointed him Adelantado or lieutenant-governor of the countries upon the South sea, with very extensive privileges and authority; and he enjoined Pedrarias to avail himself of Balboa's counsel in all his operations. After some time Pedrarias and Balboa were apparently reconciled; and by way of cementing the union between them, the former agreed to give his daughter in marriage to the latter. This happened in 1515. Jealousy still rankled in the breast of the governor; and when Balboa had with much labour finished four small brigantines, and provided 300 chosen men, in order to sail towards Peru, Pedrarias desired him to postpone the voyage; and having solicited an interview, ordered him to be arrested, and then to be tried on an accusation of disloyalty to the king, and of an intention to revolt against the governor. He was found guilty, and sentence of death was pronounced; and though the judges who passed it, seconded by the whole colony, warmly interceded for his pardon, the governor continued inexorable; and the Spaniards beheld, with astonishment and sorrow, the public execution of a man whom they universally deemed more capable than any who had borne command in America, of forming and accomplishing great designs. Upon his premature death in 1517, at the age of

42, the expedition, which he had planned, was relinquished. Balboa was distinguished among his countrymen by a variety of important and useful qualities, adapted to the station he occupied, and the services in which he engaged. Besides bravery, which he possessed in an eminent degree, he was prudent in conduct, generous, affable, and possessed of those popular talents which, in the most desperate undertakings, inspire confidence and secure attachment. Robertson's *Hist. Amer.* vol. i. p. 276—301.

BALBRIGGEN, in *Geography*, a small port town of Ireland, in the county of Dublin. It has a safe harbour with a pier, within which ships of 200 tons burden may lay their broadsides, and unload on the quay. The base of the pier is 18 feet thick, and on the outside is a considerable rampart of large fragments of rock, sunk to defend the pier against the waves. At this town there once was an extensive cotton manufactory; but it has lately declined so much, that the proprietors are now converting one of their principal cotton mills into a flour mill. Many of the inhabitants derive a subsistence from fishing, in which nine wherries are employed. On the shore near the town is a slate rock, which is a good quarry for blocks of sufficient size for making ton slates. It is distant from Dublin $15\frac{1}{2}$ Irish miles. N. lat. $53^{\circ} 36'$. W. long. $6^{\circ} 13'$.

BALBUL, in *Ornithology*, a species of *ANAS*, or duck, having a black beak, and spot of the wing above obliquely green, beneath obliquely black. Forst. *Fn. Arab.*

BALBURA, in *Ancient Geography*, a town of Asia Minor, in Cabellia, a country of Caria, situated in the vicinity of Cibyra Major. When the prætor Murena extended the principality of Cibyra, Balbura was annexed to Lycia.

BALBUS, a mountain of Africa, between the town of Clupea, the territory of Carthage, Numidia, and the sea. Hither Masinissa retired, after having been defeated by Syphax, king of Numidia.

BALBUSARDUS, in *Ornithology*. See **BALD-BUZZARD**.

BALCASH, **TENGIS**, or **PALKATI**, in *Geography*, a lake of Independent Tartary, in the country of the Kalmuks, subject to China, is about 140 British miles in length by half that breadth; being the largest lake in Asia, next to the seas of Aral and Baikal.

BALCDUTHA, a settlement in the eastern part of Kentucky, in America, on the west side of Big Sandy river.

BALCH, a river of Germany, which runs into the Rhine at Cologne.

BALCHIKANSKOI, a town of Siberia, 140 miles south-west of Doroninsk.

BALCHUYSEN, a town of Germany, in the circle of Westphalia, and duchy of Juliers, nine miles west of Cologne.

BALCONY, from the French *balcon*, in *Architecture*, a kind of open gallery without the walls of buildings, contrived chiefly for the convenience of looking around, seeing processions, cavalcades, and the like.

Where there is but one, it is usually in the middle of the front of the edifice, and level with the first floor: sometimes they are made of wood, sometimes of cast iron; the former surrounded with a rail or balustrade, the latter wrought in various figures in *demis-relievo*. Some are also made of bar iron, fashioned in crail-work, or flourishes of divers fancies.

BALCONY, in a ship, denotes a gallery either covered or open, made abaft, either for ornament or convenience of the captain's cabin.

BALDA, in *Ancient Geography*, a town of Hispania Bætica, in the country of the Turduli. Ptolemy.

BALDACANIFER, corruptly also written *balcanifer*, denotes a standard-bearer; chiefly in the ancient order of knights Templars.

BALDACHIN, or **BALDAQVIN**, in *Architecture*, a building in form of a canopy, supported with columns, and serving as a crown or covering to an altar.

The word comes from the Italian *baldachino*, which signifies the same.

BALDACHIN, or *Baldakin*, or *Baldekin*, popularly *Bau-dekin*, in *Middle Age Writers*, denotes a rich kind of cloth made of gold warp and silk wool, variously figured. It took the denomination from its being formerly brought into these countries from *Baldacio*, or Babylon.

BALD-BUZZARD, in *Ornithology*, the name under which *FALCO Haliaëtus* is described by Willughby and other English naturalists. It is also called *balbuzzard* by Buffon.

BALD-EAGLE, in *Geography*, or *Warrior Mountains*, lie about 200 miles W. of Philadelphia, in the county of Bedford, in Pennsylvania, and form the western boundary of Bald-eagle valley.

BALD-EAGLE is also a river which runs a north-east course forty-four miles, and falls into the western branch of the Susquehanna river. The water of Huron river, which falls into the lake Erie, is called Bald-eagle creek.

BALD-EAGLE Valley, or *Sinking-Spring Valley*, lies upon the frontiers of Bedford county in Pennsylvania, about 200 miles west of Philadelphia. On the east it has a chain of high rugged mountains, called the "Canoe ridge;" and on the west, the "Bald-eagle," or Warrior mountains. It is a pleasant vale of lime-stone bottom, about five miles wide; and its vicinity abounds with lead-ore. In 1779, it contained about 60 or 70 families that lived in log-houses, and formed in seven or eight years several valuable plantations. Among the curiosities of this place is that called the "Swallows," which absorb several of the largest streams of the valley, and after conveying them several miles under ground, return them again upon the surface. These subterraneous passages have given occasion to the name of "Sinking-Spring Valley." Of these the most remarkable is called the "Arch Springs," which run close upon the road from the town to the fort; being a deep hollow formed in the limestone rock, about thirty feet wide, covered with a stony arch, and giving passage to a fine stream of water. The subterraneous river enters the mouth of a spacious cave, whose exterior aperture is sufficient to admit a shallop with her tails full spread; and in the midst of this cave, from eighteen to twenty feet wide, are timber, bodies and branches of trees, &c. which being lodged up to the roof of the passage, shews that the water rises to the top during freshes. The cave, extending about forty yards, widens into a large kind of room, at the bottom of which is a vortex, where the water forms a whirlpool, and absorbs pieces of floating timber, which are instantly conveyed out of sight. From the top of the Bald-eagle mountains there is a fine prospect of those of the Alleghany, stretching along till they seem to meet the clouds. Much slate is found here; and there are strong signs of pit-coal.

BALDEGG, a lake of Swisserland, four miles long and one wide; nine miles S.S.W. of Bremgarten.

BALDENAU, a town of Germany, in the circle of the lower Rhine, and bishopric of Treves; 36 miles S.S.W. of Coblentz.

BALDERIC, in *Biography*, a French historian, a native of Orleans, lived in the 12th century, and was bishop of Dole in Brittany. He assisted at the council of Clermont, held on occasion of the holy war, and wrote a history of that war in four books, containing an account of the events

events of that fanatical expedition from its commencement to the year 1099, when Jerusalem was taken by Godfrey of Bouillon. This work may be found in "Geſta Dei per Francos à Bongaro," folio, 1511. He alſo wrote "Poems," preferred in the fourth volume of Du Chefne's collection of French hiſtorians. *Nouv. Diſt. Hiſtor.*

BALDERN, in *Geography*, a town of Germany, in the circle of Swabia, and county of Ottingen, one mile S.S.E. of Zobing.

BALD-HEAD, a cape of the north-weſt coaſt of America, and on the weſt coaſt of Norton ſound. N. lat. 64° 43'. E. long. 198° 18'.

Bald-head is alſo the ſouthernmoſt of two heads on the eaſt coaſt of Newfoundland, between Fermowes harbour on the S.S.W. and fort Agua on the N.N.E.

Baldhead lies alſo at the mouth of Cape Fear river in North Carolina, and being at the ſouth-weſt end of Smith's iſland, forms with Oak iſland the main entrance into the river.

Bald-head makes alſo the ſouth-weſt part of what is called Wells bay, in the diſtrict of Maine.

BALDI, **BERNARDINO**, in *Biography*, a learned Italian, was born at Urbino, in 1553. Such was his ardour in the proſecution of knowledge, that he ſacrificed both his meals and his ſleep to the attainment of it. Having ſtudied mathematics under Commandino in the place of his nativity, he purſued his ſtudies in the univerſity of Padua; where in his twentieth year, he was diſtinguiſhed by his literary application and proficiency. Such was his acquaintance with the Greek language, that he tranſlated the *Phænomena* of Aratus into Italian verſe, and other Greek writers into Latin; and he poſſeſſed ſuch a talent for acquiring the knowledge of languages, that he learned twelve of them, ſeveral of which were oriental. When he left Padua, he became mathematician to Ferrante Gonzaga II. duke of Guſtalla; and in 1586, he was created abbot of Guſtalla, which church he governed for many years with great reputation. At Rome, where he ſpent part of his time, he obtained the title of apoſtolic prothonotary. Towards the latter part of his life, he reſigned the church of Guſtalla, and retiring to Urbino, devoted himſelf entirely to his ſtudies. He died in that city in 1617, at the age of 64 years. Baldi obtained as high a rank among the Italian poets as he poſſeſſed among the ſcholars and mathematicians. In paſtoral poetry, his "Celeo," or "Orto," is thought to be excelled by few works in the language; and his blank verſe is much eſteemed. In mathematics and mechanics his labours were numerous. He tranſlated into Italian the Greek work of Hero of Alexandria, "On Automata, or ſelf-moving Machines;" and into Latin, the ſame author's treatiſe, "On warlike Machines." He alſo wrote "Exercitations on the Mechanics of Aristotle," and published two Latin works relative to Vitruvius, the one containing an explanation of all the terms uſed by him, and the other inquiring into the meaning of his "Scamilli impares." A poſthumous work, intitled, "Cronica de Mathematicis," being a compendium of a larger one on the lives of mathematicians, was printed in 1707. Many other monuments of his genius and induſtry, which obtained reputation in their time, are now conſigned to oblivion. *Nouv. Diſt. Hiſtor. Gen. Biog.*

BALDI, **DE UBALDIS**, a celebrated lawyer, was born at Perugia in 1319, and carefully educated by his father Francis Ubaldi, a learned phyſician. After having ſtudied law at Perugia under Bartoli, he became a preceptor, and acquired high reputation in moſt of the univerſities of Italy. He was the rival of his maſter Bartoli, and contradicted many of his opinions. The duke, John Galeazzo, was his

generous patron; and he was liberally rewarded by pope Urban VI. for pleading his cauſe againſt Clement. Having retained the full vigour of his faculties and his diſtinguiſhed reputation as an oracle of jurisprudence till the year 1400, when he had attained the age of 76, he died at Pavia, in conſequence of the bite of a dog, with which he was playing. His numerous treatiſes of law, published in three volumes folio, manifeſt deep knowledge and excellent talents; but they are written too much in the barbarous ſtyle of the age. His reputation was ſo great, that his family after his death aſſumed the name of Baldeſchi inſtead of that of Ubaldi. *Nouv. Diſt. Hiſtor.*

BALDINGER, **ERNESTUS GOTTFRIED**, a medical writer, of whom we have no memorial, but that, in 1764, he published at Berlin "Introductio in Notitiam Scriptorum Medicinæ Militaris," 8vo. a valuable work, in which, beſides the titles of the books, the author has given a critical account of their contents. *Haller. Bib. Med. Pract.*

BALDINI, **JOHN ANTHONY**, *Count*, was born at Placentia, July 7, 1654, finiſhed his ſtudies at Bologna and at Rome, and then travelled into France and Poland. In 1698, he went to Spain, and continued there nine years as ambaffador from the duke of Parma. On his return to Parma, he was again diſpatched to German courts, and at laſt to England, whence he was ſent to attend the congreſs at Utrecht. His figure was handſome, and his manners engaging; and the greater part of his time was devoted to the ſtudy of natural philoſophy, mathematics, and more eſpecially civil and eccleſiaſtical hiſtory. In England, he was elected fellow of the Royal Society; and in Spain, he collected many rare gems, with a view of having them engraved; but in the progreſs of this work he was interrupted by his public occupations and travels. At Amſterdam, he enriched his cabinet of curioſities with many Indian and Chineſe ſubjects; and he purchaſed, at a great expence, all the lexicons, atlases, and books of travels he could procure that related to the Eaſtern countries. The editor of the "Atlas Hiſtorique," in 5 vols. published at Amſterdam in 1719, was much indebted to Baldini's collection; and the diſcourſe annexed to theſe maps was originally written in Italian by Baldini. On the 23d of February 1725, Baldini died, in conſequence of a ſtroke of the apoplexy. *Gen. Biog.*

BALDINUCCI, **PHILIP**, was born at Florence in 1624; and diſtinguiſhed himſelf by his knowledge of the arts of deſign, and his reſearches concerning the lives of their profeſſors. His great undertaking was a general hiſtory of the moſt eminent painters from Cimabue to his own time, comprehended in ſix volumes, and divided into centuries. A new edition of this whole work was published at Florence in 1731, and it has been ſince reprinted at Florence and at Turin, with copious notes and additions, by Sig. Ingegnerè Piacenza. Baldinucci likewiſe published "A Vocabulary of Deſign," in conſequence of which he was admitted into the Academy della Cruſca. His work, intitled, "The Commencement and Progreſs of the Art of Engraving on Copper," Florence, 1686, 4to. abounds with curious information. He alſo published ſeveral ſmaller works; one of which drew upon him a furious and unjuſt attack from Cimilli. He died in 1695, at the age of 72 years. *Nouv. Diſt. Hiſtor.*

BALDINUS, **BERNARD**, an Italian phyſician, who flouriſhed about the middle of the ſixteenth century, taught medicine at the univerſity of Padua, and afterwards at Milan, where he died in the year 1600. In 1562, he published at Venice, "Problemata excerpta ex Commentariis Galeni in Hippocratem," 8vo.

BALDINUS, *Buccius*, another Italian physician of the same age, published, at Florence, "In Librum Hippocratis, de Aquis, Aere, et Locis, Commentaria;" "Tractatus de Cucumeribus," 1586, 4to. Haller. Bib. Med. Eloy. Dict. Hist.

BALDIVIA, or **VALDIVIA**, in *Geography*, the name of a government in the kingdom of Chili, in South America. It was formerly subject to the viceroy of Lima, but is now annexed to the jurisdiction of the president of Chili. *Baldivia*, or *Valdivia*, is also the name of a port town, situated on the north-east side of a bay of the same name, in S. lat. 40° 5'. W. long. 80° 5'. The town was built by the Spanish general Baldivia, about the year 1551; in 1559, the people of Chili chased the Spaniards from this settlement, burned the town, and put the inhabitants to the sword. Near this place are many gold mines, and therefore the Spaniards have fortified it, regarding it as the key to the South seas; and the fortifications are supported by the whites of Peru and Chili, who are banished hither for their crimes. In 1643, it was taken possession of by the Dutch; but they were compelled to abandon it, and to leave all their cannon, consisting of 30 or 40 pieces, their baggage, and their stores, on receiving intelligence that succours were transmitted from Peru. Valdivia receives from the treasury of Lima an annual supply of 70,000 dollars; 30,000 in specie, the value of 30,000 in cloths for the soldiers, and 10,000 in specie which is paid to the king's soldiers at Santiago, in order to purchase flour and other necessaries for the garrison at Valdivia. These remittances are conveyed in ships which sail from Valparaíso. The bay has a narrow entrance, and is spacious within; it is well secured from winds by point Galera and Bonifacio, which is remarkable for its high land just on the north of the bay. The rivers of Baldivia and Guyaquil are the largest on this coast; but neither of them can carry a ship of burden six leagues within land.

BALDMONIE, an old English name for gentian, the root of which is used in medicine; some also have called the *meum*, or spignel, by this name.

BALD-MOUNTAIN, in *Geography*, a noted promontory in the gulf of St. Lawrence, in North America, being a mark on the main, about 30 leagues from the nearest or north-west point of Anticosti island.

BALDNESS, **CALVITIS**, a falling of the hair, especially that of the scalp.

It differs from *alopecia*, *areæ*, *ophiopsis*, and *tinea*, as these all arise from some vice in the nutritious humour; *baldness*, from the defect of it. But the distinction is not always observed by modern physicians.

When the eyelids shed their hair, it is called a *pileosis*. Among the causes of baldness, immoderate venery is reputed one of the chief: old age usually brings it on of course. Some will have the proximate cause of baldness to be the dryness of the brain, and its shrinking from the cranium; it having been observed, that in bald persons there is always a vacuity or empty space between the skull and the brain.

Buffon says, that the crown of the head, and the space immediately above the temples, are the parts which first become bald; but that the hair below the temples, and on the inferior part of the back of the head, seldom falls off. He adds, baldness is peculiar to man: women, in the most advanced age, though their hair becomes white, are seldom affected with baldness. Children and eunuchs are not more subject to it than women. It is alleged by Aristotle, that no man becomes bald before having intercourse with women, except such as have been bald from their birth. The ancient writers upbraided the inhabitants of the

islands of the Archipelago with the epithet "bald-heads;" and assert, that these islanders are all brought into the world with this defect. Buff. Nat. Hist. by Smellie, vol. ii. p. 442.

Calvus, *bald pate*, was a frequent term of reproach among the Romans; among whom this defect was in great discredit. Hence divers arts to conceal it, as false hair, and a *galericulus*, contrived on purpose. The later Romans, however, seemed to have been reconciled to baldness; for we find among them a kind of officers or servants, called *glabratores*, or *glabrarii*, whose business was to take off the hair from all parts, even from the head. In an ancient inscription, there is mention of one Diophantus, *TI. CÆSARIS. ORNATOR. GLABR.* that is, *ornator glabrarius*. See **ALOPECIA**.

BALDO, **MOUNT**, in *Geography*, a part of the Alps, in the Aultrian territories, lying on the east of the lake Garda, and separating the country of Tyrol from that of Verona, about 30 miles in circumference.

BALDOCK, **RALPH DE**, in *Biography*, an English divine of the fourteenth century, was educated at Oxford, appointed bishop of London in 1304, chosen in 1307 lord chancellor of England, and in 1313 died at Stepney. His history of the British affairs, intitled, "Historia Anglica," seen by Leland, is now lost. Biog. Brit.

BALDOCK, in *Geography*, is a neat and pleasant market town of Hertfordshire, in England. It is seated between hills on that great Roman road which bore the name of Ickling-way, or Icknield-street. This town has been considerably improved of late years by the erection of many respectable houses; and being on a great travelling road, it has a constant succession of new company. Here are a good market on Thursday, and five annual fairs; the former is plentifully supplied with barley; and a great quantity of malt is made in this town. Baldock dates its origin and the foundation of its church to an earl of Pembroke, who granted two hundred acres of waste land, in the reign of king Stephen, for that purpose. This was conferred on the knights Templars, who dedicated the church to the Virgin Mary, and named the town Balbec, from the name of their former place of residence in Syria. The knights hospitalers of St. John, and those of Jerusalem, also erected buildings at the east end of the town, in the parish of Clothall. On the hills in the vicinity are four ancient encampments. Here is an almshouse founded by William Winn, in 1621, for twelve poor widows, who are also provided with a small legacy of forty shillings annually by the will of the same worthy founder. According to the returns published by authority of the house of commons, this town has 231 houses, and 1283 inhabitants; of whom 648 are males, and 635 are females.

BALDOVINI, **FRANCESCO**, in *Biography*, an Italian poet, was born at Florence, in 1634. His first studies were devoted to the law, for which profession his father intended him; but after the death of his parents, he surrendered himself wholly to the enchantments of poetry and music. On visiting Rome, he obtained, through the interest of his uncle cardinal Flavio Chigi, the place of secretary to cardinal Jacopo Filippo, and at the age of 40, entered into holy orders. In 1676, he obtained the living of St. Leonardo d'Arminio; and in 1694, Cosimo III. grand duke of Tuscany, conferred on him the priorship of Orbatello, which he changed, in 1699, for that of Santa Felicità. In the discharge of his new functions, he gave equal satisfaction to the court, the religious orders, and his parishioners, by his exemplary piety, and his rigid attention to the duties of his station, to which the amiableness of his manners, his knowledge of the world, and his proficiency in learning, rendered

rendered him perfectly adequate. He lived in prosperity and health till his 82d year, and died in 1716. He excelled in that species of simple, rustic, and pleasant poetry, which is neither heroic nor burlesque, and which perhaps no poetry in our language resembles more than Gay's pastorals. His "Il Lamento di Cecco da Vaulungo," or "Cecco's Complaint," is a playful poem, written in the provincial dialect of Tuscany, and published first at Florence in 1694, by Barto Commi; and afterwards, in 1755, with the author's life by Domenico Manni, and curious notes by Marini. The poem was translated into English by John Hunter, esq. in 1800, London, 8vo. See the Translator's Preface.

BALDUS, or as he wrote his name, BADUS, SEBASTIAN, a native of Genoa, who flourished in the middle of the seventeenth century, was one of the earliest writers on the properties of the Peruvian bark, and the most strenuous assertors of its value. It appears that he passed the latter part of his life at Rome, where he was patronized by the cardinal De Lugo, himself an admirer of that celebrated medicine, and who procured a parcel of it to be imported from Spain into Italy, in 1649. Baldus learned from Bolli, a Genoese merchant, that the tree producing the bark, of which he gives a description, grows at Quito, a Spanish province in South America; and that its power in curing intermittents became first known to the Spaniards, from its being successfully administered to the countess of Cinchon, the wife of the governor. He is very diffuse in his account of the qualities of the bark, and of the most efficacious mode of administering it; and gives numerous examples of the cures performed by it, not only in intermittents, but in continued fevers likewise. His works, which are all controversial, are: "Sanguis expiatus, seu de Sanguine incalcescente," Genue, 1643; "Cortex Peruvianus redivivus, contra Plempium," Gen. 1656, 12mo.; "Anastasis Corticis Peruv. seu Chinæ Defensio contra Ventilationes J. Jacobi Chifflet, et gemitus V. F. Plempii," Genue, 1663, 4to.; "Necessitas Phlebotomie in Exanthematibus," Gen. 1663, 4to. Haller. Bib. Med. Pract. Eloy. Dict. Hist.

BALDUS, *Baldus*, M. D., a native of Florence, flourished about the middle of the seventeenth century. After acquiring considerable reputation in his own country, he removed to Rome, where he was soon advanced to be physician to pope Innocent the tenth, and archiater; but died a few months after being elevated to that post. He published, in 1631, "Prælectio de Contagione pestilifera," 4to.; and in 1637, "Disquisitio ad textum secundum Hippocratis, de Aere, Aquis, et Locis, accedit, de Calculorum Causis; Aquæ Tiberis Bonitate; Quæstio de majori nunc quam præterito Seculo, calculosorum in urbe frequentia," 4to. Hall. Bib. Med. Pract. Eloy. Dict. Hist.

BALDUS, in *Entomology*, a species of PAPHIO, with very entire brown wings; on the anterior ones above and beneath, an ocellar spot, with a double pupil; on the posterior ones, four ocellar spots above and six beneath. Fabricius. *Inhabitans India*. Donov. *Inf. Ind.*

BALDWIN I. in *Biography*, emperor of Constantinople, was born in 1172, and succeeded his father as count of Flanders and Hainault. In the fourth crusade, which commenced A.D. 1198, he assumed the cross at Bruges, together with his brother Henry, and the principal knights and citizens of the rich and industrious province of Flanders, and distinguished himself so much in the wars which preceded the capture of Constantinople, that after this event he was chosen emperor of the east, A.D. 1204. But the Greeks soon revolted against this foreign empire; and formed an alliance with John, or Calo-John, the revolted chief of the

Bulgarians and Walachians. Baldwin, in his attempt to recover Adrianople, from which the French and Venetians had been expelled, was drawn into an ambuscade by the feigned flight of the enemy, and taken prisoner, A.D. 1205. He soon after died in prison; but the time and manner of his death are not known. Some say that after a confinement of sixteen months, he was cruelly murdered by an amputation of his hands and feet, and by exposing his bleeding trunk to birds of prey. The Flemings for a long time believed that he was alive; and about twenty years after his death, found a hermit in a wood of the Netherlands, who was acknowledged as the true Baldwin, the emperor of Constantinople, and lawful sovereign of Holland. But the French court detected the impostor, and he was punished with an ignominious death. Baldwin, who was celebrated for his private virtues, and for his military and princely qualities, was succeeded in the empire by his brother Henry; and in his county of Flanders by his daughter Joan or Jane, who has been accused, by some grave historians, of sacrificing to her ambition the life of an unfortunate father. Gibbon's *Hist.* vol. xi. p. 190—262.

BALDWIN II. emperor of Constantinople, was the son of the emperor Peter of Courtenay; and in his eleventh year, succeeded his brother Robert, A.D. 1229. On account of his youth, John of Brienne, the veteran king of Jerusalem, was appointed to be regent, and invested for his life with the title and prerogatives of emperor, on the sole condition that Baldwin should marry his second daughter, and succeed, at a mature age, to the throne of Constantinople. The royal youth was sent to visit the western courts, and to obtain some supplies of men and money, for the relief of the sinking empire. He thrice repeated these mendacious visits, in which he seemed to prolong his day, and postpone his return. Of the twenty-five years of his reign, a greater number was spent abroad than at home; and in no place did the emperor deem himself less free and secure than in his native country and his capital. In his first visit to England he was stopped at Dover, and checked by a severe reprimand for presuming, without leave, to enter an independent kingdom. After some delay, he was permitted to proceed, and after a reception of cold civility, thankfully departed with a present of 700 marks. From the avarice of Rome he could only obtain the proclamation of a crusade, and a treasure of indulgences. By various humbling and ruinous expeditions, he at length returned to Romania, with an army of 30,000 soldiers, and obtained some partial and temporary success. But his poverty and weakness admitted of no effectual relief; and by the sale of sacred relics, such as the crown of thorns which had been placed on the head of Christ, a portion of the true cross, the baby-linen of the son of God, the lance, the sponge, and the chains of his passion, the rod of Moses, and part of the scull of John the Baptist, he could only raise a treasure of very limited extent, and of short duration. His kingdom was soon reduced to the limits of Constantinople; and in 1261, this city was taken from him by Michael Palæologus. Baldwin, with some of the principal families, embarked on board the Venetian galleys, and steered first for the isle of Eubœa, and afterwards for Italy, where the royal fugitive was entertained by the pope and Sicilian king with a mixture of contempt and pity. Having consumed thirteen years in soliciting the Catholic powers to join in his restoration, without success, he died in 1273, and his son Philip became the heir of an ideal empire; and by Catherine, the daughter of Philip, it was transferred, in consequence of her marriage, to Charles of Valois, the brother of Philip the fair, king of France. Gibbon's *Hist.* vol. xi. 273—287.

BALDWIN, archbishop of Canterbury, was born of obscure parents at Exeter, where he received the rudiments of a classical education, and taught school; and afterwards he took orders, and was preferred to the archdeaconry of his native place. But changing his course of advancement, he assumed the monastic habit in the Cistercian order, and rose through the abbacy of his monastery to the episcopal see of Worcester, and from thence, in 1184, to the metropolitan see of Canterbury. From the monks he met with some obstruction in this last stage of his preferment; and therefore, in order to counteract their interest and power, he formed a plan for establishing a church and monastery at Hackington near Canterbury, for the reception of secular priests; but the monks, by their interest with the pope, disconcerted the design. Under the next pope the project was resumed, and Baldwin purchased a manor at Lambeth, where, upon the spot where the archbishop's palace now stands, he began to build his college, with the materials collected at Hackington; but he did not live to complete his design. In 1189, he performed the ceremony of coronation for Richard I. at Westminster; and upon the translation of the bishop of Lincoln to the see of York, he took occasion to establish the pre-eminence of the archbishop of Canterbury, by forbidding any English bishop to receive consecration from any other hands than those of this metropolitan. Archbishop Baldwin took a part in the crusade for the recovery of the holy land, and when Richard I. conducted an army into Palestine, this prelate appeared in his train; and by his private contributions and pious exhortations encouraged the enthusiastic adventurers to persevere. At the siege of Acre or Ptolemais, or, as some relate, at Tyre, the bishop was seized with a violent disorder, which terminated in his death, A.D. 1191, or A.D. 1193. During his illness, he directed his executor, the bishop of Salisbury, to distribute, at his discretion, all his effects among the soldiers. He was distinguished by his humanity and generosity; but the mildness of his temper betrayed him into remissness in his pastoral offices; so that a letter was addressed to him by pope Urban III. with this superscription; "Urban, bishop, servant of the servants of God, to Baldwin, a most zealous monk, a fervent abbot, a lukewarm bishop, and a negligent archbishop." Baldwin wrote several tracts, chiefly theological, which were collected and published by father Tisser, and which may be found in the fifth volume of the "Bibliotheca Cisterciensis." Cave, H. L. vol. ii. p. 250. Biog. Brit.

BALDWIN'S Phosphorus, in *Medicine*, a phosphorescent substance, formed by calcining the nitrat of lime in a low red heat. See **PHOSPHORUS**, *Baldwin's*.

BALE, JOHN, in Latin *Baleus*, in *Biography*, an English divine and historian, was born at Cove, near Dunwich, in Suffolk, in the year 1495. From the monastery of Carmelites at Norwich, where he was entered at the age of twelve years, he was sent to Jesus college in Cambridge. Bale, probably illuminated by lord Wentworth, and partly conceiving a dislike to celibacy, abandoned the church of Rome in which he was educated, and became a zealous protestant. The acrimony and vigilance with which his writings against popery were tinged, exposed him to a variety of severe persecution; and after the death of lord Cromwell, whose protection he enjoyed in early life, he was under a necessity of seeking an asylum in the Netherlands. Upon the accession of Edward VI. he returned to England, and, distinguished by his zeal for the reformation, he was first presented to the living of Bishop's Stoke in the county of Southampton, and afterwards obtained, by nomination from the crown, the bishoprick of Ossory in Ireland; and in 1553,

consecrated by the archbishop of Dublin. In this situation, by his attachment to the doctrines of the reformation, he was subjected to constant terror, and his life was frequently in danger. On occasion of one tumult, five of his domestics were killed in his presence, and he escaped by the seasonable protection of an armed force. Of his alarms and troubles in Ireland, he has given a particular account in his "Vocacyon of John Bale to the Bishopricke of Ossory in Irelande, his Persecutions in the same, and final Deliverance;" printed in black letter, folio, 1553. In making his escape, after temporary concealment in Dublin, the trading vessel in which he was conveyed away was taken by a Dutch man of war, and he was stripped by the captain of all his money and effects. Being driven by stress of weather on the coast of Cornwall, the bishop was seized on suspicion of treason, in consequence of the accusation of a pilot, who wished to share his money; and a similar charge was brought against him at Dover, whither he was conveyed in the same ship. Being removed as a prisoner to Holland, he was under a necessity of purchasing his liberty by a large ransom; and after his liberation he removed from Holland to Basil in Switzerland, and remained abroad till the end of queen Mary's reign. Upon the accession of Elizabeth, he returned to England; and fearful of encountering the difficulties and hazards of his Irish see, he retired to a prebendal stall in the church of Canterbury, to which he was preferred in 1560; and here he died in November 1563, in the sixty-eighth year of his age. Before his conversion from popery, Bale composed many scriptural interludes, founded upon incidents recorded in the New Testament; such as the life of St. John the Baptist, Christ in his twelfth year, baptism, and temptation, the resurrection of Lazarus, the council of the high-priests, Simon the leper, the Lord's supper, and his washing the feet of his disciples, Christ's burial and resurrection, the passion of Christ, &c. His comedy of the three laws of nature, Moses, and Christ, printed by Nicholas Bamburgh in 1538, was so popular, that it was reprinted by Colwell in 1562. In his "Vocacyon to the Bishopricke of Ossory," he informs us, that his comedy of "John the Baptist," and his tragedy of "God's promises to men," written in 1538, and first printed by Charlewood in 1577, 4to., were acted by the youths upon a Sunday, at the market-crofs of Kilkenny. But the fashion of acting mysteries seems to have expired with this writer. He says that he wrote a book of hymns, and another of jests and tales, and that he translated the tragedy of Pammachius, probably the same that was acted at Christ's college in Cambridge in 1544, and afterwards laid before the privy council as a libel on the reformation. After he renounced popery, the productions of his pen, both in Latin and English, were very numerous. Most of his English writings in prose were pointed against popery; and two of his pamphlets against the papists, all of whom he considered as monks, are intitled the "Mas of the Gluttons," and the "Alcoran of the Prelates." Next to exposing the impostures of popery, literary history was his favourite pursuit. His "Chronicle concerning sir John Oldcastle," was reprinted in 1729. The only work of bishop Bale, which has given him distinction among authors, is his "Scriptorium Illustrum Majoris Britannie Catalogus," or, "An account of the lives of eminent writers of Great Britain," commencing from Japhet one of the sons of Noah, and brought down through a series of 3618 years, to the year of the Christian æra 1557, the period at which the author was an exile in Germany. This work is compiled from various authors, and chiefly from the labours of the eminent antiquary, John Leland. The bitterness of his invectives against popery and papists gave great offence to

Roman catholic writers; and he has been charged with dissimulation and credulity by several respectable critics; among whom we may reckon Wharton and Nicolson. Granger (Biog. Hist. vol. i. p. 139, 8vo.) allows, that the intemperate zeal of this prelate often carried him beyond the bounds of decency and candour in his accounts of the papists; nevertheless, his sufferings may furnish some apology for his acrimony, and many things which he relates, though before designedly concealed or ingeniously glossed over by Roman catholic writers, might probably be true. His biographical work, with considerable allowances for the strong bias of party zeal, may be read with advantage. *Baleus de Seipso*, apud Script. Wharton, Pref. to *Anglia Sacra*, and *Hist. of English Poetry*, vol. iii. p. 79. Nicolson's *Eng. Hist. Library*, p. 156. *Biog. Brit.*

BALE, in *Commerce*, a term denoting a quantity of merchandize wrapped or packed up in cloth, and corded round very tight, after having been well secured with hay or straw, to keep it from breaking, or to preserve it from the weather. Most of the merchandize, capable of this kind of package, that is sent to fairs, or intended for exportation, ought to be in bales; and too much care cannot be taken in packing them, to secure them from damage. To sell goods in the bale is to sell them in the lump, on shewing a specimen, without unpacking or taking off the cordage. Thus it is the East India company sell their bale-goods.

BALE-GOODS, in the *East India Trade*, the bulky goods, as salt-petre, pepper, red-earth, tea, &c. The bale goods stand opposed to piece goods.

BALES of Camlet, at Smyrna, are called *tablets*, on account of their flat square figure.

A bale of cotton yarn is from three to four hundred weight; of raw silk, is from one to four hundred; of lockram or dowlas, either three, three and a half, or four pieces, &c.

BALE of Paper, denotes a certain number of reams packed together in a bundle.

There are bales of more and fewer reams. Those sent from Marseilles to Constantinople usually contain twelve reams. A bale or ballon of crown paper manufactured in some parts of Provence, consists of fourteen reams, and is sold in the Levant for Venice paper.

BALE of Dice, denotes a little packet or paper, containing some dozens of dice for playing with.

BALE, in *Geography*. See **BASEL**.

BALEARES INSULÆ, or *Balearic Islands*, in *Ancient Geography*, the name by which the two islands of Majorca and Minorca, and some others in the Mediterranean sea, were formerly distinguished. They derived their name from that of the inhabitants, who were denominated *Balcares*, as some have supposed from βαλλω, to *throw*, because they were excellent slingers. Bochart (*Geog. Sacr. apud Op. t. i. col. 634.*) deduces the appellation, as well as the people, from a Punic or Phœnician origin; and he says, citing the authorities of Polybius, Strabo, and Stephanus, that the name is formed of the two words בעל-ירה, *bal-jareh*, denoting a *master of throwing*, and thus he adds, the term הציים בעלי, *baale chisim*, Gen. xlix. 23. signify *skillful archers*. The Greeks called these islands *Gymnasia*, either as Livy or Diodorus suggest, because in summer the inhabitants were *naked*, or rather, as Hesychius observes, because they went to battle armed only with a sling. M. Gebelin intimates, that *Baal* signified among the orientals, *the sun*, and hence it became a denomination for *elevated objects*; so that the *Balcares* were persons who projected darts or stones from slings to a very great height. Whatever be the precise etymology of the name, the *Balcares* were famous for their

dexterity in the use of the sling; and in order to attain perfection, they accustomed themselves from their infancy to this kind of exercise; inasmuch that mothers did not put bread into the hands of their children, but obliged them to beat it down from a considerable eminence with their slings. They also united force with this address, and the best tempered arms were scarcely proof against the stones they discharged. When they went to battle they carried with them three slings of unequal length, according to the different distances at which they might have occasion to use them against the enemy. They were originally Phœnicians or Carthaginians, who possessed the islands called by their name from such remote antiquity, that their first arrival is prior to every thing related of them by every historian now extant, except their peopling the island Ebusus or Eracus, now Yvica, about 160 years, as Diodorus Siculus (l. v. c. 1 & 2.) informs us, after the foundation of Carthage. This island, according to Vitruvius, was reckoned to belong to the *Balearic islands*. We learn from Justin (l. xlv.), that the first expedition which the Carthaginians made to Spain, was in order to assist the city of Gades (now Cadiz); and as the Carthaginian fleet, sailing from Carthage to Gades, might easily take Ebusus and the other *Balearic islands* in its way, there is great reason to believe, that Gades was relieved, and Ebusus, with the other *Balearic islands*, planted or reduced much about the same time. The *Balcares* lived for a long time in the simplicity of uncultivated nature. Caves under the rocks, or holes dug in the earth, served them for habitations. They were almost naked, except that during the cold of winter they covered themselves with sheep-skins. The soil of their country was fertile, and supplied them with the necessaries of life; but being very eager for wine, such of them as had served in the Carthaginian armies did not fail at their return to lay out all the money they had acquired in this article: indeed, they were not allowed to bring money into their country, as the use of it was prohibited in both islands. They said, as Diodorus Siculus informs us, that Geryon's riches had of old been fatal to him, in drawing Hercules upon him as an enemy; and that, taught by this example, they had from the most remote antiquity always dreaded introducing among them a metal, capable of exciting the avidity of other nations, and thus dangerous to their tranquillity. They were in general a pacific people. However, some individuals having leagued themselves with the pirates that infested the seas, Metellus, who was consul of Rome about the year of the city 630. B. C. 124, projected an expedition for invading their country. In order to secure his success, he is said to have rendered their slings useless, by placing skins on the sides of the decks, which deadened the blows. As soon as the Roman troops landed, the inhabitants fled, and dispersed themselves over the country, so that it was more difficult to find than to defeat them. Metellus, for securing his conquest, planted two colonies, viz. Palma and Pollentia, the one at the east, and the other at the west extremity of *Balearis major*. He obtained a triumph A. U. C. 631. B. C. 123, and assumed the surname of *Balearicus*. Flor. l. iii. c. 8. The largest of these islands was called *Balearis major*, now Majorca, and the least *Balearis minor*, now Minorca. They were distant from one another, according to Pliny, thirty miles; and in the latter of the two islands, the most considerable towns were Mago and Janno. These were at first castles or forts; but being erected near the mouths of two convenient harbours, they became considerable sea-ports, especially that of Mago, now known as Port Mahon. The *Balcares* formed a part of the provincia *Tarragonensis*, and were denominated "Fortissimæ," on account of their situation and harbours.

BALEARICA Briff. *grus balearica* Aldr. *balearic crane* Ray, Willughby, Sloane, &c., in *Ornithology*, a trivial name given by these and some other ornithological writers to the *crowned heron* of Latham, and *ardea parvonia* Cmelm.

BALECHOU, JOHN JOSEPH, in *Biography*, a celebrated French engraver, flourished about the year 1750, and died not many years since at Avignon. He was perfect master of the graver, with which he entirely worked; and distinguished by the clearness of his strokes, and the depth of colour which he produced; but for want of drawing well, his prints fail in point of freedom, correctness, and harmony. His two large plates from Vernet, one representing a "Storm," the other a "Calm," are well known, and universally admired. Strutt.

BALEME PORT, in *Geography*, is a port of North America, two leagues distant from Louisbourg, on the coast of the island of cape Breton. The rocks, which are covered by a high sea, render it difficult of access.

BALEN, HENDRICK VAN, in *Biography*, a painter of history and portrait, was born at Antwerp, in 1560; and after having been a disciple of Adam Van Oort, he pursued his studies at Rome. By copying the antiques, and attending to the works of eminent modern artists, his improvement was such, that, in his return to his own country, he obtained the esteem of the ablest judges. He was distinguished by a good manner of designing, and his works are admitted into the cabinets of the curious, among those of the principal painters. He particularly excelled in the naked, and gave to his figures so much truth, roundness, and correctness of outline, that few of his cotemporaries could enter into competition with him. Several of his fine portraits are at the Hague; and particularly one adorned with the figures of wisdom and justice, which is very highly commended. His designs of the deluge, of Moses striking the rock, and the drowning of Pharaoh, are grand and noble compositions. His "Judgment of Paris" is also accounted a masterly performance; in which the figure of Venus is so elegantly designed, so full of life, and so round, that it seems to stand forth from the surface. He died in 1632. Pilkington.

BALEN, JACOB VAN, a painter of history, landscapes, and boys, was born at Antwerp, in 1611, and derived from his father Hendrick Van Balen his knowledge of the art, and his fine taste of drawing and design. He afterwards travelled to Rome, and other cities of Italy. His particular merit is exhibited in his figures of boys, cupids, and nymphs bathing or hunting; and he gained wealth and fame by his landscapes and histories. His pictures were well handled, his trees touched with spirit, and his herbage and verdure appeared natural and lively. The carnations of his figures were clear and fresh, his colouring in general was transparent, and the airs of his heads were in the manner of Albano. Pilkington.

BALENBERG, in *Geography*, a town of Germany, in the circle of the Lower Rhine, and territory of Mentz, two miles north-west of Krautheim.

BALENGER, **BALENGARIA**, in *Middle Age Writers*, a kind of vessel of war, but what in particular seems not well known. Blount says, that by the flat. 28 Hen. VI. cap. 5. balenger seems to have been a kind of barge.

BALES, PETER, in *Biography*, an extraordinary master of penmanship and fine writing, was born in 1547, and deserves to be recorded on account of the skill which he acquired in the exercise of his art. Anthony Wood mentions him as "a most dexterous person in his profession," and as having "spent several years in sciences among the Oxonians, particularly as it seems in Gloucester hall; but that study which

he used for a diversion only, proved at length an employment of profit." Holinshed, in his Chronicle, A. D. 1575, records his skill in micrography or miniature writing; and Mr. Evelyn (*Numismata*, fol. 1697, p. 268.) says of him, that in 1557 he wrote the lord's prayer, creed, decalogue, with two short Latin prayers, his own name, motto, day of the month, year of our Lord, and of the queen's reign, to whom he presented it at Hampton Court, all within the circle of a single penny, encased in a ring and border of gold, and covered with crystal; so nicely wrote as to be plainly legible, to the admiration of her majesty, her privy-council, and several ambassadors, who then saw it." He possessed also an extraordinary skill in imitating the writing of others; and he seems to have been employed in this and similar ways for the service of the state, with a view to the complete discovery and conviction of traitors, between the years 1586 and 1589. At this time he had reason to expect some place or preferment at court; but being disappointed in his expectations by the death of secretary Walsingham, he pursued the business of a writing-master in the Old Bailey; and in 1590, he published his "Writing Schoolmaster, in three Parts," containing the art of brachygraphy, or swift writing; the order of orthography, or true writing; and the key of calligraphy, or fair writing. In 1595, he was engaged in a trial of skill with another performer in the same way, for a golden pen of 20l. value, which he gained; and in another more general competition, he obtained the arms of calligraphy, which are *azure, a pen, or*. By various exercises of his pen, he recommended himself to several persons of knowledge and distinction; and Anthony Wood says, that he was engaged in the treasons of the earl of Essex, in 1600; but the real fact was, that Bales was innocently employed in serving the treacherous purposes of one of the earl's mercenary dependants. Towards the close of life, he seems to have been reduced to a destitute and distressed condition, either by his own extravagance, or by imprudent confidence in others; and to have died about the year 1610. *Biog. Brit.*

BALESCOU DE THARARF, or *Valescus of Tarenta*, a Portuguese. It appears from his own testimony, that he began writing in the year 1418, after thirty-six years experience. His first publication "De Philonio," was printed at Venice, 1490; then at Lyons, in folio, in 1521; and his work, "De Morbis Curandis," edited by Guido Desiderius, at Lyons, in 1560, in 4to. and afterwards at Frankfort 1590. A short tract, "Tractatus Chirurgie," is printed with the Philonium. He proposes extirpating cancers by an application, in which arsenic is an ingredient. This drug, we know, formed the basis of a preparation of late introduced, for the same purpose, by Plunket. Our author, however, admonishes practitioners, that arsenic is not used without danger. He saw a person who died suddenly in the night, whose head had been anointed with an arsenical preparation, for the cure of tinea capitis. It appears from his works, that he was well acquainted with the doctrine of Galen, and of the Arabic writers. Haller. *Bib. Chirurg.*

BALESIIUM, in *Ancient Geography*, a town of Italy, in Magna Græcia, in the country called Messapia. Pliny and Mela.

BALESOS, an island of the Ægean Sea, between Thrace and the isle of Crete. Anton. Itin.

BALESSAN, in *Botany*. See **BALSAM**.

BALESTRA, ANTONIO, in *Biography*, an historical painter, was born at Verona, in 1666: at the age of twenty-one, entered himself in the school of Antonio Belucci, at Venice, and afterwards visited Bologna and Rome, at which latter place he became the disciple of Carlo Maratti. Having

ing made great proficiency in designing after the antiques, after Raphael, Correggio, Annibal Caracci, and other admired painters, he obtained the prize of merit in the academy of St. Luke, in the year 1694, when he was only twenty-eight years of age. From that time his reputation was established, and his paintings were admired in every part of Europe. His style is sweet and agreeable, not unlike that of Maratti; and men of judgment observed, with delight and approbation, a certain mixture in his works of the several manners of Raphael, Correggio, and Caracci. At Venice there are two capital pictures of this master; one representing the nativity of our saviour, in the church of Santa Maria Mater Domini; and another, a dead Christ in the arms of the Virgin, in a chapel belonging to the church of St. Geminiano. We have some etchings by him, in a bold, masterly style, but very slight. According to Pilkington, he died in 1720; but Strutt says, he died in 1740, at the age of 74.

BALESTRINA, in *Geography*, a town of Italy, in the state of Genoa, a chief of the empire, nine miles north of Albenga.

BALET DE LA ROYNE, in *Music*. This dance, more ancient than any mentioned in the long article on the subject, in the *Encycl. Meth.*, where it has not been honoured with notice, merited a place, as a *curiosity*, if not for its superior plan and execution.

Henry III. of France having, in 1581, married his favourite minion, the duc de Joyeuse, to mademoiselle de Vaudemont, sister to his queen Louise de Lorraine, almost ruined his kingdom in balls, masquerades, tilts, tournaments, and every species of expensive festivity which could be devised on the occasion.

The queen, likewise, in honour of her sister's nuptials, gave an entertainment at the Louvre, in which a ballet was exhibited, called "Ceres and her Nymphs," which was then a new kind of spectacle in France, *avec une grande musique*, composed by the celebrated Claude le Jeune. The *Entrées de Ballets*, in this fête, were invented by Baltazar de Beaujoyeux, the famous Piedmontese performer on the violin, who having published an account of his devices in a book which is now become extremely scarce, we shall present our readers with its title, and a sketch of its contents.

"Ballet comique de la Royne, faite aux nocces de monseigneur le duc de Joyeuse et mademoiselle de Vaudemont sa sœur. Par Baltazar de Beaujoyeux, valet de chambre du Roy, et de la Royne sa mere." A Paris, 1582, 4to. The types and paper equal in beauty those of Elzevir in the next century; and the musical characters, though cut in wood, are much more clear and neat than any we ever saw of the kind. But as to the music itself, it is more barbarous, in point of melody, than any we have ever seen on paper. The counterpoint, indeed, is not incorrect; nor can the French be justly accused of ever being deficient in the mechanical rules of composition, since they were first established; but for fancy, air, and rhythm, there is not a passage in this whole performance, except in a few of the dances, by which we are reminded of their existence. But it seems as if dancing could not subsist without a marked measure; indeed, when poetry is sung without measure, it becomes worse than prose. In the operas of Lulli and Rameau, the music of the dances was always much more pleasing to foreigners than that which was sung, from its being necessarily more marked and accented: thus is, in what was danced some determined measure and movement was always perceptible. But in the vocal part of de Beaujoyeux ballet, there is nothing that resembles an air, or that seems to imply a selection of notes, or to suggest a reason for one sound being higher or lower, more quick or more slow, than another.

But it should be remembered, that the music of this old French ballet was not composed by Baltazarini, the Italian, who only acted as ballet master on the occasion, but by Messrs. de Beaulieu and Salmon, of the king's band, whom his majesty had ordered to assist him in composing and preparing all that was *nécessaire* in music for this festival; "and M. Beaubien," says Baltazarini, "whom all professors regard as an excellent musician, has, on this occasion, even surpassed himself, assisted by Maître Salmon, whom M. Beaubien and others highly esteem in his art."

We have dwelt the longer on this performance, as it is the only French theatrical music extant of the time. And in comparing it with that of Lulli, it appears that he did not disdain to comply with the national taste, which had been long established, with respect to measure and melody; he certainly added much to both, but conformed to the *genre*.

As it will be no kindness to curious readers to refer them to so scarce a book for examples of this music, we may venture to mention the *Gen. Hist. of Mus.* vol. iii. where copious extracts from it are inserted.

BALEY, WALTER, in *Biography*, born in the county of Dorset, in the year 1529, received his education at Winchester, and went thence to New college, Oxford. Applying himself to the study of medicine, in the year 1558 he was licensed to practise. About the same time he was made a prebendary in the cathedral church of Wells, which office he resigned the following year. He was then appointed Queen's professor of physic at Oxford. In the year 1563, he was created doctor in medicine (*Wood's Fasti Oxon.* vol. i. p. 62.), and soon after, physician to queen Elizabeth. For the remainder of his life, which was extended to the age of 63 years, he enjoyed a considerable share of reputation and practice. Of this physician we have the following works, three of which were published in his lifetime. "A Discourse of three kinds of pepper in common use," 1588, 8vo. "A brief treatise on the preservation of the eye-sight," in which he attributes great virtues to the herb eye-bright. This was re-published in 1616, and in 1622 was added to Banister's treatise of 113 diseases of the eyes and eyelids, but without the name of the author. "Directions for health, natural and artificial, with medicines for all diseases of the eyes," 1626, 4to. "A brief discourse of certain medicinal waters in the county of Warwick, near Newnham," 1587. In the library of Robert earl of Aylesbury was a MS. of this author, intitled "Explicatio Galeni de potu convalescentium, et seuum, et præcipue de nostra ætate et biris paratione." *Biograph. Mem. of Med.* J. Aikin.

BALFRUSCH, in *Geography*, a town of Persia, the capital of the province of Masanderan, situate at the southern extremity of the Caspian sea. Hither the Russians and Armenians convey their merchandise, though the traffic is much less considerable than it was, on account of the impositions of the khan of Masanderan. The chief productions are silk, rice, and cotton, of which articles there is a large exportation. Merchants from Kasken, Spahan, Schiras, and Korasan resort to Balfrusch, and bring for sale the Persian and Indian commodities. N. lat. 33° 40'. E. long. 50° 35'.

BALGA, a town of Prussia, in the province of Natangen, 25 miles south-west of Königsberg.

BALGUY, JONAS, in *Biography*, an English divine, was born at Sheffield in Yorkshire, in the year 1686. Having received instruction first from his father, who was master of a free grammar school in that place, and after his death from his successor Mr. Daubuz, author of an esteemed commentary on the revelations, he was admitted in 1702, of St.

John's college, Cambridge. From the frivolous occupation of reading romances, in which he lost two years of his academic education, a circumstance which he mentions with regret, he was diverted by reading Livy, and afterwards devoted himself with pleasure to serious studies. In 1711, he took orders, and diligently discharged the duties of his profession in the living of Lamcely and Tanfield in Durham, composing for several years a new discourse for the pulpit every week. Balguy was an early advocate for religious liberty in the Bangorian controversy: and in 1718, wrote a vindication of bishop Hoadly, intitled "An Examination of certain doctrines lately taught and defended by the Rev. Mr. Stebbing;" and in the following year, "A Letter to the Rev. Dr. Sherlock," both under the fictitious name of Silvius. In 1720, he published a third tract, intitled "Silvius's defence of a dialogue between a Papist and a Protestant." In a controversy concerning the nature and foundation of virtue, occasioned about this time by lord Shaftesbury, who, in his "Characteristicks" referred it to an instinctive sentiment; and by Hutcheson, who, in his "Inquiry into the Original of our Ideas of Beauty and Virtue," maintains the same notion; Mr. Balguy took a principal part. In 1726, he wrote, in reply to Shaftesbury, "A Letter to a Deist, concerning the beauty and excellence of moral virtue, and the support and improvement which it receives from the Christian revelation;" and in 1728, he published a tract, intitled, "The foundation of moral goodness, or a farther inquiry into the original of our idea of virtue;" which in the next year was followed by a second part, illustrating the principles and reasonings of the former, and replying to certain remarks communicated by lord Darcy to the author. (See VIRTUE.) In 1730, he published a treatise, under the title of "Divine Rectitude; or a brief Inquiry concerning the moral perfections of the Deity, particularly in respect of Creation and Providence. (See ATTRIBUTES.) This treatise was followed by "A Second Letter to a Deist," occasioned by Tindal's "Christianity as old as the Creation;" and by another tract, intitled, "The Law of Truth, or the Obligations of Reason essential to all Religion." In 1741, Mr. Balguy published an "Essay on Redemption," explaining the doctrine of atonement in a manner similar to that afterwards adopted by Dr. Taylor of Norwich. (See ATONEMENT.) Of this treatise, bishop Hoadly expressed his opinion, that the author had been more successful in rescuing Christianity from some absurd doctrines, long considered as essential to it, than in substituting others in their stead. The only additional publication of Mr. Balguy was a volume of Sermons, to which has been since added a posthumous volume; the subjects of both are chiefly practical, and the discourses have been justly admired as models of the plain and simple style of preaching. Towards the close of his life, his health declined, and he found it necessary to withdraw from company, except such as he selected at Harrowgate, which he frequented every season, and where he died in 1748, in the sixty-third year of his age. The only church preferments which Mr. Balguy enjoyed were the vicarage of North-Allerton in Yorkshire, worth about 270*l.* a year, and a prebend in the church of Salisbury, to which he was collated by bishop Hoadly in 1728. Mr. Balguy may justly be reckoned among the divines and writers who rank with Clarke and Hoadly, and who associated with these illustrious characters in maintaining the cause of rational religion and Christian liberty. Candid and liberal in his own sentiments and disposition, he cultivated friendship with worthy persons of all denominations; and his writings very much contributed to promote liberal discussion and rational inquiry. Biog. Brit.

BALHARY, in *Geography*, a town of Hindostan, in the Myfore country, seventy miles north-east of Chitteldroog, and twenty miles north-east of Raidroog. N. lat. 15° 6'. E. long. 76° 54'.

BALI, or **BALLY**, one of the isles of Sunda, situate in the Java sea, on the east side of the strait of Balli, which separates it from Java; 25 leagues long, and 15 wide, fertile and populous. It seems only remarkable for furnishing slaves, cotton-yarn, and pickled-pork. S. lat. 8° 30'. E. long. 115° 10'.

BALI, or **BALLY**, *Strait*, lies on the west side of the island of this name, in the Indian ocean. Its north entrance is in S. lat. 7° 54', and the south entrance in S. lat. 8° 39'. E. long. 114° 25'. It is sometimes called the *Balambuan* channel. Through this strait the European East India merchant ships occasionally pass in their return from China. It is sometimes called *Java Strait*.

BALI, a province which once belonged to Abyssinia, and the first taken by the Galla. It lies to the north-east of Narea, and to the west of the kingdom of Adel, which separates it from the sea, about N. lat. 10°, and E. long. 41°.

BALICASSE, *balicasse* des Philippines, in *Ornithology*. Under this name, Buffon describes the *corvus balicassius*, Gmel. in his Nat. Hist. Birds; in the Planch. Enl. it is called *choucas des Philippines*.

BALICASSIUS, a species of *Corvus*, of a greenish black colour, with a forked tail. Gmelin. *Corvus splendide nigro-viridans*. Briff. Av. The beak, legs, and claws, are black.

BALIKESRI, in *Geography*, a town of European Turkey, in the province of Natolia, fifty-two miles north-east of Pergamo. N. lat. 39° 45'. E. long. 27° 50'.

BALINCAILACH, a cape on the west coast of Banbecula, one of the western islands of Scotland.

BALINE *Head and Cove*, lie between cape Broyle and the bay of Bulls, on the coast of Newfoundland. The cove is a small place behind a rock, called the Whale's back, and a stage for fishing, with two or three boats.

BALIOL, or **BALLIOL**, **JOHN**, in *Biography*, king of Scotland, was descended from an illustrious family, which possessed large estates in Scotland and France, as well as England. He is supposed to have been born about the year 1260, or at a somewhat earlier period; and was a competitor with Robert Bruce for the crown of Scotland; the right of succession to which belonged to the descendants of David earl of Huntingdon, third son of king David I. Bruce was the son of Isabel, the second daughter of earl David; and Baliol, the son of John Baliol, who founded Baliol college in Oxford, was the grandson of Margaret, the eldest daughter of earl David. According to the rules of succession which are now established, the right of Baliol was preferable; and notwithstanding Bruce's plea of being nearer in blood to earl David, Baliol's claim, as the representative of his brother and grandmother, would be deemed incontestible. But in that age, the order of succession was not ascertained with the same precision; and though the prejudices of the people, and perhaps the laws of the kingdom, favoured Bruce, each of the rivals was supported by a powerful faction. In order to avoid the miseries of a civil war, to which it was feared recourse would be had for deciding a dispute which the laws could not settle, king Edward of England was chosen umpire, and both parties agreed to acquiesce in his decree. Under pretence of examining the question with due solemnity, this prince summoned all the Scottish barons to Norham, May 10th, 1291; and having gained some, and intimidated others, he prevailed on all who were present, not
excepting

excepting Bruce and Baliol, the competitors, to acknowledge Scotland as a fief of the English crown, and to swear fealty to him as their sovereign or liege lord. He also demanded possession of the kingdom, that he might be able to deliver it to him whose right should be preferable. This strange demand obtained assent; and Edward finding Baliol the most obsequious, and the least formidable of the two rivals, soon after gave judgment in his favour. Baliol once more professed himself the vassal of England, A. D. 1202, and submitted to every condition which the sovereign whom he had now acknowledged was pleased to prescribe. Edward having thus, as he conceived, established his dominion, began too soon to assume the matter; but his new vassals, fierce and independent, bore with impatience a yoke to which they were not accustomed. The passive spirit even of Baliol began to mutiny, upon which Edward forced him to resign the crown, and openly attempted to seize it as fallen to himself by the rebellion of his vassal. At this critical period, sir William Wallace, to whom his countrymen have ascribed many fabulous acts of prowess, ventured to take up arms in defence of the kingdom, and by his boldness revived the spirit of the nation. At last Robert Bruce, the grandson of Baliol's competitor, appeared to assert his own rights, and to vindicate the honour of his country. The nobles, ashamed of their former baseness, and enraged at the many indignities offered to the nation, crowded to his standard. In order to crush them at once, the English monarch entered Scotland, at the head of a mighty army; many battles were fought, but the Scots, though often vanquished, were not subdued. The ardent zeal with which the nobles contended for the independence of the kingdom, the prudent valour of Bruce, and above all, a national enthusiasm inspired by such a cause, baffled the repeated efforts of Edward, and counterbalanced all the advantages which he derived from the number and wealth of his subjects. And though the war continued, with little intermission, upwards of 70 years, Bruce and his posterity kept possession of the throne of Scotland, and ruled with an authority not inferior to that of its former monarchs. During the contest in favour of Bruce, John Baliol lived quietly as a private man on his own estates, which were very considerable, in France, without interfering in the affairs of Scotland. Some writers say, that he lived till he was blind, which, if true, must have been the effect of some disease, since it is certain that he died A. D. 1314, when he could not be above 55 years of age at most. "Thus ended," says sir David Dalrymple, in his *Annals of Scotland*, "the short and disastrous reign of John Baliol; an ill-fated prince! censured for doing homage to Edward, never applauded for asserting the national independency. Yet, in his original offence, he had the example of Bruce; at his revolt, he saw the royal family combating under the banners of England. His attempt to shake off a foreign yoke, speaks him of a high spirit, impatient of injuries. He erred in enterprising beyond his strength; in the cause of liberty, it was a meritorious error. He confided in the valour and unanimity of his subjects, and in the assistance of France. The efforts of his subjects were languid and discordant; and France beheld his ruin with the indifference of an unconcerned spectator." *Robertson's Hist. of Scotland*, vol. i. p. 10, &c. *Biog. Brit.*

BALIPATNA, or **PALÆ-PATNA**, in *Ancient Geography*, a maritime town of India, nearly at an equal distance from the gulf of Canthi-Colpus, and that of Barigazenus. The periplus of the Erythraean sea places it to the south-east of Mandagora. See **PATNA**.

BALIPATUA, a town of India, on this side of the Ganges. Ptolemy.

BALIS, a town of Africa, in Libya, and in the vicinity of Cyrene, which had its name from a temple dedicated to *Baal*.

BALIS, in *Geography*, a town of Asiatic Turkey, in Syria, on the frontiers of Diarbekir, on the west bank of the Euphrates, twenty leagues east of Aleppo.

BALISBIGA, in *Ancient Geography*, a town of Asia, situate in the mountains north of the river Arsanias, placed by Ptolemy in Armenia Major.

BALISSUS, a stream in the deserts which anciently separated Assyria from Arabia, near the place where Crassus was defeated by the Parthians.

BALISTA, in *Artillery*. See **BALLISTA**.

BALISTA, in *Ancient Geography*, a mountain of Italy, in Liguria. Livy.

BALISTES, in *Ichthyology*, the name of a genus of branchioslegous fishes, in the Linnæan system. The character of the genus, is to have the head compressed, continued close to the body; and sometimes a spine between the eyes; mouth narrow; teeth in each jaw eight in number, of which the two anterior ones are longest, and three interior ones against the intervals between those on the side; aperture of the gills narrow, above the pectoral fins; no operculum; rays of the membrane two; body compressed, and carinated on each side; scales joined together, coriaceous, and rough, with minute prickles. Nearly all the fishes of this genus are remarkable for their splendid colours. The species mentioned by Linnæus and Gmelin are the following: *monoceros*, *scriptus* β , *hispidus*, *tomentosus*, *papillofus*, *verrucosus*, *biaculeatus*, *aculeatus*, *vetula*, *maculatus*, *ringens*, *sinensis*, *alassii*, *capricus*, *foreipatus*, *punctatus*, *Kleinii*, *curassavicus*, and *Americanus*; which see.

Lacepede has described twenty-four species of balistes, in his work on fishes, and which he divides into four sections; le baliste mamelonné, le baliste pralin, le baliste verdâtre, le baliste Mungo-Parek (Park); le baliste métallique, &c. are new or interesting species described by Lacepede, Bose, &c. as will be noticed hereafter.

BALITO (*Guiffo Balito*), in *Ornithology*, the name of an *Emberiza tridactyla*, or three-toed grosbeak, in Buffon's *Hist. Birds*.

BALIVIS, a name given by the people of the Philippine islands to a kind of duck that is smaller than the common wild duck of this country. The species is unknown.

BALIVO amovendo, in *Law*, a writ to remove a bailiff from his office, for want of sufficient land in the bailiwick.

BALIZE, in *Geography*, a fort at the mouth of the Mississippi river.

BALK, in *Agriculture*, a ridge or bank between two furrows, or pieces of arable land.

BALKS, among *Builders*, denote large pieces of timber brought from abroad in floats; or a sort of beams imported from five to twelve inches square. The greater balks are accounted timber, if above eight inches square.

BALK, or *Bawk*, is also used in some parts of England for the summer-beam of a building, for the poles or rafters laid over outhouses or barns; and among bricklayers, for the pieces of timber that are used in making scaffolds.

BALK, in *Geography*, a province of Great Bucharia, in Independent Tartary, corresponding to the ancient Bactria or Bactriana. It lies to the south of the province of Samarcand, and east of Proper Bucharia, and has been estimated at 360 miles in length, and 250 in breadth. Bentink observes, that though this province is the smallest of the three into which Great Bucharia was formerly divided, the other two being Samarcand and Bucharia Proper; yet, being very

fertile and well cultivated, the prince draws from it a considerable revenue. The country abounds with silk, which furnished the inhabitants with a valuable article of manufacture. The Usbecks, subject to the khan of Balk, are the most civilized of all the Tartars inhabiting Great Bucharia, which circumstance is attributed to their commerce with the Persians. This country has been divided into several provinces, of which the most remarkable are Khotlan, Tokarestan, and Badakshan. Its chief cities are Balk, Fariyab, Talkan, Badakshan, and Anderab. Mod. Un. Hist. vol. iv. p. 358.

BALK, a distinguished city of the above-mentioned province, seated towards the borders of Persia, on the river Dewash, which flows into the Amu from the mountains of Gaur or Paropamisus. It was probably the ancient *BACTRIA*, which see. The historians of Persia say that it was founded by Kaiumurath, the first king of Persia, and that he gave it this name because he had found his brother, whom he had lost, on this spot: *balkhiden*, or *balgiden*, signifying, in their language, to *receive and embrace a friend*. The first kings of Persia, who inhabited the province of Aderbijan in Media, considered this city of Bactriana as the frontier of their country. After severe contests between the oriental Turks and Persians, the kings of Persia of the second dynasty made this city the capital of their empire, as it served to prevent the people of Turkestan or Tokarestan from obtaining the passage of the river Oxus or Gihon. The kings of the succeeding dynasties established other principal cities, and Balk was merely the capital of Khorasan, which pre-eminence belonged to it when it was taken by Ahnaf, the son of Alkais, the Arabian commander, under the caliphate of Othman. Under the Abasside caliphs, and succeeding sultans, Balk was a city of peculiar distinction; it was called *Cubat al Eslam*, or the *Metropolis of Mussulmanism*, and extended its jurisdiction over the countries of Badakshan, Khotlan, and Tokharestan. It was taken by the Moguls or Tartars, under Jenghiz Khan, in the year of the Hegira 618, A. D. 1221, and by his orders its inhabitants were removed out of the walls of the city, and cruelly massacred. In the year of the Hegira 771, A. D. 1369, Tamerlane compelled sultan Hussain, the last of the race of Jenghiz Khan, to surrender the city; and his successors retained possession of it till they were expelled by the Usbecks in the fifteenth century. Between the Usbeck Tartars and the Persians it has been the occasion of continual wars. The principal mosque of this city is constructed upon the model of that at Mecca. Herbel. Bibl. Orient. p. 167.

In the beginning of the last century, Balk was the most considerable of all the towns possessed by the Mahometan Tartars, as Bentink informs us, being large, handsome, and well peopled. Most of its buildings are of brick or stone; and its fortifications consist of earthen bulwarks, lined on the outside with a strong wall. The khan's castle is a magnificent structure, after the eastern fashion, built wholly of marble, dug out of the neighbouring mountains. In 1739, Balk was obliged to submit to the arms of Nadir Shah, or Kuli Khan; but has since recovered its independency. As foreigners have free liberty to trade in this city, it is the chief seat of the commerce between Great Bucharia and Hindostan. N. lat. 36° 21'. E. long. 65° 31'.

BALKAN, a bay on the eastern coast of the Caspian sea, in which are islands inhabited chiefly by pirates of the race of Turcoman Tartars. These islands produce rice and cotton, and one of them, called Naphthonia, abounds in naphtha. The traffic, says Mr. Coxe (Trav. in Russia, vol. iii. p. 332.) might be increased to the advantage of Russia; as it would

be far more commodious to trade with the Tartars of Khiva and Bucharia from these parts than from Orenburg, through the country of the warlike and independent Kirghees.

BALKAN, a mountain of European Turkey, which divides Romania from Bulgaria.

BALKEE, a town of Hindostan, in the country of Dowlatabad, 15 miles W.N.W. of Beder.

BALKERS, in the *Fishery*, persons placed on rocks and eminences at sea, to spy the herring-droves, and give notice to the fishermen by waving boughs, what way they go, and where they may be found. 1 Stat. Jac. I. cap. 23.

BALL JOHN, in *Biography*, an English divine, was born at Cassington, near Woodstock, in Oxfordshire. Although educated at Oxford, he attached himself to the cause of the Puritans. Ordained by an Irish bishop without subscription, he served a curacy of 20l. a year at Whitmore in Staffordshire, and with this, together with the produce of a small school, he lived contentedly. In this obscure and lowly condition, he distinguished himself by his writings. His chief work was "A short Treatise concerning all the principal grounds of the Christian religion;" and so popular was this treatise that it passed through fourteen editions before the year 1632, and was translated into the Turkish language. He also wrote "A Treatise on Faith," 4to. 1631; "A Friendly Trial of the Grounds of Separation," 4to. 1640; and several devotional pieces. Although he disliked ceremonies, he wrote against those who thought them a sufficient ground of separation. He died in 1640, with the character of a laborious preacher, and an ingenious writer. Biog. Brit.

BALL, in a general sense, a round body, found naturally, or formed by art, of this figure.

BALL, in *Antiquity*, gives the denomination to a species of game or sport frequent among the ancients.

The Romans had four kinds of *pile*, or balls: the first called *trigon*, or *trigonalis*, because the three gamesters at it were placed in a triangle: these alternately caught and tossed the ball, and he who first let it fall to the ground, was the loser. The second called *fellis*, or *felliculus*, was made of leather, blown up like our foot-balls: the largest sort of these were struck with the arm, the smaller with the fist: the former seems to have been distinguished by the appellation *paganica*, as being much used in country villages: the fourth was the *herpatis*, a kind of small ball, so called, because the gamesters endeavoured to snatch it from each other.

Galen has an entire treatise on the exercise of the lesser ball.

BALLS, in *Architecture*, are represented at C, in the figure of the basilic (see *BASILIC*); and are used for supporting Attic pedestals.

BALLS, in *Brewing*. They are either *brown* or *pale*, and used to tint, feed, preserve, and colour malt-drinks, wines, and cyders. See the composition of them described under *BREWING*.

BALLS, *Martial*, in *Chemistry*, a preparation of iron now entirely disused in this form, but retained in the *Materia Medica* as a powder. It is the *ferrum tartarizatum*, *tartarite of iron*; or this metal united with, and partly dissolved by, cream of tartar.

To make martial balls, take one part of filings of iron, and two parts of powdered cream of tartar; mix them well together, and put them into an earthen or iron vessel with some water; stir the mixture from time to time, till it becomes almost dry; add more water, and stir it as before, till it acquires, when nearly dry, somewhat of the consistence and

and tenacity of softened rosin; then it is rolled into the form of a ball, generally kept tied up in a rag, and when it is used, infused into water, till it gives some colour to that liquid. Mac. Chem. Dict. Eng. Ed.

BALLS, Mercurial, an amalgam of mercury and tin sufficiently solid to be moulded, and to preserve a solid form.

To make mercurial balls, add mercury to its weight of melted tin, and pour the fluid mass into a round and hollow mould.

These balls have been employed to purify water in which they are boiled, an opinion which is perhaps in some degree well-founded, since mercury even in imperceptible quantity is known to destroy animalcule. However, the boiling alone would probably produce nearly the same effect, and the mercurial balls are no longer in use. The tin is not an useless addition, since besides giving the mass a proper consistence, it assists most materially in the oxydation, and therefore the solubility, of the mercury.

BALLS, in Electricity, are two pieces of cork, or pith of elder, nicely turned in a lathe, to the size of a small pea, and suspended by fine linen threads; intended by Mr. Canton as electrometers, and of excellent use to discover small degrees of electricity, to observe the changes of it from positive to negative, and *vice versa*; and to estimate the force of a shock before the discharge, so that the operator shall always be able to tell very nearly before the discharge, by knowing how high he has charged his jars, what the explosion will be.

BALLS, Crystalline, in Natural History. There are two sorts of fossile bodies mentioned in authors by this name, and distinguished into the echinated and concave. The first are roundish nodules of strong matter, covered over with points of crystal; and the other, flints and other stones, having cavities in their middles, which are lined, or cruited over with these crystals.

BALL, Vegetalle, a very particular kind of plant of a deep green colour, of an irregularly spherical shape, hollow within, and of different sizes, from an inch and a half to three inches in diameter. It probably belongs to the *CONFERVA* genus, in the class of mosses; though Mr. Ray has ranged a similar plant under the genus of *ALCYONIUM*. (See *CORAL*.) Phil. Trans. vol. xlvii. art. 83. an. 1752.

BALL, Puff. See *LYCOPERDON*.

BALL, Hero's, Pila Heronis, in Hydraulics, is a kind of artificial fountain, wherein the water is made to spout from a hollow ball or globe.

It takes the denomination from the inventor, Hero of Alexandria, who has left the description of it in his *Spiritualia*. See *FOUNTAIN*.

BALLS of Fire in the air, in Meteorology, are meteors sometimes seen passing over countries, and computed by philosophers to be at a very considerable height in the atmosphere. They sometimes burst at that height; and though the air must be exceeding rare there, yet the explosion is heard at that distance, and for seventy miles round on the surface of the earth, &c. Does not this look as if a rare atmosphere, almost a vacuum, was no bad conductor of sound? Dr. Franklin's Works, p. 437.

Among the phenomena of the atmosphere, the large meteors called fire-balls, and *bolides*, have in modern times excited particular attention. Mr. C. F. Fulda has collected a variety of observations respecting these phenomena, in a paper read to the Physical Society of Gottingen, Dec. 7, 1796, and published in professor Gmelin's "Gottingisches Journal der Naturwissenschaften, vol. i. part 2. These meteors, he observes, appear in every climate in southern and

northern latitude, as well as under the equator. They are also seen at every season of the year, and at every period of the day, and for the most part when the sky is serene, some of them proceeding from light clouds, which has given occasion for supposing that they originated at a greater height than these clouds; and they have been observed to move with different degrees of rapidity, some proceeding at about 1530 feet in a second or even with a slower motion, and others moving at the rate of thirty English miles in the same time, or with a velocity greater by 3 $\frac{1}{2}$ miles in a second than that of the earth in its orbit. They proceed from, as well as towards, all points of the compass; however, most of them have appeared in the northern or southern parts of the horizon; and yet no general conclusion, in respect of their connection with the northern or southern lights, can be deduced from this circumstance, though some observations made in Sweden seem to favour such an hypothesis. They do not always move according to the direction of the wind, nor is their velocity proportioned to that of the wind. When, indeed, they have appeared, it has generally been calm; but some of them have been succeeded by even a violent wind. They almost all descend towards the earth, and from a rarer to a denser atmosphere, as may be inferred from their soon becoming considerably enlarged. Some, however, have proceeded in an horizontal direction over the surface of the earth, but none of them appear to move upwards. Their form is sometimes perfectly globular, and sometimes more spindle-shaped, so that their length has occupied seven or eight degrees of the heavens. When they move with a great velocity, they have been followed by a long tail, which has been ascribed to the continuance of the impression made on the eye. Others, that have moved slowly, appeared as if the tail, or part of it, belonged to the body itself; and it should seem that the long train, which marks their course, ought often to be accounted for by traces left behind them rather than by mere impression. Their apparent magnitude has been very different; but frequently larger than that of the moon. Few of them have had an apparent motion round their axes. Most of them diffused a very lively dazzling light; but the smaller number have exhibited a faint light; their colour and splendor have been very different and variable, sometimes red, sometimes blue, sometimes violet, sometimes in part yellow or dazzling white, and sometimes exhibiting the prismatic colours. Some have been seen to burn with a bright flame, and others as if in a state of ignition. Their real diameter, ascertained by actual measurement or by conjecture, has been always very considerable. The diameter of that concerning which sir John Pringle made calculations from various observations which he collected (Phil. Trans. vol. LI. pt. 1. p. 218.), and that of the meteor seen by Mr. Rittenhouse at Philadelphia, in October 1779 (Am. enc. Trans. vol. ii. p. 175.), were at most about half a German mile. These meteors seem to originate at a very different, but most of them at a very considerable, height above the surface of the earth. All of them, whose mean or greatest height has been the subject of calculation, were elevated above the highest clouds, as clouds are scarcely perceptible at the height of 13,500 toises; and Silberfchlag found the greatest height of the fire-ball, which appeared in July 1762, to be 72,276 toises. On this account their origin, as Ricciarus and Chladni have supposed, is not to be ascribed merely to electricity; but others have considered them as produced by the action of the electric fluid between the clouds and the northern lights; and this hypothesis sufficiently corresponds to their actual height, because by the measurement

of Bergman, Käftner, and Lambert, the northern lights have an altitude of more than 20 or 30 German miles, and according to every appearance, no fire balls have been seen higher. (See *AURORA BOREALIS*.) On the other hand, this general conclusion led Halley, Franklin, and Rittenhouse, to adopt the notion ingeniously defended by Chladni, that these phenomena, as well as shooting stars, are cosmical meteors belonging to the atmosphere of the sun, which, meeting our earth in its course round that luminary, are inflamed, by some cause or other, when they enter the earth's atmosphere. The time of their duration has been very different; some of them having continued half an hour, and others not longer than half a minute. Many of them in their course have thrown out sparks, and most of them have been seen to separate into several larger and smaller parts before they entirely disappeared. From this division it has been inferred, that these phenomena cannot be accounted for by the hypothesis of a tract of inflammable air set on fire; to which hypothesis Chladni has objected on other grounds. This separation has been accompanied with a rumbling noise like thunder, or a sudden report. Several, after bursting, seemed to dissolve into smoke; but most of them, after exploding, have left behind them no visible traces. In some cases, after their disappearance, a sulphureous smell has been perceived, which led Muschenbroeck to form his hypothesis of an accumulation of sulphureous inflammable vapours that arise from volcanoes and subterranean pits, which, being driven together by the winds, form clouds that are by some accident or other set on fire; but this hypothesis cannot be reconciled with their prodigious height any more than that of Silberfchlag's oily and slimy vapours. As scoriaceous masses have frequently been either actually seen to fall at the time of the disappearance of these phenomena, or have been soon after found on the surface of the earth; and as it has been sufficiently proved by various accounts, that stones have fallen from the atmosphere, Dr. Chladni concludes, that both these phenomena are connected; but this point can be determined only by future accurate observations.

This ingenious professor of Wittenberg, in his "Observations on a Mass of Iron found in Siberia by Professor Pallas, &c." has investigated the origin of fire-balls in general. This mass, described by Pallas in his "Travels," vol. iii. p. 311. was found between Krasnojarsk and Abekansk, in the high slate mountains, open and uncovered. It weighed 1600 pounds; resembled in figure a rough granite; was covered externally with a ferruginous kind of crust; and within consisted of malleable iron, brittle when heated, porous like a large sea sponge, and having its interstices filled with a brittle hard vitrified substance of an amber yellow colour. This texture and the vitrified substance appeared uniformly throughout the whole mass, and without any traces of slag or artificial fire. This mass, which the Tartars consider as a sacred relic dropped from heaven, Chladni refers to the same origin, and supposes to be of the same nature with the bolides, or fire-balls. From a variety of observations relating to these phenomena, he endeavours to prove that they do not arise from an accumulation of the matter of the aurora borealis; a transition of electricity from one part of the atmosphere to another; an accumulation of porous inflammable substances in the higher regions; or the catching fire of a long train of inflammable air; but that their component parts must be considerably dense and heavy, as their course shews in so apparent a manner the effects of gravity; and because their mass, though it distends to a monstrous size, retains sufficient consistency and weight to continue an exceedingly

rapid movement through a very large space, without being decomposed or dissolved, notwithstanding the resistance of the atmosphere. It seems to him probable, that this substance is by the effect of fire reduced to a tough fluid condition; because its form appears sometimes round and sometimes elongated, and as its extending till it bursts, as well as the bursting itself, allows us to suppose a previous capability of extension by elastic fluidity. At any rate, it appears to be certain, that such dense matter at so great a height is not collected from particles to be found in our atmosphere, or can be thrown together into large masses by any power with which we are acquainted; that no power with which we are acquainted is able to give to such bodies so rapid a projectile force in a direction almost parallel to the horizon; that the matter does not rise upwards from the earth, but exists previously in the celestial regions, and must have been conveyed thence to our earth. In the opinion of Dr. Chladni, the following is the only theory of this phenomenon that agrees with all the accounts hitherto given; which is not contrary to nature in any other respect; and which besides seems to be confirmed by various masses found on the spot where they fell.

As earthy, metallic and other particles form the principal component parts of our planets, among which iron is the prevailing part, other planetary bodies may therefore consist of similar, or perhaps the same component parts, though combined and modified in a very different manner. There may also be dense matters accumulated in smaller masses without being in immediate connection with the larger planetary bodies, dispersed through infinite space, and which, being impelled either by some projecting power or attraction, continue to move until they approach the earth or some other body; when being overcome by their attractive force, they immediately fall down. By their exceedingly great velocity, still increased by the attraction of the earth, and the violent friction in the atmosphere, a strong electricity and heat must necessarily be excited, by which means they are reduced to a flaming and melted condition, and great quantities of vapour and different kinds of gases are thus disengaged, which distend the liquid mass to a monstrous size, till by a still farther expansion of these elastic fluids, they must at length burst. Dr. Chladni thinks also, that the greater part of the shooting stars, as they are called, are nothing else than fire-balls, which differ from the latter only in this, that their peculiarly great velocity carries them past the earth at a greater distance, so that they are not so strongly attracted by it as to fall down, and therefore in their passage through the high regions of the atmosphere, occasion only a transient electric flash, or actually take fire for a moment, and are again speedily extinguished, when they get to such a distance from the earth that the air becomes too much rarefied for the existence of fire. The professor illustrates and vindicates this theory, romantic, as he allows, some may be disposed to denominate it, by a variety of reflections; and in some subsequent publications, he has endeavoured to confirm it by adducing a great number of other phenomena of a similar kind. He concludes the whole elaborate detail with observing, that the accounts of scoriaceous masses, which contained iron, earth, sulphur, &c. having fallen from the heavens, with violent explosions, are not fictions, but true relations of real natural phenomena actually observed at various times; and that fire-balls, and the falling of such masses, are the same meteor. "Respecting the question," he says, "whence fire balls and such fallen masses proceed, opinions are very different. Most people believe that they are owing to accumulations in the atmo-

atmosphere. But even when it is allowed that a great many foreign substances are dissolved in the atmosphere, the quantity of them, especially in regions at the distance of eighty miles or more, from which such fire-balls are seen to fall in the form of a luminous point, is too small to admit of our supposing such large masses to be formed of it. Should the solid particles, which may perhaps be dissolved in the atmosphere, precipitate themselves, it would be rather in the form of a fine powder. I consider it, therefore, with Anaxagoras, Maskelyne, Halley, &c. as more probable that these masses come to our regions from the common expanse of the universe; and that, besides planetary bodies, there are smaller accumulations of matter, which when they approach too near our earth must fall down. That material bodies actually exist in the remotest regions, is shewn both by the single and accumulated luminous sparks which Dr. Schröter saw pass over the field of his telescope; as also by the shooting stars which pass by our earth, probably at a greater distance and with greater velocity than to allow their being attracted by it, and made to fall to its surface; and to which fire-balls, on their first appearance, when they seem to approach like a luminous point, have a perfect resemblance. There are many reasons for inducing us to believe that shooting stars cannot be mere electric phenomena, without the presence of some coarser substances.

The paradoxicalness of this mode of explanation, which is contrary to no known observations of nature, is rather apparent than real, and consists only in this, that people have not been accustomed to it; or that, on account of the rarity of these phenomena, many facts of this kind have been denied, or have escaped notice. For this reason, after I had written the Treatise on the Mass of Iron discovered by Professor Pallas, I hesitated whether I should publish it, because I expected that it would meet with considerable opposition. The more I endeavoured however to compare, without partiality for any system, the observations already made, which correspond so much with each other, the more I found that these phenomena could not be properly explained in any other manner, without either contradicting observations already made, or well-known laws of nature: so that I see no grounds for retracting any thing I have advanced on this subject." See *Height of the ATMOSPHERE*, and *METEOR*.

BALL, in the *Military and Pyrotechnical Arts*, is a composition of divers ingredients, generally of the combustible kinds, serving to burn and destroy, give light, smoke, stench, or the like.

In this sense we read of fire-balls, light-balls, smoke-balls, stink-balls, sky-balls, water-balls, land-balls, &c.

Balls are likewise used for all sorts of fire-arms; those for cannon are made of iron, and are distinguished by their respective calibres; and those for muskets, &c. of lead.

BALLS, Fire, are bags of canvas filled with gunpowder, sulphur, saltpetre, pitch, &c. to be thrown by the soldiers, or out of mortars, in order to fire houses, incommode trenches, advanced posts, or the like.

The Greeks had divers kinds of fire-balls made of wood, sometimes a foot, or even a cubit long; their heads being armed with spikes of iron, beneath which were hemp, pitch, and other combustibles, which being set on fire, were cast among the enemy.

The preparations of fire-balls, among the moderns, consists of several operations, viz. making the bag, preparing the composition, tying, and, lastly, dipping the ball.

The bags for this purpose are either oval or round.

The composition wherewith fire-balls are filled is various.

To ten pounds of meal gunpowder, add two of sulphur, one of sulphur, and one of colophony; or, for a lighter ball, add four of saltpetre, four of sulphur, and four of powdered glass, half a pound of antimony, as much camphor, an ounce of sal ammoniac, and four of common salt, all pulverized. Sometimes they even fill fire-balls with hand grenades. For tying the fire-balls, they prepare two iron rings, one fitted round the aperture, where the ball is to be lighted, the other near its base. A cord is tied to these rings in such manner as that the several turns represent semicircles, or meridians of the sphere, cutting the globe through the poles; over the cords, extended according to the length of the ball, others are tied, cutting the former at right angles, and parallel to each other, making a knot at each intersection. Lastly, putting in a leaden bullet, the rest of the space is filled with tow or paper. Thus completed, the fire-ball remains to be dipped in a composition of melted pitch, colophony, and linseed oil, or oil of turpentine; after dipping, they cover it round with tow, and dip again, till it be brought to the just diameter required.

BALLS, Land, those which, being thrown out of a mortar, fall to the ground, burn, and burst there. The ingredients are much the same as in the water-balls, only the specific gravity is not attended to.

BALLS, Light, are such as diffuse an intense light around; or they are balls which, being cast out of a mortar, or the hand, burn for some time, and illuminate the adjacent parts.

Those for the hand are made of ground powder, saltpetre, brimstone, camphor, and borax, all sprinkled with oil, and moulded into a mass with suet, common and Greek pitch, to the size of an ordinary grenade: this is wrapped up in tow, with a sheet of strong paper over it. To fire it, a hole is made into it with a bodkin, into which is put some priming that will burn slowly. Its use is, to cast into any works that are to be discovered in the night time.

For the larger light-balls, or those to be thrown to a greater distance, they are prepared by melting equal quantities of sulphur, turpentine, and pitch; and by dipping in this composition an earthen or stone ball, of a diameter much less than that of the mortar out of which the fire-ball is to be cast; then rolling it in gun-powder, and covering it round with gauze, the dipping is repeated till it comes to fit the cavity of the mortar; lastly, it is sprinkled round with gun-powder. This being once kindled, will strongly illuminate all round the place where it is thrown, and give opportunity for examining the state and condition thereof.

BALLS, Sky, those cast on high out of mortars, and which, when arrived at their height, burst like rockets, and afford a spectacle of decoration. Sky-balls are made of a wooden shell, filled with various compositions, particularly that of the stars of rockets.

These are sometimes intermixed with crackers and other combustibles, making rains of fire, &c.

BALLS, Smoke, or Dark, those which fill the air with smoke, and thus darken a place, to prevent discoveries. To prepare a darkening ball, make an oval or spherical bag; melt rosin over the coals, and add an equal part of saltpetre not purified, also of sulphur, and a sixth part of charcoal. The whole being well incorporated, put in tow first shred, and fill the bag with this composition, and dip it after the same manner as a fire-ball.

BALLS, Stink, those which yield a great stink where fired to annoy the enemy.

Their preparation is thus: melt ten pounds of pitch, six

of rosin, twenty of saltpetre, eight of gun-powder, and four of colophony; to these add two of charcoal, six of horse-hoofs cut small, three of assa-fetida, one of stinking faracen, and any other offensive ingredients. Then proceed as in making smoke and fire-balls.

BALLS, Water, those which swim and burn a considerable time in the water, and at length burst therein.

These are made in a wooden shell, the cavity of which is filled with a composition of refined saltpetre, sulphur, saw-dust boiled in water of saltpetre, and dried; to which sometimes other ingredients are added, as iron-filings, Greek pitch, amber-dust, glass powdered, and camphor. The ingredients are to be ground and mixt up, and moistened with linseed-oil, nut-oil, olive-oil, hempseed-oil, or petrol. At the bottom is placed an iron coffin, filled with whole gun-powder that the ball may at last burst with a great noise; and lastly, the ball is, by the addition of lead, or otherwise, made of the same specific gravity with water.

BALLS, Anchor, are made in the same manner as light balls, and filled with the same composition; and, besides, they have an iron bar two-thirds of the ball's diameter in length, and three or four inches square. One half is fixed within the ball, and the other half remains without; and the exterior end is made to grapple with a hook. These are useful for firing wooden bridges or buildings, the rigging of ships, &c.; as the pile end being the heaviest, flies foremost, and wherever it touches, fails, and sets fire to all about it.

BALLS, Chain. See CHAIN-BALLS.

BALLS, Stang. See STANG-BALLS.

BALL, in *Mineralogy*, is also used in Cornwall, &c. for a tin-mine.

In this sense Godolphin's ball is said to be the most famous of all the balls or mines in Cornwall, for quantity of metal. Phil. Trans. N^o 138. p. 951.

BALL-Vein, a name given by the miners in Suffex to a sort of iron ore, common there, and wrought to considerable advantage. It yields not any great quantity of metal, but what it has runs freely in the fire; it is usually found in loose masses, not in form of strata, and is often covered with one or more crusts. It generally contains some sparkling particles, and is usually of a circular form in the perfect masses; thickest in the middle, and gradually thinner as it approaches the sides. The ores of Suffex in general are poor, but they require very little trouble in the working, so that a considerable profit is annually made from them.

BALL of a Pendulum, the weight at the bottom. In shorter pendulums, this is called the *bob*.

BALL, among *Printers*, a kind of wooden tunnel stuffed with wool, contained in a cover of sheep's skin, which is nailed to the wood; with which the ink is applied on the forms, to be wrought off.

The pressman holding one of these balls in either hand, first daubs them on the ink-block, then working them on each other, he applies them afterwards on the forms, which retain the ink necessary to make an impression.

BALLS for Horses, in *Veterinary Science*, masses made into this form which is the most usual and most convenient mode of administering medicine to these animals.

Being mixed with some viscid substance, the proposed medicine is formed into masses of an oblong or oval form, which are conveyed by the hand or otherwise to the root of the tongue, from whence they readily pass to the stomach.

This mode of administering medicines to horses is of great antiquity. These balls were termed by the Romans *ossa*; by the Greeks, *σφοχρῆς*. They, however, generally

preferred giving their remedies as a potion or drink. The kinds of balls will necessarily be as various as the nature of the medicine which is administered; as purging balls, cordial balls, diuretic, diaphoretic, febrifuge, worm-balls, cough-balls, alterative balls, &c. Any tenacious substance not possessing active properties, will serve for the admixture of them, as paste made of boiled flour, or boiled linseed meal; these particularly serve for balls that are to be immediately given, and not kept for any length of time, as they are apt to grow hard and dry, and sometimes mouldy. To prevent this, they may be immersed in melted wax, which will effectually coat them over and preserve them, and this was a mode also well known to the ancients. Honey, treacle, turpentine, and tar, are not subject to the above objection, and are all used by different persons for this purpose. The two last, however, cannot be supposed devoid of effect as a medicine; and therefore should not be employed, unless when they co-operate with, or do not destroy, the effect of the medicine prescribed.

Soft soap is also an adhesive particularly useful in the admixture of diuretic and purging balls for horses, as not drying nor being particularly expensive. Aloes, almost the only purgative at present known for horses, operates better when united with this substance than in any other way that we have tried. Calomel also operates as a purgative on horses. For the particular method of preparing them, see PHARMACOPOEIA *Equina*.

These balls should not be made too large, or be suffered to get too hard; in either case, by lodging in the œsophagus, they may prove fatal.

It may not be unnecessary also to observe, that for the easy administration of them the following circumstances should be observed. The tongue should be drawn from the mouth with the left hand over the grinder teeth, the right hand holding the ball between the thumb and first finger, the ball should then suddenly and at once be thrust into the throat by gliding the hand along the roof of the mouth; when this is done slowly, the tongue rises, opposes the hand, and renders it difficult. An iron ring with a handle is sometimes used to distend their jaws; but in this country these balls are generally given without.

When the jaw is very narrow so as not conveniently to admit the hand, the ball is placed on the end of a pointed stick, or it might be placed loosely in a cup or socket at the end of a small cane or whalebone, and be thus very conveniently given.

BALLS, in *Zoology*, various substances under this form found in the stomach and intestines of several animals; they occur most frequently in those quadrupeds which lick the surface of their bodies, in which case they are composed of the hair that has been removed by the tongue; the hair, partly by the operation of licking, and still more by the motion of the stomach, becomes mixt and interwoven in such a manner, that it resembles the texture of a hat, and when moulded into a round figure, receives a smooth, shining coat, or calculeous incrustation. These are the sort of balls usually met with in the cow, sheep, and goat kind, especially the chamois. Every indigestible substance that is swallowed is liable, however, to give origin to these balls, or to form a nucleus for calculeous concretion; hence we meet with them composed of the ruddy fibres of vegetables, husks of seeds, feathers, and different animal and vegetable exuviae. When such substances as stones of fruit, nuts, or inorganic substances, as pebbles, coins, &c. are long detained, and have been covered with a deep incrustation, they constitute the bezoardic stones. See BEZOAR. See also ÆGAGROPILA.

Accord-

According to authors, the human subject is liable to the formation of balls in the intestines, in consequence of indigestible matters not being regularly expelled. Thus cases have been related of death ensuing from accumulations of gooseberry seeds, which had been rolled into a solid ball in the stomach; and sir Hans Sloane gives the history of a ball found in the intestines of a man, much afflicted with the colic, six inches in circumference, of a spongy substance, and which, when viewed with a microscope, appeared made up of small transparent hairs or fibres, wrought together like the *tophus bovinus*; in the middle was a common plumb stone, which made, as it were, the core or nucleus upon which the fibrous matter had collected, *Stratum super illatum*. Phil. Trans. N^o 309. p. 2387. Sloane, in Phil. Trans. N^o 252. p. 1283.

Balls of Silk-worms and Spiders, are little cases or cones woven of silk, wherein those insects deposit their eggs. See SILK.

Spiders are extremely tender of their balls, which they carry about with them, adhering to the papillæ about their anus. Grew speaks of balls or bags of a species of silk-worms in Virginia, as big as hen's eggs, and containing each four *aureole*. Phil. Trans. N^o 362. p. 1037.

Ball of the Foot of a Dog, is the prominent part of the middle of the foot, called by Latin writers of the middle age, *pelota*, which is to be taken away in expedition. Duncange Gloss. Lat.

Balls, Billiard, are ivory balls used in the game of billiards. Moxon describes the method of turning hollow ivory balls one within another. Mechan. Exerc. p. 219.

Ball, Tennis, is a little globe, made and covered with cloth or leather, used in playing at the game of tennis.

Ball is also used, in a well-known sense, for an assembly of both sexes, who dance to the sound of instruments.

Balls, Glass. See GLASS-Balls.

Ball-Soap. See SOAP.

Ball and Socket, a machine contrived to give an instrument full play and motion every way. It consists of a ball or sphere of brass, fitted within a concave semi-globe, so as to be moveable every way, horizontally, vertically, and obliquely. It is carried by an endless screw, and is principally used for the managing of surveying instruments; to which it is a very necessary appendage.

The ancient balls and sockets had two concaves, or channels, the one for the horizontal, the other for the vertical direction.

Balls, Wool. See WOOL.

Ball's Pyramid, in *Geography*, a rock in the great Southern Pacific ocean. S. lat. 31° 30'. E. long. 159° 3'.

BALLABUAN, Straits of. See BALL.

BALLAD, or BALLET, a popular song containing the recital of some action, adventure, or intrigue.

The French confine their ballads to stricter terms. A ballad, according to Richelet, is a song consisting of three strophes, or stanzas, of eight verses each, besides a half strophe; the whole in rhyme, of two, three, or four verses, with a burden repeated at the end of each strophe, as well as of the half strophe.

In the old English version of the Bible, the book of Canticles is intitled the *Ballad of ballads*, which has given scandal to some Romish writers as countenancing the opinion of those who hold that book a ballad of love, or a recital of the amours between Solomon and his concubine, as Catalio and some others have conceived it to be.

Some have suggested that a collection of ballads is necessary to a minister, in order to learn the temper and inclina-

tions of a people, which are here frequently uttered with great simplicity. The great Cecil, chief minister to queen Elizabeth, is said to have made a most ample collection of ballads on this account.

A very ingenious political writer, Mr. Fletcher of Saltoun, says, that if he could but make the ballads of a nation, he would care very little who made the religion of it. There is a very curious collection of old English and Scottish ballads, published in 3 vols. 8vo. by Dr. Percy; in which, and in a dissertation prefixed to Askin's Collection of Songs, &c. the curious in this way may find abundance of entertainment and information concerning the old ballads, and ballad-makers.

BALLAD, a mean and trifling song, generally, such as is sung in the streets. In the new French Encyclopedie we are told, that we dance and sing our ballads at the same time, as the French do their *vaudevilles*. We have often heard ballads sung, and seen country-dances danced; but never at the same time, if there was a fiddle to be had. The movement of our country-dances is too rapid for the utterance of words; though the term ballad, we have no doubt, was derived from the Italian *ballata*, a song to be sung and danced at the same time, as it is defined in the Crusca Dictionary: *canzone, che si canta ballando*. *Ballatella*, and *Ballatetta*, are diminutives of the same word: *piccola canzonetta a ballo*. The English ballad has long been detached from dancing, and, since the old translation of the Bible, been confined to a lower order of song. In Shakespeare's time this species of vulgar and popular poetry was wholly degraded and turned into the streets -

“An I have not ballads made on you all, and sung to filthy tunes, may a cup of sack be my poison.” Hen. IV.

BALLADUK, in *Geography*, a town of Arabia Deserta, 140 miles E. N. E. of Damascus.

BALLA-GAUT, denoting the *higher* or *upper Gauts*, an elevated tract of the peninsula of India, being the western part of the Carnatic, or of that part of the peninsula that lies south of the Gondegama and Loombuddra (or Tungehadra) rivers, from the coast of Coromandel eastward to the Gaut mountains westward, and containing the districts which lately composed the country of Tippoo. The other or eastern part, which is the Carnatic according to its present definition, is denominated *Payen-Gaut*, or the lower Gauts. (See BALAGAT.) The *Balla-Gaut* mountains denote that elevated tract, across which goods were formerly conveyed from TAGARA, or the modern DOWLATABAD, to BARCACH, See Asiatic Researches, vol. i. p. 369, &c. 8vo.

BALLACHAN Point, a cape on the east coast of Ireland, in the county of Louth, at the south-west entrance of Carlingford bay; eleven miles south-east of Newry. N. lat. 53° 58'. W. long. 6° 4'.

BALANTIRE, or BALLANTRAE, a sea-port town or rather populous village of Scotland, on the west coast of the county of Ayr, in that subdivision called Carrick, on the frith of Clyde, containing about eighty houses, and 300 inhabitants. They have a good salmon fishery at the mouth of a small river called Ardsfinchar which joins the frith near the town; but the principal fishery of this district is that of haddocks, whittings, cod, ling, skate, &c.: twenty-eight miles S. S. W. of Ayr.

BALLARD, Cape, lies on the east coast of Newfoundland, four leagues N. N. E. from cape Race, and four miles from Fresh-water bay. N. lat. 46° 49'. W. long. 52° 40'.

BALLARD'S Point, a cape on the west coast of Ireland, in the county of Clare. N. lat. 52° 42'. W. long. 9° 52'.

BALLA.

BALLARINA, in *Ornithology*, a name under which Olinia describes the white-wagtail, motacilla alba.

BALLAS, a town of Egypt, ten miles south of Dendera.

BALLAST, in *Navigation*, any heavy matter used to sink a vessel to its proper depth in water, or to give it a just weight and counterpoise, and enable it to bear sail upright, without overturning.

The word comes from the Flemish *belast*, formed of *le*, and *last* or *left*. The French call it simply *left*. In the Mediterranean, *quartelage*. In Latin writers of the lower age it is denominated *lastagium*.

The ordinary ballast is sand or stones, stowed in the bottom, or hold, next the false keel of a vessel: sometimes, iron, lead, corn, or other heavy goods, serve for ballast.—Ships are said to be in ballast, when they have no other loading.

That ballast is best which is heaviest, lies closest and fastest, and driest, both for the ship, bearing a sail, stowing of goods, health of the company, and saving of casks and other goods. If a ship have too much ballast, she will draw too much water; if too little, she will bear no sail. The ballast is sometimes one-half, sometimes a third, and sometimes a fourth part of the burden of a vessel. But there is often great difference in the proportion of ballast required to prepare ships of equal burden for a voyage; the quantity being always greater or less, according to the sharpness or flatness of the ship's bottom, which seamen call the *floor*.

Although ships in general will not carry a sufficient quantity of sail till they are laden so deep that the surface of the water will nearly glance on the extreme breadth amidship, yet a great weight of heavy ballast, as iron, lead, &c. in the bottom, will place the centre of gravity too low in the hold; and in this case, though they may be able to carry a great sail, they will move heavily, and hazard being dismasted by their violent rolling. The art of properly ballasting a ship is that of disposing the materials of which it consists, &c. so that it may be duly poised, and maintain a just equilibrium on the water, and be neither too *stiff* nor too *crank*. In the first case, though the ship may be able to carry a great sail, yet its velocity will not be proportionably increased, whilst her masts are more endangered by her sudden jerks and excessive labouring; and in the last case she will be incapable of carrying sail, without the danger of oversetting. Stiffness in ballasting is occasioned by laying a great quantity of heavy ballast, as lead, iron, &c. in the bottom, which of course will place the centre of gravity very near the keel; and crankness is occasioned by having too little ballast, or by disposing the ship's lading in such a manner as to raise the centre of gravity too high.

As the tendency of a ship to pitch or roll depends, not only on her form, but also in a greater degree upon the due distribution of the heaviest part of her cargo, the knowledge of properly ballasting a ship, as well as of stowing her cargo, is of great importance to the mariner. Particular attention should be paid to moderate her pitching, as this most fatigues a ship and her masts; and it is usually in one of these motions that masts break, particularly when the head rises after having pitched. Rolling, indeed, is a more considerable movement than pitching; but it is slow, and seldom attended with any accident. However, it should be prevented as much as possible; and this may be easily done in general, without any detriment to the ship's stiff carrying of sail, by stowing up the ballast, when it is iron, to the floor-heads; because the ship will be restored by it with less violence after she has inclined, and it will act on a point at a little distance from the centre of gravity.

For the farther illustration of this important subject, let it be premised, that various methods have been recommended for finding the following points of a ship; viz. its centre of gravity, centre of cavity, centre of motion, and metacentre. (See these articles.) Some of these points are fixed; others are variable. When a ship is completely loaded, the centre of gravity is fixed, howsoever the vessel may alter her position. The centre of motion is always in a line with the water's edge, when the centre of gravity is even with or below the surface of the water; but, whenever the centre of gravity is above the water's surface, the centre of gravity is then the centre of motion. In circular bodies the centre of motion will be the centre of the circle. The centre of cavity varies with every inclination of the ship, because that depends upon the shape of the body immersed. The metacentre, called the shifting centre, depends upon the situation of the centre of cavity; for it is that point where a vertical line drawn from the centre of cavity cuts a line passing through the centre of gravity and perpendicular to the keel. The centre of gravity must not by any means be placed above this point; because, if that were the case, the vessel would overset.

Let the segment of a circle 1 2 3 (*fig. 14. Plate II. MECHANICS*), represent the transverse section of a vessel's bottom; W L the surface of the water; M the metacentre as well as the centre of motion, because this is a circle; C the centre of cavity; G the centre of gravity; and the line 2 4 the vertical axis of the vessel which may be turned round the point M, as on a fulcrum, supported by the centre of cavity. By thus simply considering the vessel as a lever in the direction of her vertical axis playing round her centre of motion, it is plain, that if the centre of gravity was placed above the point M, being the metacentre too, the vessel would upset; therefore that the ship may have stability, the centre of gravity must be below this point: and it may be observed, that the farther G is removed from the metacentre, the greater must be its force, as the gravity then acts with a greater length of lever, considering the fulcrum of that lever to be at the centre of motion; or, if the weight at G be augmented, it will likewise increase the force; therefore the force of G may be expressed, by multiplying the balance of weight beneath the centre of motion, by the distance of the centre of gravity from the centre of motion.

The centres of cavity and motion (in circular bodies) will ever be in a line perpendicular to the horizon, but the centre of gravity may be either on one side or the other of this line. When such a body is at rest, the centre of gravity will be in this line; but if in motion it will be diverted from it. Thus the points M and C, will always be perpendicular to W L; but the point G, by the body's rolling, may be on either side; for instance at g. While G is perpendicularly beneath the centre of motion, its action can only tend to *preserve* this circular body in her erect position; but if it is removed to either side as to g, its action is to *return* it to the erect position; and this action increases as the distance G g, which is the sine of the angle of roll g M G, the distance M G being considered as the radius. Thus, to gain the force of gravity with any roll as g M G, let the balance of weight beneath the centre of motion be multiplied by the sine of the angle of roll G g.

But the tendency to roll may be also diminished by the shape of the hull: for, let us suppose that the transverse section be allowed more beam, and increased by the dotted lines. Now when this vessel is rolled over, it is plain that the cavity will be augmented towards the side L, of course

its

its centre must remove towards L, say to c ; and, if from c be erected a perpendicular to the horizon, it will cut the vertical axis at n , which will, in this case, be the metacentre, above which, if the centre of gravity were placed, it would act in conjunction with the centre of cavity to overturn the vessel; but, as the centre of gravity is here below it at g , her stability will be increased by the increased distance of G from n , the metacentre; and the vessel will roll round the point M as her centre of motion.

When sailing in smooth water, the greater the stability the better; but if a vessel with a heavy cargo, stowed low in her bottom, be sent out into a rough tempestuous sea, where every wave will throw her from her equilibrium, she will return with such violence as to endanger her masts; and should she be dismasted, her roll will then be with still greater force, possibly to the destruction of her hull. Was the cargo in this labourfome vessel to be removed higher up towards the centre of motion, so as to lessen her stability, she would be found considerably easier; her roll would be by such deliberate motions, as to lessen the danger to her masts and hull.

The ballast is placed round and very near the centre of gravity of the ship, because it will prevent the motion of the pitching being so hard as it would be, if that weight were distant either afore or abaft that point. Whenever the sea runs a little high, the ship is never carried by a single wave; there are generally two or three always passing under at the same time, unless when the sea is extremely long, the swells coming from a great distance, and in latitudes very remote from land; for, then, it happens that the largest ships are sometimes carried by one single wave. But, in either circumstance, the ballast ought not to be stretched afore or abaft the centre of gravity, as soon as the ship is in the parallel to her draught of water marked for the ballast, which it is absolutely essential to pay attention to. To prove this principle, suppose in either case a long or short surge, and that the water strikes the ship forward, that thereby she may be exposed to the greatest and hardest pitching; for when the wave takes a ship under the stern, her motions, if she has got a little head-way, are not dangerous; because, as she flies before the wave, she recedes in some measure from its impulse; while, in the first case, she increases on the contrary that same impulse in the ratio of the square of all her velocity.

First, the ship whose extremities are light or little loaded, being supposed to run with any velocity whatever against the wave which comes to her a-head, shocks that wave with a force expressed by the square of the sum of the two velocities; she divides it and goes through it, at the same instant that she is raised by the vertical impulse of that column of water, which opposes to her a supporting power too considerable for her weight to displace; the wave which follows produces the same effect in receiving the fall of the ship, because the first is already under the middle of the ship, whence it passes to the stern, which is supported by it, while the second takes its place in the middle, and the third is come to support the head; and this is an uninterrupted succession. This motion continuing thus as long as the sea is agitated, it follows that the ship is never at rest; no sooner has she been raised by a wave, but she falls again when that wave is gone, which falling is proportionably less sharp as her head is less heavy; the shake is then less violent, since she shocks the water with a less mass, which prevents her pitching so deep as she would do, if she were more heavy; consequently, the masting does not suffer, and the head-way is less delayed, as the fullest part of the bows is not so much exposed to the shock of the water.

Secondly, when the ship is raised by one single wave, her fall is still less sharp, if little loaded a-head; for when she is carried only by the middle. She rises the first, and more easily at the moment the other wave comes to strike her, and the shake is not so violent. Was she to plunge deeper into the fluid, it might happen that the column of water would become higher than her head, and, passing partly over it, would expose her to the danger of foundering.

In the stowing of the cargo, it is proper to place the heaviest part of the stowage as low as possible, taking care to preserve that draught of the ship which is most advantageous for her, whether she be in ballast or when laden. Those points are marked both at the head and stern: in a word, the great art of stowing lies, in endeavouring that each of the vertical parts, in which the extremities of a ship may be supposed to be equally divided, be lighter, when her lading is complete, than the weight of the mass of water they are to displace; observing always, that the vertical parts of the middle admit of being loaded more heavily than the weight of water they are able to displace.

In the royal navy, the iron ballast is first stowed fore and aft, from bulkhead to bulkhead in the main hold, next to fir cants nailed on the limber-strakes on each side the keelson, five or more inches clear of the limber-boards; and is winged up three or more pigs above the floor-heads in the midships, or bearing part of the ship, and there are two tiers of pigs in the wake of the main hatchway and well-wings. Ships, built with a very clean run aft, seldom have any iron ballast stowed abaft the pump well or after-hold. Ships that have floor and futtock riders, have the iron ballast stowed either lengthways or athwart ships, agreeably to the length of the chambers, which are the clear spaces between the riders.

The shingle ballast is next spread and levelled over the iron ballast; on which is stowed the ground tier of water, bung up and bilge free from the sides, either chine and chine, or bounge and chine, beginning at the coal-room bulkhead, that being the foremost, and making the breakage, if any, at the main hatch. The midship tiers, fore and aft, are the first laid down, and the casks are sunk about one quarter of their diameter into the shingle; the sides are filled-in with wingers of small casks, as half-hogheads, gang casks, or breakers; observing not to raise the wingers above the level of the tier, to cause a breakage in the next tier above, which is stowed in the cuntline of the ground tier, bung up and bilge free; and so on, for as many tiers as can be stowed sufficiently clear of the beams.

In the after hold, between the aft-side of the pump-well and fish-room bulkhead, are stowed the provisions above the ground tier; between the casks, billet, or other wood, and shingle ballast.

In the fish-room are stowed some of the spirits, or wine, and sometimes coals; and in the spirit room, are stowed the wine and spirits for the ship's use.

In the merchant service, the stowage consists, besides the ballast, of casks, cases, bales, boxes, &c. which are all carefully wedged off from the bottom, sides, pump well, &c. and great attention paid that the most weighty materials are stowed nearest to the centre of gravity, or bearing of the ship; and higher or lower in the hold agreeably to the form of the vessel. A full low-built vessel requires them to be stowed high up, that the centre of gravity may be raised, to keep her from rolling away her masts, and from being too stiff and labourfome; as, on the contrary, a narrow high-built vessel requires the most weighty materials to be stowed low down, nearest the keelson, that the centre of gravity may be kept low, to enable her to carry sail, and to prevent her oversetting.

Ballast allowed to the following Ships.

By the 19th Geo. II. it is enacted, that if after June 1, 1746, any master or owner, or any person acting as master of any ship or other vessel whatsoever, shall call, throw out, or unlade, or if there shall be thrown out, &c. of any vessel, being within any haven, port, road, channel, or navigable river within England, any ballast, rubbish, gravel, earth, stone, wreck, or filth, but only upon the land, where the tide or water never flows or runs; any one or more justices for the county or place where or near which the offence shall be committed, upon the information thereof, shall summon or issue his warrant for bringing the master or owner of the vessel, or other person acting as such, before him; and upon appearance or default, shall proceed to examine the matter of and upon proof made thereof, either by confession of the party, or on view of the justice, or upon the oath of one or more creditable witnesses, he shall convict the said master, &c. and fine him at his discretion for every such offence any sum not exceeding 5l. nor under 50s. &c.; and for want of sufficient distress, the justice is to commit the master, or person acting as such, and convicted as aforesaid, to the common gaol or house of correction, for the space of two months, or until payment of the penalties.

Besides the above general act relating to ballast, there are the 6 Geo. II. c. 29. and the 32 Geo. II. which regulate the ballasting of merchant vessels in the river Thames, placing it under the direction of the corporation of Trinity-house. Elements and Practice of Rigging and Seaman'ship, vol. ii. p. 283, &c.

BALLAST, to trench the, denotes, to divide the ballast into two several parts or more, in the ship's hold, commonly done to find a leak in the bottom of a ship, or to undock her.

BALLAST, the, shoots, that is, runs over from the one side to the other. Hence it is that corn, and all kinds of grain, is dangerous lading, for that is apt to shoot. To prevent which, they make *poules*, that is, bulk-heads of boards, to keep it up fast, that it may not run from side to side, as the ship heels upon a tack.

BALLASTAGE. See **LASTAGE.**

BALLATOONS, large, heavy luggage-boats, carrying goods by the river from Astracan and the Caspian sea to Moscow. These will carry from a hundred to two hundred ton; and have from a hundred to a hundred and ten, or twenty men employed to row, and tow them along.

BALLENDEN, or BELLFENDEN, sir John, in *Biography*, an elegant Scots writer of the sixteenth century, descended of an ancient and honourable family in Scotland, was probably born and educated in France. Having in his youth served in the court, and, as some writers suggest, having

been employed in the education of James V., he was distinguished by the favour and patronage of that prince, and obtained extraordinary preferment in the church, as well as the office of clerk of accounts, occupied by his father Mr. Thomas Ballenden of Auchinoul, in 1541. The work by which he gained the highest reputation, was his translation of Hector Boethius out of Latin into the Scots tongue, performed by the command of his royal master, intitled, "The History and Chronicles of Scotland, &c.," and published in folio at Edinburgh, A. D. 1536. This version, in which the translator took the liberty of augmenting and amending the original as he thought proper, was well received both in Scotland and England, and soon became the standard of that history. In the succeeding reign, he was one of the lords of session; and being a zealous Romanist, he assiduously laboured, in conjunction with Dr. Laing, to hinder the progress of the reformation. His zeal involved him in disputes, which obliged him to quit Scotland, and remove to Rome, where, it is said, he died A. D. 1550. He was a man of great parts, and one of the finest poets of which his country could boast. His works, that are still extant, are distinguished by that noble enthusiasm which is the soul of poetry. His poem, intitled "Vertue and Vyce," was addressed to the monarch of the Scots, James V.; and his other pieces, both printed and in MS. are now buried in oblivion. In Carmichael's collection of Scottish poems, there are some of this author on various subjects. Biog. Brit.

BALLENDEN Point, in *Geography*, a projecting point in the bottom of Donegal bay, on the north-west coast of Ireland, south-west by south $\frac{1}{2}$ south. 8 miles from Enfinurry island.

BALLENESSE ISLANDS, are four small islands on the south of Troy island, off the N. W. point of Ireland, called Beg, Doway, Bofin, and Maghere Welley. Between Troy island and Ballenese, there is a good road and safe anchorage from a southerly or easterly wind.

BALLENAY PORT, is about 2 $\frac{1}{2}$ leagues east from Skerries island, or port Rutch, upon the main, on the north coast of Ireland; south and somewhat west from Rathlin island, and Dummer's rocks.

BALLEROY, a town of France, in the department of the Calvados, and chief place of a canton in the district of Bayeux, six leagues south of Caen, and 2 $\frac{1}{4}$ S. S. W. of Bayeux.

BALLERUS, in *Ichthyology*, the name under which the Gmelinian cyprinus latus is noticed by Jonk. and other old authors.

BALLERUS, a species of CYPRINUS, with forty rays in the anal fin. Linnæus Fn. Suec. This fish inhabits the lakes in some parts of Europe, and near the Caspian sea. The head is small, obtuse, and brown in the front; cheeks and gill-covers alternately blue, yellow, or red; eyes large; iris yellow, with two black spots; jaws equal, lower one curved; back carinated; lateral line straight, variegated with brown dots; edges of the fins blue; dorsal fin placed farther back from the head than the pectoral one; anal fin very broad; tail lunated. Weight in general about a pound; deposits an immense number of eggs in April; grows slowly, is thin, and covered with minute lax scales; the colour above is blackish-blue, yellowish on the sides, silvery below, and reddish on the belly; flesh not very good. Bloch observes that the number of rays in the anal fin amount to one more than Linnæus mentions, and characterises the species as having forty-one rays in the anal fin; cyprinus pinna ani radiis 41. Bloch.

BALLET, or BALET, BALETTO, a kind of dramatic poem, representing some fabulous action or subject, divided into

into several entries; in which several persons appear, and recite things under the name of some deity, or other illustrious character.

BALLET, from *βαλλω*, to cast, is more particularly used for a stage dance. Rousseau defines this word a theatrical action, represented by dancing, guided by music. The term is derived from the old French word *baller*, to dance, sing, divert one's self. The music of a *ballet* ought to be still more cadenced and accented than mere vocal melody; as it is the business of music to suggest to the dancer that animation and expression which the finger acquires from the words; and it is likewise her business to supply, in the language of the soul and the passions, all that the dancer cannot present to the eyes of the spectator.

BALLET is likewise the name given in France to a whimsical kind of opera, where dancing is hardly more in place than in the others, or productive of better effects. In most of these *ballets*, the several acts seem so many different subjects, connected together only by some general relation foreign to the action, which the spectator would not discover, if the author did not make it known in the prologue.

These *ballets* contain other little *ballets*, which are called festivals or entertainments; they are likewise called suits or series of dances, which succeed each other without subject or connection with the principal action, and where the principal dancers tell you nothing but that they dance well. This arrangement, by no means theatrical, may do very well at a private ball, where each individual has fulfilled his object sufficiently, when he has amused himself, and where the interest which the spectator takes in this individual, dispenses with his giving him any other gratification. But this defect in the subject and connection, ought never to be suffered on a public stage, not even in the representation of a ball, where the whole ought to be combined by a secret action, which keeps up the attention and interests the spectator. In general, every dance which represents nothing but itself, and every *ballet* which is only a ball, should be banished from the theatre. Indeed every action on the stage is the representation of another action, and what we see there is only the image of what we suppose there; so that it ought not to be merely this or that dancer who presents himself to your observation, but the person whose character he has assumed. Thus, though the private dance can represent nothing but itself, the theatrical dance ought necessarily to be the representation of something else, in the same manner as the finger represents a person that is speaking, and the decoration other places than those which he occupies.

The worst *ballets* are those which are founded on allegorical subjects, and which represent nothing but an imitation of an imitation. The whole art of this kind of dramas consists in the personifying intellectual images, and in making the spectator see what he disbelieves; as if, instead of attaching him to the stage, it were meritorious to carry him from it. Besides, this species of representation requires so much subtilty in the dialogue, that the composer of the music finds himself lost in the land of points, allusions, and epigrams, while the spectator does not forget himself a moment. When the words of an opera speak sense, the music will learn to speak it likewise.

These reflections of Rousseau, according to M. Framery, are now useless, as this kind of spectacle no longer exists. But as we wish to record the productions of each art, Rousseau's account of the ballets of his time will be historical of what they were at the period when he wrote, that is about fifty years ago; and we think what Jean Jaques says of allegorical ballets, would suit the mythological nearly as well.

Ballet is one of the longest and most elaborate articles of the new French Encyclopedie. When M. Framery seems to have exhausted the subject, it is refused by his colleague in the musical department, M. Guignee, who has still found much to say on the subject. *Ballet* is, in France, a term that includes three different kinds of exhibition on the Lyric stage. In the first, the dance constitutes only a subordinate part of the action represented in the second, it is the principal part; poetry and vocal music then being only accessories in their turn; and, lastly, in the third, the whole business is performed in dancing; and in representing an action in which the performers neither speak nor sing, they dance. The first kind is simply called a *ballet*; the second a *ballet-opera*, or *opera ballet*; an opera with dance analogous to the drama: the third is called a *pantomime ballet*.

"To treat this subject in its full extent (say, M. Guignee) would require a volume." And an excellent volume has already been written on the subject, by the celebrated Noverre, intitled "Lettres sur la Danse," 1760. In 1754, M. Cahusac had published a pleasing work in 3 vols. "Sur la Danse ancienne et moderne," an historical treatise. But father Menestier's treatise, "Des Ballets anciens et modernes," 1682, is perhaps the most curious of them all, in the historical part.

Music is so inseparable from the dance, that the word *ballet* may be regarded as a musical term. The music to opera dances used to be furnished by the composer of the airs and recitatives. Haffé, Jomelli, and Gluck, distinguished themselves as much by the music of grand *ballets*, as by the opera itself; as did our countryman Dr. Arne, by the dances in *Comus*. Of late years, it has been generally assigned to the principal second violin to compose the music and head the band, in the dances between the acts of an opera. Agui, Noverre, and Le Brun the hautboy player, performed this office during many seasons; and their business was executed for a considerable time to the satisfaction of the public and the performers, by the late Sig. Puffi. The airs of many *ballets* were usually brought from France, particularly those of Rameau; but Teiler, a German, about twenty years ago, acquired great reputation by the music of his *chaconnes* and *ballets berriques*. See DANCE, and PANTOMIME.

BALLET, in English Poetry, &c. See BALLAD.

BALLEXFORD, JAMES, in *Biography*, born at Geneva, in October 1726, became a distinguished practitioner of medicine in that city, where he lived much celebrated to the year 1774, and published the following: "Dissertation sur l'Education Physique des Enfants," Paris, 1762, 8vo. "Dissertation sur les causes principales de la mort d'un aussi grand nombre d'Enfants, &c." Geneva, 1775, 8vo. Lloyd Dict. Histor.

BALLEZE, **BALLIZE**, or **WALLIS**, in *Geography*, a river in the peninsula of Yucatan, New Spain, runs northerly above 200 miles, and discharges itself into the bay of Honduras, opposite to the north end of Turneff Island. By the treaty of peace in 1783, it is agreed that British subjects shall have the right of cutting and carrying away logwood in the district lying between this river and that of Rio Honda on the north, which falls into Henover bay. The unalterable boundaries are the course of the rivers.

BALLIACE, in *Ancient Geography*, a town of Illyria, in the vicinity of Apollonia. Strabo.

BALLIAGE, a small duty paid to the city of London, by aliens, and even denizens, for certain commodities exported by them; which they claim by their charter, dated the 5th of September, in the sixteenth of Charles II. confirmed by the twentieth rule of the Book of Rates, and by 2 W. & M. cap. 8.

BALLIANI, JOHN BAPTIST. in *Biography*, a senator of Geneva, was born in 1586, and distinguished himself among natural philosophers by a Latin treatise, "On the natural motion of heavy bodies," first printed in 1638, and republished in 1646, with many valuable additions. Having passed with honour through many public offices, he died in 1666.

BALLIBAY, in *Geography*, a market and post town of the county of Monaghan, province of Ulster, Ireland, situated 53 miles north by west of Dublin. This town was in a wretched state; but of late years, since the establishment of its linen market, it is greatly improved, and several new houses have been built. There is a market-house, and a market on Saturdays, at which webs are purchased to the amount of 1500*l.* weekly. In the neighbourhood of the town are the extensive bleach-greens and mills of Crieve, at which 50,000 webs are bleached. Turf is so abundant, that it is sold in the town of Ballibay at 6¼*d* for a horse-load. A district called the Cahills, in this neighbourhood, is remarkable for producing a heavy crop of flax, equal to twenty-eight stone of scutched flax to the quarter of an acre, and from one bushel of seed sowed; this is an immense produce, but the quality is proportionably coarse. Sir Charles Coote's Statistical Account of Monaghan.

BALLIBOY, a small post and fair town of the King's county, province of Leinster, Ireland, situated on the Silver river, and giving name to one of the baronies in that county; which, from the average rent, stated by Mr. Young, and compared with that of the other baronies, seems to contain the worst ground in it. Distance from Dublin 56 Irish miles. N. Lat. 53° 8' W. Long. 7° 39' Young's Tour.

BALLIELLA, or **BALLIELA Point**, the south-east point of Galway bay, on the west coast of Ireland, eleven leagues north-east by east from Loup's head.

BALLIMONEY, a post and market-town of the county of Antrim in Ireland, not far from Coleraine, and 107½ Irish miles from Dublin. It is a pretty large town, and has a good market, especially for linens, ¾ this wide, called Coleraines. Between it and Ballymena is much grazing land, from which Belfast is in great measure supplied with provisions for exportation. N. lat. 55° 4' W. long. 6° 23'.

BALLIMORE, a small post town, or rather village, of the county of Westmeath, in Ireland, seated on the west side of Lough Seudy. It was a strong garrison of the English forces towards the latter end of the war of 1641, being conveniently situated between Mullingar and Athlone, and deriving great advantage from the lake. The name of this place implies the *great town*, and it may probably have declined considerably in importance; but the idea of a great town, when this name was given, must have been very different from that now entertained. Distance from Dublin 50 Irish miles. N. lat. 53° 26' W. long. 7° 33'. Collect. Hibern. Beaufort's Map, &c.

BALLIMORE Estuary, a small town, in a detached part of the county of Dublin, in Ireland, pleasantly situated on the Liffey, over which it has a handsome bridge; it has decayed on account of the great southern road from Dublin having been turned so as to pass through Killellen. Near this town is Rufsborough, the seat of lord Milltown, universally esteemed one of the most superb in Ireland, and containing a valuable collection of paintings by several eminent masters. There is also a great natural curiosity in the neighbourhood, the water-fall of Poll-a-phuca, or the demon's hole, formed by a river which rises in the county of Wicklow, and here falls into the Liffey. Lord Milltown, the proprietor, has spared no pains to assist the natural beauties

of the spot, having planted its fine hanging banks, and built several cottages and grottoes for the reception and accommodation of the numerous parties that resort to it. Distance from Dublin 17½ miles. N. lat. 53° 7' W. long. 6° 73'. Wilson's Book of Roads. Dodd's Traveller's Director, 1801.

BALLIMOTE, a village in the county of Sligo, Ireland, which deserves to be mentioned, on account of the flourishing aspect which the linen business wears in its neighbourhood. The great exertions of the late Mr. Fitzmaurice, brother of the present marquis of Landsdowne, first established this manufacture, which has spread throughout all the adjoining country. Beaufort. Young.

BALLINA, a town of the county of Mayo, in Ireland, situated on the river Moy, and connected by a bridge over that river with Ardnaree, in the county of Sligo, forming together one town, which is neat and thriving, and has a brisk market for linen every week. Mr. Arthur Young describes its situation as uncommonly pleasing. It has a salmon fishery, which is one of the most considerable in the island, supplying seventy or eighty tons of salted fish, besides the fresh. It was let for 520*l.* a year in 1776. This town, being near Killala, was soon taken possession of by the French under general Humbert in the late invasion, and many depredations were committed there by the rebels. Its distance from Dublin 120 Irish miles. N. lat. 54° 6' 30". W. long. 8° 59'. Beaufort. Young.

BALLINACOURTY POINT, a cape on the south coast of Ireland, in the county of Waterford, and north side of Dungarvon bay, four miles east of Dungarvon.

BALLINAHINCH, a barony in the western part of the county of Galway, and province of Connaught, Ireland, better known by its ancient name of Connamara, or *Connmacemara*, which implies the *chief tribe on the great sea*. This large district is very rude and mountainous, and as might be expected, very thinly inhabited. Some of the hills are very high; especially the vast ridge called Beanna-beola, or the twelve pins, which is a well-known seamark, consisting of almost perpendicular rocks. At the foot of this ridge, close to the little village of Ballinahinch, a charming lake spreads itself for some miles; and on the river which runs from it into Roundstone bay, there is a great salmon fishery. On the sides of hills, and in the vallies, which are watered by rivers and small lakes, and sheltered in some places by the venerable remains of ancient woods, the soil is mostly inclined to a black bog; but gravel, sand, or rock lie at no greater depth than from one to three feet below the surface. Great quantities of kelp are made all along the coast, and by manuring with sea wrack, the land is rendered very productive to the scattered families that inhabit it, who are all little farmers and hardy fishermen. Besides the herring fishery, which employs a great many persons, there is a fishery of sun-fish on the coast from the 10th of April to the 10th of May, which is carried on by the herring boats. Mr. Young says, that one fish is valued at five pounds, and that if a boat takes three fish in the month, it is reckoned good luck. The number of boats employed is from 40 to 50. The indented shores of this barony abound in well-sheltered havens, of which no use is made except by smugglers, who carry on business very extensively, and almost without interruption. The bays of Kilkerran, Birterbuy, Roundstone, and Ballinakill, are the largest; and the fine harbour of Killery, on which is a fishing town, is at the northern extremity of this district. On the promontory of Slymthead, forming the north extremity of Birterbuy bay, is a light-house. In this barony are made those woollen stockings, known throughout Ireland by the

name of Connamara, and very good blankets; and the encouragement given by the present possessor (Col. Martin, M. P. for the county) to settlers from Ulster, will probably contribute much to the improvement of what is now one of the most rude and uncivilized districts in Ireland. A late traveller observes, that even in Galway, within 15 miles of it, Connamara was less known than the islands of the Pacific ocean; and that he was advised not to venture into it. Such a dread had the inhabitants of this town of the clan of O'Flahertys, which possessed it, that death was threatened, by an inscription over the gate, to every person of that name found within the walls. Yet notwithstanding their ancient character, the above-mentioned traveller, in his ramble through the country, found the people peaceable and friendly, and less savage in their appearance than the peasantry near the capital. They are in general much better clothed, and are more industrious. The women, like those of Wales, knit as they go from one place to another. Smuggling is very general; and it is considered such an asylum for deserters, that it is not uncommon for poor peasants to go across Lough Corrib, and enlist; and when they are paid and clothed, take the first opportunity of returning, after which they are never heard of. There are many traces throughout the country of its having been cultivated in ancient times by some intelligent people. Dr. Beaufort's Memoirs. Mr. Young's Tour. Latocnaye's Rambles through Ireland.

BALLINAHINCH, a market and post town of the county of Down, in Ireland, situated nearly in the centre of the county, and for that reason occasionally fixed on for meetings of the farming society, and others of a public nature. It was the scene of a dreadful engagement in the late rebellion, the insurgents being numerous, and strongly posted in the lawn before lord Moira's house, which is close to the town. They were however defeated with considerable loss, and one side of the town entirely destroyed. In its neighbourhood, at the skirt of *Sliebh Croob* mountain, is a sulphureo-chalybeate spring, which is much frequented. The water is very clear and cold, and of a highly disagreeable smell and taste, like some of the waters of Aix la Chapelle. Distance from Dublin, 76 Irish miles. N. lat. $54^{\circ} 23'$. W. long. $5^{\circ} 48'$. Dr. Beaufort's Map. Book of Roads. Ratty on Mineral Waters.

BALLINAKILL, a fair, market, and post town, of the Queen's county, in Ireland, situate 48 Irish miles south-west of Dublin. Until the union took place it was also a borough town, and returned two members to parliament. It now has a brewery and three tan-yards, besides some inconsiderable woollen factories. The ruins of a castle yet remain, which was battered by general Fairfax, and bravely defended by the garrison. Coote's Statist. Account of Queen's County.

BALLINASKELIGS, a haven in the county of Kerry, Ireland, between Kenmare river and Dingle bay. It is deep and open, but not sheltered from southerly winds. It takes its name from a town, of which scarcely a trace is now to be seen; but which is in Stanihurst's Catalogue of the haven towns of Ireland, prefixed to Hollinhead's Chronicle. The ruins of a monastery are near the shore, which formerly belonged to the Augustine order, and was removed from the greater Skelig island to this place. From these islands the town took its name. In the neighbourhood is St. Michael's well, one of those holy springs to be met with in every part of Ireland, which are frequented by the common people on the day of the patron saint, and which are supposed to cure all manner of diseases. This devotion paid to wells has been mentioned as one of the remains of Druid-

ical superstition, though seemingly without sufficient authority. N. lat. $51^{\circ} 42'$. W. long. $9^{\circ} 22'$. Smith's History of Kerry. Rambles through Ireland. Hollinhead's Chronicle.

BALLINASLOE, a small but neat and well-built town of the county of Galway, in the province of Connaught, Ireland. It is situated on the west side of the river Sack (though in many maps it is placed on the east side, in the county of Roscommon), which river from the nature of the country might be easily made navigable to the Shannon. It is one of the most thriving towns in the county, having a great wool fair on the 13th of July, and several cattle fairs, at which 10,000 oxen and 100,000 sheep were sold annually from the pastures of Galway, Clare, and Mayo. From the increase of tillage however, and other causes, the number of sheep is said to have decreased. At one of these fairs, a show of cattle and premiums have lately been introduced, under the auspices of the farming society of Ireland, for the laudable purpose of improving the breeds. The wool fair was established in 1757, by Mr. Trench, father of the present lord viscount Dunlo, to whom the town belongs; and on account of the more convenient situation of Ballinasloe in the heart of the wool country, and the great attention paid to the accommodation of those who frequent it, it has taken the lead of Mullingar fair, and is now perhaps the greatest for wool in the united kingdom. Several days generally elapse before the buyers and sellers can agree respecting the price; during which period, the news of the day is as eagerly sought as on the Stock Exchange, and often produces a considerable effect. The number of bags usually brought to the fair for some years past was about 1500, each containing about eight hundred weight; but this is scarcely a fourth part of what is engaged from the country gentlemen at the same time, at a somewhat higher price. Mr. A. Young has made a comparison between the price of wool in the fleece in Ireland, and in Lincolnshire; from which it appears, that for 16 years ending in 1779, the average price in Ireland was 13s. 8d. per stone of sixteen pounds; and in Lincolnshire during the same years, it was 9s. 3d. for the same quantity. The height of price in Ireland he attributes to a decrease in the quantity produced, from ploughing up great tracts of sheep-walks, and an increase in the consumption. The same causes have continued to operate in a still greater degree, so that the average price for four years ending in 1801, was 18s. as the writer of this article was informed by an eminent manufacturer. A good deal of large combing wool was bought indeed at a lower price, but not that fit for making cloth. In comparing the price of English and Irish wool, it should be mentioned that in Leinster and Connaught, the bags are always paid for as wool, which makes an addition of fourpence per stone to the price. Yet though the price of wool is so much higher, such is the difference in the price of labour, that there is in time of peace a considerable export of worsted yarn to Norwich and Manchester. The distance of Ballinasloe from Dublin is 72 Irish miles. N. lat. $53^{\circ} 15'$. W. long. $8^{\circ} 8'$. Mr. A. Young. Dr. Beaufort.

BALLINROBE, a market, post, and occasionally an assize town of the county of Mayo, in Ireland, which is small, but flourishing, situated on the river Robe, which runs into Lough Mask. Here are the ruins of an abbey; and in the neighbourhood a charter school for forty boys. Within a few miles of it, on the road to Castlebar, are the ruins of Ballintobac abbey. The part that yet remains entire of this venerable structure, exhibits a fine specimen of Gothic architecture; the rafters, if they may be so termed,

termed, being formed of hewn stone joined in a very singular manner. A view and description of this abbey may be found in Ledwich's edition of Grose's Antiquities of Ireland. The distance of Ballinrobe from Dublin is 120 miles. N. lat. 53° 34' 30". W. long. 9° 6'.

BALLINTOY, a small town on the northern coast of the county of Antrim, formerly called Belletree, which has a tolerably good bay. A vein of coals was discovered here in 1756, which is wrought with such effect, as not only to supply a saltwork here, but others also at Portrush and Colerain. A grant of 2000 pounds was made by parliament in 1758 for improving the harbour. The distance from Dublin is 150 miles. N. lat. 55° 14'. W. long. 6° 12".

A little to the eastward of Ballintoy, on an abrupt and romantic shore, is a small rocky island called *Carrick-a-rede*. This rock is separated from the adjacent land by a chasm full sixty feet in breadth, and of a depth frightful to look at; at the bottom of which the sea usually breaks with an uninterrupted roar among the rocks. This island is peculiarly well situated for the salmon fishery; but being inaccessible from the water except at one spot, and the turbulence of the sea making it difficult to land even here unless the weather be extremely calm, the fishermen have contrived a singular bridge over the abyss. Two strong cables are extended across the gulph by an expert climber, and fastened firmly into iron rings mortised into the rock on each side. Between these ropes, a number of boards about a foot in breadth are laid in succession, supported at intervals by cross-cords; and thus the pathway is formed, which, though broad enough to bear a man's foot with tolerable convenience, does by no means hide from view "the rocks and raging sea beneath;" which in this situation exhibit the fatal effects of a fall in very strong colouring, while the swinging and undulations of the bridge itself, and of a single hand rope, which scarcely any degree of tension can prevent in so great a length, suggest no very comfortable feelings to persons of weak nerves. Upon the whole, it is a beautiful bridge in the scenery of a landscape, but a frightful one in real life. Hamilton's Letters on the Coast of Antrim.

BALLISTA, or **BALISTA**, in *Antiquity*, a military engine in use among the ancients, somewhat like our cross-bow, though much larger, more forcible, and more complicated in its form. It was used in the besieging cities, to throw in stones and sometimes darts and javelins; and received its name from the Greek *βάλισσα*, *to throw*.

Marcellinus describes the ballista thus: a round iron cylinder is fastened between two planks, from which reaches a hollow square beam placed cross-wise, fastened with cords, to which are added screws; at one end of this stands the engineer, who puts a wooden shaft with a big head into the cavity of the beam; this done, two men bend the engine, by drawing some wheels; when the top of the head is drawn to the utmost end of the cords, the shaft is driven out of the ballista, &c. According to Vitruvius, the ballista was made after divers manners, though all used to the same purpose: one sort was framed with levers and bars; another with pulleys; another with a crane; and others with a roothed wheel. The ballista was ranked by the ancients in the sling kind; and its structure and effect reduced to the principles of the sling; whence some writers called it *funda* and *fundibulus*. Gautherus calls it *Balearica machina*, as a sling peculiar to the Balearic islands.

M. Rollin joined the account of the catapulta and ballista together (Arts and Sciences, vol. ii. p. 52.), observing, that though authors distinguish them, they also often confound them. The ballista was at first chiefly used for throw-

ing stones, and the catapulta for lancing darts and arrows; but by degrees they were confounded and indifferently appropriated to both. (Grose Hist. Eng. Army, vol. i. p. 366.) The ballista, however, must have been the heaviest and most difficult to carry; because there were always a greater number of the catapultæ in the army. Livy, in his description of the siege of Carthage, says there were an hundred and twenty great, and two hundred small catapultæ taken; with thirty-three great ballistæ, and fifty-two small ones. Josephus mentions the same difference among the Romans, who had three hundred catapultæ and forty ballistæ at the siege of Jerusalem.

Vegetius says, that the ballistæ discharged darts with such rapidity and violence, that nothing could resist their force. Athenæus tells us, that Agefistratus made one of little more than two feet in length, which shot darts almost five hundred paces. There were others of much greater force which threw stones of three hundred weight upwards of twenty-five paces. The surprising effects of these machines are particularly recorded by Josephus (Beil. Jud. v. 6.); at Jerusalem, they projected stones which beat down the battlements, and broke the angles of the towers; there was no phalanx so deep, but one of them would sweep an whole file of it from one end to the other: and a man who stood by Josephus, had his head taken off by a stone at the distance of three hundred and seventy-five paces. (Rollin Arts & Sc. ii. 52, 53.) Tacitus too has recorded more than one instance of their force. (Anal. xv. 9. Hist. iv. 23.)

Among the Saxons, as we have already mentioned (see **ARTILLERY**), great military engines of almost every kind seem to have been unknown; it is to the middle ages we look for the introduction of any thing like field artillery. William of Poicton (p. 201.) says, that machines for throwing darts and stones were used with great success at the battle of Haling's. The darts that were shot from these machines, as well as from the cross-bows, were called *quarrels*; and were pointed with heavy pieces of steel like pyramids, which made them very sharp and very destructive. The ballistæ were more frequently used in sea fights than in battles on shore; nor was this particularly the case in the middle ages; Livy (xii. 21.) says, that both scorpions and ballistæ were used in a similar way by the Tarentines so long ago as 281. Nor was it in the ancient times alone that the names and properties and even the uses of the catapulta and ballista were confounded. In the Latin of the middle ages, ballista, in lieu of arbalest, was frequently the term for the cross-bow; and catapulta for the sling.

Perrault, in his notes on Vitruvius, gives a contrivance similar to that of the ballista, for throwing bombs without gunpowder.

When the ballista is painted in *Armory*, it is represented as charged with a stone. Guillim and other heraldic writers call it a *swamp*.

BALLISTA, in *Practical Geometry*, the geometrical cross, called also *Jacob's staff*. See **CROSS STAFF**.

BALLISTA, or *Os Ballistæ*, is a denomination given by some anatomists to the first bone of the tarsus, otherwise called *talus* and *astragalus*.

BALLISTARIUM, or **BALISTARIUM**, in *Antiquity*, slingers in the ancient armies, or soldiers who fought with the *ballistæ*. There were two kinds of ballistarii milites; the former cast stones and other missile weapons with the hand, and were called manuballistarii, or sometimes simply manuballistæ; the latter, called carballistæ, made use of a machine. Some writers speak of a third kind called arcuballistarii, but these are better reduced to the second. The ballistarii were scarce heard of before the age of Constantine.

Balistarius in our ancient history is to be differently explained. Sometimes it refers to the men who shot stones and darts out of cross-bows; at others to the officers of the steel-bow-men, or directors of the great brakes or engines, with which the walls of any place were battered; and occasionally even to the slingers. (See Kelham on Doomsd. Book, p. 161.) Our kings, so early as the Conquest, had an officer styled *Archaballistarius* or *Balistarius Regis*, and lands were held in capite of the king, by the service of presenting annually a cross-bow-string as often as he passed through a certain district. (See Blount's Ten. p. 57, 70, 81.) Walter de Mofely in the thirty-second year of king Hen. III. held lands in Surrey by the serjeantry of being the king's ballistarius (or cross-bow-man) in his army for forty days in the year. (Pat. rot. in turr. Lond.) And it is not perhaps, improbable, that the inspector of the works relating to the ballistæ might occasionally bear the same title. Such an officer occurs in the patent rolls of the same king two years before. (Ibid. 37 Hen. 3. m. 8.)

BALLISTES, in *Ichthyology*. See **BALISTES**.

BALLISTEUM, or **BALISTEA**, in *Antiquity*, a military song or dance used on occasions of victory.

The *ballistæ* were a kind of popular ballads composed by poets of the lower class, without much regard to the laws of metre.

BALLISTIC Pendulum. See **PENDULUM**.

BALLISTICA, **BALLISTICS**, is used for the art of throwing heavy bodies. F. Merfennus has published a treatise on the projection of bodies, under this title.

BALLIPORE, in *Geography*, a small port town in the county of Kildare, in the province of Leinster, in Ireland, pleasantly situated in a well planted valley on the banks of the river Grees, a little on the right of the great road from Dublin to the south. It was chiefly a settlement of Quakers, but the number of these has considerably decreased; and the active part taken by many of the inhabitants in the late rebellion, caused it to be in a great measure destroyed. The celebrated Edmund Burke received his early education in this town at the school of Mr. Abraham Shakleton, one of the respectable class above-mentioned; which school was then held in high estimation, and has been continued by his descendants of the same name to the present day. Distance from Dublin twenty-eight miles. N. lat. 53°. W. long. 6° 51'.

BALLIUM, or **BAILEY**, in our ancient *Military Tactics*, was used to signify a certain plot of ground within a fortified place. The outer ballium was that which presented itself immediately on entering the outer gate of the castle, where we usually see a mount of earth to command some distant work of the besiegers. It was separated by a strong embattled wall and towered gate from the inner ballium, where were commonly the houses and barracks for the garrison, the chapel, stables, and hospital; and within which, or at one corner of it, in the early castles, surrounded by a ditch, stood the keep or dungeon, generally a large square tower, sometimes flanked at its angles with small turrets: this keep was to our old fortresses, what the citadel is to modern ones, the last retreat or redoubt of the garrison. (See Grose Hist. of the Eng. Army, ii. 3.) And here may be noticed, that the small remains of Oxford castle exhibit a remarkable instance of the double ballium; in the outer space stands the mount, and at no great distance from it (though without the castle precincts), the church of St. Peter in the *Bailey*; behind it at a considerable distance stands the ancient Norman keep, in the upper part of which, on the different sides, are round-head arches filled up with masonry, whence, as from the last retreat of the garrison, the besiegers,

though in possession of the mount, might be annoyed. The *Old Bailey*, or outer space near Ludgate in the ancient fortification of London, has perhaps a similar etymology with St. Peter in the *Bailey* at Oxford.

BALLOCK, in *Geography*, the name of rocks on the N. W. coast of the island of Ila.

BALLOGISTAN, a district of Hindostan, in the country of Delhi, bordering on the north of Mewat, and approaching by its eastern limit within twenty-four miles of Delhi. It is eighty or ninety miles long, and from thirty to forty broad. Within the present century, and more probably since the rapid decline of the Mogul empire, this territory was seized by the Balkages or Baliochies, whose proper country adjoins to the western bank of the Indus, opposite to Multan. Some tribes of them are also found in Makran. They are represented as a most savage race, and appear to be very proper neighbours for the Mewatis. This territory is full of ravines, and difficult of access to invaders. It has, however, undergone the fate of its neighbours, and been successively tributary to the Rohilla chief, Nidjib Dowlah; to the Jats; and Nudjuff Cawn. Westward, it borders on the Seiks. Res. Mem. Introd. p. 120.

BALLOON, in *Architæcture*, is used for a round ball, or globe, placed at the top of a pillar, or the like, by way of acroter, or crowning. That on the top of St. Peter's at Rome is of brass sustained by an iron arming within; and being at the height of sixty-seven fathoms, is above eight feet in diameter.

BALLOON, in *Chemistry*, *Ballon Fr.* is a large globular vessel, generally of glass, with a short neck, which is employed in a variety of chemical operations, particularly in receiving the products of distillation; in containing gasses for experiments in which heat or combustion are used; and for several other purposes. Frequently, it is made with more than one orifice. It is larger than the matrass, has a shorter neck, and if heated on a sand-bath great care must be taken to do it gradually on account of the greater thickness of the glass. In making the glass-balloon, it is simply blown, without a burr at the bottom like the matrass, whereas the receiver is generally fashioned at the neck, and therefore must have the above imperfection at the bottom, unless it is afterwards ground off.

BALLOON, in *French Commerce*, denotes a quantity of paper, containing twenty-four reams.

BALLOON, *Ballon*, or *Ballot*, signifies a certain quantity of glass-plates, greater or less according to their quality. The balloon of white glass contains twenty-five bundles, of six plates per bundle; but the balloon of coloured glass consists only of 12½ bundles, each bundle including three plates.

BALLOON also denotes a kind of game something resembling tennis.

The balloon is played in the open field, with a great round ball of double leather blown up with wind, and thus driven to and from with the strength of a man's arm, fortified with a brace of wood.

BALLOON, or *Balloon*, is more particularly used among *Voyagers*, for the flat barges of Siam.

The balloons are a kind of brigantine, managed with oars, of very odd figures, as serpents, sea-horses, &c. but by their sharpness and number of oars, of incredible swiftness. The balloons are said to be made of a single piece of timber, of uncommon length; they are raised high, and much decorated with carving at head and stern: some are gilt over, and carry 120, or even 150 rowers on each side. The oars are either plated over with silver, or gilt, or radiated with gold; and the dome or canopy in the middle, where the company

company is placed, is ornamented with some rich stuff, and furnished with a ballast of ivory, or other costly matter, enriched with gilding. The edges of the balloons just touch the water, but the extremities rise with a sweep to a great height. Some are adorned with a variety of figures, made of pieces of mother of pearl inlaid: the richer sort, instead of a dome, carry a kind of steeple in the middle; so that considering the slenderness of the vessel, which is usually 100 or 120 feet long, and scarce six broad, the height of the two ends, and of the steeple, with the load of decoration, it is a wonder they are not overset.

BALLOON, in *Pneumatics*, a name lately given to an ærotatic machine, employed for the purpose of aerial navigation. See **AEROSTATION**.

BALLOON, in *Pyrotechny*. See **BALLS**, **FIRE-WORKS**, and **PYROTECHNY**.

BALLOTA, in *Botany*, borehound. Lin. g. 720. Schreb. 975. Juss. 114. Class, *dichynamia gymnosperma*. Nat. Ord. *verticillata*, or *lobata*. Gen. Char. Cal. perianth one-leaved, tubular, salver-shaped, five-cornered, oblong, ten-freaked, erect, permanent, equal; mouth acute, patulous, plaited, five-toothed; involucre of linear leaflets under the whorls. Cor. monopetalous, ringent; tube cylindrical, the length of the calyx; upper lip erect, ovate, entire, crenate, concave; lower trifid, obtuse; the middle segment emarginate, largest. Stam. filaments four, the two shorter subulate, bending towards the upper lip, and shorter than it; anthers oblong, lateral. Pist. germ quadrifid; style filiform; stigma slender, bifid. Per. none. Calyx unchanged, fostering the seeds in its bosom. Seeds four, ovate.

Ess. Gen. Char. Cal. salver-shaped, five-toothed, ten-freaked. Cor. upper lip crenate, concave. It is observed that this genus has the involucre of clinopodium; the calyx of marrubium; and the corolla of stachys.

Species, 1. *B. nigra*, stinking or black borehound. Smith. Brit. 635. Hudson 260. With. 533. Eng. Bot. 46. "Leaves ovate, undivided, ferrate, calyxes dilated upwards, somewhat truncated." A hairy plant with an acrid pungent smell; stem two or three feet high, erect, branched, covered with recurved hairs; leaves petioled, ovate, or subcordate, ferrate; flowers numerous, in axillary whorls, pedunculated, leafy, bracteated; bractes bristle-shaped, ciliate, half the length of the calyx; calyx tubular, hirsute, ten-ribbed, plaited or furrowed at the margin, obtusely five-lobed, reticulated with veins, teeth awned, spreading; corolla purple, the upper lip of which is emarginate, hairy, on the outside; the under three lobed, beset with white veins. It is a perennial plant, common in waste places, and hedges, flowering in July. 2. *B. alba*, white flowered black borehound. "Leaves cordate, undivided, ferrate, calyxes subtruncate." This Swedish plant has not yet been satisfactorily determined. 3. *B. lanata*, woolly black borehound. Philomis fol. multifidis. Gmel. lib. iii. 241. n. 72. t. 54. "Leaves palmate, toothed, stem woolly." Stems white with wool; whorls extremely hirsute; leaves like those of gooseberry, with blunt three-toothed lobes, smooth above, hirsute underneath; corolla a pale yellow, extremely hairy. A native of Siberia, cultivated here in 1776, by Mr. J. Gordon. 4. *B. suaveolens*, sweet smelling black borehound. Jac. Amer. 172. pict. t. 165. *Dysstrepogon suaveolens*. L'Herit. Sert. Ang. 19. *Mesophysperum*. Brown Jam. t. 18. f. 3. *Mentastrum*. Sloane Jam. t. 102. f. 2. "Leaves cordate, spikes leafy, calyxes truncate, awns linear." A shrubby, annual, upright plant; leaves roundish or elliptic, crenate, nerved, villose, on long footstalks; peduncles axillary, from three to five-flowered; flowers blue; calyx and branches villose; filaments longer than the throat of the corolla. Seeds two, black, a little

compressed. A native of the West Indies, where it is used in warm baths for its odour. 5. *B. disticha*, betony leaved black borehound. "Whorls halved, two-parted, half-spiked." Stem pubescent, from one to two feet high; leaves stalked, subcordate, ferrate, tomentose; whorls single on each side; each two-parted; flowers alternate, sessile, rising on a simple flexuose rachis. A tapering bracte under each flower. A native of the East Indies. Introduced in 1783, by the earl of Bute. 6. *B. pilosa*. Lour. Cochinch. 364. "Leaves ovate, tomentose, crenate, whorls hairy, calyxes ten-toothed." Stem perennial, four feet high, weak, streaked, hairy, branched; leaves acute; flowers white in hairy whorls; calyx recurved, ten-toothed. A native of Cochinchina.

Propagation and Culture. The European sorts are never introduced into gardens. The third species is hardy, but the three last require the protection of a stove. They may all be increased by seeds. See Martyn' Miller's Dict.

BALLOTADE, or **BALOTADE**, in the *Manege*, is a leap in which the horse seems as if he intended to kick out without doing it; he only offers or makes a half kick, shewing only the shoes of his hind feet. Berenger farther observes, that the horses destined to their airs (croupades and balotades), ought to have a light and steady mouth, and an active and lively disposition, with clean nervous strength; for all the art and knowledge of the horsemen can never confer these qualities, which yet are essentially necessary to the perfection of this manege.

The croupades and balotades are different from curvets, inasmuch, as they are much higher behind, and consequently their time and measure not so quick and close, but slower and more extended; therefore, the rider should keep his horse's croup in awe, by striking it from time to time with the switch, supporting him not quite so high before, and observing to aid with his legs slower, and not so forward as in curvets.

To manage the strength and vigour of the horse you intend to work upon the volts, in croupades and balotades, let the line of the volt be larger than for curvets, and let the action of the shoulders be not quite so high; thus you will not only check and confine his activity and lightness, but by raising his shoulders in a less degree, will give liberty to his croup, and he will be enabled to furnish his air altogether, that is, before and behind, better and with more ease; there is still another reason for this, for when the shoulders come to the ground from too great a height, the shock alarms and disorders the mouth, and thus the horse losing the steadiness of his appuy, he never will raise his croup so high as he ought to make perfect balotades.

BALLOTING, a method of voting at elections, &c. by means of little balls, which are usually of different colours, by the French called *ballotes*; which are put into a box privately.

BALLTOWN, in *Geography*, a township of America, in Saratoga county, New York, formerly in Albany county, contained in the year 1790, 7333 inhabitants, including sixty-nine slaves. By the state census in 1796, there appear to be 266 electors in this township. It lies 36 miles N. from Albany, has a Presbyterian meeting-house, and is in a thriving state. The medicinal waters called "Balltown Springs," from their being situated within the limits of this town, have acquired celebrity on account of their sanative virtue, and the accommodations adjoining to them for valetudinarians. The springs are found in the bottom of a valley, or excavation, forming a kind of basin, and comprehending in their extent about fifty acres. In the vicinity of the springs are several neat bathing-houses, and shower-baths, for the convenience

venience of invalids. Most of them are private property, belonging to a merchant of New York; but the largest spring belongs to the public. The waters of these springs contain iron, a mineral alkali, common salt and lime; they are brisk and sparkling like champagne; and they possess the properties of other waters of the mephitic kind, in which there is an intermixture of fixed air or carbonic acid; they are reckoned cathartic, diuretic, and sudorific; and recourse is had to them by invalids of various descriptions.

BALLTOWN, or *Ballytown*, a township in Lincoln county, in the district of Maine, containing 1072 inhabitants, 195 miles N. E. from Boston.

BALLUS, in *Entomology*, a species of *PAPILIO* (*Plebe Rur.*), with entire fulvous wings dotted with black; posterior one green, with a brown margin. Gmelin, &c. Inhabits Spain.

BALLUSTER, or **BALLISTER**, in *Architecture*, a small kind of column or pillar, whereof ballustrades are formed.

The word is French, *balustr*, which signifies the same, formed from the Latin *balustrum* or *balustrium*, a place among the ancients where the baths were raised in.

Ballustrades are of divers forms, as well as matters, according to different occasions, and different orders of architecture.

BALLUSTER of the Ionic capital, denotes the lateral part of the volute answering to what Vitruvius calls *puleinata* on account of its resemblance to a pillow.

BALLUSTRADE, an assemblage of one or more rows of ballusters high enough to rest the elbow on, fixed upon a terrace, or the top of a building, by way of security; sometimes also to make a separation between one part and another, as those around altars, fountains, &c. See figure of **BASILIC**.

BALLY, **BALLIN**, or *Baily*, prefixed to names of places in Ireland, signifies a town or inclosed place of habitation. It comes from the Irish *baile*, which O'Brien, in his dictionary, supposes to be derived from the Latin *villa*, changing *v* into *b*, and that both come from *vallis*, on account of the preference given to low situations. General Vallancy derives it from the Arabic *balad*, a province; and quotes J. Bapt. Pafferi, as explaining the Phœnician *bal* in the same sense as the Irish *baile*. But Mr. Ledwich, in his *Antiquities of Ireland*, observes, that it is plainly the Teutonic *baile*, an inclosure.

BALLYCASTLE, a sea-port town, in the northern part of the county of Antrim, province of Ulster, Ireland, situated on the west of Fairhead, near the mouth of the little river Glensheik, and opposite to the island of Rathery. Between this town and Fairhead are valuable collieries, in an abrupt bank which overhangs the sea; a circumstance, however, from which little advantage can be derived, as the unsheltered situation of the place, and the prevailing westerly winds, make a delay on the coast extremely dangerous, and render it difficult to embark the coals. As the want of capital has always been an impediment to such undertakings in Ireland, application was made to the legislature, on the discovery of the mine in 1721, for aid to work it; and 6000 pounds were granted for this purpose, as well as the large sum of 23,000l. at different times for making a harbour there, and building a pier to protect it; which expence was incurred in the hope that Dublin would be in a great measure supplied from this colliery, and thus be rendered less dependant on the proprietors of the Cumberland mines. The pier, however, has been wasted away, and the harbour choked up with sand, that like many other publick grants in Ireland, it has been productive of little or no national benefit. By the exertions of an individual, some years ago,

much coal was procured, and several manufactures were established in the town, but since his death the latter have been neglected. The collieries, however, continue to be worked, and from the latest accounts seem to be productive, though not to the degree that was expected. The coal is said to resemble the Scotch coal, but does not burn so fast. The different fossils commonly situated above it are non-stone, black shivery slate, grey, brown, or yellowish sand-stone, and whin-stone. The accidental discovery of an old mine in 1770, which was very extensive, and was found to be a complete gallery, branching into numerous chambers, which were dressed in a workmanlike manner, and must have been wrought by persons at least as expert in the business as the present generation, has furnished Mr. Hamilton with an argument in favour of the ancient civilization of Ireland. As no coal mine at this place is mentioned either by Boate, or by sir William Petty, the latter of whom visited Ballycastle between 1660 and 1670, and is particular in his account of it; as for many centuries previous to the reign of James I. a work of this nature was not likely to have been carried on; as the kinds of fossil-coal are various in the cement with which a castle of great antiquity in the adjoining isle of Rathery was built; and as the tradition of the natives refers it to a very early period, he concludes that it must have been worked previously to the eighth century. This opinion seems to be strengthened by Mr. Whitaker's reasons for supposing fossil-coal to have been known to the ancient Britons. Mr. Ledwich, on the other hand, affirms, on the authority of Lombard, that coal was not discovered and used in Ireland long before A.D. 1632. Near Ballycastle are two mineral springs, one of them vitriolic, and the other chalybeate. Distance from Dublin 113 Irish miles. N. lat. 55° 11'. W. long. 6° 6'. Hamilton's Letters on Antim. Statutes of Ireland. Latouraye's Rambles. Ledwich's Antiquities. Beaufort's Memoirs. Rutton on Mineral Waters.

BALLYCLARE, a post and fair town in the county of Antrim, province of Ulster, Ireland, ninety-five miles north of Dublin.

BALLYCONNELL, a small market and post town of the county of Cavan, Ireland, situate sixty-seven Irish miles north-west from Dublin, on the borders of a wild and mountainous district. The peasants are hardy and industrious, yet hitherto much depressed for want of encouragement. The women spin a good deal of wool as well as flax, and friezes are made for home use; but every thing is on a very narrow and contracted scale. Agriculture has lately improved, and the culture of wheat has been increased by the establishment of a good flour-mill; and there is also an excellent bleach-green near the town. The mineral treasures of this neighbourhood are, however, the most valuable. Coal is found in the adjoining mountain of Sheve-Ruffell, and generally dug out of the side of the hill, in blocks, near the surface. No attention to this valuable concern has yet actuated the proprietors on whose estates this mineral is found in such abundance, and so easily raised. In the mountain of Ortnacullagh, both silver and lead ore are carried down the stream which flows from it. Besides these, pure sulphur is frequently found; and fuller's earth is in abundance. There is much pipe-clay also, which is found very soft, and when baked in the sun acquires a proper consistency. Sir C. Coote's Statistical Account of Cavan.

BALLYCOTTON, a village on the east-side of the county of Cork, province of Munster, Ireland, frequented by fishermen, and frequented for sea-bathing. It is four miles from Cloyne, and has for many years been in the neighbourhood. It gives name to a large but dangerous bay, nearly semicircular, which is remarkable for an abundance of

fine flat fish and lobsters, which are chiefly sent to Cork. There is a small island of the same name, which forms one extremity of the bay, and is almost covered, in the season, with the nests and eggs of various sea-fowl, especially puffins. N. lat. $51^{\circ} 50'$. W. long. $7^{\circ} 59'$.

BALLYDONEYAN, a bay on the south coast of Ireland, in the county of Cork, on the south side of the entrance into Kenmare river. It has an open entrance, with a good depth of water and anchorage.

BALLYELA, a bay in the Atlantic ocean, on the west coast of Ireland, twelve miles south-east of South Arran islands. N. lat. $52^{\circ} 53'$. W. long. $9^{\circ} 20'$. See **BALIELLA**.

BALLYGELLY HEAD, a cape on the east coast of Ireland, in the Irish sea. N. lat. $54^{\circ} 54'$. W. long. $5^{\circ} 44'$.

BALLYHAVEN, in *Geography*, lies within the entrance of Strangford haven, on the east coast of Ireland, beyond Port Ferry on the east side.

BALLYHAUNIS, a post-town, or rather village, in the county of Mayo, province of Connaught, Ireland, where are the ruins of a monastery; 100 Irish miles north-west of Dublin.

BALLYHAYES, a small town of the county of Cavan in Ireland, which has an improving market, and mills for flour and oatmeal. The market-house and the ring of the old town are arched, and built of brick. These antique and fantastical buildings shew it to have been once a place of considerable note, being remarkably furnished with all the old-fashioned ornaments that the lords of this county were particularly attached to. This town and the adjoining demesne have suffered much from a long dispute respecting the possession. Distance from Dublin 57 Irish miles north-west.

BALLYKAIA, an island on the north-west side of the sea of Azof, and near the northern extremity of it. N. lat. $46^{\circ} 38'$. E. long. $56^{\circ} 18'$.

BALLYLANY, a small island in the Atlantic ocean, near the west coast of Ireland. N. lat. $53^{\circ} 23'$. W. long. $10^{\circ} 16'$.

BALLYLEIGH HEAD, or *Kerry-head*, the south point of the entrance of Shannon river.

BALLYLESS BAY, a small harbour on the north-west coast of Ireland, towards the western point, having Dunfine head for its eastern limit, and directly west from Sligo bay, and east from Broad haven.

BALLYMACHUS POINT, the western point of the entrance into Oyster-haven, without the eastern point of the entrance into Kinsale harbour, on the south-east coast of Ireland.

BALLYMEHON, a market and post town in the county of Longford, province of Leinster, Ireland, 58 Irish miles north-west of Dublin.

BALLYMENAH, a town of Ireland, in the county of Antrim; ten miles north of Antrim.

BALLYNAMORE, a post-town in the county of Galway, province of Connaught, Ireland, eighty-five Irish miles west of Dublin.

BALLYQUINTON POINT, a cape on the east of the county of Down in Ireland, in the Irish sea, at the east of the entrance into Strangford lough; seven miles east of Downpatrick. N. lat. $54^{\circ} 19'$. W. long. $5^{\circ} 26'$.

BALLYSERAY CAPE, lies north-east of Ballykaia island, in the sea of Azof, on a peninsula. N. lat. $46^{\circ} 50'$. E. long. $56^{\circ} 48'$. It is also called *Kossa Bico Sierai Cape*.

BALLYSHANNON, a town of the county of Donegal, in the province of Ulster, Ireland, situated on the river

Erne, which discharges the waters of Lough Erne into the bay of Donegal, at the distance of about three miles from the sea. It is the principal town in the county, and was formerly of some consequence as a fortified place, though at present it derives its importance chiefly from its salmon fishery. The harbour is a barred one, but at high water is navigable for vessels of 40 or 50 tons burthen up to the waterfall, where is safe anchorage for a great deal of shipping; but the bar is for some hundreds of yards so exposed to south-westerly storms, as to render it quite inaccessible during high winds. The salmon leap, which is near the town, has a very beautiful appearance; the fall is down a ridge of rocks about twelve feet high, and at low water forms a very picturesque object. It is one of the principal salmon leaps in Ireland, and when last rented was let for near 1100 l. It has during the two last years (1802) been much more productive. There is also an eel fishery, which sets at 325 l. 10s. 6d. yearly. Before the fall, in the middle of the river, is a rocky island, on which is a curing-house, instead of the turret of a ruined castle for which it seems formed. The coast of the river is very bold, consisting of perpendicular rocks with grass of a beautiful verdure to the very edge; it projects in little promontories which grow longer as they approach the sea, and open to give a fine view of the ocean. The town is prettily situated on the rising ground on each side of the river, over which there is a bridge of fourteen arches. It has improved much within a few years, and is acquiring some degree of importance in trade, which would increase much more if a strong wall was built to shelter the entrance of the harbour. The completion of the canal which has been undertaken to join Lough Erne to the sea at Ballyshannon, would also be of material service to it. Near the town, the Rt. Hon. Thomas Conolly has established a linen manufactory, viz. twenty houses with two looms in each house, and a certain portion of land annexed to it. The Tyrhugh Farmers Society has also offered premiums for establishing a linen market at Ballyshannon. A little north of the town of Ballyshannon, on Mr. Conolly's estate, is a large bank of yellow pyrites. This town was made a corporation in 1611, and sent two members to parliament; but this privilege has been discontinued since the union. Its distance from Dublin is 101 Irish miles. Longitude $8^{\circ} 2'$ west of Greenwich, latitude $54^{\circ} 31'$ N. Young's Tour. Boate. Dr. Beaufort. M'Farlane's Stat. Account of Donegal.

BALLYTEIGH BAY lies round the east point of the entrance into Bannock or Bannow bay. (See **BANNOCK**.) At the south end is a small island called Inch island.

BALLYVAGHAN, a bay on the western coast of Ireland, and north part of the county of Clare, in the south part of Galway bay.

BALLYVARY, a post and fair town in the county of Mayo, province of Connaught, Ireland, 135 Irish miles north-west of Dublin.

BALLYWATER, the mouth of the entrance into Carrickfergus bay, on the north-east coast of Ireland, and the opening of Belfast river. The name is sometimes given to the sea southward along the east coast of the peninsula, of which Strangford lough, or lake, is the west side.

BALM, in *Botany*. See **MELISSA**.

BALM of Gilead. See **DRACOCEPHALUM**.

BALM, or **BALSAM**. See **BALSAM**.

BALM, in *Geography*, a town of Germany, in the circle of Upper Saxony, and Hinder Pomerania, 17 miles S. W. of Stargard, and 17 south of Old Stettin. N. lat. $53^{\circ} 8'$. E. long. $14^{\circ} 48'$.

BALMALA,

BALMALA, a town of Africa, in the desert of Berdon.

BALMAMAT, a town of Asiatic Turkey, twelve miles west of Karahisar.

BALMARINO, in the county of Fife, in Scotland, is the name of a parish within whose limits is a small harbour, and the remains of an abbey which bears the name of the parish. From the former a considerable quantity of grain is annually exported; and a salmon fishery is established near this place in the firth of Tay. The abbey of Balmarino, which was founded in 1229, for monks of the Cistercian order, has been a magnificent and extensive pile of building; but its grandeur is nearly annihilated, and only a few fragments remain to mark its site and character. It is about ten miles to the east of Perth.

BALMING. See **EMBALMING**.

BALMUCCIA, a town of Piedmont, in the valley of Sesia, seven miles west of Varallo.

BALNAVES, HENRY, in *Biography*, a Scots Protestant divine, was born in the shire of Fife in the reign of James V., and educated in the university of St. Andrews. He finished his studies in France; and on his return to Scotland, was admitted into the family of the earl of Argyll, but dismissed in 1542, for embracing the Protestant religion. Having joined the murderers of cardinal Beaton in 1564, he was declared a traitor, and excommunicated. During the siege of St. Andrews, he was sent by this party to England, and returned with a considerable supply of provisions and money; but being compelled to surrender to the French, he was sent with the rest of the garrison to France. After his return to Scotland, about the year 1559, he was appointed one of the commissioners to treat with the duke of Norfolk on the part of queen Elizabeth. In 1563, he was made one of the lords of session; and appointed, with other learned men, to revise the book of discipline. Knox, who was his fellow-labourer, gives him the character of a very learned and pious divine. He died at Edinburgh in 1579. His writings are "A Treatise concerning Justification," and "A Catechism, or Confession of Faith." *Encycl. Brit.*

BALNEARI SERVI, in *Antiquity*, servants or attendants belonging to the baths.

Some were appointed to heat them, called *fornicatores*; others were denominated *capfarii*, who kept the clothes of those that went into them; others *alipse*, whose care it was to pull off the hair; others *unduarii*, who anointed and perfumed the body.

BALNEARIUS FUR, a kind of thief who practised stealing the clothes of persons in the baths; sometimes also called *fur balnearum*.

The crime of those thieves was a kind of sacrilege; for the hot baths were sacred; hence they were more severely punished than common thieves, who stole out of private houses. The latter were acquitted with paying double the value of the thing stolen; whereas the former were punished with death.

BALNEUM, in *Chemistry*. See **BATH**.

BALNIA, CABO, in *Geography*, Balnea, or White Cape, a small white cliff, about six leagues from cape Pafado, nearly under the equator, on the coast of Peru, in South America.

BALOG, a town of Hungary, twenty miles east of Altfol.

BALOHA, a town of Africa, on the river Grand, inhabited by the descendants of a mixture of Portuguese and Africans.

BALONGO, in *Geography*, three islands in the bay of

Bengal, near the coast of Arracan. N. lat. 19° 50' to 20° 5'. E. long. 93° to 93° 20'.

BALONJCHI, in the *Matéria Medica* of the ancients, a name given by Avicenna, Averroes, and others, to a kind of camphor, which they describe as coarse, brown, and of less value than the other sorts. This is probably the same with our rough camphor, as brought over to us from the East Indies.

BALONTES, in *Geography*, a people of Africa, who inhabit the banks of the river Senegal, the channel of which separates Biliao from the main land. Their territory is about twelve leagues in length, and about as much in breadth. The Balontes maintain a commerce with the neighbouring negroes, either on the continent or islands; and though they sometimes travel beyond their own limits, they will permit no foreign negroes to pass their frontiers. Their religion is Molatry, and their form of government an aristocracy. They allow of no slavery; they are bold, hardy, and warlike; but crafty, treacherous, and fraudulent. Their arms are assagayes, arrows, and spears. The Balontes are supposed to have gold mines in their country; and under this idea the Portuguese assembled a large body of troops at Biliao in 1695, and invaded the country. But the rain of the season rendered their arms and ammunition useless; and the Balontes attacked them with this disadvantage so vigorously, with their assagayes and spears, as soon to rout them and force them to retire with a considerable loss of men, and of all their ammunition and stores.

BALOU, a town of Asia, in Armenia, twenty-five miles northwest of Cars.

BALQUHIDDER is a parish in Perthshire, in the highlands of Scotland, and is noted for its mountainous scenery. Some of the mountains are very high and steep; among them, those of Benmore and Benvoich are the most lofty and conspicuous; the first rising to the height of 5903 feet above the level of the sea, and the latter to that of 3300 feet. In this parish is a considerable extent of the ancient Caledonian forest; but it is annually abridged by the inclosing system, which has at length found its way into these northern regions. Here are also several lakes or lochs, of which the principal are those of Lochdale, Lochvoil, part of Lochluuing, and part of Lochearno. The military road from Stirling to Fort William passes through this parish. The great inequality of ground prevents the farmers from appropriating any of their lands to arable; and the pasture on the sides of the hills is chiefly fed by sheep.

BALS, a river of Greenland, which runs into the sea. N. lat. 64° 30'. W. long. 50° 15'.

BALSA, in *Ancient Geography*, *Tarixa*, a town of Hispania, in Lusitania; belonging, according to Ptolemy, to the Turdetani. It was in the part called *Concom*, near the sea, and not far from *Alas* to the west.—*Alas*, a burgh of the interior of Africa, reckoned by Ptolemy among the conquests of Cornelius Balbus.

BALSAM, in *Chemistry* and *Medicine*, *Balsamum*, Gr.; *balzamus*, *balsumum*, Lat.; *baume*, Fr. Various meanings have been affixed to this term, which it is of some importance to distinguish, as the oils of natural balsams have been esteemed from the earliest ages as some of the most valuable productions of the vegetable kingdom, have formed the most precious articles of commerce in the East, and have been used for medicinal purposes, and about the human body, as long as the art of medicine and the practice of adorning the person have been cultivated.

The term balsam appears to have been originally confined

to a certain fragrant viscid juice exuding from a tree in Arabia and Egypt, and now denominated the balsam of Mecca, or Opobalsam. Hence it was extended to other productions of the same nature; and we may define the true meaning of a balsam to be a fragrant, oily, viscid, inflammable juice, exuding from various trees and plants, not soluble in water, incapable of putrefaction, and possessed of the power of preserving animal matter from spontaneous change for a considerable length of time. This latter property has given rise to the term *embalming* or *balsamation* of bodies, so universally practised among the Egyptians.

Balsams are generally more or less acrid to the taste, particularly after having been for some time chewed in the mouth. They have the strongest affinity to RESINS, from which they seem to differ only in containing a larger portion of essential oil, so that if any of the liquid balsams (turpentine for example) be distilled *per se* with a gentle heat, an oil rises in considerable quantity, and the residuum is a substance now dry and brittle, scarcely in any respect different from a resin.

Of late years a distinction has been made, and admitted into the French nomenclature, between balsams and resins, in the circumstance of the former containing a portion of the Benzoic acid, which considerably adds to the penetrating fragrance of these substances, especially when warmed, and may be expelled from them by a gentle heat. This distinction was proposed by Bucquet, and has since been very generally adopted. We cannot however allow of its propriety, since it would confine the term to a very small number of substances, even to the exclusion of the original balsam of Mecca and many others to which the term has long been appropriated; and it would extend to the solid and brittle gum benzoïn contrary to the quality of *unctuosities* or *viscidities* which has always been considered as essential to a balsam, so much so that even the solution of sulphur in oil has on this account been termed a balsam.

Balsams are natural or artificial. The latter are compositions exclusively belonging to pharmacy, and generally composed of essential oils, resins, and aromatics brought to the consistence of a balsam, sometimes by oil, sometimes by ardent spirit. These preparations are so numerous and often complex, that we shall only mention a few of the most celebrated; but first we shall notice the—

§ 1. *Natural Balsams.*

Balsamum Meccæ.—*B. Opobalsamum.*—*B. Gilcadense.*—*B. Judaicum.*—*B. Syriacum.*—The genuine opobalsam or balm of Mecca.

This celebrated balsam has preserved almost from time immemorial the high value in which it has been invariably held by the eastern nations. This indeed is partly owing to the exclusive spirit of oriental despotism, which prevents this precious drug from entering the common markets; so that all our knowledge of its properties is derived either from report, or from the rare opportunities which individuals have enjoyed of possessing a specimen of it.

The tree that yields it is the *AMYRIS*, of which there appear to be several species, all of them fragrant and balsamic. It is commonly obtained by incisions: the *xylobalsamum* being prepared from the wood, and the *carpobalsamum* from the fruit. It is chiefly collected in Arabia, in the interior of the country, between Mecca and Medina. According to Bruce, when fresh from the tree, the balsam is of a light yellow colour, a little turbid. It presently grows clear and yellow like honey, which deepens by age. Its smell is exquisitely fragrant and very pungent, giving a sensation like that of volatile salts. This remains for years if

the balsam is kept carefully corked. The taste is bitter, acrid, aromatic, and astringent.

The quantity yielded by one tree is very small, seldom more than about a dram daily, which alone must render it an expensive article; but in all probability it might be obtained without much difficulty by Europeans, if it was likely to repay the expence. On pouring a drop of this balsam on a glass of cold water, it spreads itself over the surface in a thin pellicle, which may afterwards be taken off by a pin, whilst the water becomes strongly impregnated with the scent and flavour of the balsam. This is generally mentioned as a test of the genuineness of this article, but it is entirely fallacious, for when long kept the true balsam will not exhibit this appearance, and many of the other thin balsams will shew it with as much ease as the opobalsam. When rubbed with water it becomes milky, and is resolved into a mass resembling lard in appearance. On adding more water it separates altogether, and swims at the top. Spirit of wine highly rectified dissolves this balsam without much difficulty: on adding water, the whole becomes milky. It is also soluble in the expressed and the essential oils. If a solution in olive oil is mixed with water very gradually, it forms a kind of pommade.

This costly balsam is in the highest esteem among the Turks and other eastern nations both as a medicine and a cosmetic. The Turks take it in the dose of a few drops to fortify the stomach and excite the animal powers: externally it is used as a vulnerary. It may readily be imagined that the oriental spirit of exaggeration should have extolled the superior virtues of this admired balsam; but fair experiments on its medicinal properties are still wanting, nor is it probable that it would be found to exceed the other balsams in this respect, so much as it does in fragrance of scent.

The Mecca balsam is also employed at Constantinople as a cosmetic in the seraglio, according to the testimony of lady Wortley Montague. Under what form it is used does not appear, but its acrimony is such as to irritate the skin very considerably when rubbed on the face unmixed, as the same eminent lady experienced on her own person. It is scarcely necessary to add that the substance sometimes sold in the shops for balsam of Mecca, and at no great price, must be a mixed and adulterated compound in no degree to be depended on as the true opobalsam.

The dried berries of this tree were formerly kept in the shops, and called, as well as the balsam, *carpobalsamum*; and the dried twigs, *xylobalsamum*.

Balsamum Copaiva.—*B. Copaibæ.*—*B. Brasiliense.*—*Copaiba* or *Capivi Balsam.*

This balsam, one of the most active and valuable for medicine, is obtained from the *COPAIFERA officinalis*, Linn. a tall and elegant tree growing in Brasil and several other parts of South America. To procure it, several incisions or sometimes augur-holes are made near the ground penetrating through the bark into the substance of the wood, when the balsam flows out in such abundance, that sometimes in three hours twelve pounds have been obtained.

This balsam is colourless when flowing from the tree; after a while it becomes of an amber yellow, and considerably viscid, but retains its transparency; it is never known to become perfectly solid. The smell of capivi balsam is fragrant and powerful; to the taste it is bitterish, heating, aromatic, and permanent on the tongue; it stains paper as oil does. It is nearly insoluble in water; but on being long rubbed with it, a kind of milky emulsion is produced, from which however the balsam soon separates and rises to the top. It is readily soluble in fixed and volatile oils, and in spirit

spirit of wine: the latter makes a very strong penetrating tincture. Distillation readily separates the balsam into an oil which has all the sensible properties of the capivi, and into an insipid resin. If carefully distilled with water, from a fifth to half the weight of oil is obtained, which is highly fragrant and nearly colourless. The residuum is a resin, at first green and tenacious, afterwards growing yellow and brittle, soluble in alcohol, but not in water. The water with which the balsam has been distilled becomes slightly impregnated with the odour and flavour of the capivi. Distilled *per se*, or mixed with ashes and subjected to a strong heat, the oil which rises is at first fragrant and clear, afterwards bluish, thick, empyreumatic, but not ungrateful to the smell.

The capivi balsam is unquestionably an active substance when taken into the stomach; and its medicinal virtues, though perhaps over-rated, are however very considerable. Like turpentine, it determines powerfully to the kidneys, and impregnates the urine with its qualities, and has therefore been supposed peculiarly suited to diseases of these organs. As its effects, however, are heating and irritating, it is capable of producing much mischief as well as good, and its use is now chiefly confined to the cure of gleet and gonorrhœa. It is also serviceable in certain states of hæmorrhoids and diseases of the rectum, a fact which may well be credited, when it is considered of what acrid materials the celebrated Ward's paste is composed. In pulmonary affections it has been used strictly as a *sulcerary* or *balsamic*, but it is too apt to produce or increase the general fever, and can seldom be employed with safety in these cases. The usual dose of this balsam is about twenty drops, but it is so viscid that this method of division cannot be adopted till it is warmed. The best form of exhibition is triturated with yolk of egg, almonds or mucilage, and thus united with water into an emulsion. This balsam is easily adulterated with the thinner turpentine or with oils, and the detection of this fraud is often difficult on account of the potency of the smell and taste of the capivi, which covers almost every other.

Balsamum Peruvianum exudes from a large tree growing in Peru, Mexico, Brazil, and other parts of America. See MYROXYLOS *Peruvianum*.

There are two species of the Peruvian balsam, the white and the brown: the white balsam is very rarely met with in the shops. It is procured by incision of the bark, but very sparingly, and it soon concretes into a fragrant brittle resin, which is brought over in gourd shells. It is also called the *white Syrax*. It is less hot and more fragrant than the black balsam, and more approaches to the properties of *Syrax*.

The common Peruvian balsam is of a dark colour approaching to black; the smell highly fragrant; the taste aromatic, rather bitter, and considerably acid; the consistence always thick and viscid. Dropt into water, it sinks to the bottom, and refuses to mix with it: but by agitation gives it a fragrant smell and somewhat of the sensible properties of the balsam. It dissolves readily in spirit of wine. When mixed with the fixed oils and heated, it is decomposed; its essential oily ingredient, which gave it fluidity, is absorbed by the expressed oil, and a thick tenacious resin remains, which gradually becomes solid in the air. In this insolubility in fixed oils it remarkably differs from the other balsams, nor does it readily mingle with the other balsams. Distilled with water, it gives about a sixteenth of an essential fragrant reddish oil, very sparingly soluble in alcohol. Distillation *per se* gives a similar oil, but empyreumatic. By

regulated heat a small quantity of benzoic acid may be sublimed out of this balsam.

Peruvian balsam is one of the most stimulant of all this species of substances, and is therefore applied with advantage in several diseases. It is also particularly recommended as an external application, where a warm stimulant is required. A tincture is made by dissolving it in spirit of wine (*Tinctura Balsami Peruviani*, Ph. Lond.), and it enters into several of the artificial or compound balsamic preparations. The dose of this balsam is from two to twelve grains, and it may be given in the form of an emulsion mixed with water through the medium of yolk of egg. Alonic and warm cordial pills are conveniently made up with this balsam, and their virtue is somewhat increased by it.

Baumé asserts that it is sometimes falsified by the second oil that rises from gum benzoin in distillation, digested upon poplar buds, which have a fine terbinthous odour, and afterwards mixed with a little of the true balsam. The comparatively low price of the genuine balsam, however, would seem to render this falsification scarcely worth the trouble.

Balsamum Tolutanum is the product of the *TOLUIFERA Balsamum*, a tree which grows in the province of Tolu, in Spanish America, behind Carthagena. The balsam is obtained by making incisions on the bark of the tree, and is brought over in small gourd shells. This balsam is of a reddish yellow colour, and pellucid; its consistence when fresh is extremely tenacious, but by age it becomes brittle; but in hot weather, pieces of this balsam generally coalesce and adhere to the bottom of any vessel in which it is kept. The smell of this balsam is extremely fragrant and grateful; it has but little taste; when chewed, it sticks to the teeth, and appears almost insoluble in the saliva, but gives a gentle aromatic warmth to the tongue. The Tolu balsam is one of those that contain a notable proportion of the benzoic acid, and is therefore strictly a balsam according to the modern acceptation, and probably owing to the presence of this acid, it readily imparts its flavour to watery liquids, though it appears to be scarcely at all soluble in this fluid. Eight ounces of this balsam boiled for two hours in a close vessel in three pints of water make a very fragrant decoction, which, when mixed with the requisite quantity of sugar, forms the *Syrupus Tolutanus*, Ph. Lond. In the Edinburgh Pharmacopœia the syrup is formed by the admixture of two pounds of simple syrup recently prepared and not yet cold, with one ounce of the tincture of Tolu.

This balsam is perfectly soluble in spirit of wine. The *tinctura Tolutana*, Ph. Ed. and *tinctura Balsami Tolutani* Ph. Lond. are prepared by dissolving an ounce and a half of Tolu balsam in a pint of rectified spirit of wine. It is easily soluble in the essential oils, but with difficulty in the fixed. By distillation *per se*, the sublimed benzoic acid is first given out in a very gentle heat, together with a fragrant empyreumatic oil. On account of the benzoic acid, this balsam burns with a remarkably aromatic penetrating smoke; and was often an ingredient in those fumigations which were formerly so much employed either with a view of purifying an infected atmosphere, or for dissipating a grateful scent. When taken medicinally, either the tincture is employed, or the balsam is united with water by egg or mucilage. Its powers are gently stimulating; but it appears altogether a trifling article of the *Matena Medica*, except on account of its odour. It is given with more security in pulmonary complaints than the other balsams; and it appears to have some effect in checking or disgusting the excessively offensive fetor of the breath of persons suffering under ulceration of the lungs.

Balsamum Resolva is a balsam described by Murray (App. M. J.), which Spilman takes to be brought from India. In consistence, and other sensible properties, it much resembles the Tolu balsam, but appears to be weaker. Its origin is unknown, and it is supposed to be fictitious. It is seldom seen, and never used.

Balsamum Carpathicum, Carpathian or Hungary balsam, *Krummholtzbahn*, Germ.; called also *balsamum Libani*. This fine balsam is procured from the pinus Muro and the pinus Ambria, which grow abundantly on the Carpathian mountains, the Tyrol, and many parts of Hungary, Germany, and Switzerland. The balsam is esteemed by the common people as a sovereign remedy for almost every disorder external and internal. The *Oleum Templinum*, or *Krummholtz-Öhl* is an oil of turpentine prepared by distilling this balsam, and is in equal repute. For a further description of this and of all the turpentines, which are truly and properly *balsams* in the usual meaning of the term, see the articles PINUS, and TERPENTINE, particularly the latter, under which we mean to include most of the resinous products of the different species of fir.

Balsamum Canadense, a very fine fragrant and powerful TURPENTINE, procured from the PINUS *balsamea*, the Virginian or Canada fir.

Balsamum Styracis, storax, or liquid amber. See STRYRAX.

§ 2. Artificial Balsams.

These are preparations of the Materia Medica formerly in much repute, and compounded of a vast variety of resinous and aromatic drugs, the whole brought to a thickish consistence, so as to resemble the natural balsams. They are but little employed at present. Any preparation in which oil was so far thickened as to be brought to a treacly consistence, was termed, in the older Pharmacopœias, a balsam, and many of this species were equally used as external and internal applications. We shall only mention a few of these preparations.

Balsamum Locatelli.—Of the former London and Edinburgh Pharmacopœias. In the former, it was prepared by melting half a pound of yellow wax with about half a pint of olive oil, then adding another half pint of oil, with half a pound of Strasburg turpentine, and when nearly cold, stirring in six drams of red sanders wood to colour the whole. In the latter, instead of the red sanders, balsam of Peru, and powdered dragon's blood were added to the melted wax, oil, and turpentine. Another variety of this preparation used in the Paris Pharmacopœia, is to employ wax, olive oil, white wine (which was evaporated off the wax and oil), turpentine, sanders wood, and Peruvian balsam.

Balsamum Commendatoris, *Baume du Commandeur*.—*Balsam of Berne*.—*Wade's Balsam*.—*Jesuits Drops*, or *Friar's Balsam*. Under all these appellations, and with some variation in the ingredients, was this celebrated balsam known and prepared. In the Paris receipt, a tincture is first made of angelica root and the flowers of hypericum in spirit of wine, in this are dissolved myrrh, olibanum, aloes, storax, benzoin, Peruvian balsam, and ambergris. The whole makes a thick, fragrant, and highly stimulating liquid; which is used either internally as a cordial and supposed vulnerary, or externally to promote the cicatrization of wounds. A judicious reformation of this balsam is retained by the London and Edinburgh colleges, under the name of—

Balsamum Traumaticum, or *Tinctura Benzoiis Composita*. This is prepared by dissolving three ounces of benzoin, two ounces of storax, one ounce of balsam of Tolu, and half an

ounce of aloes, in two pints of rectified spirit of wine. The Edinburgh college omit the storax.

Balsamum Vitæ, *Baume de Vie*. This powerful medicine was prepared by Hoffman, under whose name it went. It consists of a solution of several essential oils, and a small portion of Peruvian balsam, in highly rectified spirit of wine. It is extremely fragrant and stimulating, and is employed almost entirely as an internal medicine in languors, faintings, violent colic, and other cases that require a sudden and powerful stimulant. The ingredients in the Brandenburg pharmacopœia, adopted as an improvement of Hoffman's balsam of life, are the essential oils of lavender, nutmegs, cloves, rhodium, wild thyme, cinnamon, lemon, bergamotte, and balsam of Peru, dissolved in spirit of lavender. The present laudable custom of simplifying the pharmaceutical preparations, would probably diminish the number of these essential oils which appears to be quite arbitrary.

A mixture of eight ounces of vitriolic acid, and two ounces of olive oil forms the—

Balsamum Aromaticum, a very powerful external application, in which the corrosive power of the vitriolic is moderated, but it requires to be used with great caution. In preparing it, the acid must be added very gradually to the oil with constant agitation, otherwise part of the oil will be charred and reduced to a hard black mass. When well prepared, it is of a very dark brown colour, and an uniform balsamic consistence.

The last of the artificial balsams which we shall mention, are the combinations of sulphur with oil.

Balsamum Sulphuris, or *Oleum Sulphuratum*; Ph. Lond. and Edin. prepared by melting in an iron pot flowers of sulphur, with four, or with eight times the weight of olive oil.

The result is a thick, fetid, tenacious balsam.

Petroleum Sulphuratum is prepared the same way, only with the use of petroleum, instead of olive oil.

Balsamum Sulphuris Terebinthinatum. B. S. *Anisatum*, which are now nearly disused, were prepared by digelling the sulphur in oil of turpentine, in glass vessels on a sand heat, and in the latter case, also adding oil of anise seed. Oil of turpentine readily dissolves the sulphur, and with vehemence when in quantities, so that this preparation should be made in a very large matrafs. All the sulphur balsams differ from the other balsams in having a very offensive smell and taste. They are hot and irritating, and their internal use is very limited. Externally, the thick sulphur balsam is used in farricry.

BALSAM Apple, *Male*, in Botany. See MOMORDICA.

BALSAM Bay, in Geography, lies on the west side of Old Cape François, and on the north side of the island of Hispaniola, or St. Domingo, in the West Indies. N. lat. 19. 42°. W. long. 69° 35'. See BAUME.

BALSAMATION. See EMBALMING.

BALSAMELÆON, in the *Materia Medica*, a name given by some authors to the balm of Gilead, or true *balsamum Judaicum*.

BALSAMICS, in Medicine. Before we conclude the article of balsams, it may be proper to make a few observations on their use in medicine. Of the properties which have been attributed to the internal use of all balsams, none is more ancient, and commonly prevalent than that of *healing* or *vulnerary*. This idea appears to have arisen from the observations of their use, when externally applied to a recent wound. If a gash is made in the hand with a clean cutting knife, and the parts are brought together and bound up with a rag dipped in any balsam, and left undisturbed for some days,

it is a matter of common remark, that the wound will generally heal without any suppuration, by simple union of the divided parts. However, it is highly probable that the balsam acts, in this case, principally as a cement to keep the divided lips in more complete re-union, and to exclude the external air; for the same application to the surface of an open lacerated wound, is known by every surgeon frequently to bring on extreme pain and inflammation, and to increase all the danger of too extensive suppuration or gangrene. The natural balsams are some milder than others, but all have a certain degree of acrimony, which renders their indiscriminate use in injuries of the body extremely hazardous; though under due management they may be of essential service. But scarcely a single circumstance which recommends their external use, can apply to internal ulceration or rupture of vessels. The healing power depends chiefly on the mode of application, the degree of topical stimulus, and probably the exclusion of external air; and hence, the value which has been set on balsams as *internal* vulneraries is entirely lost. A languid indolent ulcer in the kidney might perhaps be assisted by local stimulating remedies, but when the remedy must enter the stomach, and pervade all the vessels mixed with and diluted by the common circulating fluid, the remedy is no longer local, and the irritation which it produces, is either counteracted during the circulation, or is equally diffused over the whole system. Balsams, therefore, though they are by no means to be despised, are no longer viewed with that degree of partiality which the older physicians entertained for them, and repeated experience has shewn them to be sometimes absolutely useless, and often positively detrimental in internal ulceration of the lungs, kidney, or other diseases for which they have been long celebrated.

BALSAMINA, or **BALSAM**, in *Botany*. See **IMPA-TIENS**.

BALSAMITA. See **ACHILLEA**, **CHRYSANTHEMUM**, and **TANACETUM**.

BALSAMITA, in the *Materia Medica*. See **TANACE-TUM**.

BALSAMITA, in *Entomology*, a species of **APHIS**, that feeds on the *tanacetum balsamita*. Müll. Zool. Dan.—The general colour is black; abdomen green; eyes red.

BALSAMON, **THEODORE**, in *Biography*, an eminent master of the canon law, flourished in the Greek church towards the close of the twelfth century. He was appointed guardian of the laws and records, i. e. Nomophylax and Chartophylax, of the church of Constantinople; and he was nominated by the Greek church to the patriarchate of Antioch; but this see being seized by the Latins, never came into his possession. By the emperor Isaac Angelus Comnenus he was flattered, for serving his own purposes in favour of Dositheus, with the hope of being advanced to the patriarchate of Constantinople; and thus seduced, he maintained, in the assembly of the prelates, that the translation of the patriarch of Jerusalem to this elevated station, was agreeable to the canon law, and the prelates acquiesced in his opinion. But after this exercise of ingenuity and violation of conscience, he was deceived and disappointed; for Dositheus was preferred, upon the authority of his decision. Balsamon wrote several learned works on canon law; particularly "Commentaries on the Apostolical Canons, the General and Particular Councils, and the Canonical Letters of the Greek fathers," printed in folio, in Greek and Latin, at Paris, in 1620; and in two volumes folio, in "Beverege's Pandects of Canons," printed at Oxford in 1672. He also wrote a "Collection of Ecclesiastical Constitutions, which may be found in Greek and

Latin in "Justelli Bibliotheca Canonica," and other learned works. Fabr. Bibl. Græc. t. v. p. 33. t. ix. p. 184. t. xi. p. 47. t. xii. p. 403, &c.

BALSANO, in *Geography*, a town of Italy, in the kingdom of Naples, and province of Bari; seven miles south of Bari.

BALSAS, a town of South America, in Peru, in the jurisdiction of Caxamarca, near the river Maragon.

BALSAS, in *Navigation*. See **CATAMARAN**.

BALSEY Cliff, in *Geography*. See **PAWDSKEY**.

BALSHAM, **HUGH DE**, in *Biography*, an English divine, bishop of Ely, and founder of St. Peter's college, or Peter-house, in Cambridge, was born, probably, at Balsham in Cambridgeshire, towards the beginning of the thirteenth century. In 1247, he was nominated by the monks of the Benedictine monastery of Ely, of which he was sub-prior, to the see of Ely: but Henry III. refused to confirm the nomination. Balsham appealed to the pope, and the business remained for ten years undecided. At last, however, the pope and monks prevailed. When the prelate was seated in his see, he projected the laudable design of providing education for poor scholars, and instituted a college, since known by the name of Peter-house. He died at Dodington, in 1286, and was buried in the cathedral church of Ely. By his will he left many books to his scholars, and 300 marks for erecting new buildings. By an instrument, dated in 1291, his memory is annually celebrated in his college. The distinction of jurisdiction between the chancellor of the university of Cambridge, and the arch-deacon of Ely, was settled in 1276 by this prelate. Bog. Ent.

BALSIO, in *Ancient Geography*, a town of Spain, twenty miles from Turiaso, near the Iberus, and south-east of Cadaguriis.

BALSORA, in *Geography*. See **BASSORA**.

BALTAGI, among the Turks, porters, and hewers of wood, in the court of the grand signior; who also mount on horseback, when the emperor rides out. Part of them also, who for that purpose must be castrated, keep watch at the gates of the first and second courts of the seraglio. These last are called *capigi*, and their commander *capigi pascha*.

BALTAS, in *Geography*, a town of Courland, 20 miles east of Seelburg.

BALTAZARINI, in *Biography*, an Italian performer on the violin, who seems first to have brought that instrument into favour at the court of France, before any honourable mention is made of it elsewhere in that kingdom. He was sent, 1577, at the head of a band of violin players from Piedmont, by marshal Brissac, to Catharine de Medicis, and appointed by that princess her first valet de chambre, and superintendent of her music. The violin, however, seems to have been well known and in general use in Italy at this time, as Montague, who was at Verona in 1580, says that there were organs and violins to accompany the mass in the great church. Journ. du Voyage. Baltazarini having contributed greatly to the amusement of the royal family and nobility, by his ingenuity in suggesting magnificent plans, machinery, and decorations, for ballets, divertissements, and other dramatic representations, received the quaint title of *de Beau-joyeux*. See **BALET de la Royné**.

BALCHATSKO, a town of Siberia, 48 miles east of Krasnoiarik.

BALTEATUS, in *Entomology*, a species of **CIMEX** (*Spinifus*) that inhabits South America. It is oblong, ferruginous, with a transverse yellow line, and many teeth on the hinder thighs. Fabricius. Gmelin.

BALTEATUS,

BALTEATUS, a species of **ELATER**, of a black colour, anterior half of the wing-cases rufous. Linn. Fa. Suec. A native of Europe.

BALTELUK, in *Geography*, a town of European Turkey, in the province of Bulgaria, twelve miles north-east of Varna.

BALTEUS, in *Entomology*, a species of **CERAMBYX**, that inhabits Lusitania. The thorax is spinous; body ferruginous; abdomen ovate; wing-cases with a blackish band. Linnæus.

BALTHAZAR, **ANTHONY**, in *Biography*, surgeon at Leyden, published in 1722, "Pathologia chirurgicæ, &c." 8vo. in which are some judicious observations on hernia congenita, and on wounds of the cerebellum, which he does not consider as mortal. He mentions a hernia of the brain, reaching from the occiput to the shoulder, and persons living to an adult age, who were born with spina bifida. True schirri are not curable, he maintains, by internal medicines. The work has considerable merit; of the author, however, we have no particular account. Haller Bib. Chirurg.

BALTHAZAR, *Christopher*, a learned French Protestant, was born about the year 1588, at Villeneuve-le-roi, and, though educated in the Romish church, induced by the study of ecclesiastical history to embrace the reformed religion. On account of this change in his religious profession, he was obliged to abandon the lucrative post of advocate to the presidial of Auxerre, and to remove to Charonton, at a distance from his relations and friends, where he was publicly received among the Protestants. He was afterwards patronised by a wealthy young counsellor of Castres, who, as an acknowledgment for the benefit of his instructions, allowed him a liberal pension. But attached to the Protestant cause, and desirous of promoting it, he left the house of his patron, and devoted himself to writing. His talents and zeal attracted the notice of the reformed party, and in 1659, the national synod of Loudon granted him a pension of 750 livres. In his dissertations on the subjects in dispute between the Catholics and Protestants, he particularly opposed cardinal Baronius, and his papers having been read and approved by M. Daillé, moderator of the synod of Loudon, were ordered for publication. But being returned to their author, who soon after died, they were probably suppressed by him on account of the defect of their style, as they could not be found. In his animadversions on the annals of Baronius, he is said to have been so attentive to his style, that he was not able to finish a single page of his work in a day. Of his Latinity, a favourable specimen may be seen in his "Panegyric on M. Fouquet," printed in 4to. in 1655. He also wrote in French "A Treatise on the Usurpations of the Kings of Spain upon the Crown of France," 8vo. Paris, 1626, and another tract upon the same subject, published in 1657. Gen. Dict.

BALTHEUS *Orionis*, belt of Orion, in *Astronomy*, a part of the constellation of Orion, consisting of three bright stars of the second magnitude, placed nearly in a right line in Orion's girdle.

BALTHICA, in *Cynchology*, a species of **TELLINA** that inhabits the Baltic sea. This shell is roundish, smooth, outside carnation colour. Linn. Fa. Suec. About the size of a horse-bean, and very rarely larger; extremely thin, pellucid, brittle, and white within. Chemnitz, &c.

BALTHICA, a species of **HELIX** found on the shores of the Baltic sea. This shell is imperforated, ovate, and pointed; with elevated wrinkles; aperture ovate, and very

ample. Linn. Fa. Suec. The animal is black, with two tentacula; shell pellucid, and with four whorls.

BALTHICUS, a species of **NAUTILUS**, of the smaller kind, that is found adhering to the roots of fuci. This shell is sometimes opaque, sometimes glossy, frequently pellucid; and the wreaths either smooth, striated, ribbed, or tuberculated. It is specifically distinguished by being white, convex, aperture linear, and the first wreath much larger than the others. Schroët.

BALTIC, or **EAST-SEA**, anciently called *Variatskoi moré*, or the sea of the Varags or Varagians, in *Geography*, lies westward of Russia. Ptolemy calls it *Venedicus sinus*; Tacitus, *mare Suevicum*; and Pliny speaks of it under the name of *Codanus sinus*. The Russians denominate it *Baltiskoi moré*; the Germans the *Ost-see*; and the Swedes *Ostter-sion*. That part of it which washes the coasts of the governments of St. Petersburg, Reval, and Vyborg, is called the gulf of Finland, which is above four hundred versts in length, and from a hundred to a hundred and twenty broad; the part extending between the government of Riga and the island **CESÉL**, is called the gulf of Riga. The chief harbours in the Baltic are, Riga or *Dunamunde*, Reval, Pernau, *Habsal*, *Rogeryvk*, now called *Baltic-port*, *Petersburg* or *Cronstadt*, *Vyborg*, *Frederickshamm*, and *Arensberg* in the isle of **CESÉL**. The principal islands in this sea are, *Rugen*, *Bornholm*, *Oland*, *Gottland*, *CESÉL*, *Dago*, *Falster*, *Mohn*, *Seisfari*, *Penisfari*, *Lavanfari*, *Tyterfari*, *Hochland*, *Cronstadt*. There are great fisheries in these parts, and numbers of seals are taken; but far more considerable is the navigation; as it may be computed that every year upwards of two thousand ships of burden pass to and from the Russian ports alone. Much skill and caution are requisite for navigating this sea, and especially the gulf of Finland, both on account of the heavy squalls and gales of wind so frequent here, and the multitude of rocks and shelves with which these seas abound. The water is only brackish, and has a very perceptible current, so that in northerly winds it is almost fresh to the taste. It is asserted, on very good foundation, that the water of the Baltic is every year decreasing; indeed, by repeated observations made in Sweden, it is found to subside at the rate of forty-five inches every hundred years. Mr. Otto (*ubi infra*) is of opinion, that nothing certain can be determined upon this point. Since the time when the Baltic was confined within its present boundaries, the decrease and increase of its water are, as he conceives, merely apparent; and it may have happened from various causes, that land may have been gained in one quarter and lost in another. Large rivers, which flow with great rapidity, may, for example, have carried with them into the sea a great deal of earth and sand, by which the beds at their mouths may have been raised, and the banks extended towards the sea. The Baltic has Denmark on the south, Sweden to the west, Lapland to the north, and to the east *Bothnia*, *Finland*, *Livonia*, *Ingria*, *Courland*, and a part of *Poland*. It communicates with the *Cattégatte* to the south by the *Sound*, the great and the lesser *Belt*. At *Pillau* and *Memel* it communicates with two large lakes, the *Frisch Haff* and *Curisch Haff*, both of which contain fresh water. The waves of the Baltic are less high than in the ocean, but they succeed one another in greater number and with more impetuosity, and thus are more harassing to the ships. In its agitations it deposits amber on the shores of *Courland* and *Prussia*. It appears from *Tacitus* (*De Moribus German. c. 44, 45.*) that the knowledge which the Romans acquired of the maritime powers of the Baltic was obtained by their land journies in search of amber. The Baltic is liable to be frozen for about three months in the year, which may probably be in part owing to the freshness

of its water, which again may be occasioned by the numerous rivers that flow into it. The number of streams which directly or indirectly empty themselves into this sea, amount, according to Buffon, to 40; and among these the Oder, the Vistula, &c. are the most considerable. We are assured by history, that this sea has been sometimes totally frozen during severe cold. This was the case in 1333, at which time people could travel on the ice from Lubeck to Prussia and Denmark; and on this occasion tents were erected in different places for the accommodation of travellers. A similar phenomenon occurred in 1399, and in 1533; and in 1423, people could walk and ride over the sea in a straight line from Königsberg to Lubeck. Journeys of the like kind were undertaken, six years after, not only from Prussia to Holstein, but also from Mecklenburg to Denmark; and this was done likewise in 1459. The frosts of the year 1709, and also of 1740, were also very remarkable. The depth of the Baltic, in most places, never exceeds 50 fathoms. In some few places of the gulf of Bothnia no bottom is to be found; but in others, quite near, the depth is not more than 50 fathoms.

It has been observed, that the water in the Baltic is cooler even in the hottest summers than that of the other seas. The Baltic has no tides, or is not subject to a regular ebbing and flowing, as it is surrounded by land, and is united with the North sea only by the Sound and the two Belts; which circumstance has given occasion to its being called the inactive sea, or "Mare pigrum." During a long continuance of the west wind its natural efflux is prevented, and a considerable quantity of water is forced into it from the North sea; so that it then rises on the coasts a little above its usual level. This connection, however, with the German ocean is sometimes the cause that the ebbing and flowing of the latter, though weak, co-operates with the Baltic, so that traces of their effects may be perceived. See Physical Observations on the East or Baltic Sea, by F. W. Otto, from "Abriss einer Naturgeschichte des Meeres, Berlin, 1792 and 1794, 2 vols. 8vo.

BALTIC Port, formerly called Rogervyk, was raised to a circle town in 1783, and one of the five districts of the government of Reval, or Esthonia, according to the geographical division of the Russian empire in 1782 and 1783. Situate in a bay on the Baltic, in the government of Reval, lat. $59^{\circ} 22'$ long. $41^{\circ} 51' 3''$. It has 110 timber houses, 211 inhabitants, and a brick church. This harbour has been greatly improved of late by art. Its trade arises from the fishery, &c. but it has few or no manufactories.

BALTIC Fishery and Commerce. A considerable fishery is carried on along the coasts of the Baltic. The gulfs of Riga and of Finland contain generally the same species of fish, and the employment which the produce of both occasions is nearly equal. The naturalist of Livonia (Fischer) enumerates in the waters belonging to that province forty-nine different species of fish, among which the salmon, streamlings, pike, and lampreys, are not for home consumption, yet for exportation, are the most important. The salmon is caught in almost all the rivers, but those in the Dvina and the Narova are the best, though they come far behind those of Archangel in delicacy and plumpness; they are exported smoked and salted. The streamlings, a degenerate species of herring, are everywhere found on the shores of the Baltic, but especially about Pernau, where they are in such quantities, that 300 of these small fish are bought for three or five kopecks; a ton of them when salted costs from three to six rubles. Formerly they were exported; but the northern herrings have annihilated this branch of commerce, which are at present even bought by Livonia, the streamlings being not sufficient for the home and the foreign consump-

tion. Yet instances are not wanting of 300,000 of them having been taken at one successful draught. One species of fish quite peculiar to these waters is the kyllo streamling, a smaller and more delicate variety of the true streamling, caught in great numbers in autumn near Reval and Rogervyk. They are pickled, and form a good substitute for sardines and herrings, and are accordingly, thus prepared, sent abroad to various parts. Not less exquisite are the potted lampreys that come particularly from Narva. The greatest store of the gulf of Finland consists in herrings, salmon, and carp; even sturgeon are found in the gulf of Cronstadt, and likewise at times in the Neva. Of the smaller sorts of fish with which the government of Vyborg is provided to a great superfluity, an exceedingly great quantity is brought alive in pierced vessels to St. Petersburg, and there sold cheap at the water-side in the banks which form a sort of fish market, and others that lie in various parts of the canals. In winter the transport of frozen fish from the remoter parts of the empire is also very considerable. The Russian commerce, in all the ports, which may be generally termed the Baltic trade, as it is stated by Mr. Tooke, from Herrmann and Taubert amounted in 1790 to a sum of 35,750,000 rubles, of which the exports make 21,200,000, and the imports 14,550,000 rubles. Tooke's View of the Russian Empire, vol. iv. p. 73, 456.

BALTIMORA, in Botany (a plant so named by Linnaeus in honour of F. C. lord Baltimore, proprietor of Maryland in North America). L. n. g. Schr. b. 1332. Juss. 107. Gært. t. 169. Class. *Jungeria poligona neoflora*. Nat. Ord. *compositae oppositifoliae Corymbifera*. Juss. Gen. Char. Cal. common cylindrical; leaflets seven, lanceolate, erect; the inferior ones shorter. Cor. compound, radiate; corollules hermaphrodite of the disk (cl. 1); females of the ray five; proper of the hermaphrodites funnel-form, with a five-cleft, tomentose border; of the females ligulate, ovate, trisid, the middle ones leis. Stam. in the hermaphrodite, filaments five; anther cylindrical. Pyl. in the hermaphrodite, germ obscure; style short; stigma none: in the females, germ oblong, crowned with a toothed deciduous calycle; style filiform, very short; stigma two, filiform, longer than the corollule. Per. none. Calyx unchanged. Seeds, in the hermaphrodite none; in the females three-seeded, naked, gibbous at the top. Rec. chafy.

Ess. Gen. Char. Cal. cylindrical, many-leaved; ray of the corolla five-flowered; down none. Rec. chafy.

Species, 1. *B. recta*. Gært. Fruct. 2. 244. An annual upright plant about two feet high. Stem four-cornered, channelled, green, rugged at the angles. Branches short, lateral; leaves opposite, stalked, ovate, acuminate, serrate, three-nerved, somewhat tomentose; flowers yellow, in terminal panicles; corollules of the disk tomentose, with black anthers. This is a distinct genus from *Milleria*, although the plant much resembles it. A native of Maryland, near Baltimore. Introduced in 1781 by Mons. Thouin. It flowers in June and July.

BALTIMORE, in Geography, a county of Maryland, in North America, lies between Patapsco and Gunpowder rivers; the former separating it from Ann Arundel county on the south and south-west, and Gunpowder and Little Gunpowder dividing it from Hartford county on the east and north-east. It has Frederick county on the west and north-west, Pennsylvania on the north, and Chesapeake bay on the south east. Besides the rivers which bound it, and their branches, this county has Back and Middle rivers, between the two former, but they are rather arms of Chesapeake bay than rivers. In this county there are numerous iron works; and it contains 25,434 inhabitants, including 5,577 slaves.

BALTIMORE, the chief town in the above county, and the largest in the state of Maryland; ranks in size the fourth, and in commerce the fifth, in the United States. It is seated on the north side of Patapsco river, at a small distance from its junction with the Chesapeake, and surrounds what is called the Basin, in which the water rises at common tides to the height of five or six feet, and which is reckoned one of the finest harbours in America. This basin, says Weld, affords about nine feet of water, and is large enough to contain 2000 sail of merchant vessels. Along this basin are wharfs and stores through the whole length of the town. Baltimore is divided into the part called the town, and that called Fell's point, by a creek, over which are two bridges; but the houses are irregularly scattered from the one to the other. At Fell's point the water is deep enough for ships of burden, but only small vessels go up to the town. Wharfs have been built at this point, by the side of which vessels of 600 tons burden may lie with perfect safety. Here many persons have been induced to settle, on account of its contiguity to the shipping. Upwards of 700 houses have been already erected there, and regular streets laid out, with a large market place. These houses, generally speaking, are considered as a part of Baltimore, though they apparently form a separate town, being more than a mile distant from the other part of the town. Fell's point is chiefly the residence of seafaring people, and of the younger partners of mercantile houses, who are stationed there to attend the shipping. The situation of Baltimore is low, and it was formerly thought insalubrious; but by its rapid increase, and the improvements attending it, the air is less loaded with vapours, and the town is become more healthy. The season of the year, least favourable to health, is autumn, when the more opulent inhabitants retire to their country seats, delightfully situated in the neighbourhood. The principal street, called Market street, is nearly a mile long, and about eighty feet wide, and runs nearly from east to west, parallel with the water; it is crossed at right angles, much after the manner of those in Philadelphia, by other streets, several houses of which are well built, leading from the water. North and east of the town the land rises, and affords a fine prospect of the town and bay; the town, the point, the shipping both in the basin and at Fell's point, the bay as far as the eye can reach, rising ground on the right and left of the harbour, a grove of trees on the declivity at the right, and a stream of water breaking over the rocks at the foot of the hill on the left, all conspire to complete the beauty and grandeur of the prospect.

In 1787, Baltimore contained 1955 dwelling-houses, 1200 being in the town, and the rest at Fell's point. It then contained 152 stores. The number of the inhabitants of the town and precincts amounted, in 1791, to 13,503, including 1,255 slaves. But the number of houses and inhabitants have since that time very much increased. Mr. Weld, who visited this place in 1795, says that it contains about 16,000 inhabitants; among whom are to be found English, Irish, Scots, and French; but the Irish, of whom many are the principal merchants of the town, are the most numerous. Since the war it has received a great accession of French, both from France and from the West India islands.

Most of the inhabitants are engaged in trade. They are mostly plain people, sociable, however, among themselves, says Weld, and very friendly and hospitable towards strangers. "There are many respectable families in Baltimore," says Morfe, "who live genocelly, are hospitable to strangers, and maintain a friendly and improving intercourse with each other; but the bulk of the inhabitants, recently collected from almost all quarters of the world, bent on the pursuit

of wealth, varying in their habits, their manners, and their religion, if they have any, are unfocial, unimproved, and inhospitable." The churches and places for public worship are ten in number; one respectively for Episcopalians, Presbyterians, German Lutherans, German Calvinists, Reformed Germans, Nicolites or new Quakers, Baptists, Roman Catholics, and two for Methodists. The best building, and the handsomest in the town, is the Presbyterian church, lately erected. At Baltimore there are two theatres, that are used occasionally; cards and dancing are favourite amusements, both in private and public assemblies, which are held every fortnight. They have three incorporated banks in this town, and the number of notes issued from them, some of which are for so small a sum as a single dollar, is so great as almost to preclude the circulation of specie. Gold is extremely scarce. As for the state of the trade of this town, Morfe informs us, that, in 1790, it owned 27 ships, one snow, 31 brigantines, 34 schooners, and 9 sloops; in all 102, whose total tonnage was 13,564. The exports in the same year amounted to 2,027,770, and the imports to 1,949,899 dollars. In July, August, and September of this year, they amounted only to 343,584 dollars; but in the same months in 1795, they were advanced to 1,675,748 dollars. The police of the town is conducted by a board of town commissioners, a board of special commissioners, and a board of wardens; the first board supplies its own vacancies, and is perpetual; the two last are appointed by electors, chosen every fifth year by the citizens. Baltimore is distant 53 miles S.W. from Elkton, 176 N.E. from Richmond, in Virginia, 50 N.E. from the city of Washington, and 103 S.W. from Philadelphia. N. lat. 39° 21'. W. long. 77° 48'. Morfe's Geog. p. 353. Weld's Travels through N. America, in 1795, 1796, and 1797, vol. i. p. 43.

BALTIMORE Bay, lies near the extremity of the southern coast of Ireland, between two headlands, and runs a considerable way into the land towards the north-east. The town, or village, from which it takes its name, was formerly a place of trade, but being plundered by the Algerines, in 1631, it never recovered itself. It was one of the Irish boroughs, and sent two members to parliament. It stands on the south point of the eastern headland, in N. lat. 51° 15'. and W. long. 9° 10'; and has a good harbour. The bay extends from Baltimore point on the east to Mizen head on the west, which are eight leagues asunder. It has several coves or harbours besides that of Baltimore, and contains many small islands.

BALTIMORE, in *Ornithology*, a species of **ORIOLE**, of a blackish colour, with a fulvous breast and belly, and a band on the wing of the same colour. Gmelin. Linn. Syst. Nat. This is *le Baltimore* of Brisson, Buffon, &c.; *Baltimore bird* of Catesby; and *Baltimore oriole* of Latham.

"Baltimore birds are found in many parts of North America, the northern parts of which they occupy in summer, being seen sometimes as far as Montreal in Canada, where they come in May; returning southward in the winter, which accounts for their being seen in Maryland and Virginia at that time. They make the nest of soft downy matter, in the shape of a purse, tying it with threads to the very extreme forked twigs of the tulip, plane, and hickory trees; in which they lay their eggs, and rear their young, free from depredators of all kinds.

"They are called fire-birds by the country people; and indeed, when in high plumage, their motions from branch to branch not inaptly resemble a flash of fire." Latham Gen. Syn.

This kind is about seven inches in length. The male bird has the head, neck, and upper parts black; rest of the body,

bend of the wing, and lesser wing-coverts orange; greater coverts and quills black; the first tipped with white, which forms a white bar on the wing; two middle tail feathers black; four outer ones orange from the middle to the tips; and the two next orange at the tip; legs and claws black. The female, according to Buffon, has all the foreparts of a fine black, like the male; tail the same; wing-coverts and quills blackish; and those parts of a dull red, which are of a fine orange in the male.

BALTIMORE, *Buffard.* This is rather shorter than the true Baltimore. The bill is lead colour; forehead and cheeks black and yellowish mixed; hind head and nape olive-grey, marked with a few spots of black; upper part of the back dull black; lower part of the back, the rump, forepart of the neck, breast, belly, sides, thighs, upper tail-coverts, and under the wings, orange-yellow, brightest on the breast and tail-coverts; lesser wing-coverts deep brown; the greater the same, tipped with dirty yellowish white; quills brown, bordered on both edges with whitish; the two middle tail feathers are olive and black confusedly mixed; and the four outer ones of a yellowish olive; legs and claws blueish.

This latter bird is described by Linnæus under the specific name of *Spurius*. Dr. Latham, to whom we are indebted for the preceding minute description, observes, that there seems to be much confusion and uncertainty between the true and bastard Baltimores and their females; and that at last they may prove to be mere varieties of one single species; all perhaps referable to one or other sex of the true Baltimore, in different stages of life. See *SPURIUS Oriolus*.

BALTINGLASS, in *Geography*, a town of Ireland, in the county of Wicklow, twenty-five miles west from Wicklow.

BALTISTAN. See *Little THIBET*.

BALTRUM, an island in the German ocean, near the coast of East Friesland, about 4 miles long, and about 1½ broad. N. lat. 53° 47'. E. long. 6° 56'.

BALTSHIK, a town of European Turkey, in the province of Bulgaria, eighteen miles north-east from Varna.

BALTURTA, a salt lake of Asiatic Russia, in the government of Orenburg, 144 miles S.W. from Ufa.

BALTZAR, THOMAS, in *Biography*, the first great performer on the violin who visited this country from the continent, whose name appears in our musical annals; and the account, which Anthony Wood gives of this extraordinary musician, in his life written by himself, is so characteristically quaint, minute, and amusing, that we shall transcribe it in his own words; as it will at once convey an idea to the musical reader of the superiority of Baltzar's execution, and of the state of music at Oxford during the latter end of the interregnum.

"Thomas Baltzar," says Ant. Wood, "a Lubecker born, and the most famous artist for the violin that the world had yet produced, was now (1658) in Oxon, and this day, July 24, A.W. was with him and Mr. Ed. Low, lately organist of Ch. Ch. at the house of Will. Ellis. A.W. did then and there, to his very great astonishment, hear him play on the violin. He then saw him run up his fingers to the end of the finger-board of the violin, and run them back insensibly, and all with alacrity and in very good tune, which he nor any in England saw the like before. A.W. entertained him and Mr. Low with what the house could then afford, and afterwards he invited them to the tavern; but they being engaged to go to other company, he could no more hear him play or see him play at that time. Afterwards he came to one of the weekly meetings of Mr. El-

li's house, and he played to the wonder of all the auditory, and exercising his finger and instrument several ways to the utmost of his power. Wilson (Doctor) thereupon, the public professor, the greatest judge of musick that ever was, did, after his humourfome way, scoop downe to Baltzar's feet, to see whether he had a huff on, that is to say, to see whether he was a devil or not, because he acted beyond the parts of man.

"About this time it was that Dr. John Wilkins, afterwards bishop of Chester, and called the *Flying Bishop*, warden of Wadhams, the greatest curiozo of his time, invited him, and some of the musicians to his lodgings in that coll. purposely to have a concert, and to see and hear him play. The instruments and books were carried thither, but none could be persuaded there to play against him in consort on the violin. At length the company perceiving A.W. standing behind in a corner near the dore, they haled him in among them, and play, forsooth, he must against him. Whereupon, he being not able to avoid it, he took up a violin, as poor Troylus did against Achilles. He abashed at it, yet honour he got by playing with and against such a grand master as Baltzar was. Mr. Davis Mell was accounted hitherto the best for the violin in England; but after Baltzar came into England, and shewed his most wonderful parts on that instrument, Mell was not so admired, yet he played sweeter, was a well-bred gentleman, and not given to excessive drinking as Baltzar was."

At the restoration of king Charles II. Baltzar was placed at the head of his majesty's new band of violins. His compositions have more force and variety in them, and consequently required more hand to execute them, than any music then known for his instrument; as appears by a MS. collection of his pieces, with which we were presented by the late Rev. Dr. Montagu North.

Ant. Wood tells us, that this celebrated violinist died in July 1663, and was buried in the cloister belonging to St. Peter's church, at Westminster; and adds, that "this person being much beloved by all lovers of musick, his company was therefore desired; and company, especially musical company, delighting in drinking, made him drink more than ordinary, which brought him to his grave." A.Wood's Life, p.190.

BALU, or BALOU. See **BALI**.

BALUCLAVO, or JAMBOL, a sea-port town of Crimea, on the Black sea, with a fine harbour; the only one on this sea capable of accommodating a large fleet.

BALVE, in *Geography*, a town of Germany, in the circle of the Lower Rhine, a seat of a bailiwick in the duchy of Westphalia, seated on the Holm, 10 miles S.W. from Arnsberg, and 38 N.E. from Cologne.

BALUMA POINT, lies on the west coast of Africa, to the south-east from cape Roxo. N. lat. 12°.

BALUS HEAD, the north-west point of the entrance into Ballinglickings bay, on the south-west coast of Ireland.

BALUZE, STEPHEN, in *Biography*, was born at Tulle in 1631, and as he advanced in years, directed his particular attention to manuscripts, and to new editions of books, upon which he bestowed much critical skill and erudition. His principal object, however, was ecclesiastical history; and in this department, such work as the lives and letters of popes, and other eminent ecclesiastics, histories of councils, and homilies. In 1656 he was taken under the patronage of the archbishop of Toulouse, and he was, after his death, librarian to the famous Colbert. The king created in his favour a chair of canon law in the royal college, appointed him inspector of the college, and granted him a pension. His "Genealogical History of the House of Auvergne" writ-

ten at the instigation of cardinal Bouillon, gave such offence to the court, that the work was suppressed by order of the parliament of Paris, and the author deprived of his places and pension, and sent into exile; nor was he recalled to Paris till after the peace of Utrecht. In old age, he amused himself in writing the history of his native place, under the title of "Historia Tutellenfis," printed in 1717, at Paris, in 4to. He died in 1718, much regretted by his friends on account of his amiable, obliging, and communicative disposition; and honoured amongst the learned for his extensive acquaintance with books and manuscripts. Gen. Dict.

BALZAC, JOHN LEWIS GUEZ DE, was the son of a gentleman, whose name was William Guez, of Languedoc, and born at Angoulême in 1595, or 1596. In his youth, he attached himself to cardinal de la Valette, who for two years employed him as his agent at Rome. On his return, he was introduced to court, and much admired. By the favour of cardinal Richelieu he obtained a pension, together with the brevets of counsellor of state, and royal historiographer. His "Letters," first published in 1624, established his reputation in early life, and were long regarded as perfect models in that kind of composition. "With much fine sentiment and beauty of language, they are, however, studied, pompous, and inflated." With regard to style and manner, they form a contrast to the ease and sprightliness of Voiture, though Balzac excels in respect to weight of matter. Such was this epistolary writer's reputation, that those who were desirous of being thought "bel esprits" in France, wished to engage Balzac in a correspondence, that they might be in possession of one of his letters. His style became the subject of criticism; and even the morality of his writings was abused, without sufficient reason. Disgusted by this treatment, he retired to his estate at Balzac, on the borders of the Charente, near Angoulême; and there employed his time in study and composition, and in correspondence with his friends, among whom were some of the most learned and eminent of his countrymen. He was deemed a good classical scholar; and he wrote Latin with ease and elegance; and his conversation was unaffected and agreeable. His general character was that of a good man, and a devout charitable christian. He set apart, even in his life-time, eight thousand crowns of his estate, to be distributed to pious uses. He built two chambers in the convent of capuchins at Angoulême, where he often resided; and at his death he bequeathed 12,000 livres to this hospital, and he left an estate of 100 francs per annum, to be appropriated every two years as a prize to him who, in the judgment of the French academy, of which he was a member, should write the best discourses upon a subject of religion. He died in 1654, and was buried, according to his own order, "at the feet of the poor interred" in the hospital at Angoulême. "The French language (says Voltaire, age of Louis XIV.) is under very great obligations to Balzac. He first gave number and harmony to its prose." In early life he seems to have been unduly admired, and afterwards he sunk into unmerited degradation and neglect. His principal works are his "Letters," printed at different times; "Le Prince;" "Le Socrate Chrétien;" "L'Arithippe;" "Entretiens;" "Latin verses," in three books, of which his "Amyntas," and "Christ victorious," are most esteemed. All these have been collected in two volumes, folio, and were published at Paris in 1665. Gen. Dict. Nouv. Dict. Hist.

BAMBA, in *Geography*, the largest and richest province or duchy of the kingdom of Congo, in Africa, situate between the rivers Ambrisi and Loze; the last of which parts it from the marquise of Pemba on the east, and the Ambrisi from the county of Songo on the north. Along

the sea-coasts it extends still farther northward to the river Lelunda, and on the south to that of Danda, which separates it from the kingdom of Angola. The governors of this province bear the title of dukes, and are always princes of the royal family, being as despotic and arbitrary as if they were really kings. The soil is fertile, and capable of producing all the necessaries of life in great abundance, if it were duly cultivated. The sea-coasts produce a large quantity of salt, which forms a considerable article of exportation. The fishery of the Zimbis, whose shell is the current coin in this and the two neighbouring kingdoms, furnishes also a valuable source of revenue. Several authors have added a third kind of treasure in this province, viz. the mines of gold, silver, quicksilver, copper, tin, and iron, which are found in the mountainous parts; but the richness, and even the reality of these mines, have been questioned; and it is certain, that the iron mines are only allowed to be used, and that there are severe laws against meddling with any of the rest. The interior of the country furnishes elephants, stags, buffaloes, tigers, civets, and parroquets; and here is a considerable traffic of slaves. The people are numerous, strong, and warlike. In this province is a town of the same name, which is large and populous, distant about seventy leagues from the sea, and in the possession of the Portuguese.

BAMBA, a collection of villages in the kingdom of Dembea, in Abyssinia, near the western bank of the lake Tzana, or Dembea. N. lat. 12° 11'. E. long. 37°.

BAMBALA, in *Ancient Geography*, a maritime town of India, on this side of the Ganges. Ptolemy.

BAMBAMARCA, in *Geography*, a town of South America, in Peru, and jurisdiction of Patas, or Caxamarquilla.

BAMBAN, a town of Upper Egypt, seated on the Nile, about forty-two miles S. S. E. of Éneh. N. lat. 24° 26'.

BAMBARA, an extensive kingdom of Western Africa, bounded by the Moorish kingdom of Beeroo to the north, and Masina, a Foulah state south of Beeroo, by the districts of Gotto, Baedoo, and Marciana, and Nigritia or Soudan, to the east, by Kong to the south, and by Ludamar and Kaarta to the west. The course of the river Jolibah, or Niger, lies through this country; and its capital is Sego, seated on this river, in N. lat. 14° 10' 30". and W. long. 2° 1'. The language of Bambara was found by Mr. Park, in his travels through this country, to be a sort of corrupted Mandingo; and from Mansong, the king, who resided in this city, he received tokens of favour, though from motives of prudence he was not admitted into the royal presence, and he was ordered to leave Sego. This benevolent prince, in spite of the jealous machinations of the Moorish inhabitants, thought a stranger in distress a proper object of compassion and relief; and probably dismissed him under an apprehension that he might not be able to afford him effectual protection against their blind and inveterate malice. This country is beautiful and highly cultivated; and at Kabba, which Mr. Park visited, and which is situated at a small distance from Sego, it bore, according to this traveller, a greater resemblance to the centre of England, than to what he should have supposed to have been the middle of Africa. The shea-trees (see SHEA), from which the inhabitants prepare their vegetable butter, constituting a main article of their inland commerce, abound in this part of Bambara. Whilst Mr. Park travelled through this country, he was much incommoded by the tropical rains; and he was chiefly indebted for his daily support to the dooty or chief man in the several towns through which he passed. This officer seems to possess the authority of mayor in the corporate towns

towns of England; and it reflects great honour on the police of the African kingdoms, or on the benevolent manners of the natives, that it is considered as one part of the deity's province to bestow food on the indigent traveller. "To suffer the king's stranger to depart hungry," as they express themselves, is an offence of a very heinous nature. See AFRICA, and SERO.

BAMBELE (*glatic Landlie*), in *Ithyology*, the name of *capivina phosinus*, Gmel. in Gesner's Thierb.

BAMBERG, in *Geography*, a principality and bishopric of Germany, in the circle of Franconia, is bounded on the north by the principality of Coburg and the Vogtland, on the east by Brandenburg-Baryenth and the estates of Nuremberg, on the south by the estates of Nuremberg and the principality of Schwartzberg, and on the west by the bishopric of Wurtzburg. It is about sixty miles long, and forty broad; the soil is good, and produces all sorts of grain, fruit, and wine; and in the vicinity of the capital are such numbers of laurel, fig, lemon, and orange trees, that this spot is generally called the garden of Italy. The inhabitants also rear a considerable number of cattle. The principal rivers are the Mayn, the Rotach, the Itz, and the Regnitz. It contains eighteen cities and fifteen mark-towns. At the diet of the empire, the bishop, whose revenue is about 700,000 florins, takes the fourth place in the council of spiritual princes. The inhabitants are Roman Catholics. The military consists of one company of 100 men, and 50 hussars.

BAMBERG, the capital of the above bishopric, is said to have derived its name from Baba, sister to the emperor Henry I. and is pleasantly situated on the river Regnitz, in the midst of a fruitful country. It was formerly an imperial city, but is now subject to its bishop. The town is large and populous; and being situated in the centre of Germany, contiguous to seven or eight different states, it is a very great thoroughfare. The streets are wide, and the buildings neat and regular. It has no fortifications, but lies open, and has the appearance of a large village. The cathedral is one of the most magnificent in the empire. The chapter is composed of twenty capitular canons, and fifteen domiciled. The bishopric was founded by the emperor Henry II. in 1106. Among other curiosities deposited in the treasury of this church, are the imperial crown of Henry II., consisting of six plates of gold adorned with precious stones, and another of his empress, composed of two circles of gold neatly set with pearls and jewels; and also a folio MS. of the four gospels in Latin, upon fine vellum, in a neat Roman character, with Gothic letters interspersed, and very beautiful miniatures; the binding is adorned with pearls and precious stones. There is another Latin MS. in folio, of the four gospels, with a commentary by St. Jerome, and fine miniatures; and a third in Gothic letters, with a binding of very great value; all of which were presented to this church by Henry II. In this city there are several convents of men and women, two palaces, and an university, founded in 1585. The bishop is absolute sovereign of this town and district, and has several castles and royalties in Carinthia and other parts of Germany. He holds immediately under the see of Rome; and he is joint director of the circle of Franconia with the marquis of Culembach. The benefices in this bishopric and that of Wurtzburg are reckoned the best in Germany. Within nine miles of Bamberg, at a place called Pommersfelden, there is a beautiful palace belonging to the house of Schonborn, which may be considered as one of the best in Germany. N. lat. 49° 51'. E. long. 10° 50'.

BAMBERG, New, a town of Germany, in the circle of

the Lower Rhine, twenty miles south-west of Mentz, and eight south of Bingen.

BAMBINI, in *Biography*, a spirited Italian composer, who arrived at Paris during infancy, with the company of Lucia singers who first performed in that capital the *Serva Padrona* of Pergolisi, which gave birth to Rousseau's admirable "Lettre sur la Musique Française," and raised a party for Italian music, which has increased ever since. Bambini was the child, whose judicious accompaniment of the burletta singers on the harpsichord, Rousseau in his letter has so well described, and recommended to clarify thorough-bass players, who let nothing else be heard but the clattering of their chords. This letter, for which Rousseau was burnt in effigy at the opera-house door at Paris, has never yet been forgiven, even by those who pretend to admire no vocal music but Italian, or German on that model. See ACCOMPANIMENT.

BAMBULA, in *Ornithology*, a species of *Turdus* that inhabits Cayenne, and is about the size of the common or domestic Sparrow. It is spotted; above rufous brown; beneath cinerous; wings black, with a transverse white band. This is the *black-winged thrush* of Latham, and *lanilla* of Buffon.

BAMBO, in *Commerce*, an East India measure, containing five English pints.

BAMBOCCIO, in *Biography*, an eminent painter of conversations, landscapes, cattle, &c. was born at Laceri, near Narden, in 1613; and for his real name of Peter Van Laer, they substituted in Italy that of Bamboccio, from his uncommon figure, the lower part of his body being one-third part larger than the upper, and his neck so short that it was buried between his shoulders. His genius, however, was very great; and his taste extended to every part of painting. He resided at Rome for 16 years, and availed himself of the opportunities for improvement which that city afforded him. His style of painting is sweet and true, and his touch delicate, with great transparency of colouring. His figures are well proportioned and correctly designed; and though his subjects are deduced from the lower kind of nature, such as plunderings, playing at bowls, inns, farriers' shops, cattle, or conversations, his designs and execution were so excellent, that his manner was adopted by many of the Italian painters of his time; and he has been justly ranked in the first class of eminent masters. His hand was as quick as his imagination, so that he seldom made sketches or designs; but having marked the subject with a crayon on the canvas, he immediately finished it. He possessed an astonishing memory, and the idea of any objects which he saw was so strongly impressed on his mind, that he could represent them with as much truth as if they were placed before his eyes. The close of his life was embittered by an asthmatic complaint; and it is said, that in order to terminate his misery, he threw himself into a canal, and was drowned, A. D. 1673. Pilkington.

BAMBOO, in *Botany*. See ARUNDO, and NASTUS.

BAMBOO Habit, a Chinese invention, by which a person, who cannot swim, may easily keep himself above water. Four bamboos, two before and two behind their bodies, are placed horizontally, and project about twenty-eight inches. They are crossed on each side by two others, and the whole properly secured, leaving a space for their body; it is put over their heads, and tied secure in two minutes.

BAMBOROUGH, in *Geography*, a village of England, in the county of Northumberland, near the coast of the German ocean, with a castle said to be built by Ina, king of the Northumbrians, in the year 548. This castle with the estate was purchased by Crew, bishop of Durham, and left

left to charitable uses. One of the trustees, Dr. Sharp, prebendary of Durham, resided in this castle, and appropriated a part of it to the accommodation of shipwrecked mariners, and to the purposes of a granary, which served for the supply of the poor with corn, in dear seasons, at a low price. A patrol was kept every stormy night through the whole extent of the manor, which was eight miles, for the succour of the distressed; and by the mode of firing a cannon from the castle, the place where any disastrous accident occurred was pointed out, and directions given for the neighbouring people to afford assistance. This village is four miles east from Belford, and 32.4 north of London.

BAMBOTHUM, in *Ancient Geography*, a river of Africa, in Lower Libya, from which extended a chain of mountains as far as mount Theon Ochema. Pliny.

BAMBOUK, in *Geography*, a kingdom of western Africa, situate between the rivers Basing and Faleme, which, by their junction with the Kokoro and other streams, form the river Senegal; and bounded on the north by Kajaaga and Kaffoon, on the east by the rivers Basing and Brooko, on the south by Konkodoo or Concondou, and Satadoo, and on the west by the river Faleme and Bondou. The town of Bambouk is seated on a stream which joins the river Faleme, and lies, according to Rennell's map, in about N. lat. 13° 24'. W. long. 9° 10'. This country, according to the account of the proceedings of the African association, is inhabited by a nation whose woolly hair and sable complexion denote them to be of the negro race; but their character seems to vary in proportion as the country rises from the plains of its western division to the highlands of the east. The inhabitants are distinguished into sects or parties like the people of Woolli and Bondou, by the different tenets of Mahometans and Deists; they are equally at peace with one another, and mutually tolerate the opinions they respectively condemn. Their chief occupations are agriculture and pasturage; but they have made such progress in the arts and manufactures, that they are able to smelt iron, and to furnish themselves with the several instruments of husbandry and war. Their process for weaving cotton cloth, the habit of this part of Africa, is difficult and laborious. Their common vegetable food appears to consist of rice, and their animal diet of beef or mutton; a liquor prepared from fermented honey supplies the want of wine, and furnishes the means of those festive entertainments that constitute the luxury of the court of Bambouk. The king of Bambouk gave to major Houghton a friendly reception at Ferbanne, where he resided; but the major did not long survive this visit. The mountains of Konkodoo, characteristically so called because it is the "country of mountains," extend through Bambouk and Kaffon, and are productive in gold. Proceedings of the African Association, by major Rennell, 1798.

BAMBRIDGE, or **BAINBRIDGE**, *Christopher*, in *Bio-graphy*, an English divine, was a native of Hilton, near Appleby, in Westmoreland, and a student in Queen's college, Oxford. By a rapid progress he was advanced, in 1507, to the see of Durham; and in the next year, to the archbishopric of York. Under Henry VII. he regained that royal favour, which had been interrupted in the reign of Richard III.; was made almoner to that prince, and employed by him in several foreign embassies. In the reign of Henry VIII. he was engaged in a negotiation with pope Julius II. under a pretence of restoring peace to Europe, but in reality to excite the pope's enmity against the king of France. Bambridge, attentive to his own interest, contrived so to ingratiate himself with the pope, as to obtain a cardinal's hat and an informal precedence in the conclave. He was also appointed legate of the

ecclesiastical army, which was then besieging Bastia. Upon his return home, he manifested his gratitude to the pope by inducing his royal master to enter into an unnecessary war in his defence. Ambition seems to have been the ruling principle of Bambridge; of his learning no evidence remains; and as to his temper, no favourable opinion can be entertained of it if we advert to the tragical incident that closed his life. Inflamed with resentment against Renaud of Modena, his major-domo, he fell upon him with fury and beat him; and the enraged domestic revenged himself for the insult and abuse, by administering to his master a dose of poison. This happened at Rome, on the 14th of July 1514. Biog. Brit.

BAMBUKALAI, in *Geography*, a town of Asiatic Turkey, in the province of Natolia, twelve miles north of Dognizlu.

BAMBUSA, in *Botany*, Lin. gen. Schreb. 607. Class, *hexandria monogynia*. Gen. Char. Cal. none, except glume-like bractes scattered, often three under each spikelet, oblong, pointed, concave, keeled, unequal, shorter than the floscules, two opposite, the third leaning on the flat side of the spikelet; spikelets lanceolate, distichous, compressed, sharp, nearly five-flowered. Cor. glume two-valved; valve inferior, oblong, ventricose, acuminate, towards the tip keeled and streaked; interior lanceolate, flat, with complicated margins, ciliate, a little longer than the inferior, and projecting from it; nectary two-leaved, flat at the anterior side of the germ; leaflets ovate, acuminate, bearded at the tip, membranous. Stam. filaments six, capillary, almost the length of the corolla; anthers paralleliped, two cleft at the base. Pist. germ oblong; style capillary, two cleft; stigmas feathery. Per. none; corolla envelopes the seed, gapes? lets it fall? seed single, oblong. Obs. The superior floscules in several spikelets examined by Schreber were merely male; he therefore says, "ought not this genus to be transferred to *polygamia*?" For the rest see **ARUNDO**, **BAMBOS**, and **NASTUS**. Gmelin has made two genera of this, under *Bambus*, and *Nastus*.

BAMBYCE, in *Ancient Geography*, a town of Asia, in Assyria, beyond the Euphrates; called also, according to Strabo, *Edeffa*, and *Hierapolis*.

BAMFF, or **BANFF**, in *Geography*, the capital of Banffshire, in Scotland, stands on a gentle declivity at the mouth of the Deveron, a considerable stream which has its source among the mountains of Aberdeenshire, and after winding through narrow vallies and well cultivated plains, falls into the Moray frith, a little below this ancient burgh. The earliest authentic document we meet with relating to this town states, that Robert II. by virtue of charter, dated October 7, 1372, conferred on it all the immunities and privileges of a royal burgh; which were afterwards confirmed by James VI. and further by his grandson Charles II. Soon after the union of South and North Britain, this burgh, in common with many others, lost much of its political importance; as by that event it was united with Inverary, Cullen, Elgin, and Kintore, which return but one representative to parliament. Agreeable to the *Sett*, or municipal government of Banff, two thirds of its magistrates are re-elected annually. Duff-house, the family residence of the earl of Fife, together with the pleasure grounds and plantations around that truly magnificent mansion; the harbour which is defended by a battery, and the shipping; the plain substantial bridge of seven arches over the smooth winding Deveron; the castle of Banff belonging to the earl of Finlater; the town house and prison, including its handsome spire; the parish church, an elegant and newly built structure; are striking and interesting objects, with respect

to the general appearance and commercial consequence of this flourishing sea-port town. The industry of its inhabitants is sufficiently manifest in their various employments; and those of condition set a laudable example in the improvements carried on in the immediate vicinity; so that in all likelihood Bamff bids fair to accumulate wealth under circumstances favourable to the spirited exertions of those engaged in commerce and trade. The salmon-fishery extends about four miles on the Deveron. It belongs to the earl of Fife; and it yields him a yearly rent of 1250*l*. The right of this property, together with some land, was, in A. D. 1470, by reason of the poverty of the burghers of Bamff, alienated to perpetuity for a small annual fine-duty or fine for the purpose of keeping the parish church and prison in proper repair. Before the reformation, there was a convent dedicated to the Virgin Mary, which belonged to the order of Carmelites, or white friars; its house and lands were annexed to the old college of Aberdeen, in A. D. 1617; and in the year 1752, these were purchased by the present earl of Fife. The ecclesiastics, both episcopal and presbyterian, are on the best terms with each other. The former are under the jurisdiction of the bishop of Aberdeen; and the latter is under the presbytery of Fordyce. The unfortunate James Sharp, archbishop of St. Andrews, the arch-episcopal see of Scotland, was born in the castle of Bamff, in May 1613.

The parish of Bamff is about six miles in length and two in breadth; its surface is beautifully diversified, and the soil is generally good, though of different qualities. The greater part is kept in pasturage, on which a number of black cattle are annually reared. Population of the town in 1800, 3571. Bamff is about 165 miles north of Edinburgh. In the vicinity of this town is Duff-house, the magnificent mansion of the earl of Fife. This was built after the designs of the late Mr. Adam. It is enriched with fluted columns, sculptured cornices, and statues, vases, &c. which give peculiar elegance to its external appearance. The internal is splendidly furnished, contains a large, well-selected library, and many valuable paintings, &c. Cordiner's Antiquities and Scenery of Scotland.

BAMFFSHIRE gives name to one of the counties in Scotland; it is bounded on the north by the Moray frith, on the west by the counties of Moray and Inverness, and on the south and east by Aberdeenshire. It extends about 36 miles in its longest diameter north and south; and its average breadth is about 16 miles. Within its boundaries are included twenty-four parishes, and two royal boroughs. The surface of the country is agreeably diversified with hill and dale, well-watered with rivers, and ornamented with several seats and their annexed plantations. The principal of these belong to the duke of Gordon, earl of Findlater, earl of Fife, and lord Bamff. Part of the county is mountainous; but the lower lands, and those in the vicinity of towns, are in high cultivation. Its principal rivers are the Spey, which partly divides this county from Morayshire; the Deveron, which separates it from Aberdeenshire; the Isla, Conglas, Avon, and Fiddich. Some valuable minerals are found in this county; and great quantities of hones and whetstones are obtained from a hill in the district of Balvenie. Several mountains are noted for their elevated summits. Of these Cairngorum, about 4050 feet in height, is the chief, and is reckoned among the highest of the Grampian hills. That of Belrinnes runs to the height of 2690 feet above the level of the sea, and Knock-hill is estimated at 2500 feet. At Portfroy, near the north coast, is a stratum of serpentine, called Portfroy marble, also a species of granite, which when polished exhibits various figures and characters, some of them resembling those of the Arabic

and Hebrew alphabet. A great number of tumuli are scattered over the hills near the coast; and some druidical antiquities are in this district. The population of this county, according to the parliamentary report in 1800, was 35,807.

BAMIAN, or BAMIYAN, a city which some have referred to Khorasan, in Persia; and others, with greater propriety, to that part of Independent Tartary, called great Bucharia, near its southern limit, at the foot of mount Caucasus, or near that part of this range of mountains called Paropamisus, and Hindoo Khoo, and not far from the ancient Alexandria. Bamian belongs to the same portion of Bucharia which includes Gaur, and lies between this province and Cabul. It is eighty-eight geographical miles from Chizni. N. lat. 34° 30'. E. long. 67°. It gives name to a district that extends from Balk towards the east, or the kingdom of Cabul. This famous city, denominated the Thebes of the east, is situated on the road between Bahlac, or Balk, and Cabul; and they reckon eight manzils, or days' journey, from Cabul to Bamian. Like Thebes in Egypt, it is entirely cut out of an insulated mountain, and the valley round it is called, in the language of the country, the Tagavi of Bamiyan; Tagavi being synonymous with Purganah or district. Nearly to the south are the ruins of several buildings of masonry round a small conical hill; on the summit of which are the remains of the palace of its ancient kings. A rivulet, rising in the adjacent hills, goes through the ruins of Ghulguleh and the Tagavi of Bamiyan, and falls into a small lake, from which issue four rivers, the Hirmend, the Landhi-Sindh, the rivers of Bahlac, and of Conduz. The city of Bamiyan consists of a great number of apartments and recesses, cut out of the rock; some of which, on account of their extraordinary dimensions, are supposed to have been temples. Some of them are adorned with niches and carved work; and there are some remains of figures, in relievo, which have been destroyed or disfigured by the Mussulmans. Some remains of paintings on the walls are still to be seen; but the smoke has almost obliterated them. In the Ayeen-Akbery it is said, that there are about 12000 of these recesses in the Tagavi of Bamian; and this account is confirmed by the general report of travellers. The country of the Afghans, as far as Bahlac and Badakshan, abounds with these recesses, called Samach'hes in the language of the country, or Samajes in Persian. The most perfect are at a place called Mohi, on the road between Bamian and Balk; but as they are situated among precipices, the Mussulmans have not thought of using them as habitations; the paintings with which they are adorned appear quite fresh. The attention of travellers is particularly attracted by two colossal statues, which are seen at a great distance. They are erect, and adhere to the mountain from which they were cut out. They are in a sort of niches, the depth of which is equal to their thickness; and in the Ayeen-Akbery, the largest is said to be eighty ells high, and the other only fifty. But these dimensions are exaggerated; and the truth seems to be, that they are only fifty cubits high. At some distance from these, there is another about fifteen cubits high. Authors are disagreed both as to their sex and their names. A late traveller says, that the drapery is covered with embroidery and figured work, which was formerly painted of different colours; one seeming to have been red, and the other retaining the original colour of the stone, or having been painted grey. According to Dr. Hyde, one of these statues is called Surkh-But, or the red idol, and the other Khink-But, or the grey idol. Between the legs of the male figure is a door leading into a spacious temple, at the entrance of which are stationed a few wretched Banyans, who sell provisions to travellers. According to Persian authors, Bamian must have existed before

before the flood : but the followers of Buddha insist, that it was built by a religious man called Shama, supposed to be the same with the patriarch Shem, and that his posterity lived there for several generations. Hence Balk-Bamian is said to have been originally the place of abode of Abraham, who, according to scripture, and the Hindu sacred books, removed with his father to distant countries to the westward. According to Diodorus Siculus, Bamian existed before Ninus ; for this historian, as well as the Persian authors, has mistaken Bahlac for Bamian ; which he describes as situated among steep hills ; whilst Bahlac is situated in a low, flat country, and at a great distance from the mountains. The natives look upon Bamian, and the adjacent countries, as the place of abode of the progenitors of mankind, both before and after the flood ; meaning by Bamian and the adjacent countries all the country from Sistan to Samarcand, reaching towards the east as far as the Ganges. This tradition is very ancient, and is countenanced equally by Persian authors and the sacred books of the Hindus.

Bamian, as well as Cabul and Balk, were at an early period in the hands of the Mussulmans. There were even kings of Bamian ; but this dynasty lasted but a few years, and ended in 1215. The kings and governors resided at Ghulguleh, called at that time the fort or palace of Bamian. It was destroyed by Genghiz Khan, in the year 1210 ; and because the inhabitants had presumed to resist him, he ordered them to be butchered, without distinction either of age or sex ; and in his brutal rage, he spared neither animals nor even trees. He ordered it to be called in his own language Mau-balig, or the city of grief and sorrow ; but the inhabitants of the country called it, in their own dialect, Ghulguleh, which word used also in Persian, signifies " the cries of woe." To have rebuilt it would have been ominous ; and, therefore, they erected a fort on a hill to the north of Bamian, which is called to this day the imperial fort. This fort was also destroyed by Zingis the Usbeck, in 1628, and has not been rebuilt since. The city of Bamian is represented in the ancient legends of the country as the fountain of purity and holiness ; and was called Para-Bamiyan, or Bamiyan the pure and holy, and the district of Bamiyan might also be called Para-defa, the pure and holy country. It is now barren, and without a single tree ; but, according to the sacred books of the Hindus and of the Buddhists, it was otherwise formerly. Tradition also informs us, that the number of inhabitants was at one period so prodigious, that the trees, underwood, grass, and plants were destroyed. The vegetable soil being no longer protected, was in the course of ages washed away by the rains : and it is certain, that the soil in the valleys is very fertile, and the whole district, in its present state, is a most enchanting and delightful spot. The country to the eastward of Bamiyan, as far as the Indus, is the native country of the vine, and of almost all the fruit-trees we have in Europe : there they grow spontaneously, and to a great degree of perfection. When the natives find a vine, an apple-tree, &c. in the forests, they clear all the wood about it, dig the ground, and thus the fruit comes to perfect maturity. " When we are told in scripture of Noah cultivating the vine, we may be sure (says captain Wilford, *ubi infra*), that it was in its native country, or at least very near it." Bamiyan, though not mentioned by name in Nonnus's *Dionysiacs*, is well described by him as the abode of the benevolent Brongus, who lived in Samach'hes, or recesses artfully excavated in the mountains. Brongus was the Bhranga of the Puranas ; and had several children, who ascended the throne of Calinga, after their father had forsaken the world. Bamiyan appears to be the town called Drasloca by Ptolemy ; which is derived from the Sanscrit Drashtaca, and implies the stone-city :

towns before being merely an assemblage of huts. Its distance and bearing, says captain Wilford, from Cabua, or Orthospaana, the present city of Cabul, puts it beyond doubt. See captain Francis Wilford's " *Observations on Mount Caucasus*," in *Asiatic Researches*, vol. vi. p. 495.

BAMMAGURA, in *Ancient Geography*, a town of India, on this side of the Ganges. Ptolemy.

BAMMAKOO, in *Geography*, a town of the Mandingo country, in Western Africa, seated on the river Niger, where it ceases to be navigable, about 150 miles below its source. Here the river descends from the high land of Manding into Bambara, on the eastward, with a rapid and furious course ; after which it glides smoothly along, and affords an uninterrupted navigation to Houssa, and probably by Kaffina to Wangarah. It lies about fifty miles short of Kamalich ; and it is reckoned by the natives ten journeys only from Segou. By Mr. Parke's bearings corrected, it lies from Segou W. 25° S. distant 178 geographical miles. N. lat. 12° 54'. W. long. 5° 20'.

BAMMONITIS, in *Ancient Geography*, a country of Asia Minor, which Strabo places in the vicinity of the river Halis.

BAMOTH-BAAL, a city of Palestine, beyond Jordan, belonging to the tribe of Reuben, seated in the plain through which lay the course of the Arnon. Josh. xiii. 17. In this city was a high place consecrated to Baal, the idol of the Moabites.

BAMPTON, in *Geography*, is an ancient market town in the county of Devon, in England. Polwhele asserts that it was a Roman station ; but this is not proved by his description of the parish, nor by any discoveries that have been made relating to that people. It is seated on a branch of the river Exe, and is also watered by the river Batham, over which is a strong stone bridge. The town is nearly encompassed with hills which consist chiefly of lime-stone rocks. These are burnt on the spot, and the lime used by the neighbouring farmers in meliorating the soil of their lands. Bampton is governed by two portreves, two constables, and other inferior officers, who are annually elected at the lord's court. The principal manufactory of the place is ferges. This was formerly a borough, and sent two members to parliament, whose expences were defrayed by the inhabitants ; but this privilege has long been lost. It gives name to the hundred, and includes within the parish two small villages, whose chapels have only monthly service. The town is irregularly built, and extends about half a mile in length ; containing 302 houses, with 1364 inhabitants. Here is a large church with a lofty tower, and the church-yard, which is extensive, contains two yew trees, distinguished for their age and magnitude. The market is held every Saturday, and here are two annual fairs. Bampton is 167 miles west of London, and about twenty-two N. W. from Exeter. Polwhele's *History of Devonshire*, vol. ii.

BAN, a sort of smooth fine muslin, which the English import from the East Indies. The piece is a yard broad, and runs about twenty yards and a half.

BAN and *Bans*. See BANN and BANNS.

BAN Island, in *Geography*, is the most southerly of the Ladrões, north of New Guinea, in N. lat. 11°, and E. long. of the east end 142°. Between this and Bato island, on the north is a rocky island.

BAN, *Arriere*. See ARRIERE.

BANA, in *Ancient Geography*, a town of Arabia Felix. Ptolemy.

BANAAUSI, a town of India, on this side of the Ganges. Ptolemy.

BANABA, a town of Asia, in Mesopotamia. Ptolemy.

BANAGHER, in *Geography*, a market and post town of

of the King's county, in the province of Leinster, in Ireland, which, before the union, returned two members to the house of commons. Here are an excellent mill-pond for a fishery, and an ancient bridge over the Sluannon, on which river it is situated, but it is a very inconsiderable town. Its distance west from Dublin is 65½ Irish miles.

BANAMATAPA, a town of Africa, in the country of Monor or Mog.

BANANA, in *Burmy*. See *Musa*.

BANANA BIRD, of Jamaica, in *Ornithology*, the name under which the *Ornithopus* of Scopoli and Gmelin is figured in *Bonville's Nat. Hist. Jamaica*; and *LA BANA*, Birds.—The *Uruba* mentioned of Latham, is the *Ornithopus lananivora* of Gmelin, and *Linnaeus's* of Buffon.

BANARA, in *Botany, a small tree in Cayenne. *Lin. g. Schreb. 829. Aubl. 217. Juss. 295. Cist. de Verville monogyria. Nat. Ord. Columniferae.—Tiliaceae, Juss. Gen. Char. Cal. perianth one-leafed, six-parted, permanent; parts ovate. Cor. petals five, roundish, concave, spreading, three times larger than the calyx, inserted into the receptacle. Stam. filaments fifteen and more, capillary, length of the corolla, inserted into a glandule surrounding the germ; anthers roundish. Pyl. germ somewhat globose, seated in a glandule; style filiform of the height of the stamens; stigma headed. Per. berry globose, but little succulent, one-celled, crowned by the permanent style. Seeds numerous, very small, cornered, striated.**

Ess. Gen. Char. Cal. six-parted, permanent. Cor. six-petalled; germ seated on a small gland; stigma headed; berry globose, one-celled, many-seeded.

Species, 1. B. guianensis. Aubl. Guian. 548. t. 217. A tree growing about ten or more feet high, and about seven inches in diameter. Its bark is grayish, and its wood whitish and light. Leaves alternate, ovate-oblong, toothletted, sharp, green and smooth on the upper surface, pale, and slightly tomentose on the lower; petioles short, with two small deciduous stipules at the base of each. The largest leaves are five inches long and two broad; flowers yellow, in axillary and terminal racemes, with a single bract to each pedicel; berry black. A native of the island of Cayenne, flowering in May.

BANASA, or **BANASSA**, in *Ancient Geography*, a Roman colony established in Africa, in Mauritania Tingitana. It was seated on the river of Subur, at a considerable distance northerly from Gontiana.

BANAURIDES, islands of the Tyrrhenian sea, so called from Banaurus, son of *Aeas*. *Steph. Byz.*

BANAW, in *Geography*, a river of Prussia, which runs into the Frisch Haff, two miles W. N. W. of Heiligenthal.

BANAZ, a town of Asiatic Turkey, thirty miles N. W. of Karabissar.

BANBURY, a town of Oxfordshire, in England, lies on the river Chawwell, at the distance of 17 miles north of Oxford, and about 74 miles west from London. This town is supposed to occupy the site of the Roman station named *Branavris*, as many coins, and a Roman altar, have been found here. The latter was placed in a niche under the sign of an inn, which was called from thence the Altar-stone-inn; but this has been converted into a private house, and the altar is probably demolished. A castle was built in this town by Alexander bishop of Lincoln, soon after his consecration, which occurred in 1123. This building was preserved as one of the diocesan palaces from the above date till the first of Edward VI. when bishop Holbech conveyed it, with about thirty other manors, to the king and his courtiers. The estate was afterwards given by queen Elizabeth to the bishopric of Oxford in exchange for other lands. In the time of Henry VIII. 1534, it was valued at 14l. 13s. 10d. but at the time of the above exchange it was estimated at

49l. 18s. 9d. a year. This place was made a borough by queen Mary, who being pleased with the fidelity and their support of her against lady Jane Grey, granted them a charter, and inveilled the town with five aldermen. This charter was altered by James I. who appointed the government of the town to consist of a mayor, twelve aldermen, and five capital burgesses. A new charter was granted by George I. A. D. 1718, and the corporation was composed by a mayor, high steward, recorder, six capital burgesses, and thirty assistants, a town-deck, and two sergeants at law. The church, which is a large handsome structure, was built by the above bishop Alexander, who is supposed to have been buried in the chancel under a tomb, on which is a recumbent instituted figure. The outer wall of the church is ornamented with a number of carved heads of men and animals. Banbury has been particularly noted for the number of Puritanic inhabitants, who have been figured by Ben Jonson, and other dramatic writers. Camden speaks of it as famous for *cakes and ale*; and when Holland translated his *Britannia*, he changed the latter word, and printed it *cakes and zeal*. Here are a free-school, two charity schools, and a workhouse.

Many military transactions and battles have taken place in this town and neighbourhood; and the castle of Banbury is often mentioned by historians as the scene of repeated sieges and retreats. In the time of Edward IV. the earl of Pembroke and lord Stafford entered this town with their army, when a battle was fought between them and an army under the command of the earl of Warwick. After the battle of Edge-hill, the parliament had a garrison of 800 foot and a troop of horse in the castle, which was surrendered to the king in a few days, who gave it up with other garrisons to the Scots general.

The navigable canal from Coventry to Oxford passes by this town, and at the distance of about five miles it is conveyed through a hill by a tunnel three quarters of a mile in length. In the grounds adjoining the Ram inn is a well of sulphurated water; and at a short distance from the town is another spring of chalybeate water. The Pyrites-aureus, or golden fire stone, is often found here in digging wells. A number of the inhabitants are employed in the manufactory of plush and shag cloth; great quantities of which are annually made here, and sent to London and Portugal. Banbury has a weekly market on Thursday, and five annual fairs; one of which is appropriated for the poor, and is, and is provincially called a mop. The principal fairs in the neighbourhood are, Wroxton-house or fair, belonging to the earl of Guildford; and Broughton-castle, the property of lord Say and Sele. The first was a priory of Augustinian canons, founded by Michael Bek, an ecclesiastic in the reign of king John. Banbury sends one member to parliament, contains 525 houses, and 2755 inhabitants. *Bay's Sketch of a Tour into Derbyshire, &c.*

BANC, **BANCS**, or **BANCA**, in *Law*, denotes a seat or bench of judgment. See *COURT*. *Jus Banca*, or the privilege of having a bench, was at first only allowed to the king's judges, *qui summam administrant justitiam*. Inferior courts, as courts baron, hundred courts, &c. were not allowed that prerogative; and even at this day the hundred court at Frestedge in Norfolk is held under an oak at Geywood; and that of Woolfrey, in Herefordshire, under an oak, near Ashton in that county, called Hundred-oak.

BANCA, in *Geography*, an island of the East Indies, extending from S. lat. 3° 15' to S. lat. 1° 50' and from E. long. 107° 5', to E. long. 105° 25'. The latitude of Capt. Marchand's anchorage at three leagues distance from the northern coast, deduced by the dead reckoning, was 1° 23' S. and long. 103° 27' E. from Paris. It lies on the east side of the island of Sumatra, opposite to the river Palam-

bang in that island; on which the sovereign of Banca, who is possessor also of the territory of Palambang, keeps his constant residence. He maintains his authority over his own subjects, and his independence of the neighbouring princes, in great measure, by the assistance of the Dutch, who have a settlement and troops at Palambang, and who enjoy the benefit of a contract with the king of Banca for the tin which his subjects procure from thence; and which, like the king of Bantam, with regard to pepper, he compels the miners to deliver to him at a low price, and he sells it to the Dutch at a small advance, agreeably to his contract. This island is celebrated throughout Asia for its tin-mines, which were first discovered in 1710 or 1711, and which since that time have yielded immense quantities of ore, and appear to be inexhaustible. It is dug chiefly in seven places, which are under the direction of Chinese managers, that provide and pay the labourers, who are also, in general, of that nation. These miners reduce the ore into metal by employing wood as fuel in their furnaces, and not fossil-coal or coak, which is seldom so free from sulphur as not to affect the malleability of the metal. It is therefore sometimes preferred to European tin at the Canton market; and the profit upon it to the Dutch company is supposed to be not less any year than 150,000 pounds. The tin is delivered by the managers of the mines to the king at Palambang for five rix-dollars per 125 pounds, and by him to the Dutch for 15 rix-dollars, equal to about 58s. sterling per cwt. English. Raynal, and others, state the quantity of tin received by the Dutch company at 2,000,000lb, but it appears that they take at least 3,000,000lb. Very little, however, comes to Europe; in 1778, 700,000lb were sold in Holland at f. 42 per 100lb, but the greatest part goes to the China market. Stavorinus's Voyage to the East Indies, by Wilcocke, vol. i. p. 357. Staunton's Embassy to China, vol. i. p. 305.

BANCA, *Straits of*, lie between this island and Sumatra; which, on its eastern side, forms the western side of these straits, and its southern extremity forms the northern side of the straits of Sunda. Through these straits there is a safe navigation from the China sea, except near the northern entrance, where a shoal lies off, and another within it; so that it is necessary for a ship to found in that situation. Capt. Marchand, in endeavouring to gain the entrance of these straits, experienced strong currents, some setting to the E.N.E. others to the E. and others to the E.S.E. He therefore renounced the idea of going out of the China sea by the straits of Banca, and determined to sail by another strait situated more to the eastward, between the island of Banca and that of Billiton. This strait is known under the names of *Gaspars*, *Billiton's*, or *Clement's* strait; and has been much frequented in passing to and from the China sea. See Marchand's Voyage, vol. i. p. 98.

BANCALA, a kingdom in the island of Celebes.

BANCALIS, a town of the island of Sumatra, in the kingdom of Acheen.—Also, a bay on the north-east coast of this island, in N. lat. $1^{\circ} 15'$. E. long. $100^{\circ} 7'$. 43 leagues west of Malacca; it is in Brower strait, which is a branch of that of Malacca; is large, and affords good anchorage, and its navigation, as far as Bancalis, at the south extremity, is safe.

BANCAPOUR, a district of Hindostan, in the country of the Mahrattas.—Also, a town of this district. N. lat. $44^{\circ} 55'$. E. long. $75^{\circ} 15'$.

BANCAPOUR, *Sanore*. See SANORE.

BANCK, LAURENCE, in *Biography*, a Swedish lawyer, was born at Norcopin, and after returning from his travels in France, Italy, Spain, &c. acquired great reputation as professor of the civil law in the university of Franeker, which post he occupied for 15 years. He died on the 13th of October in the year 1662. In 1649, he published a Latin work "On the Tyranny of the Pope over Christian Kings

and Princes;" and in 1656, "Rome triumphant, or the Inauguration of Innocent X." But his principal work was his edition of the famous book of "The Tax of the Roman Chancery," in which are fixed the prices of absolution for the most heinous and infamous crimes. This edition, formed by a collation of the most ancient copies, both printed and manuscript, was printed at Franeker, in 8vo. in 1651; and several other editions have been, before and since, printed at different places. Jurieu, in his "Prejuges legit. contre le Papisme," t. i. p. 295, &c. published the particulars of these taxes. Banck's edition of these taxes, and some others, have been referred to the class of prohibited books, in the "Index" of the Inquisition, as corrupted by heretics; but enough remains in uncontroverted editions to induce worthy Catholics to lament that such taxes should ever have disgraced the church. Gen. Dict.

BANCK, *Peter Vander*, an eminent engraver, was a native of Paris, and received instruction in the art of engraving from the celebrated Francois de Poilly. About the year 1674, he came over to England, and married; but not receiving recompence answerable to his labour as an artist, he was reduced to penury, and to dependence on the brother of his wife. He died at Bradfield in 1697, and left his plates to his widow, who sold them to great advantage, and left an easy fortune.

His chief employment was engraving of portraits; and he was the first in England who engraved them on so large a scale. Like many of Poilly's disciples, his great merit consists in the laboured neatness and management of the mechanical part of the art. In England his productions will be always esteemed, as they preserve the best resemblance of many eminent persons who were living at that time. Strutt.

BANCOK, BANOK, or FOU, in *Geography*, a maritime and fortified town of Asia, in the kingdom of Siam, seated on an island formed by the river Menan. N. lat. $13^{\circ} 25'$. E. long. $101^{\circ} 5'$.

BANCOTE, now fort *Victoria*, lies on the Malabar coast of India, contiguous to Rajapore. It has a good harbour, and a great trade for salt, &c. from Bombay, whither it makes returns in cattle.
